FILED

2007 JUN -6 PM 4:23

OFFICE WEST VIRGINIA
SECRETARY OF STATE

NOTICE OF A PUBLIC HEARING ON A PROPOSED RULE

AGENCY: WV Department of Environmental Protection - Division of Air Quality TITLE NUMBER: 45

RULE TYPE: Legislative CITE AUTHORITY: WV Code §22-5-4

AMENDMENT TO AN EXISTING RULE: YES [X] NO [ ]

IF YES, SERIES NUMBER OF RULE BEING AMENDED: 34

TITLE OF RULE BEING AMENDED: Emission Standards for Hazardous Air Pollutants for Source Categories Pursuant to 40 CFR Part 63

IF NO, SERIES NUMBER OF RULE BEING PROPOSED: _____

TITLE OF RULE BEING PROPOSED: _____

DATE OF PUBLIC HEARING: July 9, 2007 TIME: 6:00 p.m.

LOCATION OF PUBLIC HEARING: West Virginia Department of Environmental Protection
Dolly Sods Conference Room
601 57th Street, SE
Charleston, WV 25304

COMMENTS LIMITED TO: ORAL [ ] WRITTEN [ ] BOTH [X]

DATE WRITTEN COMMENT PERIOD ENDS: July 9, 2007 TIME: 6:00 p.m.

WRITTEN COMMENTS MAY BE MAILED TO:
Public Information Office
Department of Environmental Protection
601 57th Street, SE
Charleston, WV 25304

The Department requests that persons wishing to make comments at the hearing make an effort to submit written comments in order to facilitate the review of these comments.

The issues to be heard shall be limited to the proposed rule.

ATTACH A **BRIEF** SUMMARY OF YOUR PROPOSAL

Authorized Signature

DEPARTMENT OF ENVIRONMENTAL PROTECTION
DIVISION OF AIR QUALITY

BRIEFING DOCUMENT

Rule Title: 45CSR34 - "Emission Standards for Hazardous Air Pollutants"

A. AUTHORITY: W.Va. Code §22-5-4

B. SUMMARY OF RULE:

This rule establishes and adopts national emission standards for hazardous air pollutants (NESHAP) and other regulatory requirements promulgated by the United States Environmental Protection Agency (U.S. EPA) pursuant to section 112 of the federal Clean Air Act, as amended (CAA). This rule codifies general procedures and criteria to implement emission standards for stationary sources that emit, or have the potential to emit, one or more of the hazardous air pollutants set forth in section 112(b) of the CAA, or one or more of the eight substances listed as hazardous air pollutants in 40 CFR §61.01(a). The rule incorporates by reference the NESHAP standards of 40 CFR Parts 61, 63 and 40 CFR Part 65 (Consolidated Federal Air Rule), to the extent referenced in 40 CFR Parts 61 and 63, promulgated as of June 1, 2007. The rule also adopts associated appendices, reference methods, performance specifications and other test methods which are appended to these standards and contained in 40 CFR Parts 61 and 63. Any person who constructs, reconstructs, modifies or operates any source subject to the provisions of 40 CFR Parts 61 or 63 must comply with the applicable NESHAPS and this rule.

This rule will repeal and replace 45CSR15 "Emission Standards for Hazardous Air Pollutants Pursuant to 40 CFR Part 61" filed April 28, 2006 and effective June 1, 2006, as 45CSR34 will now include all federal NESHAPS under 40 CFR Parts 61 and 63.

The revised rule incorporates by reference the following new or revised NESHAP standards promulgated as of June 1, 2007: Miscellaneous Organic Chemical Manufacturing, Waste Management System; Testing and Monitoring Activities, Methods Innovation Rule and SW-846 Final Update IIIB, Cellulose Products Manufacturing, Primary Aluminum Reduction Plants, Cross-Media Electronic Reporting, Hazardous Waste Combustors (Phase I Final Replacement Standards and Phase II), Requirements for Control Technology Determinations for Major Sources in Accordance With Clean Air Act Sections, Sections 112(g) and 112(j), Primary Copper Smelting, Coke Ovens: Pushing, Quenching, and Battery Stacks, Cellulose Products Manufacturing, Reinforced Plastic Composites Production; Miscellaneous Organic Chemical Manufacturing, Secondary Aluminum Production, Brick and Structural Clay Products Manufacturing, Hazardous Waste Combustors, Exemption of Certain Area Sources From Title V Operating Permit Programs, List of Hazardous Air

Pollutants, Petition Process, Lesser Quantity Designations, Source Category List, Miscellaneous Coating Manufacturing, Industrial, Commercial, and Institutional Boilers and Process Heaters: Reconsideration, Surface Coating of Metal Cans, Refractory Products Manufacturing, Plywood and Composite Wood Products; List of Hazardous Air Pollutants, Lesser Quantity Designations, Source Category List, Miscellaneous Organic Chemical Manufacturing, Hydrochloric Acid Production, Industrial Process Cooling Towers, Magnetic Tape Manufacturing Operations, Ethylene Oxide Emissions Standards for Sterilization Facilities, Refractory Products Manufacturing, General Provisions; Printing and Publishing Industry; Source Categories; Integrated Iron and Steel Manufacturing Facilities; Dry Cleaning Facilities; Organic Liquids Distribution (Non-Gasoline); Miscellaneous Coating Manufacturing; Site Remediation; Portland Cement Manufacturing Industry; Synthetic Organic Chemical Manufacturing Industry; Surface Coating of Automobiles and Light-Duty Trucks; Oil and Natural Gas Production Facilities; Surface Coating of Plastic Parts and Products, and Halogenated Solvent Cleaning.

The following 40 CFR Part 63 standards affecting non-major sources of hazardous air pollutants are being excluded from incorporation by reference: Oil and Natural Gas Production; Polyvinyl Chloride and Copolymers Production; Primary Copper Smelting; Secondary Copper Smelting; and Primary Nonferrous Metals - Zinc, Cadmium, and Beryllium.

C. STATEMENT OF CIRCUMSTANCES WHICH REQUIRE RULE:

As provided in 40 CFR §§61.04(b) and 63.12(b)(1), and because West Virginia has an approved Title V permit program, the Secretary therefore has the authority to implement and enforce national emission standards for hazardous air pollutants for stationary sources required to obtain a Title V permit under 40 CFR Parts 61 and 63, pursuant to Section 112 of the CAA. Promulgation of this rule will enable the Department of Environmental Protection, Division of Air Quality to continue to be the primary enforcement authority for NESHAP promulgated under 40 CFR Parts 61 and 63 by U.S. EPA as of June 1, 2007. Promulgation of this rule by the Legislature is necessary for the State to fulfill its responsibilities under the CAA. Revisions to the rule include rule title, revision of scope, addition of repeal language for 45CSR15, definition of 'hazardous air pollutant', general annual updates and addition of incorporation by reference of 40 CFR Part 61, updated exclusions to adoption of standards to include Part 61 exclusions from 45CSR15, and general language clarification and correction.

D. FEDERAL COUNTERPART REGULATIONS - INCORPORATION BY REFERENCE/DETERMINATION OF STRINGENCY:

A federal counterpart to this proposed rule exists. In accordance with the Secretary's recommendation, and with limited exception, the Division of Air Quality proposes that the rule incorporate by reference the federal counterparts. Because the proposed rule incorporates by reference the federal counterpart, no determination of stringency is required.

E. CONSTITUTIONAL TAKINGS DETERMINATION:

In accordance with W.Va. Code §§22-1A-1 and 3(c), the Secretary has determined that this rule will not result in taking of private property within the meaning of the Constitutions of West Virginia and the United States of America.

F. CONSULTATION WITH THE ENVIRONMENTAL PROTECTION ADVISORY COUNCIL:

At its May 21, 2007, and May 30, 2007 meetings, the Environmental Protection Advisory Council reviewed and discussed this rule. (See attached minutes for Council's discussion).

West Virginia Department of Environmental Protection

ADVISORY COUNCIL MEETING MINUTES

Monday – May 21, 2007
1:00 p.m. – 3:00 p.m.
601 57th Street, SE, Charleston, WV
West Virginia Room – 3rd Floor

ATTENDEES:

Advisory Council Members:

Rick Roberts
Karen Price
Bill Raney
Lisa Dooley
Larry Harris
Jackie Hallinan

DEP:

Randy Huffman, Deputy Cabinet Secretary/Director –Division of Mining & Reclamation
Karen G. Watson, Assistant General Counsel
Ken Ellison, Director - Division of Land Restoration
Lisa McClung, Director – Division of Water and Waste Management
John Benedict, Director – Division of Air Quality
Lewis Halstead, DMR
Ken Politan, DMR
Charlie Sturey, DMR
Jessica Greathouse, Chief Communication Officer – WVDEP – Public Information Office
James Martin, Chief, Office of Oil & Gas
Carroll Cather, DWWM
Pam Nixon, Advocate
David L. Vande Linde, Blasting
Jim Mason, DAQ
Mike Zeto, DWWM – EE
Matt Sweeney, DWWM

VISITORS:

Ann Bradley, Spilman Thomas & Battle
Charlie Burd, IOGA
Don Garvin, WVEC
Dave Yaussy, Robinson & McElwee

Randy Huffman, Deputy Cabinet Secretary - West Virginia Department of Environmental Protection called the meeting to order at 1:00 p.m.

Karen Price stated that the Council did not have enough time to review the rules, therefore was requesting to have another meeting to discuss further and the remaining of the Council agreed. The Council will meet May 30, 2007 at 10:00 a.m. – WVDEP – 601 57th Street, SE – Charleston, WV 25304 – West Virginia Room (3001).

Deputy Cabinet Secretary Huffman apologized for the short time period regarding the rules getting out to Council. Randy Huffman then introduced Karen Watson, Assistant General Counsel to discuss with the Council the DEP bills that had passed in the 2007 Regular Legislative Session:

- SB 337 – Establishing New Greenhouse Gas Inventory Program
  Approved by Governor – April 4, 2007

- SB 425 – Relating to Water Pollution Control Revolving Fund
  Approved by Governor – April 4, 2007

- SB 465 – Establishing Dam Safety Rehabilitation Revolving Fund
  Approved by Governor – March 27, 2007

- SB 490 – Relating to Underground Storage Tank Insurance Fund
  Approved by Governor – April 3, 2007

- SB 524 – Requiring Proof of Lawful Disposal of Solid Waste
  Approved by Governor – March 28, 2007

- SB 588 – Removing Tax Expiration Date on Manufacturing or Production of Synthetic Fuel From Coal
  Approved by Governor – April 4, 2007

Karen Watson then gave a brief summary of each proposed rule for the 2008 legislative session:

Air Quality

45CSR6 – Control of Air Pollution from Combustion of Refuse

SUMMARY

Proposed Rule 6 is now a basic open burning/ incinerator rule. Revised scope includes 'statutory air pollution,' addition of new language for posted operating instructions and open burning or incineration of animal or poultry carcasses during a declared state of emergency. Except for temporary Air Curtain Incinerators for land clearing debris (DOH jobs) and incineration of animal or poultry remains, most Air Curtain Incinerators will now be exempted under Rule 6 and placed under Rule 18.

COMMENT

Mr. Harris: Why does it allow low-level radioactive waste?

DEP Response: To allow crematories to dispose of bodies with chemo drugs. Does not allow high-level radioactive compounds related to research.

Council wanted to know if the agency would accept comments in writing after the meeting (e-mail in comments)

DEP Response: Yes

45CSR8 – Ambient Air Quality Standards

SUMMARY

NAAQS rules 45CSR8, 45CSR9 & 45CSR12 have been combined for the 2008 legislative session. Rule 8 is now the complete NAAQS incorporation by reference rule, and 45CSR9 & 45CSR12 will be repealed and replaced. Revisions to SO_2 & PM NAAQS include correction of SO_2 annual primary standard from 0.003 to 0.030 ppm, addition of annual and 24-hour $PM_{2.5}$ standards, and addition of measurement methods for $PM_{2.5}$. Revisions to CO & Ozone NAAQS include revocation of one-hour ozone standard except for Berkeley & Jefferson counties, identification of one-hour ozone maintenance areas, and addition of 8-hour primary and secondary ozone standards. Revisions to NO_2 and Lead NAAQS include addition of primary and secondary standards for lead, and addition of measurement methods for lead. Revisions also include general language updates, improved citing and consistency.

COMMENT

Mr. Harris: Are we sure we are protecting the public's health? We should not be lowering standards so that our energy being transmitted to other states doesn't pollute our air. Are we aware of EPA's Science Advisory Panel?

DEP Response: CAIR aims to lower emissions at power plants. Utility controls are helping us meet targets earlier. EPA's regional approach has generally been successful and we are seeing tremendous benefits. The agency is aware of the EPA's panel, and EPA is considering more stringent regulations but has not done so yet.

45CSR16 – Standards of Performance for New Stationary Sources

SUMMARY

Revisions to rule incorporate annual incorporation by reference updates and exclusions.

COMMENT

No questions.

45CSR18 – Control of Air Pollution from Combustion of Solid Waste

SUMMARY

CISWI Rule 18 combines and incorporates by reference all current federal Section 111/129 combustion regulation into one rule. Old Rule 24 will be repealed and replaced. New exemption section is consistent with revised Rules 6, 25 and 34. Revisions also include revised scope, extensive federal counterpart language updates, improved citing and consistency.

COMMENT

No questions.

45CSR25 – Control of Air Pollution from Hazardous Waste Treatment, Storage and Disposal Facilities

SUMMARY

Revisions to the proposed rule include general annual incorporation by reference and revisions required to maintain consistency with the DWWM's rule 33CSR20 and federal counterpart regulation. Addition of direct incorporation by reference of new provisions published in the Federal Register. Language for pathological waste incinerators is revised for clarity.

COMMENT

No questions.

45CSR34 – Emission Standards for Hazardous Air Pollutants

SUMMARY

Rule 34 now combines all NESHAP regulations previously adopted under both Rules 15 & 34. Old Rule 15 will be repealed and replaced. Revisions to Rule 34 incorporate annual NESHAP updates under Parts 61 & 63. Some Part 63 standards affecting non-major sources of hazardous air pollutants are being excluded from incorporation by reference: Oil and Natural Gas; Polyvinyl Chloride and Copolymers; Primary Copper Smelting; Secondary Copper Smelting; and Primary Nonferrous Metals.

COMMENT

No questions.

45CSR39 – Control of Annual Nitrogen Oxides Emissions

SUMMARY

Annual CAIR NOx Rule - Incorporates revisions to 40 CFR Part 96.

COMMENT

No questions.

45CSR40 - Control of Ozone Season Nitrogen Oxides Emissions

SUMMARY

Ozone Season CAIR NOx Rule - Incorporates revisions 40 CFR to Part 96.

COMMENT

No questions.

45CSR41 – Control of Annual Sulfur Dioxide Emissions

SUMMARY

Annual CAIR SO_2 Rule - Incorporates revisions to 40 CFR Part 96.

COMMENT

No questions.

45CSR42 – Greenhouse Gas Emissions Inventory Program

SUMMARY

The Greenhouse Gas Inventory Program Rule is authorized by SB337 passed in the 2007 legislative session. The rule establishes a program which requires the reporting and inventory of greenhouse gas emissions by stationary sources which emit more than a *de minimis* amount; inventories greenhouse gas emissions from stationary, area, mobile and biogenic sources, and accounts for reductions, capture and sequestration; provides for: a periodic compilation of a greenhouse gas inventory; a determination whether WV is a net sink or emitter; development of a registry for voluntary reductions; and a determination whether greenhouse gas can be developed as an asset for economic development.

COMMENT

Mr. Raney: Is the exclusion still there for coal preparation activities?

DEP Response: Yes, section 3.2. (45CSR42)

Mr. Raney: How do we quantify sequestration?

DEP Response: Don't think we will get down to stationary source level. Agency will look at area

sources and biogenic activities. Once we get information, we will compile in an inventory.

Division of Water and Waste Management

33CSR9 – Standards for Beneficial use of Filtrate from Water Treatment Plants

SUMMARY

This legislative rule establishes a mechanism and requirements for the permitting, siting, bonding, and use of water treatment plant sludge from water treatment plants that has beneficial properties. This rule applies to the beneficial use of water treatment plant sludge and to any person who seeks approval from the Secretary to beneficially use such sludge within the state. This rule is intended to enhance the resource recovery and recycling goals of article fifteen of chapter twenty-two of the West Virginia Code and to encourage the beneficial use of water treatment plant filtrate. Section 22-15-23 of the West Virginia Code and this rule, and not the provisions of W. Va. Code § 22-15-10 or 33 CSR 1, shall govern the beneficial use of water treatment plant sludge. This rule does not apply to sewage sludge, products derived from sewage sludge, sludges regulated under 33 CSR 8, or materials regulated as hazardous waste under W. Va. Code §§22-18-1, et seq.

COMMENT

Lisa Dooley: Public notice of permits – who bears the cost – there has to be a more efficient way of getting notices out than Class I legal ads. This is a suggestion for the future.

DEP Response: Applicant bears cost – DEP is trying other methods of getting the information out – but not everyone has access to e-mail.

400 people on DEP's mailing list to receive permits by e-mail and we have between 30-40 who receive permits by US mail.

33CSR20 – Hazardous Waste Management System

SUMMARY

This amendment will adopt by reference approximately two years of changes to federal regulations by adopting the federal regulations in effect as of June 1, 2007 consisting of changes that correct errors in previously enacted Dye and Pigment rule and Manifest rule, allow more hazardous waste, allow greater flexibility in SW-846 testing and monitoring, allow more mercury containing devices to be managed as universal waste, streamline permitting process through a standardized permit, allow additional headworks and de minimus waste exemptions, reference Clean Air Act standards for hazardous waste combustors, allow a series of paperwork burden reductions for hazardous waste management facilities, corrects errors in 40 CFR (federal regulations) and excludes cathode ray tubes from the definition of solid waste under certain conditions. Language corrections, updated references and a change as the result of an EPA comment regarding annual groundwater monitoring at corrective action sites are also included in the amended rule. The rule amendment is not projected to require additional operating expenses above current levels as the amendments are generally de-regulatory in nature.

COMMENT

No questions.

33CSR30 – Underground Storage Tanks

SUMMARY

There are several new provisions to reflect the 2005 Federal Energy Act, including: secondary containment requirements for new or replaced thanks or piping; secondary containment requirements for new or replaced fuel dispenser systems; tank eligibility for delivery, deposit or acceptance – enables agency to prevent deposit or delivery to a tank that is not in compliance; and training requirements for individuals who operate, maintain or are responsible to address emergencies from spills or releases from underground storage tank systems.

COMMENT

No questions.

47CSR2 – Requirements Governing Water Quality Standards

SUMMARY

The proposed revisions reflect updates identified during the federally-mandated triennial review of the Water Quality Standards rule. These include proposed additions to the trout water list, new criteria for nutrients, revisions to criteria in Appendix E and a use redesignation in the Guyandotte River Basin.

COMMENT

Mr. Raney: Would like to have the trout water list stay within the agency and be able to discuss the science on a case-by-base basis before the EQB, not the Legislature.

DEP Response: The DEP believes the scientific basis for the proposed trout streams is clear and does not need to be litigated before the EQB.

Mr. Harris: Commented on the changes in Appendix E and asked whether the formula change for copper and cadmium resulted in a more or less stringent standard.

DEP Response: The changes in Appendix E are recommended by EPA, updating MCL's, etc. The revised hardness formulas represent EPA's latest science.

47CSR10 – National Pollutant Discharge Elimination System (NPDES)

SUMMARY

The proposed revisions to the National Pollutant Discharge Elimination System Rule reflect updates/additions made to the various federal regulations that govern the NPDES program. The proposed changes also include specific language in section 14 of the rule relating to the Pretreatment Program to ensure that the rule is consistent with the most recent federal pretreatment regulations in 40 CFR Part 403.

COMMENT

No questions.

47CSR34 – Dam Safety

SUMMARY

The proposed revisions establish requirements governing the disbursement and use of moneys in the Dam Safety Rehabilitation Revolving Fund, authorized by SB 465 in the 2007 legislative session.

COMMENT

Ms. Hallinan: Any progress being made in reducing the number of deficient dams?

DEP Response: Not very much. The fund initiative is badly needed.

60CSR5 – Antidegradation Implementation Procedures

SUMMARY

Antidegradation is a requirement of the federal Clean Water Act intended to preserve the existing quality of the State's waters and to prevent and/or minimize future degradation. The rule was first adopted in 2001 and establishes four levels, or tiers, of protection for state waters, Tiers 1, 2, 2.5 and 3. Each tier provides a graduated level of protection used during the NPDES permit issuance process. The proposed revisions to the rule carry forward the agency's antidegradation implementation efforts, and move the Tier 2.5 streams that had been on the "presumptive" list in Appendix C to a final proposed list in Appendix A. The agency is proposing a total of 156 streams be included on the list. The list of 156 waters is comprised of the 37 waters that did not receive objections in the formal objection period, those waters that contain reproducing trout and are 100% on public land, those waters listed as high quality on public land based on their high biological scores, and Loop Creek.

COMMENT

Mr. Harris: Suggested we file with 309 streams instead of 156 streams because Legislature will further reduce.

Mr. Raney: Suggested we start with 39.

Mr. Harris: Asked about section 2.11 in the definitions regarding "trading" and if it includes cross-pollutant trading.

DEP Response: The definitions were unchanged from the ones the EQB first adopted in 2001. The agency does not think it allows cross-pollutant trading.

Division of Mining and Reclamation

38CSR2 – Surface Mining Reclamation Rule

SUMMARY

§38-2-3.2.g. Notice of Technical Completeness is new language and is to provide the public an opportunity to review the application once technical review is completed. §38-2-5.4.e.1 is removing language that is contrary to returning the natural drainway to its original pattern, profile, and dimensions once drainage control structure is removed. The changes in §38-2-5.6 clarify what operations may be exempt from conducting a "Surface Water Runoff Analysis", monitoring requirements and removes phase-in compliance schedule that expired on June 19, 2006. Changes to §38-2-6 removes duplication of rules for Blasting and after this change, all the requirements for blasting will be contained in Surface Mining Blasting Rule, Title 199 Series 1. New §38-2-11.8 titled "Bond Credit for Reclamation of Bond Forfeiture Site under a No Cost Reclamation Contract" encourages qualified operators to undertake reclamation of bond forfeiture sites for the purpose of eliminating hazards to human health and safety, abating pollution of surface and ground waters and the contribution of sediment to adjacent areas, and restoring land to beneficial uses. Changes in §38-2-14.15.c.2 and 14.15.d.3 are clarifying contemporaneous reclamation rules on excess spoil disposal. The changes in 14.15.e remove a phase-in compliance schedule that expired in 2004. The changes in §38-2-23 are being made to make the mining rule consistent with the proposed changes in the State's NPDES Mining Rules.

COMMENT

No questions.

47CSR5A – Individual State Certification of Activities Requiring a Federal Permit

SUMMARY

The proposed amendments to this rule are being made to adopt into rule requirements that have been applied through past practices for coal related activities requiring mitigation and issuance of a 401 State Certification of a 404 Permit. Ratios for monetary compensation for temporary impacts are detailed. Monetary compensation for permanent impacts to wetlands from coal related activities are made the same as non-coal related. Additional economic and stream measurement information is being requested to be added to the 401 application.

COMMENT

Mr. Harris: How do we determine the "ordinary high water mark" under section 4.2.f.4 and how is it determined on a small stream?

DEP Response: The US Army Corps of Engineers is responsible for determining "waters of the U.S." under the rule.

Mr. Harris: What are the differences between coal and non-coal impacts and how are they determined?

DEP Response: Rule has to be consistent with statute.

47CSR30 – WV/NPDES Rules for Coal Mining Facilities

SUMMARY

The proposed amendments to this rule are being made to allow general clean-up of sections referencing outdated names of agencies and references to the EQB governing rule making. This rule addresses the Secretary as being the person as head of all actions. References to the "Director" are changed to "Secretary" to eliminate the need to distinguish between the Director of Mining and Reclamation and the Director of Water and Waste Management when issuing a coal related WV/NPDES permit. This rule adds provision for storm-water coverage for certain minimal activities without the requirement for modification through application to the permit. This rule also provides for an advanced approval of transfer of a WV/NPDES Permit to coincide with the advanced approval of the corresponding Article 3 Permit. This rule clarifies provisions related to coal remining operations and provides a remining water quality standard variance for any parameter of concern.

COMMENT

No questions.

199CSR1 - Surface Mining Blasting Rule

SUMMARY

The proposed amendments change the following sections: 2.27. Adds the definition of "other structure" (structures built by the permittee); 2.38 Clarifies definition of "surface mine operation"; 3.2.C. Plan for blasting should include seismic monitoring when within 1000 ft of a structure, and performance specifications for blasting seismographs; 3.4. Areas of blasting that will be regulated for shaft and slope development; 3.6.c.3. Requiring field practice guidelines for blasting seismographs; 3.7a Request for alternate limits must have written consent of the owner; 3.9. Minimum qualifications and continuing education requirements for surveyor; 4.1.b. Allows the agency to consider blasting experience of applicants that was gained prior to the last three years; 4.5.d. Requires applicants who have been suspended or revoked in other states to show cause as to why should be issued a certification; 4.9.a.2 process for issuing a temporary suspension to a blaster and appeal rights; 4.13 Clarifies blasters responsibility of training the blasting crew; 5.2.a.3&4 Clarifies

the investigations process on a claim of blasting damage; 6.1 Requiring that any arbitrators that are removed from the list must be done with cause; and 7.3 Detonators and initiation systems are not considered for calculation of fees.

COMMENT

No questions.

Office of Oil and Gas

35CSR3 – Coalbed Methane Wells Rule

SUMMARY

The WVDEP, Office of Oil and Gas is proposing to revise existing rule 35CSR3. Series 3 is a legislative rule in place to enforce the provisions in WV Code §22-21-1 et seq., Coalbed Methane Wells and Units, commonly referred to at the Coalbed Methane Act. The revisions will: Address the establishment of special field rules to promote the orderly development of coalbed methane fields; Protect the correlative rights of all owners located within the geographic area for which special field rules are established; Provide a process by which the Review Board may hold a hearing on an application for special field rules and issue such rules; Insert language (Section 17) which was inadvertently deleted from the rule during the 2006 legislative session. This language existed in the rule prior to the revisions in 2006.

COMMENT

Is this the same rule that went through last year?

DEP Response: Yes, except for two sections that had changes:

16.2.e – advertisement "15 days"

16.1.6.1 – "FOIA" issue that came out of the LRMRC.

Mr. Raney: Is this the product of the stakeholders group?

DEP Response: Yes.

Ms. Hallinan: What is a field rule?

DEP Response: Special spacing procedure for coalbed methane wells. It deals with pooling and royalty issues.

Division of Land Restoration

33CSR10 – Recycling Assistance Grant Program

SUMMARY
This rule sets out guidelines and procedures for providing assistance grants to local governments and other interested parties for the purpose of planning, initiating, expanding, or upgrading recycling programs, provide related public education programs, and assist in recycling market procurement efforts.

COMMENT

No questions.

60CSR3 – Voluntary Remediation and Redevelopment Rule

SUMMARY

This legislative rule establishes the eligibility, procedures, standards and legal documents required for voluntary and brownfield cleanups and updates risk protocol standards, including updates to the deminimis table. It also includes changes to the land use covenant section to incorporate the components of the Uniform Covenant Act.

COMMENT

Ms. Dooley: Are there grant dollars for brownfields?

DEP Response: Yes

The next scheduled Advisory Council Meeting will be on May 30, 2007 at 10:00 a.m. Mr. Huffman asked the Council members to notify the DEP of which rules they want to discuss so the right agency person can be at the meeting. He also asked them to submit comments prior to the meeting if possible.

West Virginia Department of Environmental Protection

ADVISORY COUNCIL MEETING MINUTES

Wednesday – May 30, 2007
10:00 a.m. – 12:00 p.m.
601 57th Street, SE, Charleston, WV
West Virginia Room – 3rd Floor

ATTENDEES:

Advisory Council Members:

Rick Roberts
Karen Price
Bill Raney
Larry Harris - Teleconference
Jackie Hallinan

DEP:

Randy Huffman, Deputy Cabinet Secretary/Director –Division of Mining & Reclamation
Karen G. Watson, Assistant General Counsel
Lisa McClung, Director – Division of Water and Waste Management
John Benedict, Director – Division of Air Quality
Jessica Greathouse, Chief Communication Officer – WVDEP – Public Information Office
Pam Nixon, Advocate
Jim Mason, DAQ
Mike Zeto, DWWM – EE
John Morgan, DWWM
Scott Mandirola, DWWM
Greg Adolfson, PIO

VISITORS:

Dave Yaussy
Brittany Carns
Joe Gollehon
Gregory Hoyer
Jeff Mauzy
Amy Christy

Randy Huffman, Deputy Cabinet Secretary - West Virginia Department of Environmental Protection called the meeting to order at 10:00 a.m. Advisory Council Member Larry Harris joined the meeting via teleconference. Deputy Cabinet Secretary Huffman then turned the meeting over to Karen Watson, Assistant General Counsel for the West Virginia Department of Environmental Protection. Karen informed the Council that the agency had received comments from several Council members and those comments would be appended to the minutes. (see attached) She explained the agency

had representatives from each of the programs to answer questions for the rules identified in those comments. She also explained the agency had made several changes in the rules as a result of those comments.

Air Quality

45CSR6 – Control of Air Pollution from Combustion of Refuse

SUMMARY

Proposed Rule 6 is now a basic open burning/ incinerator rule. Revised scope includes 'statutory air pollution,' addition of new language for posted operating instructions and open burning or incineration of animal or poultry carcasses during a declared state of emergency. Except for temporary Air Curtain Incinerators for land clearing debris (DOH jobs) and incineration of animal or poultry remains, most Air Curtain Incinerators will now be exempted under Rule 6 and placed under Rule 18.

COMMENT

Larry Harris: Had raised the issue of "low-level radioactive waste" in the last meeting.

DEP Response: DEP has removed the chemotherapeutic waste and low-level radioactive waste provisions from the proposed rule. The proposed rule does not in any way affect current medical waste incineration rules now on the books.

45CSR8 – Ambient Air Quality Standards

SUMMARY

NAAQS rules 45CSR8, 45CSR9 & 45CSR12 have been combined for the 2008 legislative session. Rule 8 is now the complete NAAQS incorporation by reference rule, and 45CSR9 & 45CSR12 will be repealed and replaced. Revisions to SO_2 & PM NAAQS include correction of SO_2 annual primary standard from 0.003 to 0.030 ppm, addition of annual and 24-hour $PM_{2.5}$ standards, and addition of measurement methods for $PM_{2.5}$. Revisions to CO & Ozone NAAQS include revocation of one-hour ozone standard except for Berkeley & Jefferson counties, identification of one-hour ozone maintenance areas, and addition of 8-hour primary and secondary ozone standards. Revisions to NO_2 and Lead NAAQS include addition of primary and secondary standards for lead, and addition of measurement methods for lead. Revisions also include general language updates, improved citing and consistency.

COMMENT

Karen Price: Section 4.2.c – $PM_{2.5}$ Maximum 24-Hour Average Concentration. The level for the 24-hour primary and secondary standard states 35 ug/m^3. This should be 65 ug/m^3, pursuant to 40 CFR 50.7.

DEP Response: On October 17, 2006, the federal NAAQS regulation changed from 65 to 35.

Larry Harris: Restated his concern that the standards may not be stringent enough to protect public health. He also restated his question about the antidegradation language struck from the rule.

DEP Response: DEP cannot lower the NAAQS standards below that of federal levels unless the provisions for the stringency test in §22-1-3a are fully met. 45CSR14, in its entirety, has wholly replaced the intent of the relic anti-degradation language struck in proposed Rule 8.

45CSR39 – Control of Annual Nitrogen Oxides Emissions

45CSR40 - Control of Ozone Season Nitrogen Oxides Emissions

Ozone Season CAIR NOx Rule - Incorporates revisions 40 CFR to Part 96.

Annual CAIR NOx Rule - Incorporates revisions to 40 CFR Part 96.

45CSR41 – Control of Annual Sulfur Dioxide Emissions

Annual CAIR SO_2 Rule - Incorporates revisions to 40 CFR Part 96.

COMMENT

Karen Price: Asked why the opt-in language was deleted from each of these rules.

DEP Response: has removed the opt-in provisions in the three CAIR rules so that West Virginia can say that CAIR equals NOx RACT for EGUs under the PM2.5 implementation rule.

45CSR42 – Greenhouse Gas Emissions Inventory Program

SUMMARY

The Greenhouse Gas Inventory Program Rule is authorized by SB337 passed in the 2007 legislative session. The rule establishes a program which requires the reporting and inventory of greenhouse gas emissions by stationary sources which emit more than a *de minimis* amount; inventories greenhouse gas emissions from stationary, area, mobile and biogenic sources, and accounts for reductions, capture and sequestration; provides for: a periodic compilation of a greenhouse gas inventory; a determination whether WV is a net sink or emitter; development of a registry for voluntary reductions; and a determination whether greenhouse gas can be developed as an asset for economic development.

COMMENT

Karen Price and Larry Harris: Both asked about the definitions of "anthropogenic" and "biogenic" in the rule and asked for examples of each.

DEP Response: An example of an anthropogenic source is the coal extraction process and an example of a biogenic source is the erosion of soil exposing a coal seam. The agency does not plan

to ask sources to report biogenic activities. In order to receive credit a source must report all of its emissions.

Karen Price: Can the reporting requirement in section 4.1 be made consistent with the emissions inventory requirements.

DEP Response: The date in the rule is March 31st and is the same as the emissions inventory date.

Karen Price: Does not believe fees should be required for greenhouse gas reporting.

DEP Response: The agency will consider the issue.

Karen Price: The last sentence in section 5.3 allowing the Secretary to request information is not authorized by statute.

DEP Response: It is authorized by the statute.

Karen Price: There should be a reasonable protocol for reporting emissions.

DEP Response: DAQ purposely wrote the rule in a manner flexible to the Secretary, as greenhouse gas reduction quantification protocols are still being developed at this time.

Karen Price: Is WV going to sign on to the climate registry or are we going to have our own?

DEP Response: In order to trade, we have to be consistent with other programs, but we do not want to be more specific in the rule.

Bill Raney: The exemption in section 3.2 includes language referring to sources covered by chapter 22-3 as well as sources required to report emissions. We are concerned this may take the exemption in the statute away.

DEP Response: While the agency did not want to require mining extraction to report emissions, thermal dryers associated with coal prep plants often have huge emissions of greenhouse gases. That is the reason the statute and rule only exempt sources permitted under chapter 22-3.

Division of Water and Waste Management

33CSR9 – Standards for Beneficial use of Filtrate from Water Treatment Plants

SUMMARY

This legislative rule establishes a mechanism and requirements for the permitting, siting, bonding, and use of water treatment plant sludge from water treatment plants that has beneficial properties. This rule applies to the beneficial use of water treatment plant sludge and to any person who seeks approval from the Secretary to beneficially use such sludge within the state. This rule is intended to enhance the resource recovery and recycling goals of article fifteen of chapter twenty-two of the West Virginia Code and to encourage the beneficial use of water treatment plant filtrate. Section 22-

15-23 of the West Virginia Code and this rule, and not the provisions of W. Va. Code § 22-15-10 or 33 CSR 1, shall govern the beneficial use of water treatment plant sludge. This rule does not apply to sewage sludge, products derived from sewage sludge, sludges regulated under 33 CSR 8, or materials regulated as hazardous waste under W. Va. Code §§22-18-1, et seq.

COMMENT

Larry Harris: DEP made changes to this rule during the Interims process last year, and the rule now requires a permit for both short-term and long-term applications. This is a good change. However, we feel that most of the information required in Section 7.3. Permit Application Requirements for long-term permits should also be required for short-term permits.

DEP Response: The requirements of section 7.3 were intended to be directed toward facilities that proposed to land apply filtrate as the beneficial use. It was intended to be applicable to both, if land application was the proposed method of reuse. Section 7.3 will be revised to more clearly reflect the applicability of the requirement for both long-term and short-term, if land application is the proposed beneficial reuse.

Rick Roberts and Larry Harris: Regarding the environmental effects of disposal of sludge are the values in Table 1 of the rule sufficient?

DEP Response: The Table 1 values are the same as the sewage sludge levels in DEP's other rules, and the agency believes they are supported by sound science.

Rick Roberts and Larry Harris: Mr. Harris expressed concern with the distinction between "beneficial reuse" and "disposal." Mr. Roberts believes that his concern is satisfied by the language in section 3.1.b.1.

Rick Roberts: The rule should include general permits as proposed.

Larry Harris: Only individual permits should be allowed under the rule.

DEP Response: There will be public notice in the general permit process.

33CSR30 – Underground Storage Tanks

SUMMARY

There are several new provisions to reflect the 2005 Federal Energy Act, including: secondary containment requirements for new or replaced thanks or piping; secondary containment requirements for new or replaced fuel dispenser systems; tank eligibility for delivery, deposit or acceptance – enables agency to prevent deposit or delivery to a tank that is not in compliance; and training requirements for individuals who operate, maintain or are responsible to address emergencies from spills or releases from underground storage tank systems.

COMMENT

Karen Price: Section 6.1. states "....including any person who accepts a delivery order, accepts payment, delivers or deposits product into an underground storage tank.....". The portion that states "...accepts payment..." should be removed from this section because those individuals within a company who accept payment or make payments most often do not know anything about the underground storage tank (UST), the operation of the UST, or the current regulatory status of the UST.

DEP Response: This language will give the agency a better handle on transporters and middle-men involved in the process.

Karen Price: Section 7.3.a.1. states "....the methodology for verifying attendance, the date, time and location of the course, the name of the offering organization, the credentials of the instructors, and a certification that the technology or methods.....".

1. The portion that states "..the date, time and location of the course,...." should be deleted. For large companies with many UST installations and locations there can be numerous individuals that need to be trained. Training will most likely occur on multiple dates, times, and locations that may not always be known until just prior to the training event. When new employees are hired training might occur on short notice and for one individual. The burden of having to report the dates, time and locations would hinder and slow down the training process and restrict a company's ability to comply.

2. The portion that states "...the credentials of the instructors..." should be removed. Credentials will vary from instructor to instructor new instructors might be utilized, and a company might not know which instructors will be used at the various training sessions until just prior to the training session. In addition, the course content is the main issue of concern and should be the main focus in obtaining State approval of a training program.

DEP Response: Regarding dates, times and location of the training the agency will not require the information prior to the training. As far as the credentials of the instructor the agency needs this information as part of its curriculum review, in this case before the training.

Karen Price: Section 7.3.a.2 - This section states that a nonrefundable application fee of $280 must be submitted with the application. Larger companies may have one training program, but administer the training on multiple dates, times and locations. Having to submit an application for approval of the training program each time the program is administered would be cost prohibitive, burdensome, and would hinder the training process.

DEP Response: The agency agrees and believes the rule only requires a one-time fee.

Rick Roberts: Regarding the $5.00 per ton fee, how does a source measure the tonnage? Perhaps the agency should consider using a cubic-yard approach.

DEP Response: The agency will consider.

47CSR2 – Requirements Governing Water Quality Standards

SUMMARY

The proposed revisions reflect updates identified during the federally-mandated triennial review of the Water Quality Standards rule. These include proposed additions to the trout water list, new criteria for nutrients, revisions to criteria in Appendix E and a use redesignation in the Guyandotte River Basin.

COMMENT

Larry Harris: Does the use removal in section 7.2.d follow the federal Clean Water Act requirements?

DEP Response: Yes, the agency followed all the requirements, federal and state, and required extensive information from the company. The agency also conducted two public meetings.
Bill Raney: Mr. Raney repeated his concern with the listing of trout waters in the rule and the fact that the list has to be approved by the Legislature. Karen Price agreed with this comment. Jackie Hallinan and Larry Harris did not agree with this comment.

Karen Price: Questioned the need for Appendix D, because the Category C use applies to all state waters.

DEP Response: Agency will consider.

Karen Price: Will the agency consider not making use removals go through the legislative process.

DEP Response: The agency decided not to include any language pertaining to this issue at this point in time, but will be subjecting this issue to the public participation process in the coming months.

60CSR5 – Antidegradation Implementation Procedures

SUMMARY

Antidegradation is a requirement of the federal Clean Water Act intended to preserve the existing quality of the State's waters and to prevent and/or minimize future degradation. The rule was first adopted in 2001 and establishes four levels, or tiers, of protection for state waters, Tiers 1, 2, 2.5 and 3. Each tier provides a graduated level of protection used during the NPDES permit issuance process. The proposed revisions to the rule carry forward the agency's antidegradation implementation efforts, and move the Tier 2.5 streams that had been on the "presumptive" list in Appendix C to a final proposed list in Appendix A. The agency is proposing a total of 156 streams be included on the list. The list of 156 waters is comprised of the 37 waters that did not receive objections in the formal objection period, those waters that contain reproducing trout and are 100% on public land, those waters listed as high quality on public land based on their high biological scores, and Loop Creek.

COMMENT

Larry Harris: Scientific criteria should be used to add or delete streams from the Tier 2.5 list.

Rick Roberts: Can the SRF program give priority to facilities impacted by the Tier 2.5 list?

DEP Response: Agency will take this under advisement.

Larry Harris: Is the nomination process adequate?

DEP Response: The agency believes the process is generally adequate and workable. If, however a large number of streams are nominated at one time, the individual notification requirements may be difficult and costly.

At this point in the meeting, Bill Raney submitted written comments regarding several mining rules. (see attached)

60CSR8 - Environmental Excellence Program

Greg Adolfson summarized the rule revisions. He said the changes would provide more flexibility for the agency to approve or disapprove of incentives in the program, as well as other flexibilities.

SUMMARY

Changes are being proposed to the Environmental Excellence Program Rule (60CSR8) to better align with and follow the momentum of the United States Environmental Protection Agency's National Environmental Performance Track Program. Additionally, the primary purpose for the changes is to give more flexibility to the Department of Environmental Protection Cabinet Secretary in areas such as: Eligibility Criteria for Participation (section 4); Environmental Performance Record (section 5); Environmental Management System (section 6); Public Participation (section 8); Incentives (section 9); Procedures for Application (section 10); and Annual Performance Report (section 14). Language, such as "may include, but will not be limited to, the following," has been added to allow for this flexibility.

COMMENT

Rick Roberts: Why is section 6.2 completely deleted?

DEP Response: The section is not completed deleted, just the 1996 standards. This will allow the agency to use the most current standards.

Bill Raney: How many companies are participating in the program?

DEP Response: There are two in the National Program, Toyota and Dow.

Jackie Hallinan: The program is a good idea.

Meeting was adjourned by Deputy Cabinet Secretary Randy Huffman.

Council Meeting – 5/30/07
Comments
Submitted
by Bill Raney

Bill...

Here are some preliminary comments provided by the Environmental-Technical Committee on the rules that will be reviewed by the Advisory Council:

Water Quality Standards Rule (47CSR2)

Only concern relates to the Trout Stream List:

Inclusion of a stream in the codified list contained in the rule forever locks in unrealistic WQS on that stream regardless of existing and/or future water quality. The lower standards are very problematic for the coal industry by targeting iron and aluminum.

WVCA believes the list is immaterial to protection of the existing use if it is indeed a trout stream.

WV DEP, in the NPDES permitting process, will apply appropriate trout stream effluent limitations if the agency believes a stream to have a trout population regardless of whether or not it in on the codified list contained in the water quality standards rule or not. The only difference is that in the permitting process, the applicant has the opportunity to present data and sampling to refute the agency's assertion that a stream is a trout stream, and has a right of appeal if they continue to disagree with agency's assignment of trout stream limits. The ability to dispute the trout stream designation is very important, especially since some of the data supporting the current initiative to expand the codified list is decades old.

If a trout stream is included on the codified list approved by the legislature, the only option for removing that designation is to once again pursue a legislative fix. Under those circumstances, it is easier to just challenge the entire expansion of the trout stream list.

The massive expansion of the trout stream list as currently proposed is much more restrictive than the standards found in surrounding states, where the regulatory agencies have developed different levels and categories of trout streams. West Virginia continues to treat all trout streams the same as though they were native, naturally-reproducing, cold water streams that deserve the highest levels of protection. This is simply not true, as many streams in West Virginia are stocked trout streams where the existing, in-stream water quality is lower than the established effluent guidelines for native trout streams.

Mining & Reclamation Rule (38 CSR 2)

Main concern relates to 14.15.c.2, regarding contemporaneous reclamation and valley fills:

This revision will penalize operators that are constructing "bottom-up" valley fills, the agency's preferred method of fill construction by unnecessarily restricting when such fill can be counted as "reclaimed" under the state's contemporaneous reclamation rules. These rules already vastly exceed the federal requirements and those of any other surrounding state, and this change will only make them worse.

Additionally, this proposed revision was deleted during the Legislative session in 2007.

401 Water Quality Certification Rule (47 CSR 5A)

The changes to this rule are totally un-necessary, and add further detail and complication to a state mitigation rule when the Legislature has specifically instructed the agency to better align its mitigation program with that of the Corps of Engineers. Several years ago, the Legislature passed a bill directing WV DEP to provide state mitigation credit for Corps mitigation. While this has occurred, we feel the revisions to this rule will drive the two programs further apart. Additionally, we know of no state statutory revision that necessitates these changes...the state mitigation program has functioned for years without this level of detail, and we question why it's needed now.

Further, we are concerned that the rule seeks to change definitions that should only be revised in the statute with Legislative approval. For example, the revisions jettison the long-used references to stream types and insert reference to ordinary high water mark. This appears to be an effort to expand the definition of "waters of the state" to all cover every erosional feature, regardless of whether or not it actually functions as a stream.

July 18, 2006

Mr. Charles Sturey
West Virginia Department of Environmental Protection
Division of Mining & Reclamation
601 57th Street SE
Charleston, WV 25304

Re: Comments on Proposed Revisions to 47 CSR 5A

Dear Mr. Sturey:

Pursuant to the notice filed with the Secretary of State on June 15, 2006, the West Virginia Coal Association (WVCA) offers the following comments and observations regarding the agency's proposed revisions to 47 CSR 5A, "Rules for Individual State Certification of Activities Requiring a Federal Permit".

WVCA is a non-profit state trade association representing the interests of the West Virginia coal industry on policy and regulatory issues before various state and federal agencies that regulate coal extraction, processing, transportation and consumption. WVCA's primary goal is to enhance the viability of West Virginia's coal industry by supporting efficient and environmentally responsible coal extraction and processing through reasonable, equitable and achievable state and federal policy and regulation. WVCA appreciates the opportunity to provide comments regarding the West Virginia Department of Environmental Protection's (WVDEP") proposed revisions to the state's Clean Water Act ("CWA") Section 401 certification rule.

General Comments

WVCA is very concerned about the WVDEP's proposal to add detail to its § 401 mitigation program, particularly at this time. The WVDEP has not articulated any problems with implementation of its existing mitigation program pursuant to this rule, and the WVCA sees no benefit to adding further detail and complexity now. Even more importantly, the WVCA understands the history of the WVDEP's § 401 mitigation program, and believes that the very basis for its development years ago no longer exists. The WVDEP's program has been fully replaced by the federal mitigation program which has developed into a comprehensive program and is the subject of new joint United States Army Corps of Engineers ("Corps") and the United States Environmental Protection Agency ("EPA") rules to update and conform their collective mitigation goals and requirements. The state's mitigation requirements, at least as they relate to mitigation for activities permitted by a CWA § 404 permit, have become obsolete and duplicative.

History of State § 401 Mitigation Requirements.

The state's mitigation program as maintained by the WVDEP and implemented through the § 401 rules is not a required component of the federal § 404 permitting program. The § 401 certification program is intended to insure that

issuance of a federal permit does not result in a violation of state water quality standards:

> CWA section 401 provides that states certify that federal activities or activities requiring federal approvals relative to CWA section 404 would not violate applicable effluent limitations, or other limitations, or other water quality requirements.[1]

Instead, the state has independently required mitigation as a condition of § 401 certification. Implementation of the state's mitigation program and requirements dates from a time when the Corps imposed no federal mitigation requirement on mining operations authorized by the § 404 General Permit for coal mining operations, Nationwide Permit 21("NWP 21"):

> [NWP] 21. Activities associated with surface coal mining activities provided they are authorized by the Department of the Interior, Office of Surface Mining (OSM) or by states with approved programs under Title V of the Surface Mining Control and Reclamation Act of 1977 and provided the permittee notifies the District Engineer in accordance with the "Notification" general condition. **The notification must include an OSM or state-approved mitigation plan** (emphasis added).[2]

Based on the requirements of the NWP 21, a state mitigation plan was required for a mining-related § 404 permit (usually a NWP 21) to be issued by the Corps:

> Prior to reissuance of NWP 21 in January 2002, the COE [Corps] considered mitigation adequate with the inclusion of an OSM or state-approved SMCRA onsite mitigation plan in the permit application.[3]

---

[1] Programmatic Environmental Impact Statement. Corps, EPA et.al. 2005. page II.C-42.
[2] Final Notice of Issuance, Reissuance, and Modification of Nationwide Permits. U.S. Army Corps of Engineers, Dec. 13, 1996. 61 Fed. Reg. 241.
[3] Programmatic Environmental Impact Statement. Corps, EPA et.al. 2005. Page II.C-52

West Virginia implemented this program through the § 401 certification program which imposed monetary or in-lieu fee requirements on coal mining related § 404 permits.

In 2002, the Corps revised and reissued NWP 21 adding a condition that the Corps' District Engineer require federal mitigation, reviewed and approved by the Corps in accordance with its joint mitigation rules and regulations maintained with the EPA.[4] The revised and reissued NWP 21 allowed the Corps to consider state mitigation when determining federal mitigation, but removed the automatic acceptance of state-required mitigation as sufficient for § 404 authorization. From this point on, the state mitigation requirements as maintained in the § 401 certification process became duplicative because the Corps was requiring federal mitigation plans as part of the § 404 permitting process.

Federal Mitigation Requirements are Comprehensive.

Coal mining-related § 404 permitting and mitigation has evolved since the Corps's reissuance of NWP 21 in 2002. Most mining projects are now permitted using the Corps' Individual Permit process and mitigation plans are now developed based on the Corps's and EPA's combined preference for on-site, in-kind mitigation to restore the impacted aquatic resource.

As you know, coal mining operations are typically subject to the federal CWA § 404 program and the state § 401 certification program because of

[4] Final Notice of Issuance, Reissuance and Modification of Nationwide Permits. U.S. Army Corps of Engineers, Jan. 15, 2002. 67 Fed Reg. 10.

activities undertaken in jurisdictional waters. The steeply-sloped terrain of West Virginia is permeated by small ephemeral and intermittent streams that serve to drain natural runoff into larger perennial stream systems. Any development in these areas--coal mining or otherwise--will result in some form of impact to small streams. Unlike many other activities subject to § 404 permitting and § 401 certification, mining activities are mostly temporary in nature, with the reclamation process providing a unique opportunity for reconstruction of impacted stream segments.[5] The Corps has recognized this opportunity for on-site, in-kind replacement/restoration of impacted aquatic resources and issued guidance encouraging this type of mitigation:

> This guidance acknowledges the uniqueness of regional and site-specific conditions, recognizes that features constructed in accordance with the Surface Mining Control and Reclamation Act may contribute to overall mitigation plans, and identifies several appropriate ways to accomplish appropriate mitigation projects.
>
> Surface mining operations can result in the creation of intermittent and and/or perennial streams depending on the on-site hydrologic conditions and the chosen method of dealing with groundwater and/or runoff. Applicants are encouraged to optimize these opportunities for on-site mitigation.
>
> ...Corps staff, Office of Surface Mining staff, and the mining operator should coordinate to explore options for incorporating...features required by SMCRA into compensatory mitigation plans. If successfully implemented, channels and other features will help maintain and potentially improve the physical, chemical and biological integrity of waters of the United States.[6]

---

[5] See pages ____ of attachment "A", comments filed by WVCA concerning the draft federal mitigation rule.

[6] "Mitigation for Impacts to Aquatic Resources from Surface Coal Mining." U.S. Army Corps of Engineers. May 7, 2004

In addition to the Corps's above-cited guidance for mining, on-site, in-kind mitigation remains the preferred means of performing mitigation for other authorized impacts to aquatic resources:

> In the interest of achieving functional replacement, in-kind compensation of aquatic resources will often be appropriate.[7]
>
> Mitigation should be required, when practicable, in areas adjacent or contiguous to the discharge site. On-site mitigation generally compensates for locally important functions, e.g., local flood control functions or unusual wildlife habitat.[8]
>
> Compensatory mitigation should generally be "in-kind" and occur as close to the site of the adverse impact as practicable in order to minimize losses to the local aquatic ecosystem.[9]

To satisfy the Corps's preference (enunciated in previously-cited Regulatory Guidance Letters issued by the Corps) for in-kind mitigation, or a functional replacement of the impacted resources, a Functional Assessment Protocol, referred to as the "Central Appalachian Protocol", has been used for several years now by the Huntington District to assist in assessing and assigning mitigation requirements for mining-related projects.[10]

Unfortunately, the WVDEP has to date largely ignored the mitigation guidance and requirements developed and imposed by the Corps, as well as the functional assessment protocol. The WVDEP has continued to implement its duplicative § 401 mitigation requirements, and typically requires mitigation above

[8] Regulatory Guidance Letter No 02-2. U S Army Corps of Engineers, December 24, 2002.
[9] Compensatory Mitigation Guidelines- Huntington District U S Army Corps of Engineers, Huntington, WV District. January 30, 2004.
[10] See attached power point presentation---Central Appalachian Protocol.

and beyond that which is required by the Corps despite the mandate of W. Va. Code § 22-11-7a(a)(2)(C):

> The Director shall provide credit for any mitigation that is a required component of the permit issued by the United States Army Corps of Engineers pursuant to 33 U.S.C. § 1344 to the extent that it satisfies required mitigation pursuant to this section.

Because a comprehensive federal mitigation program is being implemented, the WVDEP's failure to provide credit for such mitigation ***as mandated*** is a serious concern to the WVCA. To the extent a state program is relevant at all, perhaps to address the limited circumstances where the state's definition of "waters of the state" is broader than the CWA definition of "waters of the United States," it should be narrowly tailored to address that need. The WVCA cannot support proposed revisions that are not so narrowly tailored.

WVCA urges WVDEP to postpone pursuit of these proposed revisions at this time and to more fully consider the need for its separate mitigation program in light of (1) the federal mitigation now required as part of a § 404 permit, (2) the possibility of creating inconsistencies with the draft federal Corps and EPA rule for mitigation, (3) the deletion of NWP 21 conditions relating to state mitigation, and (4) the mandate of W. Va. Code § 22-11-7a(a)(2)(C) to rely on and give credit for federally mandated mitigation to satisfy any state mitigation needs.

Specific Comments

Page 4 4.2.f.2.A. Economic Info[redacted]tion about the coal mi[redacted]g operations, including, without limitation, the estimated nu[redacted]r of jobs created, the e[redacted]ated proportion of employees who will be residents of Wes[redacted]irginia, the estimated a[redacted]al payroll, the

estimated annual coal production (if applicable), the estimated life of the operation, the estimated severance tax for the operation, the estimated annual property tax, and such other economic information as may be requested by the agency.

WVCA questions why this level of information is needed for the § 401 certification process. Similar information is provided to the Corps under the § 404 permitting program and to the state through the Community Impact Statement. The justification for requiring duplicative information as part of the § 401 certification process is lacking. Further, we are puzzled as to why this information is required only for mining operations. Sections 404 and 401 of the CWA apply to all manner of filling activities, not just coal mining operations. If this information is needed by the WVDEP to properly implement the § 401 certification process, then it should be required for all dredge and fill activities. If it is not, then it should be removed from the proposed revisions. Without further explanation and justification, the WVCA does not support this proposed revision.

4.2.f.4. A Delineation of the Stream to be Impacted. The length, width and depth of the stream segment impacted shall be measured. Width and depth measurements shall be made at one hundred (100)foot intervals. The stream delineation shall indicate the ephemeral and intermittent/perennial segments to be impacted. The stream shall be measured from the farthest downstream disturbance, excluding stream crossings associated with haul roads for surface mining operations, upstream to the beginning of ~~an intermittent stream, as defined in 46 CSR 1-2.9 and/or 38 CSR 2-2.71.~~ the ordinary high water mark. The applicant shall provide a table listing the station number with the corresponding acreage, including the drainage area from the toe of the pond and the toe of the fill.

As proposed, this revision appears to extend the reach of the state's jurisdiction and expand the WVDEP's mitigation requirements under the § 401 certification program. While this change may be motivated by a desire to more closely align the state's mitigation requirements with those of the Corps, the

WVDEP's first and most needed step in that direction is compliance with W. Va. Code § 22-11-7a(a)(2)(C). Until the WVDEP revises its mitigation rules and policies to accept Corps-required mitigation, this proposed change will serve only to increase the amount of in-lieu fee mitigation provided to the state, with no resulting environmental benefit. Further, the proposed change appears to be counter to the authorizing statute which bears no mention of the "ordinary high water mark." The WVCA does not support this proposed revision.

6.2.b.1. Compensatory mitigation shall be required for all permanent and temporary stream impacts resulting from coal related activities in watersheds greater than or equal to two hundred and fifty (250) acres and/or when the activity results in a stream loss or impact exceeding one half (1/2) acre of stream. The drainage area and ½ acre assessments shall be measured starting from the toe of the most downstream permanent or temporary impact (excluding stream crossings) in which the activity occurs.

WVCA believes that this proposed revision extends the authority of the state beyond the authorizing, underlying statute:

> 1) If the applicant's surface coal mining operation will not impact waters of the state designated as national resource waters and streams where trout naturally reproduce and will not impact wetlands of the state in a manner inconsistent with all applicable state or federal standards as the case may be, as required by the federal Clean Water Act, and if the watershed above the toe of the farthest downstream permanent structure authorized pursuant to the United States Army Corps of Engineers permits issued in accordance with 33 U.S.C. §1344 and 33 C.F.R. Parts 323 or 330 is less than two hundred fifty acres, then the director may issue a water quality certification pursuant to the requirements of this section. If the watershed above the toe of the farthest downstream permanent structure impacted is equal to or greater than two hundred fifty acres, the director shall require that mitigation be undertaken. Additionally, the director may require mitigation for temporary impacts to waters of the state as specified in subdivision (2) of this subsection.

(2) If the watershed above the toe of the farthest downstream permanent structure authorized pursuant to the United States Army Corps of Engineers permits issued in accordance with 33 U.S.C. §1344 and 33 C.F.R. Parts 323 or 330 is greater than or equal to two hundred fifty acres and all other necessary requirements are met consistent with this section, the director shall further condition a water quality certification on a requirement that the applicant mitigate the expected water quality impacts under the following conditions…

The above-cited statute contains no reference to "1/2 acre" of stream. Apparently, the agency is attempting to further extend its jurisdiction or merely implementing past policies that existed with respect to coal and non-coal mitigation. Since the statute contains no reference to ½ acre of stream, **WVCA suggests the agency delete this proposed revision. If the agency truly believes that this change is necessary, it should seek a legislative revision to 22-11-7(a) and only then seek to modify the rule.**

~~6.2.d.1. Permanent impacts for coal related monetary mitigation will be assessed at $200,000 per acre of impacts in watersheds greater than or equal to two hundred and fifty (250) acres from the toe of the farthest downstream permanent structure, and/or exceeds a ½ acre of loss or impact of stream.~~ Monetary compensation for stream impacts resulting from coal related activities shall be assessed as follows:

6.2.d.1.APermanent impacts for coal related monetary mitigation will be assessed at $200,000 per acre of impacts

6.2.d.1.B Temporary coal related stream impacts resulting from structures (excluding stream crossings) that will be removed prior to final bond release will be assessed at $20,000 per acre of stream impact per each five-year period of impact and/or prorated for each year the impact occurs.

6.2.d.1.CTemporary coal related stream impacts resulting from stream crossings (i.e. culverting) and stream relocations where the stream impact is greater than or equal to two hundred one (201) lineal feet, but less than or equal to four hundred (400) lineal feet and is in place for five years or more, shall be assessed at $20,000 per acre for the first five (5) year period and prorated for each additional year the impact shall occur. A temporary stream impact resulting in more than four hundred (400) linear feet shall be monetary compensated at a rate of $20,000 per acre per each five (5) year term and/or prorated for

each year the impact occurs.

As noted in our general comments, the state § 401 certification program has functioned for several years without the level of minutia and detail presented here, and there appears to be no justification for adding these new provisions to the rule at this time. In addition, because § 404 permit mitigation plans cover both permanent and temporary impacts, there is no need for the duplicative state provision for monetary mitigation. As explained in our general comments, the Corps and EPA have continuously stressed a desire for on-site, in-kind mitigation. Using the "Central Appalachian Protocol", coal mining operations have been providing on-site, in-kind mitigation through the reclamation and stream reconstruction process. These projects have been embraced by the Corps and EPA through mining-specific regulatory guidance.

WVCA questions the need for these revisions, and urges WVDEP to re-evaluate the need for this provisions in light of the federal mitigation now required as part of a § 404 permit and the mandate of W. Va. Code § 22-11-7a(a)(2)(C) to rely on and give credit for federally mandated mitigation to satisfy any state mitigation needs.

6.2.d.1.D Permanent wetland impacts for coal related monetary mitigation will be assessed at the rate $30,000 per acre of wetland replaced based on the ratios in section 6.2.c.

Again, as noted in our general comments, the state § 401 certification program has functioned for several years without the level of minutia and detail presented here, and there appears to be no justification for adding these new provisions to the rule at this time. In addition, § 404 permit mitigation plans cover

both permanent and temporary impacts to all impacted aquatic resources, including wetlands, and there is no need for the duplicative state provision for monetary mitigation for wetland impacts.

To the extent WVDEP nevertheless chooses to pursue this proposed revision, it has no justification for the $30,000 replacement value proposed. In addition, by proposing this specific amount, the WVDEP has excluded any opportunity to determine a monetary mitigation amount for wetlands on a case-by-case basis, which could be either higher or lower than $30,000 per acre.

In-lieu fee payment for wetlands impacts is a desirable option to have, but we question whether the agency will ultimately determine that wetland replacement as already specified in the rule is sufficient. The WVCA cannot support this proposed revision without additional justification and explanation, and again urges the WVDEP to re-evaluate the need for this provisions in light of the federal mitigation now required as part of a § 404 permit and the mandate of W. Va. Code § 22-11-7a(a)(2)(C) to rely on and give credit for federally mandated mitigation to satisfy any state mitigation needs.

Sincerely,

Jason Bostic, Vice President

Re: Comments on 2007 Triennial Review of Water Quality Standards

Dear Ms. Shaffer:

Pursuant to the September 22, 2005 announcement by the West Virginia Department of Environmental Protection (WV DEP), the West Virginia Coal Association (WVCA) offers the following comments and observations regarding the agency's first triennial review of water quality standards.

WVCA is a non-profit state coal trade association representing the interests of the West Virginia coal industry on policy and regulation issues before various state and federal agencies that regulate coal extraction, processing, transportation and consumption. WVCA's producing members account for 80 percent of the Mountain State's underground and surface coal production. WVCA also represents associate members that supply an array of services to the mining industry in West Virginia. WVCA's primary goal is to enhance the viability of the West Virginia coal industry by supporting efficient and environmentally

criteria. EPA is currently in the process of revising the nationally-recommended selenium criteria.[6] Because of the flawed nature of the current selenium criteria and its inappropriate application to flowing waters in West Virginia, WVCA is supportive of this federal initiative. However, we caution WV DEP to fully analyze the appropriateness of applying any federally-revised standard in West Virginia. Available information seems to indicate that a state-specific selenium standard for West Virginia may be warranted, as fish populations appear to be healthy and diverse in streams with identified selenium concentrations.[7] The pressing nature of selenium also warrants that WV DEP investigate a state-specific criteria for West Virginia since the federal revisions remains pending. The agency has recently completed draft TMDL documents that impose selenium allocations based on the existing water quality criteria, and will continue to develop and implement selenium TMDLs, adding urgency to this important issue.

Trout Streams

In the EQB's last triennial review, it proposed adding some 400 streams to the list of Trout Waters contained in the water quality standards rule. The EQB allowed only a 30-day comment period on this major expansion of the Trout Waters list. The EQB proposal was based only on the recommendations of the

---

[6] See Attachment "F", October 29, 1999 Federal Register Notice published by EPA regarding revision of the selenium criteria and Attachment "G", December 17, 2004 Federal Register Notice announcing draft criteria and requesting public comments.

[7] See Attachment "H", relevant pages from comments filed by the National Mining Association and WVCA regarding the programmatic Mountaintop Mining/ Valley Fill Environmental Impact Statement and *Fish Communities and Their Responses to Environmental Factors in the Kanawha River Basin, West Virginia, Virginia, and North Carolina*. U.S. Geological Survey, 2001.

West Virginia Division of Natural Resources, with no accompanying data or information on whether or not the streams actually meet the requirements to be classified as trout waters. Based on the lack of information regarding the current status of the proposed trout waters and the limited opportunity for comment provided, the West Virginia Legislature rejected the revision.

The permitting ramifications of classifying streams as trout waters can be significant, as different water quality standards (uniformly more stringent) apply to trout streams. Incorrectly classifying a water as a trout stream can have serious economic impacts for property owners and NPDES dischargers along that streams and should not be taken lightly be WV DEP. Before the agency undertakes any effort as part of its 2007 triennial review to list any additional streams as trout waters, WV DEP should conduct scientific investigations of water quality and fish populations in order to ascertain if a water body meets the criteria required of a trout stream. The agency should also hold hearings in the communities where such streams are located to take comment from the persons most familiar with the conditions of these streams.

We appreciate the agency's consideration of these comments.

Respectfully Submitted,

Jason D. Bostic

Re: Comments on Proposed Revisions to 38 CSR 2

Dear Mr. Sturey:

Pursuant to the notice filed with the Secretary of State on June 15, 2006, the West Virginia Coal Association (WVCA) offers the following comments and observations regarding the agency's proposed revisions to 38 CSR 2, the state's Mining and Reclamation rules.

WVCA is a non-profit state coal trade association representing the interests of the West Virginia coal industry on policy and regulation issues before various state and federal agencies that regulate coal extraction, processing, transportation and consumption. WVCA's membership accounts for over 80 percent of the Mountain State's underground and surface coal production. WVCA's primary goal is to enhance the viability of the West Virginia coal industry by supporting efficient and environmentally responsible coal extraction and processing through reasonable, equitable and achievable state and federal policy and regulation. WVCA appreciates the opportunity to provide comments to the West Virginia

Department of Environmental Protection (WV DEP) regarding the proposed revisions to the state's mining and reclamation rule.

Specific Comments

3.2.g. Notice of Technical Completeness. After the Secretary deems a Surface Mine Application technically complete, the Secretary shall cause the applicant to advertise stating such. The notice shall state that the application has been deemed technically complete by the Secretary and include a fifteen (15) day public review period. Provided, however, Notice of Technical Completeness may not be necessary if the application was technically complete prior to the end of the comment period of the original advertisement and a decision is made within ninety (90) day of the end of the comment period or informal conference.

WVCA believes this revision is unnecessary. Existing state rules provide the agency with authority to require re-advertisement:

> 3.2.e. Re-advertisement. After a Surface Mine Application (SMA) has been advertised once a week for four successive weeks, and is determined by the Secretary to have had a limited number of minor changes that do not significantly affect the health, safety or welfare of the public and which do not significantly affect the method of operation, the reclamation plan, and/or the original advertisement, he may require one (1) additional advertisement to be published with a ten (10) day public comment period.

As the above-cited provision reveals, the agency has the authority to require the additional advertisement that appears to be the goal of the proposed revision. The language of 38 CSR 2.3.e restricts the applicability of the provision to "a limited number of minor changes that do not significantly affect the health, safety or welfare of the public and which do not significantly affect the method of operation, the reclamation plan, and/or the original advertisement..." for changes that are substantive WV DEP has always required re-advertisement. Additionally,

the proposed revisions exceed the corresponding federal requirements maintained by the Office of Surface Mining (OSM) at 30 CFR 773.6. Because the agency has already has the authority to require re-advertisement, WVCA suggests that WV DEP delete the proposed revision.

14.15.c.2. Areas within the confines of excess spoil disposal fills which are under construction provided the fill is being constructed in the "conventional" method, i.e., completed from the toe up, or those fills which are being constructed progressively in lifts from the toe up or are being progressively completed from the toe up by constructing benches and appropriate drainage control structures (ditches, flumes, channels, etc.) from the toe up as soon as the ~~area is available to do so;~~ first two lifts are in and are seeded and certified;

WVCA is extremely concerned about this proposed revision and believes that it will unnecessarily restrict operating flexibility and thereby discourage the construction of "bottom-up" valley fills. WVCA strongly suggests the agency delete this proposed revision. This entire section of rules already exceeds the corresponding federal requirements of OSM, but members of WVCA negotiated the rules in good faith to remedy an agency-perceived problem with valley fill construction. These rules have been scrutinized and approved by the West Virginia Legislature and OSM. WVCA is concerned as to why the agency believes this change is necessary, and would be willing to discuss other possible remedies to the situation.

Respectfully Submitted,

Jason D. Bostic, Vice-President

2.5 Biogenic Sources include COAL

TITLE 45

LEGISLATIVE RULE
DEPARTMENT OF ENVIRONMENTAL PROTECTION
DIVISION OF AIR QUALITY

SERIES 42
GREENHOUSE GAS EMISSIONS INVENTORY PROGRAM

3.2 turned on exemption into inclusion
5.3 "Shall provide information"

§45-42-1. General.

1.1. Scope. -- This rule establishes a greenhouse gas emissions inventory program in West Virginia which:

1.1.a. Requires the reporting and inventory of greenhouse gas emissions by stationary sources which emit more than a *de minimis* amount of greenhouse gases on an annual basis;

1.1.b Inventories greenhouse gas emissions from stationary, area, mobile and biogenic sources, and accounts for reductions and sequestration of greenhouse gas emissions;

1.1.c. Provides for a periodic compilation of a greenhouse gas emissions inventory and a determination whether West Virginia is a net sink or emitter of greenhouse gases;

1.1.d Provides for development of a registry to record voluntary reductions of greenhouse gas emissions; and

1.1.e. Provides for a determination whether the reduction and sequestration of greenhouse gas emissions can be developed as an asset for economic development.

1.2. Authority -- W.Va. Code §22-5-19

1.3. Filing Date --

1.4. Effective Date. -- June 1, 2008.

§45-42-2. Definitions.

2.1. "Air pollutants" means solids, liquids, or gases which, if discharged into the air, may result in statutory air pollution

2.2. "Air pollution" or "statutory air pollution" means and is limited to the discharge into the air by the act of man substances (liquid, solid, gaseous, organic or inorganic) in a locality, manner and amount as to be injurious to human health or welfare, animal or plant life, or property, or which would interfere with the enjoyment of life or property.

2.3. "Anthropogenic" means a direct result of human activities or the result of natural processes that have been influenced by human activities.

2.4 "Area source" means, for purposes of this rule, a collection of similar sources of air pollutants within a geographic area. Area sources collectively represent individual sources that are small and numerous, and that typically have not been inventoried as a stationary or mobile source.

2.5. "Biogenic" means a naturally occurring biological source or process that is not significantly affected by human actions or activity.

Biogenic sources include COAL

2.6. "Capture" means the collection of greenhouse gas emissions from a stationary source.

2.7 "*De minimis*" means emissions from a stationary source that are equal to or less than ten thousand tons per year for carbon dioxide, four hundred seventy-six tons per year for methane, thirty-two and six tenths tons per year for nitrous oxide, eight hundred fifty-five thousandths tons per year for hydrofluorocarbons, one and nine hundredths tons per year for perfluorocarbons and forty-two hundredths tons per year for sulfur hexafluoride.

2.8. "Emission" means the release, escape or discharge of regulated air pollutants or greenhouse gases into the air.

2.9 "Greenhouse gas" means the gaseous compounds: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride (SF_6).

2.10. "Mobile source" means a variety of onroad and nonroad vehicles, engines, locomotives, marine vessels, airplanes and other equipment that generate air pollutants and greenhouse gas emissions, and that move or can be moved from place to place.

2.11. "Regulated air pollutant" means, for purposes of this rule, any air pollutant regulated under rules promulgated by the Secretary pursuant to W.Va. Code §22-5-4.

2.12. "Reservoir" means a geological site where a greenhouse gas is securely stored.

2.13. "Secretary" means the Secretary of the Department of Environmental Protection or such other person to whom the Secretary has delegated authority or duties pursuant to W.Va Code §§22-1-6 or 22-1-8.

2.14. "Sequestration" means the physical process by which emissions of a greenhouse gas are directly captured for storage in a reservoir, or the biologic process by which a greenhouse gas is indirectly removed from the atmosphere for storage in a sink.

2.15 "Sink" means any process, activity or mechanism which removes a greenhouse gas from the atmosphere. Forests are considered sinks because they remove carbon dioxide through photosynthesis.

2.16. "Source" means, for purposes of this rule, any process or activity which releases a greenhouse gas into the air.

2.17. "Stationary source" means any building, structure, facility, installation, stationary process or process equipment which emits or may emit any regulated air pollutant or greenhouse gas.

2.18 "Ton" means a short ton, or 2000 pounds.

2.19. Other words and phrases used in this rule, unless otherwise indicated, shall have the meaning ascribed to them in W.Va. Code §22-5-1 et seq.

§45-42-3. Applicability.

3.1. Any stationary source that emits one or more greenhouse gases on an annual basis greater than the *de minimis* amounts listed in the table below, and reports emissions of regulated air pollutants pursuant to the emissions inventory requirements of the Secretary under rule or W.Va. Code §22-5-4(a)(14), shall be an affected source required to report emissions of all greenhouse gases to the Secretary under section 4:

Greenhouse Gas Compound	tons/year
carbon dioxide	10,000
methane	476
nitrous oxide	32.6

any facility, etc.

hydrofluorocarbons	0.855
perfluorocarbons	1.09

sulfur hexafluoride	0.42

fuel plants under Title IV

3.2. Stationary sources which are regulated by the Secretary under W.Va. Code §22-3-1 et seq. and do not report emissions of regulated air pollutants pursuant to the emissions inventory requirements under W.Va. Code §22-5-4(a)(14) are not required to, but may voluntarily report their greenhouse gas emissions under section 4.

n/a Stationary sources

§45-42-4.Reporting Requirements.

4.1. By March 31, 2009, and March 31 of each year thereafter, affected sources shall report to the Secretary the quantity of all greenhouse gases emitted in the previous calendar year.

4.2. Affected sources shall only be required to report annual quantities of anthropogenic non-mobile source greenhouse gas emissions at the source, and shall not be required to report biogenic emissions of greenhouse gases.

4.3. The Secretary shall determine the form and format of the information reported by affected sources under subsection 4.1 to ensure that the information is consistent as possible with developing regional, national, or international greenhouse gas emissions programs.

4.4. Notwithstanding the provisions of subsection 4.3, to satisfy the greenhouse gas emission reporting requirements under this section, affected sources may submit greenhouse gas emissions inventory information from documented greenhouse gas inventories such as those provided to the Environmental Protection Agency's Climate Leaders Program, Chicago Climate Exchange Registry, the International Organization for Standardization and the SF_6 Emissions Reduction Partnership for Electric Power Systems. Greenhouse gas emissions inventory information from other widely recognized and verified greenhouse gas emissions inventory programs may be submitted by affected sources under this subsection, but shall be subject to approval by the Secretary on a case-by-case basis.

4.5. Reports of greenhouse gas emissions submitted to the Secretary under this section shall be signed by a responsible official and shall include the following certification statement: "I, the undersigned, hereby certify that the data transmitted to the West Virginia Department of Environmental Protection is true, accurate, and complete, based upon information and belief formed after reasonable inquiry."

§45-42-5.Greenhouse Gas Emissions Inventory.

5.1. The Secretary shall periodically compile an inventory of greenhouse gas emissions to:

5.1.a. Characterize the relative contributions of greenhouse gas emissions from stationary, area, mobile and biogenic sources in West Virginia; and

5.1.b. Determine the extent to which greenhouse gas emissions are offset by the rate of sequestration, and whether West Virginia is a net sink or emitter of greenhouse gases

5.2. The greenhouse gas emissions inventory shall include the emissions from stationary sources reported under section 4, and other relevant information regarding significant emissions, reductions, and sequestration of greenhouse gases from stationary, area, mobile

entire surface Area / underground Area is an AREA source

and biogenic sources requested by the Secretary under subsections 5.3 and 5.4.

5.3. To inventory greenhouse gas emissions reductions, the Secretary shall consult with the citizenry and other entities such as industry trade groups that have information relating to greenhouse gas emissions reductions, and sequestration. Upon request of the Secretary, such entities shall provide relevant information relating to greenhouse gas emissions reductions; capture and sequestration.

5.4. The Department of Agriculture, the Division of Forestry, Marshall University, West Virginia University, West Virginia Geological and Economic Survey, and the Department of Transportation shall enter into interagency agreements with the Secretary and at the Secretary's request provide:

5.4.a. Relevant information relating to greenhouse gas emissions from area, mobile and biogenic sources;

5.4.b. Relevant information relating to greenhouse gas emissions reductions and sequestration; and

5.4.c Any assistance the Secretary may request during the development of the greenhouse gas emissions inventory.

5.5 The Secretary shall determine the form and format of the information submitted by the entities under subsections 5.3 and 5.4 to ensure that the information is consistent as possible with developing regional, national, or international greenhouse gas emissions programs.

§45-42-6.Greenhouse Gas Emissions Registry Program.

6.1 The Secretary shall develop a registry for the recordation of voluntary reductions of greenhouse gas emissions.

6.2. The greenhouse gas emissions registry program shall be as consistent as possible with developing regional, national, or international programs designed to monitor, quantify and register reductions in greenhouse gas emissions with respect to:

6.2.a. Development of criteria, based on a set of standardized emissions accounting, reporting and verification protocols, to determine baseline emissions and quantification of voluntary reductions in emissions of greenhouse gases;

6.2.b. Public recognition of such voluntary emissions reductions;

6.2.c. Consideration of voluntary greenhouse gas emission reductions when determining baselines and reduction requirements under future federal greenhouse gas emission reduction programs; and

6.2.d The ability of sources to participate in future greenhouse gas emission trading programs.

§45-42-7.Economic Development Potential.

7.1. Using information obtained, gathered or developed under this rule, the Secretary will determine whether the reduction and sequestration of greenhouse gas emissions can be developed as an asset for economic development in West Virginia.

§45-42-8.Inconsistency Between Rules.

8.1. In the event of any inconsistency between this rule and any other rule of the West Virginia Department of Environmental Protection, the inconsistency shall be resolved by the determination of the Secretary and the determination shall be based upon the application of the more stringent provision, term, condition, method or rule.

Biogenic substance

Wikipedia, the free encyclopedia - Cite This Source

A **biogenic substance** is a substance produced by life processes. It may be either constituents, or secretions, of plants or animals.
Examples

Coal and oil are examples of constituents which have undergone changes over geologic time periods.

Chalk, and limestone are examples of secretions (marine animal shells) which are of geologic age.

Cotton and wood is are biogenic constituents of contemporary origin.

Pearls, silk and ambergris are examples of secretions of contemporary origin.

Subject: Re: May 30, 2007 Meeting

Trish: I received some last minute comments on 33CSR8 that I would like to submit:

§33-9-2. Definitions -- Section 2.5 defines "Beneficial Use" as "the use of a non-hazardous material for a specific beneficial purpose where it is done in a manner that protects groundwater and surface water quality, soil quality, air quality, human health, and the environment." We are concerned that it has not been adequately demonstrated that this filtrate is non-hazardous, and point to the current "inter-sex" fish issue in the Potomac River drainage which illustrates that there are unanswered questions concerning unmonitored pollutants in sludge from both water and waste treatment facilities

§33-9-2. Definitions - Section 2.5 defines beneficial uses as including "use as a fertilizer substitute, soil amendment, cover material, fill material, mulch or horticultural product, or other purpose approved by the Secretary." However, Section 33-9-3, in sub-Section 3.1.b.1 requires that "The use proposed is a reuse, and not a disposal." We suggest that the use of this filtrate as fill material is actually simply a disposal and not a "reuse." We believe this material should not be used as fill material. This would also require a change to Section 33-9-5, sub-Section 5.2.

§33-9-5. Standards for Beneficial Use of Filtrate - sub-Section 5.3 states, "The Secretary may approve the use of filtrate as fill material within fifty (50) feet of surface water upon submission of information sufficient to show that the fill material will have no significant impact on the quality of runoff reaching the surface water." Even the U.S. Forest Service has adopted stronger stream buffers for sediment runoff. DEP should develop stronger stream buffers for this rule, and there should be no discretion.

§33-9-7. -- DEP made changes to this rule during the Interims process last year, and the rule now requires a permit for both short-term and long-term applications. This is a good change. However, we feel that most of the information required in Section 7.3. Permit Application Requirements for long-term permits should also be required for short-term permits

§33-9-8. Draft Permits and Public Comment. Section 8.2.a. provides for a 30-day public comment period for long-term permits, but only a 15-day public comment period for short-term permits. We oppose the shortened public notice provisions for short-term permits. The 30-day comment period should apply in both instances.

§ 33-9-11. General permits. We oppose the development of a General Permit to cover the provisions of this rule. Specific individual permits are necessary to inform potentially affected parties of the application of this material.

Appendix A -- Frequency of Monitoring. The Legislative Rule-Making Review Committee last session accepted an amendment proposed by industry that reduced monitoring tests to once a year. While we would prefer even more frequent monitoring than proposed in this rule, we hope DEP will strongly oppose any attempts to reduce the monitoring provisions provided in this rule.

Comments on DEP Rules for 2007

Communicated by Larry Harris, Public Advisory Council Member

I would like to commend the staff of the DEP for the hard work and expertise used in preparing and reviewing the rules with Council. As promised, I include below some of the technical and other issues raised during the May 21 meeting of the Council, omitting some questions that were answered at the meeting. Members of the environmental community who reviewed the rules raised some of the questions.

Some of the issues mentioned below are related to the act of valley fills and determining compensation for this process. I have pointed out my view to Council previously that the permitting of valley fills is essentially allowing the destruction of upper tributaries of watersheds. As such the process should be outlawed, in my view.

47CSR2 Water Quality

We learned that the B2 list is essentially the same as submitted previously and includes the definition of trout waters cited on page 2 of the rule.

.Page 11: Why is the temperature regulation on Stony River being removed?

47CSR2 (7.2.d.9) — The removal of variances, etc. on the Blackwater seems to be a strength, but why do these rivers remain "reserved" on the list? Why not just remove them?

47CSR2 (7.2.d.34.1): Adds language for site-specific applicability of water use categories and water quality criteria: "Pats Branch from its confluence with the Guyandotte River to a point 1000 feet upstream shall not have Water Use Category A and Category D1 designation."

* Is this a use removal? Yes was the answer.
* If so, did this go through the appropriate public process and use attainability analysis to justify a use removal . Did the use and attainability

analysis follow the federal Clean Water Act provision. (i.e. how was this decision justified)? Not sure this was fully answered.

47CSR2 (Appendix E):

Are the changes in concentrations for cadmium, copper, and others in Appendix E consistent with EPA changes/ recommendations? Some of the changes in hardness calculations are in response to comments from our groups last year asking DEP to be consistent—so this is good.

47CSR5A

47 CSR 5A (State Certification)

***47CSR5A (4.2.f.4): seems to be weakening the system for determining stream miles (delineation). DEP inserts the language: "The stream shall be measured from the farthest downstream disturbance, excluding stream crossings associated with haul roads for surface mining operations, upstream to the beginning of the ordinary high water mark."

This will result in fewer stream miles being "delineated" as actual stream miles, it seems. Why would you move upstream (where there are fewer inputs) to find a high water mark? Thus, it also seems fewer miles of headwaters will be mitigated for impacts.

47CSR5A (6.2.b): Typo—"loses" should be "losses"

47CSR5A (6.2.d.1): Is there a discrepancy between how monetary compensation for coal versus non-coal impacts is assessed? It may be worth determining that coal is not getting a break, in comparison to non-coal.

For example—why is it lineal miles for coal and acreage for non-coal? If they are going to assess from the high water mark—as discussed above—will this not result in fewer stream miles and thus fewer miles to mitigate/compensate? Also, there is no assessment for non-coal related temporary impacts—why?

60 CSR5 Antidegradation

I made the suggestion that the list of Tier 2.5 streams (156 in the current rule) should be returned to the same number as began the legislative session, which is 309 streams. A scientific process that included expertise

from the WVDNR, which manages trout waters, arrived at the list of 309 streams. The list now submitted with the bill was reduced by the political process. Politics should not determine which streams merit protection from pollution; science should.

Other issues:

2.11 Explanation of the addition of this trading section is needed. Is this similar to EPA rules and consistent with the Clean Water Act?

3.9 Which advisory committee is this phrase referring to:

5.5b is removed. Why?

Is the procedure for nomination and addition of streams to the tier 2.5 list adequate?

Comments from Adam Webster (WVRC)

60CSR5 (2.11) : It's good that DEP provides "upstream controls" and mentions "for the same parameter" in the first sentence of the "trading" definition. Overall, the definition is good, but it is important to remember that the intent of the definition is not to allow cross-pollutant trading. With this in mind, the second sentence—"More than one parameter of concern may be traded on a given stream"—needs to be worded more restrictively (i.e. despite what the first sentence says, the second sentence could be interpreted as if cross-pollutant trading is allowed).

*** 60CSR5 (5.2) : Removes (strikes) the language: "Water segments that support the minimum fishable/swimmable uses and have assimilative capacity remaining for some parameters shall generally be afforded Tier 2 protection".

Does this suggest the default is Tier 1 (if data does not suggest otherwise)? If so,why?

60CSR5 (5.6.c) : The deletion is a response to lawsuit. However, the new 5.6.c suggests they cannot assess assimilative capacity when dealing with pH,

DO, temperature, and fecal coliform. We feel that they can assess these parameters and should not treat them separately.

45CSR42 Greenhouse Gases

The fact that the DEP is beginning to deal with the process of greenhouse gases that lead to global warming is commendable. Some questions on the rule were raised by Dr. Kotcon:

The greenhouse gases emissions inventory rule (45-42-1) needs to be
>strengthened considerably. The sections on emissions inventory
>(section 5, pages 3-4) is so vague as to be meaningless, especially
>as it deals with sequestration for area sources and sinks. I do not
>see how any meaningful data can be generated with this language.
How would the carbon sequestration be estimated? Has there been studies estimating the biogenic incorporation of CO2 per acre of woodland, for example? The rule appears to be a vague in how it would be implemented.

Air Quality and Emission Rules (see below)

45CSR8 Ambient Air Quality Standards

Don Garvin pointed out that the the antidegradation language was removed from this rule, and it was explained that the agency feels these provisions are now covered in 45-CSR-14("Prevention of Significant Deterioration.") However, the language that was stricken does not appear in 45-CSR-14, and the stricken language is the ONLY statement in the rules of West Virginia's antidegradation policy for air quality. The environmental community still believes the stricken language should be restored.

Here is what should be reinstated:

§45-8-2. Anti-Degradation Policy.

2.1. Pursuant to the best interests of the State of West Virginia, it is the objective of the Secretary to obtain and maintain the cleanest air possible, consistent with the best available technology.

2.2. Where the present ambient air is of better quality than the established standards, the Secretary will develop long-range plans to protect the difference between the present quality and the established standards. The plans will be based upon the best available forecasts of probable land and air uses in these areas of high air quality.

2.3. The air quality of these areas will not be lowered unless it has been clearly demonstrated to the Secretary that such a change is justifiable as a result of necessary economic or social development and will not result in statutory air pollution. This will require that any industrial, public, or private project or development which could constitute a new source of air pollutants, within an area of such high air quality, provide the best practicable control available under existing technology as part of the initial project or development.

45CSR41 Control of Annual SO2 emissions

45CSR6 Control of Air Pollution from Refuse Combustion

45CSR39 Nitrogen Oxides

I raised the general concern whether the standards for air quality were consistent with the EPA guidelines or not. Further, were any recognized health authorities consulted when these levels were determined? I also raised the issue that West Virginia is increasing supplying electricity to the population east of our mountains. New transmission lines are proposed that are to be connected with coal burning power plants. Billy Jack Gregg, Consumer Advocate for the WV PSC has pointed out that the states receiving our generated power will not permit generation plants in their region. They are concerned about air pollution and its various effects. But they need power, so they turn to West Virginia. This helps the coal industry and generation plants, but puts the health of West Virginians in jeopardy. I feel that our air quality and emission limits should be even more stringent than the EPA calls for in order to protect our citizens. This should be particularly true for power plants that export electricity.

Dr. Kotcon has raised the following issues:

45-CSR-8 Ambient Air Quality Standards

The standards for PM2.5 and Ozone are not adequately protective. I recommend that the standards be lowered from 15 ug/m^3 to 13 ug/m^3 in section 4.2.b., and from 0.08 ppm to 0.07 ppm in section 4.4.b.

The air standards (45-8-1) retains the standards for PM2.5 and ozone
>that the EPA Clean Air Scientific Advisory Council has already
>determined to be inadequate. Keeping these old standards will kill
>dozens or hundreds of West Virginians each year.

>The rule on refuse combustion (45-6-1) attempts to revise the
>definition of low-level radioactive waste and revives the
>Below-Regulatory_Concern (BRC) issue from some years ago. It also
>creates a large number of exemptions for "temporary" pollution
>sources. I am not yet sure if this re-opens old battles over
>medical waste incineration, but this was a really hot issue a few
>years back.

Comment submitted by Karen Price at Council meeting 5/30/07

Questions/Comments on DEP's 2007 Proposed Rules

- **45 CSR 8 Ambient Air Quality Standards**

Section 4.2.c – $PM_{2.5}$ Maximum 24-Hour Average Concentration. The level for the 24-hour primary and secondary standard states 35 ug/m^3. This should be 65 ug/m^3, pursuant to 40 CFR 50.7.

- **45 CSR 39, 45 CSR 40, 45 CSR 41**

The opt-in unit language is deleted from each of these rules. What is the purpose for the deletion of these provisions?

- **33 CSR 30, Underground Storage Tank Rules**

Section 6.1. states "....including any person who accepts a delivery order, accepts payment, delivers or deposits product into an underground storage tank....". The portion that states "...accepts payment..." should be removed from this section because those individuals within a company who accept payment or make payments most often do not know anything about the underground storage tank (UST), the operation of the UST, or the current regulatory status of the UST.

Section 7.3.a.1. states " ...the methodology for verifying attendance, the date, time and location of the course, the name of the offering organization, the credentials of the instructors, and a certification that the technology or methods....."

1. The portion that states "..the date, time and location of the course,...." should be deleted. For large companies with many UST installations and locations there can be numerous individuals that need to be trained. Training will most likely occur on multiple dates, times, and locations that may not always be known until just prior to the training event. When new employees are hired training might

occur on short notice and for one individual. The burden of having to repor the dates, time and locations would hinder and slow down the training process and restrict a company's ability to comply.

2. The portion that states "...the credentials of the instructors..." should be removed. Credentials will vary from instructor to instructor new instructors might be utilized, and a company might not know which instructors will be used at the various training sessions until just prior to the training session. In addition, the course content is the main issue of concern and should be the main focus in obtaining State approval of a training program.

Section 7.3.a.2 - This section states that a nonrefundable application fee of $280 must be submitted with the application. Larger companies may have one training program, but administer the training on multiple dates, times and locations. Having to submit an application for approval of the training program each time the program is administered would be cost prohibitive, burdensome, and would hinder the training process. The State should clarify or make provision for a company to submit one application for the training program that will be administered to all company UST facilities. This will make the $280 application fee reasonable and the application process less burdensome.

45CSR42

TITLE 45
LEGISLATIVE RULE
DEPARTMENT OF ENVIRONMENTAL PROTECTION
DIVISION OF AIR QUALITY

SERIES 42
GREENHOUSE GAS EMISSIONS INVENTORY PROGRAM

§45-42-1.General.

1.1 Scope -- This rule establishes a greenhouse gas emissions inventory program in West Virginia which:

1.1.a. Requires the reporting and inventory of greenhouse gas emissions by stationary sources which emit more than a *de minimis* amount of greenhouse gases on an annual basis;

1.1.b Inventories greenhouse gas emissions from stationary, area, mobile and biogenic sources, and accounts for reductions and sequestration of greenhouse gas emissions;

1.1.c. Provides for a periodic compilation of a greenhouse gas emissions inventory and a determination whether West Virginia is a net sink or emitter of greenhouse gases;

1.1.d. Provides for development of a registry to record voluntary reductions of greenhouse gas emissions; and

1.1.e Provides for a determination whether the reduction and sequestration of greenhouse gas emissions can be developed as an asset for economic development.

1.2 Authority -- W Va Code §22-5-19.

1.3. Filing Date --

1.4. Effective Date -- June 1, 2008.

§45-42-2. Definitions.

2.1. "Air pollutants" means solids, liquids, or gases which, if discharged into the air, may result in statutory air pollution

2.2. "Air pollution" or "statutory air pollution" means and is limited to the discharge into the air by the act of man substances (liquid, solid, gaseous, organic or inorganic) in a locality, manner and amount as to be injurious to human health or welfare, animal or plant life, or property, or which would interfere with the enjoyment of life or property.

2.3. "Anthropogenic" means a direct result of human activities or the result of natural processes that have been influenced significantly by human activities.

2.4. "Area source" means, for purposes of this rule, a collection of similar sources of air pollutants within a geographic area. Area sources collectively represent individual sources that are small and numerous, and that typically have not been inventoried as a stationary or mobile source.

2.5. "Biogenic" means a naturally occurring biological source or process that is not significantly affected by human actions or activity.

2.6. "Capture" means the collection of greenhouse gas emissions from a stationary source

2.7. "*De minimis*" means emissions from a stationary source that are equal to or less than ten thousand tons per year for carbon dioxide, four hundred seventy-six tons per year for methane, thirty-two and six tenths tons per year for nitrous oxide, eight hundred fifty-five thousandths tons per year for hydrofluorocarbons, one and nine hundredths tons per year for perfluorocarbons and forty-two hundredths tons per year for sulfur hexafluoride.

2.8. "Emission" means the release, escape or discharge of regulated air pollutants or greenhouse gases into the air.

2.9. "Greenhouse gas" means the gaseous compounds: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride (SF_6)

2.10. "Mobile source" means a variety of onroad and nonroad vehicles, engines, locomotives, marine vessels, airplanes and other equipment that generate air pollutants and greenhouse gas emissions, and that move or can be moved from place to place.

2.11. "Regulated air pollutant" means, for purposes of this rule, any air pollutant regulated under rules promulgated by the Secretary pursuant to W.Va. Code §22-5-4

2.12. "Reservoir" means a geological site where a greenhouse gas is securely stored.

2.13. "Secretary" means the Secretary of the Department of Environmental Protection or such other person to whom the Secretary has delegated authority or duties pursuant to W.Va Code §§22-1-6 or 22-1-8

2.14. "Sequestration" means the physical process by which emissions of a greenhouse gas are directly captured for storage in a reservoir, or the biologic process by which a greenhouse gas is indirectly removed from the atmosphere for storage in a sink

2.15 "Sink" means any process, activity or mechanism which removes a greenhouse gas from the atmosphere Forests are considered sinks because they remove carbon dioxide through photosynthesis.

2.16 "Source" means, for purposes of this rule, any process or activity which releases a greenhouse gas into the air.

2.17 "Stationary source" means any building, structure, facility, installation, stationary process or process equipment which emits or may emit any regulated air pollutant or greenhouse gas.

2.18 "Ton" means a short ton, or 2000 pounds.

2.19. Other words and phrases used in this rule, unless otherwise indicated, shall have the meaning ascribed to them in W.Va. Code §22-5-1 et seq

§45-42-3. Applicability.

3.1. Any stationary source that emits one or more greenhouse gases on an annual basis greater than the *de minimis* amounts listed in the table below, excluding biogenic emissions, and reports emissions of regulated air pollutants pursuant to the emissions inventory requirements of the Secretary under rule or W.Va. Code §22-5-4(a)(14), shall be an affected source required to report emissions of all greenhouse gases emitted above *de minimis* amounts to the Secretary under section 4:

Greenhouse Gas Compound	tons/year
carbon dioxide	10,000
methane	476

nitrous oxide	32.6
perfluorocarbons	1.09
sulfur hexafluoride	0.42
hydrofluorocarbons	0.855

3.2. Stationary sources which are regulated by the Secretary under W.Va. Code §22-3-1 et seq. and do not report emissions of regulated air pollutants pursuant to the emissions inventory requirements under W.Va. Code §22-5-4(a)(14) are not required to, but may voluntarily report their greenhouse gas emissions under section 4.

§45-42-4. Reporting Requirements.

4.1. ~~By March 31, 2009, and March 31 of each year thereafter, affected~~ Affected sources shall report to the Secretary the quantity of all greenhouse gases emitted above *de minimis* amounts in the previous calendar year at the same time such sources are to report emissions of regulated air pollutants pursuant to the emissions inventory requirements of the Secretary under rule or W.Va. Code §22-5-4(a)(14).

4.2. Affected sources shall only be required to report annual quantities of anthropogenic non-mobile source greenhouse gas emissions directly at the source, and shall not be required to report biogenic or mobile emissions of greenhouse gases, or indirect emissions of greenhouse gases, such as emissions occurring offsite from energy consumption.

4.3. The Secretary shall determine the form and format of the information reported by affected sources under subsection 4.1 to ensure that the information is consistent as possible with developing regional, national, or international greenhouse gas emissions programs

4.4. Notwithstanding the provisions of subsection 4.3, to satisfy the greenhouse gas emission reporting requirements under this section, affected sources may submit greenhouse gas emissions inventory information from documented greenhouse gas inventories such as those provided to the Environmental Protection Agency's Climate Leaders Program, Chicago Climate Exchange Registry, the International Organization for Standardization and the SF_6 Emissions Reduction Partnership for Electric Power Systems. Greenhouse gas emissions inventory information from other widely recognized and verified greenhouse gas emissions inventory programs may be submitted by affected sources under this subsection, but shall be subject to approval by the Secretary on a case-by-case basis

4.5. Reports of greenhouse gas emissions submitted to the Secretary under this section shall be signed by a responsible official and shall include the following certification statement: "I, the undersigned, hereby certify that the data transmitted to the West Virginia Department of Environmental Protection is true, accurate, and complete, based upon information and belief formed after reasonable inquiry."

4.6. Greenhouse gases reported under this section are not subject to fees under 45 CSR 30, unless the greenhouse gases are otherwise regulated by the Secretary.

§45-42-5. Greenhouse Gas Emissions Inventory.

5.1. The Secretary shall periodically compile an inventory of greenhouse gas emissions to:

5.1.a. Characterize the relative contributions of greenhouse gas emissions from stationary, area, mobile and biogenic sources in West Virginia; and

5.1 b. Determine the extent to which greenhouse gas emissions are offset by the rate of sequestration, and whether West Virginia is a net sink or emitter of greenhouse gases.

5.2. The greenhouse gas emissions inventory shall include the emissions from stationary sources reported under section 4, and other relevant information regarding significant emissions, reductions, and sequestration of greenhouse gases from stationary, area, mobile and biogenic sources requested by the Secretary under subsections 5.3 and 5.4.

5.3. To inventory greenhouse gas emissions reductions, the Secretary shall consult with the citizenry and other entities such as industry trade groups that have information relating to greenhouse gas emissions reductions, and sequestration. ~~Upon request of the Secretary, such entities shall provide relevant information relating to greenhouse gas emissions reductions, capture and sequestration.~~

5.4. The Department of Agriculture, the Division of Forestry, Marshall University, West Virginia University, West Virginia Geological and Economic Survey, and the Department of Transportation shall enter into interagency agreements with the Secretary and at the Secretary's request provide:

5.4.a. Relevant information relating to greenhouse gas emissions from area, mobile and biogenic sources;

5.4.b. Relevant information relating to greenhouse gas emissions reductions and sequestration; and

5.4.c. Any assistance the Secretary may request during the development of the greenhouse gas emissions inventory.

5.5. The Secretary shall determine the form and format of the information submitted by the entities under subsections 5.3 and 5.4 to ensure that the information is consistent as possible with developing regional, national, or international greenhouse gas emissions programs.

§45-42-6.Greenhouse Gas Emissions Registry Program.

6.1. The Secretary shall develop a registry for the recordation of voluntary reductions of greenhouse gas emissions.

6.2. The greenhouse gas emissions registry program shall be as consistent as possible with developing regional, national, or international programs designed to monitor, quantify and register reductions in greenhouse gas emissions with respect to:

6.2.a. Development of criteria, based on a set of standardized emissions accounting, reporting and verification protocols, to determine baseline emissions and quantification of voluntary reductions in emissions of greenhouse gases;

6.2.b. Public recognition of such voluntary emissions reductions;

6.2.c. Consideration of voluntary greenhouse gas emission reductions when determining baselines and reduction requirements under future federal greenhouse gas emission reduction programs; and

6.2.d. The ability of sources to participate in future greenhouse gas emission trading programs.

§45-42-7.Economic Development Potential.

7.1. Using information obtained, gathered or developed under this rule, the Secretary will determine whether the reduction and sequestration of greenhouse gas emissions can be developed as an asset for net economic development or will result in a deterrent to net economic development in West Virginia.

§45-42-8.Inconsistency Between Rules.

8.1. In the event of any inconsistency between this rule and any other rule of the West Virginia Department of Environmental Protection, the inconsistency shall be resolved by the determination of the Secretary and the determination shall be based upon the application of the more stringent provision, term, condition, method or rule

Summary of Industry's Suggested Changes and Comments on 45 CSR 42, Greenhouse Gas Emissions Inventory Program

- Section 2.3. The definition of "anthropogenic" should be revised to state that it is the "result of natural processes that have been influenced significantly by human activities". Adding the term "significantly" makes the definition consistent with the definition of "biogenic" which means a "naturally occurring biological source or process that is not significantly affected by human actions or activity."

- Section 3.1. Applicability. This section should be revised to clarify that only individual greenhouse gases emitted above the *de minimis* amounts are required to be reported. Otherwise, affected sources that trigger any of the *de minimis* amounts could be required to report emissions of all of the greenhouse gases even if they are below the *de minimis* amounts. We do not believe that this is DEP's intent. Also, this section should be revised to clarify that the *de minimis* amounts do not include biogenic emissions.

- Section 4.1. Reporting Requirements. This section should be revised to require reporting of greenhouse gases at the same time the air emissions inventory reporting is required. Sources should not be required to report their emissions at two different times. This section should also be clarified so that only greenhouse gases emitted above the *de minimis* amounts are required to be reported.

- Section 4.2 should be revised so that "mobile" emissions of greenhouse gases are not required to be reported. This section should also be revised to clarify that only direct emissions and not indirect greenhouse gas emissions (e.g., emissions occurring offsite from electricity consumption) are required to be reported. The references in section 4.3 to programs like Climate Leaders could lead sources to include indirect and direct emissions in their reporting. This would lead to double counting of electric generation greenhouse gas emissions and to higher source emissions compared to the *de minimis* amounts.

- Section 4.6 should be added so that sources will not be subject to fees for reporting greenhouse gas emissions, as the purpose of such reporting is to create an inventory, not to generate fees.

- Section 5.3. This section should be revised to delete the requirement that certain entities, including trade associations, must provide relevant information on greenhouse gas emissions, reductions, capture and sequestration to the Secretary upon request. This requirement is not found in the statute and could be interpreted to require such entities to report reductions, which is also not required under the statute.

- Section 7.1. Economic Development Potential. This section should be revised to require the DEP to also determine whether reduction and sequestration will result in a deterrent to net economic development – not just whether it will be an asset.

- Additional questions/issues:

    - A reasonable protocol for reporting greenhouse gas emissions from stationary sources should be developed. Affected sources should not be required to report emissions from individual units within a stationary source if such emissions are insignificant. Affected stationary sources should have the option to report all of its greenhouse gas emissions in the aggregate.

    - Over 30 states have signed on to "The Climate Registry". Does West Virginia intend on signing on? The rule indicates that West Virginia will have its own registry independent of "The Climate Registry". Does DEP intend to rely upon any greenhouse gas registry programs, such as the Chicago Climate Exchange Registry, in developing the registry program?

MEMORANDUM

TO: Karen Price

FROM: David L Yaussy

DATE: May 29, 2007

SUBJECT: DEP Advisory Council Rules

A. Rules for Individual State Certification of Activities Requiring a Federal Permit.
Title 47, Series 5A.

No comment.

B. National Pollutant Discharge Elimination System (NPDES) Program.
Title 47, Series 10.

We would urge the DEP to update the rule. It still contains references to the Chief, rather than the Director (See, for example, Sections 5.13.d.1, 6.2 and 9.1.a.)

Has the DEP updated this rule to reflect changes in the Code of Federal Regulations that were made since it was last comprehensively updated?

C. Antidegradation Implementation Procedures.
Title 60, Series 5.

We agree that the State should do away with Section 6.2. There is no need for an initial presumptive listing procedure at this point. As for the 156 (I counted 157, but I may have miscounted) streams in Appendix A, we will disagree with all those listed except the 39 to which no objections were ever lodged.

D. Requirements Governing Water Quality Standards.

Title 57, Series 2.

There are a couple of minor errors – Section 2.2 has a "then" that should be "than" and Section 6.1 is missing text

We remain disappointed that the State continues to interpret its water quality standards to apply all uses in all streams at all times Section 6.1 clearly provides that B and C are the only default, or universal, uses

Appendix D should be eliminated. Category C, Water Contact Recreation, is a default use, and listing all streams with that use assigned to them suggests that there are streams that do not have that designation.

Appendix A. The DEP is listing a huge number of trout streams with no justification for their listing. If streams meet the requirements of trout waters, they qualify as such; if they do not, there is no reason to list them. Unless the DEP can document that each stream has year round, multi-age populations, they should not be listed.

DLY:shb

APPENDIX B

FISCAL NOTE FOR PROPOSED RULES

Rule Title: 45CSR34 - "Emission Standards for Hazardous Air Pollutants"

Type of Rule: ___X__ Legislative _____Interpretive _____Procedural

Agency: Division of Air Quality

Address: 601 57th Street SE

Charleston, WV 25304

Phone Number: 926-0475 Email: tmowrer@wvdep.org

Fiscal Note Summary

Summarize in a clear and concise manner what impact this measure will have on costs and revenues of state government.

No impact above that resulting from currently applicable federal emission standards.

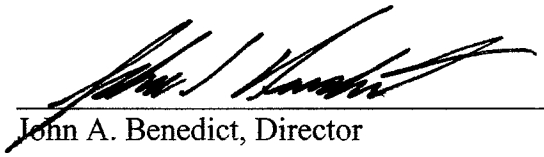
Fiscal Note Detail

Show over-all effect in Item 1 and 2 and, in Item 3, give an explanation of Breakdown by fiscal year, including long-range effect.

FISCAL YEAR			
Effect of Proposal	2008 Increase/Decrease (use "-")	2009 Increase/Decrease (use "-")	Fiscal Year (Upon Full Implementation)
1. Estimated Total Cost	$ 0	$ 0	$ 0
Personal Services	0	0	0
Current Expenses	0	0	0
Repairs & Alterations	0	0	0
Assets	0	0	0
Equipment	0	0	0
Other	0	0	0
2. Estimated Total Revenues	0	0	0

Rule Title: 45CSR34 - "Emission Standards for Hazardous Air Pollutants"

3. Explanation of above estimates (including long-range effect):
Please include any increase or decrease in fees in your estimated total revenues.



Costs anticipated to be incurred in the implementation of federal rules promulgated under 40 CFR Parts 61 and 63 as of June 1, 2007 are included in prior cost estimates prepared for state implementation of Title V of the Clean Air Act, as amended, under 45CSR30. Full Title V program approval was issued by the U.S. Environmental Protection Agency on November 19, 2001.

MEMORANDUM

Please identify any areas of vagueness, technical defects, reasons the proposed rule **would not** have a fiscal impact, and/or any special issues **not** captured elsewhere on this form.

Date: June 1, 2007

Signature of Agency Head or Authorized Representative

OFFICE WEST VIRGINIA SECRETARY OF STATE

TITLE 45
LEGISLATIVE RULE
DEPARTMENT OF ENVIRONMENTAL PROTECTION
~~OFFICE~~ DIVISION OF AIR QUALITY

SERIES 34
EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS
~~FOR SOURCE CATEGORIES PURSUANT TO 40 CFR PART 63~~

§45-34-1. General.

1.1. Scope. -- This rule establishes and adopts a program of national emission standards for hazardous air pollutants (NESHAPS) and other regulatory requirements promulgated by the United States Environmental Protection Agency pursuant to 40 CFR ~~Part~~ Parts 61, 63 and section 112 of the federal Clean Air Act, as amended (CAA). This rule codifies general procedures and criteria to implement emission standards for stationary sources that emit (or have the potential to emit) one or more of the eight substances listed as hazardous air pollutants in 40 CFR §61.01(a), or one or more of the substances listed as hazardous air pollutants in section 112(b) of the CAA. The Secretary hereby adopts these standards by reference. The Secretary also adopts associated reference methods, performance specifications and other test methods which are appended to these standards.

1.2. Authority. -- W.Va. Code §22-5-4.

1.3. Filing Date. -- ~~April 28, 2006~~.

1.4. Effective Date. -- ~~June 1, 2006~~.

1.5. Incorporation by Reference. -- Federal Counterpart Regulation. The Secretary has determined that a federal counterpart regulation exists, and in accordance with the Secretary's recommendation, with limited exception, this rule incorporates by reference 40 CFR Parts 61, 63 and 65, to the extent referenced in 40 CFR ~~Part~~ Parts 61 and 63, effective ~~June 1, 2005~~ June 1, 2007.

1.6. Repealed provisions. -- The repealed provisions of 45CSR15 - "Emission Standards for Hazardous Air Pollutants Pursuant to 40 CFR Part 61" relating to federal standards for emissions of hazardous air pollutants are incorporated into this rule as of the effective date set forth in subsection 1.4.

~~1.6.~~ 1.7. Former Rules. -- This legislative rule amends 45CSR34 - "Emission Standards for Hazardous Air Pollutants for Source Categories Pursuant to 40 CFR Part 63" which was filed ~~May 20, 2005~~ April 28, 2006, and which became effective ~~June 1, 2005~~ June 1, 2006.

§45-34-2. Definitions.

2.1. "Administrator" means the Administrator of the United States Environmental Protection Agency or his or her authorized representative.

2.2. "Clean Air Act" ("CAA") means 42 U.S.C. §7401 et seq.

2.3. "Hazardous air pollutant" means any air pollutant listed pursuant to 40 CFR Part 61.01(a) or section 112(b) of the CAA.

2.4. "Secretary" means the Secretary of the Department of Environmental Protection or other person to whom the Secretary has delegated authority or duties pursuant to W.Va. Code §§22-1-6 or 22-1-8.

2.5. Other words and phrases used in this rule, unless otherwise indicated, ~~will~~ shall have the meaning ascribed to them in 40 CFR ~~Part~~ Parts 61

and 63. Words and phrases not defined therein ~~will~~ shall have the meaning given to them in federal Clean Air Act.

§45-34-3. Requirements.

3.1. No person may construct, reconstruct, modify, or operate, or cause to be constructed, reconstructed, modified, or operated any source subject to the provisions of 40 CFR ~~Part~~ Parts 61 and 63 which results or will result in a violation of this rule.

3.2. ~~After the effective date of the state permit program under Title V of the CAA, no~~ No person may construct or reconstruct any major source of hazardous air pollutants, unless the Secretary determines that the maximum achievable control technology emission limitation under 40 CFR Part 63 and this rule for new sources will be met.

3.3. ~~After the effective date of the state permit program under Title V of the CAA, the~~ The Secretary ~~will~~ shall determine and apply case-by-case maximum achievable control technology standards to existing sources categorized by the Administrator pursuant to section 112(c)(1) of the CAA for which the Administrator has not promulgated emission standards in accordance with sections 112(d) and 112(e) of the CAA.

3.4. Prior to constructing, reconstructing or modifying any facility subject to this rule, the owner or operator ~~must~~ shall obtain a permit in accordance with the applicable requirements of 45CSR13, 45CSR14, 45CSR19, 45CSR30 and this rule.

§45-34-4. Adoption of Standards.

4.1. The Secretary hereby adopts and incorporates by reference the provisions of 40 CFR Parts 61, 63 and 65, to the extent referenced in 40 CFR ~~Part~~ Parts 61 and 63, including any reference methods, performance specifications and other test methods which are appended to these standards and contained in 40 CFR Parts 61, 63 and 65, effective ~~June 1, 2005~~ June 1, 2007, for the purposes of implementing a program for emission standards for hazardous air pollutants ~~for source categories~~, except as follows:

4.1.a. 40 CFR §§61.16 and 63.15 ~~is~~ are amended to provide that information ~~will~~ shall be available to the public in accordance with W.Va. Code §§22-5-1 et seq., 29B-1-1 et seq., and 45CSR31; ~~and~~

4.1.b. Subpart E of 40 CFR Part 63 and any provision related to section 112(r) of the CAA, notwithstanding any requirements of 45CSR30 ~~will~~ shall be excluded~~.~~;

4.1.c. Provisions under Subpart HH of 40 CFR Part 63 which apply to non-major area sources of hazardous air pollutants described in 40 CFR §63.760(b)(2) shall be excluded;

4.1.d. Subparts DDDDDD, EEEEEE, FFFFFF, and GGGGGG of 40 CFR Part 63 shall be excluded; and

4.1.e. Subparts B, H, I, K, Q, R, T, and W; Methods 111, 114, 115 and Appendix D and E of 40 CFR Part 61 shall be excluded.

§45-34-5. Secretary.

5.1. Any and all references in 40 CFR Parts 63 and 65 to the "Administrator" are amended to be the "Secretary" except as follows:

5.1.a. where the federal regulations specifically provide that the Administrator ~~will~~ shall retain authority and not transfer authority to the Secretary;

5.1.b. where provisions occur which refer to:

5.1.b.1. alternate means of emission limitations;

5.1.b.2. alternate control technologies;

5.1.b.3. innovative technology waivers;

5.1.b.4. alternate test methods;

5.1.b.5. alternate monitoring methods;

5.1.b.6. waivers/adjustments to record-keeping and reporting;

5.1.b.7. emissions averaging; or

5.1.b.8. applicability determinations; or

5.1.c. where the context of the regulation clearly requires otherwise.

§45-34-6. Permits.

6.1. Nothing contained in this rule ~~must~~ shall be construed or inferred to mean that permit requirements in accordance with applicable rules ~~will~~ shall in any way be limited or inapplicable.

§45-34-7. Inconsistency Between Rules.

7.1. In the event of any inconsistency between this rule and any other rule of the West Virginia Department of Environmental Protection, the inconsistency ~~will~~ shall be resolved by the determination of the Secretary and the determination ~~will~~ shall be based upon the application of the more stringent provision, term, condition, method or rule.

RIN 2060–AK22

National Air Emission Standards for Hazardous Air Pollutants: Halogenated Solvent Cleaning

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: EPA is promulgating revised standards to limit emissions of methylene chloride (MC), trichloroethylene (TCE) and perchloroethylene (PCE) from facilities engaged in halogenated solvent cleaning. On December 2, 1994, EPA promulgated technology-based emission standards to control HAP emissions of halogenated solvents from halogenated solvent cleaning. Pursuant to the Clean Air Act (CAA) section 112(f), EPA has evaluated the remaining risk to public health and the environment following implementation of the technology-based rule and is promulgating more stringent standards in order to provide an ample margin of safety to protect public health. These final standards will provide further reductions of MC, PCE, and TCE beyond the 1994 national emission standards for hazardous air pollutants (NESHAP), through application of a facility-wide total MC, PCE, and TCE emission standard. In addition, EPA has reviewed the standards as required by section 112(d)(6) of the CAA and has determined that, taking into account developments in practices, processes, and control technologies, no further action beyond what is required under CAA section 112(f) is necessary at this time.

EFFECTIVE DATE: This final rule is effective May 3, 2007.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0009. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available (*e.g.*, Confidential Business Information (CBI) or other information whose disclosure is restricted by statute). Certain other material, such as copyrighted material, will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the EPA Docket Center, Docket ID No. EPA–HQ–OAR–2002–0009, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. This Docket Facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The Docket telephone number is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742. EPA visitors are required to show photographic identification and sign the EPA visitor log. After processing through the X-ray and magnetometer machines, visitors will be given an EPA/DC badge that must be visible at all times.

Informational updates will be provided via the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* as they are available.

FOR FURTHER INFORMATION CONTACT: For questions about the final rule amendments, contact Mr. H. Lynn Dail, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Natural Resources and Commerce Group (E143–03), Research Triangle Park, NC 27711; telephone number (919) 541–2363; fax number (919) 541–3470; e-mail address: *dail.lynn@epa.gov*. For questions on the residual risk analysis, contact Mr. Dennis Pagano, EPA, Office of Air Quality Planning and Standards, Health and Environmental Impacts Division, Sector Based Assessment Group (C539–02), Research Triangle Park, NC 27711; telephone number (919) 541–0502; fax number (919) 541–0840; e-mail address: *pagano.dennis@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by the final rule include:

Category	NAICS [1] code	Examples of potentially regulated entities
Industry	Any of numerous industries using halogenated solvent cleaning, primary affected industries include those in NAICS Codes beginning with: 331 (primary metal man.), 332 (fabricated metal man.), 333 (machinery man.), 334 (computer and electronic product man.), 335 (electrical equipment, appliance, and component man.); 336 (transportation equipment man.); 337 (furniture and related products man.); and 339 (misc. man.).	Operations at sources that are engaged in solvent cleaning using MC, PCE, or TCE.
Federal, State, local, and tribal government.		Operations at sources that are engaged in solvent cleaning using MC, PCE, or TCE.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by the final rule. This final rule directs an owner or operator of a facility that is subject to the 1994 NESHAP for Halogenated Solvent Cleaning (40 CFR 63.460 of subpart T), to determine whether today's final standards require the facility additionally to operate under the certain specific emission limits. If you have any questions regarding the applicability of the final rule to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Docket. The docket number for the National Emission Standards for Hazardous Air Pollutants: Halogenated Solvent Cleaning (40 CFR part 63, subpart T) is Docket ID No. EPA–HQ–OAR–2002–0009.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule is also available on the WWW. Following the Administrator's signature, a copy of the final rule will be posted on EPA's Technology Transfer Network (TTN) policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 2, 2007. Under CAA section 307(d)(7)(B), only an objection to the final rule that was raised with

reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under CAA section 307(b)(2), the requirements established by this final action may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides a mechanism for EPA to convene a proceeding for reconsideration, "if the person raising the objection can demonstrate to the EPA that it was impracticable to raise such an objection [within the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to the EPA should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel, Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Outline. The information presented in this Preamble is organized as follows:

I. Background
A. What is the statutory authority for this action?
B. What is halogenated solvent cleaning?
C. What are the health effects of halogenated solvent cleaning?
D. What does the 1994 halogenated solvent cleaning NESHAP require?
II. Summary of the Proposed Rule
A. Issuance of the Notice of Data Availability (NODA)
III. Summary of the Final Rule
A. What does the final rule require?
1. What are the requirements for halogenated solvent cleaning machines?
2. What are the requirements for halogenated solvent cleaning machines at military depot maintenance facilities?
3. What are the requirements for continuous web cleaners and halogenated solvent cleaning machines at narrow tube manufacturing and aerospace industries?
B. What is the rationale for the final rule?
1. Revision of the Baseline Risk Estimate
2. Rationale for the 60,000 kg/yr MC Equivalent Emission Limit
3. Rationale for the Requirements for Halogenated Solvent Cleaning Machines at Military Depot Maintenance Facilities.
4. Rationale for Our Decisions Regarding Continuous Web Cleaners and Halogenated Solvent Cleaning Machines at Narrow Tube Manufacturing and Aerospace Facilities
C. What is the compliance schedule?
D. What is the final decision on the applicable unit risk value?
E. What is EPA's finding on the Section 112(d)(6) review requirements?
IV. Responses to Significant Comments
A. Significant Comments on the Proposal
1. Emission Limit Option 1 or Option 2
2. Equation for MC Equivalents
3. Use of CalEPA or OPPTS URE for Implementation of the Emission Limit
4. Compliance Deadline
5. Applicability of Control Requirements
6. Costs Associated With Compliance
7. General Comments
V. Responses to Significant Comments on EPA's December 14, 2006, Notice of Data Availability (NODA)
A. Emission Limits
B. Cost Impacts
C. Compliance Schedule
VI. Impacts
VII. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a comprehensive regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In accordance with CAA section 112(c), EPA identifies categories and subcategories of sources emitting one or more of the HAP listed in CAA section 112(b). CAA section 112(d) then requires us to promulgate national technology-based emission standards for each category of sources that emits or has the potential to emit any single HAP at a rate of ten tons or more per year or any combination of HAP at a rate of 25 tons or more per year (known as "major sources"), as well as for certain area sources emitting less than those amounts. For major sources, these technology-based standards must reflect the maximum reductions of HAP achievable (after considering cost, energy requirements, and non-air health and environmental impacts) and are commonly referred to as maximum achievable control technology (MACT) standards. For area sources, CAA section 112(d)(5) provides that the standards may reflect generally available control technology or management practices in lieu of MACT, and are commonly referred to as generally available control technology (GACT) standards.

In what we refer to as the "technology review", CAA section 112(d)(6) then requires EPA to review the CAA section 112(d) standards and to revise them "as necessary, taking into account developments in practices, processes and control technologies," no less frequently than every 8 years.

The residual risk review is described in section 112(f) of the CAA. EPA prepared a Report to Congress discussing (among other things) methods of calculating risk posed (or potentially posed) by sources after implementation of the MACT standards, the public health significance of those risks, the means and costs of controlling them, actual health effects to persons in proximity to emitting sources, and recommendations as to legislation regarding such remaining risk. The EPA prepared and submitted this report ("Residual Risk Report to Congress," EPA–453/R–99–001) in March 1999. The Congress did not act on any of the recommendations in the report; thereby, triggering the second stage of the standard-setting process, the residual risk phase.

CAA section 112(f)(2) requires us to determine whether additional standards are "required in order to provide an ample margin of safety to protect public health." If the MACT standards for a HAP "classified as a known, probable, or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than 1-in-a-million," EPA must promulgate residual risk standards for the source category (or subcategory) as necessary to provide an ample margin of safety. EPA's framework for making ample margin of safety determinations under CAA section 112(f)(2) is provided in the Benzene NESHAP (54 FR 38044, September 14, 1989) which was codified by Congress in CAA section 112(f)(2)(B). The EPA also must promulgate more stringent standards to prevent an adverse environmental effect (defined in CAA section 112(a)(7) as "any significant and widespread adverse effect * * * to wildlife, aquatic life, or other natural resources, including adverse impacts on populations of endangered or threatened species or significant degradation of environmental quality over broad

areas."), but must consider costs, energy, safety, and other relevant factors in doing so.

B. What is halogenated solvent cleaning?

Halogenated solvent cleaning machines use the halogenated solvents methylene chloride (MC), perchloroethylene (PCE), trichloroethylene (TCE), or 1,1,1,-trichloroethane (TCA) and halogenated solvent blends or their vapors to remove soils such as grease, oils, waxes, carbon deposits, fluxes, and tars from metal, plastic, fiberglass, printed circuit boards, and other surfaces. Halogenated solvent cleaning is typically performed prior to processes such as painting, plating, inspection, repair, assembly, heat treatment, and machining. Types of solvent cleaning machines include, but are not limited to, batch vapor, in-line vapor, in-line cold, and batch cold solvent cleaning machines. Buckets, pails, and beakers with capacities of 7.6 liters (2 gallons) or less are not considered solvent cleaning machines.

Halogenated solvent cleaning does not constitute a distinct industrial category, but is an integral part of many major industries. The five 3-digit NAICS Codes that use the largest quantities of halogenated solvents for cleaning are NAICS 337 (furniture and related products manufacturing), NAICS 332 (fabricated metal manufacturing), NAICS 335 (electrical equipment, appliance, and component manufacturing), NAICS 336 (transportation equipment manufacturing), and NAICS 339 (miscellaneous manufacturing). Additional industries that use halogenated solvents for cleaning include NAICS 331 (primary metals), NAICS 333 (machinery), and NAICS 334 (electronic equipment manufacturing). Non-manufacturing industries such as railroad (NAICS 482), bus (NAICS 485), aircraft (NAICS 481), and truck (NAICS 484) maintenance facilities; automotive and electric tool repair shops (NAICS 811); and automobile dealers (NAICS 411) also use halogenated solvent cleaning machines. We estimated that there were approximately 16,400 batch vapor, 8,100 in-line, and perhaps as many as 100,000 batch cold cleaning machines in the U.S. prior to promulgation of the MACT standards. More recent information shows that the current number of cleaning machines is much lower than these pre-MACT estimates. We currently estimate the number of sources in this source category to be about 3,800 cleaning machines located at 1,900 facilities in the U.S. This estimate is based on information we collected in 1998 and reflects the decreases in HAP emissions and demand that were expected due to implementation of MACT control technologies and work practice standards. Information suggesting that further decreases in solvent usage and therefore, solvent emissions, have occurred in the post-MACT implementation years may reflect that either the number of sources in the source category have declined or that sources are implementing methods to recycle more solvent, resulting in reduced emissions and some cost savings.

"Solvent cleaning machine" is defined in the **Federal Register**, 40 Code of Federal Regulations (CFR) § 63.461. Solvent cleaning machine types such as batch cleaners and in-line cleaners are also described. Both cleaner types can be designed to use either solvent at room temperature (cold cleaners) or solvent vapor (vapor cleaners).

Continuous web cleaners are a subset of in-line cleaners that are used to clean products such as films, sheet metal, and wire in rolls or coils. The workload is uncoiled and conveyorized throughout the cleaning machine at speeds in excess of 11 feet per minute and recoiled or cut as it exits the machine. Emission points from continuous cleaners are similar to emission points from other inline cleaners. Continuous cleaners are semi-enclosed, with emission points where the workload enters and exits the machine. Squeegee rollers reduce carry out emissions by removing excess solvent from the exiting workload. Some continuous machines have exhaust systems similar to those used with some other in-line cleaners.

C. What are the health effects of halogenated solvent cleaning?

MC, PCE, TCA, and TCE are the primary halogenated solvents used for solvent cleaning. The health effects of these four solvents were described in the proposed rule of August 17, 2006 (71 FR 47680), which is available for review in docket EPA–HQ–OAR–2002–0009. All four produce acute and/or chronic non-cancer health effects at sufficient concentrations; three of the four have been classified as probable or possible human carcinogens by either EPA or other governmental or international agencies. Carbon tetrachloride and chloroform are no longer used as degreasing solvents; therefore, their health effects were not discussed in the proposed rule.

The Agency's Integrated Risk Information System's (IRIS) toxicological reviews of PCE, TCE and MC are currently being developed or revised. The current schedule indicates that the new or final IRIS toxicological reviews of the carcinogens PCE, TCE and MC are not expected until late 2008 for PCE, mid 2009 for MC, and late 2010 for TCE. A publicly available draft revised toxicological review of the non-carcinogenic HAP TCA, has been released for external peer review. A final revised IRIS toxicological review of TCA is not expected until late 2007. The National Research Council (NRC) released a report in 2006 that described their findings after a comprehensive review of the health effects of TCE, focusing on critical issues in developing an objective, realistic, and scientifically based health risk assessment for TCE. This report is available at *http://www.nas.edu/catalog/11707.html.* Toxicity or status information for the four HAPs may be obtained from the following Web sites: EPA's Toxicity database at *http://www.epa.gov/ttn/atw/toxsource/table1.pdf* shows the benchmarks for the four HAPs used in the risk assessment. Specific information underlying the values used may be found at the following locations: California EPA's Web site at *http://www.oehha.ca.gov/air/hot_spots/index.html* has the background information on PCE and TCE used to develop the cancer potency values.

The Agency for Toxic Substances and Disease Registry's Web site at *http://www.atsdr.cdc.gov/toxpro2.html* has the background information used to develop the non-cancer values for MC and PCE.

EPA's IRIS Web site at *http://www.epa.gov/iris/index.html* provides the information supporting the cancer potency value for MC.

Status reports for IRIS chemical reassessments, (*i.e.*, TCA) are available at *http://cfpub.epa.gov/iristrac/index.cfm.*

D. What does the 1994 halogenated solvent cleaning NESHAP require?

On December 2, 1994, we promulgated national emission standards for halogenated solvent cleaning (59 FR 61801, (December 2, 1994)) and required existing sources to comply with the national emission standards by December 2, 1996.

The promulgated standards in 40 CFR Subpart T include multiple alternatives to allow owners or operators maximum compliance flexibility. The final rules for the halogenated solvent cleaning source category are available in the docket, EPA–HA–OAR–2002–0009.

II. Summary of the Proposed Rule

The August 17, 2006 proposed rule would have required all owners and

operators of halogenated solvent cleaning machines that are subject to the 1994 NESHAP (40 CFR Part 63, subpart T), except for cold batch area source cleaning machines subject to GACT, to comply with a facility-wide solvent emission limit, summarized in Table 1 of this Preamble. As proposed, the standards would be in addition to the requirements of the 1994 NESHAP.

Specifically, we co-proposed two facility-wide emission limits for facilities that use multiple HAP solvents, 25,000 kg/yr and 40,000 kg/yr of MC equivalent emissions, and solicited comments on which of these two options would be the most appropriate. We developed a method for facilities using multiple HAP solvents to determine their emission limit by calculating their MC-equivalent emissions using the toxicity-weighting equation, which is shown as equation 1, below. We proposed that where more than one halogenated solvent is used at a facility, the owner or operator would be required to calculate the facility's weighted halogenated solvent cleaning emissions using equation 1 and to comply with the limit in the last row of Table 1 of this Preamble. For owners or operators of facilities that use a single halogenated solvent (MC, TCE or PCE), we proposed that the owner or operator of each affected facility would be required to ensure that its emissions of the single halogenated solvent would not exceed the single-solvent limits specified in Table 1 of this Preamble.

TABLE 1.—SUMMARY OF THE PROPOSED FACILITY-WIDE ANNUAL EMISSION LIMITS

Solvents emitted	Proposed facility-wide annual emission limits in kg/yr—option 1	Proposed facility-wide annual emission limits in kg/yr—option 2
PCE only	[a] 3,200 [b] (26,700)	[a] 2,000 [b] (16,700)
TCE only	10,000	6,250
MC only	40,000	25,000
Multiple solvents—Calculate the MC-weighted emissions using equation 1	40,000	25,000

[a] *PCE emission limit calculated using California EPA (CalEPA) Unit Risk Estimate (URE).*
[b] *PCE emission limit calculated using the EPA Office of Prevention, Pesticides and Toxic Substances (OPPTS) Unit Risk Estimate (URE).*

Equation 1:

(kgs/yr of PCE emissions × A)+(kgs/yr of TCE emissions × B) + (kgs/yr of MC emissions) = MC weighted emissions in kgs/yr

In equation 1, the facility emissions of PCE and TCE are weighted according to their carcinogenic potency relative to that of MC. Thus, "A" in the equation is the ratio of the cancer unit risk estimate (URE) for PCE to the URE for MC, and the "B" in the equation is the ratio of the URE for TCE to the URE for MC. Because the IRIS assessment for PCE is in process, we requested comment on the use of the CalEPA URE, the OPPTS URE, or other values in deriving the PCE emission limit for the final rule. See 71 FR 47680. As explained in our proposal, the value of "A" would be 1.5 or 12.5, depending on whether we used the OPPTS URE or the CalEPA URE value for PCE. The value for "B" is 4.25. At proposal, we stated that there may be other approaches for deriving emissions standards for facilities that use multiple HAP. We requested comment on other possible methods for establishing emission limits at facilities using more than one of the listed HAP solvents.

Further, at proposal we presented and discussed our evaluation of four other emission limits that would reduce residual risk. These emission limits are summarized below:

- 100,000 level—Sources would reduce MC-equivalent emissions to no more than 100,000 kg/yr (220,000 lbs/yr).
- 60,000 level— Sources would reduce MC-equivalent emissions to no more than 60,000 kg/yr (132,000 lbs/yr).
- 15,000 level— Sources would reduce MC-equivalent emissions to no more than 15,000 kg/yr (33,000 lbs/yr).
- 6,000 level—Sources would reduce MC-equivalent emissions to no more than 6,000kg/yr (13,200 lbs/yr).

See 71 FR 47680–81 for further discussion of these four emission levels.

We proposed a compliance deadline of two years after the effective date of the final rule for existing sources by resolving the seemingly conflicting provisions of section 112(f)(4)(A) and 112(i), and by determining that CAA section 112(i) was the controlling provision for compliance deadlines for existing sources with regard to standards promulgated under CAA section 112(f)(2). This proposal was based on our belief that the proposed compliance date was realistic for any affected facility that has to plan a control strategy, purchase and install the control device(s), and bring the control device(s) online.

See 71 FR 47683–84 for a complete discussion of the proposed facility-wide solvent emission limit, compliance options, and our rationale for proposing the facility-wide solvent emission limit.

A. Issuance of the Notice of Data Availability (NODA)

We received comments on the proposed rule from industry, states, solvent manufacturers, industry associations and district air associations. Industry's comments were primarily submitted by four specific sectors: Narrow tubing manufacturing facilities, facilities that manufacture specialized products requiring continuous web cleaning, aerospace manufacturing and maintenance facilities, and military depot maintenance facilities. Additional comments were submitted by facilities that use multiple halogenated solvent cleaning machines. Comments and data submitted by the four industry sectors focused on the unique nature and size of the halogenated solvent cleaning machines they use in their cleaning operations. These data and information were otherwise not available to EPA at proposal. The commenters expressed concern about their ability to comply with the proposed emission limits because of technical and economic difficulties. They also expressed an inability to meet the proposed compliance deadline. Based on these comments and our desire to reconcile these concerns, we issued a Notice of Data Availability (NODA) on December 14, 2006 (71 FR 75182). In addition, in order to have adequate time to address these concerns, we asked for and received an extension of our December 15, 2006 court-ordered promulgation deadline to April 16, 2007. The NODA was intended to gather more information, especially from these four industry sectors, on the availability of technology or methods to meet the proposed emission limits, the costs to achieve the proposed emission limits, and the time required to achieve the proposed emission limits.

As a result of the NODA, EPA received significant comments from responders associated with the above-noted industries, industry associations, and commenters that were not associated with the above-noted industries. They provided additional data and information that were directly relevant to the promulgation of the proposed facility-wide emission limits. These data and information were otherwise not available to EPA at proposal. A more complete description of the comments received may be found in section V of this Preamble and in the docket for this rule.

III. Summary of Final Rule

A. What does the final rule require?

Using the data from comments on the proposal and NODA, we re-evaluated the costs and technical feasibility of complying with the proposed emission limits. The re-analysis resulted in a final rule that changed from what we proposed, especially for four industry sectors: narrow tubing manufacturing facilities, facilities that manufacture specialized products requiring continuous web cleaning, aerospace manufacturing and maintenance facilities, and military depot maintenance facilities.

1. What are the requirements for Halogenated Solvent Cleaning Machines?

EPA is promulgating a facility-wide emission limit of 60,000 kg/yr MC equivalent, as shown in Table 2 of this Preamble, applicable to all existing halogenated solvent cleaning machines with the exception of halogenated solvent cleaning machines used by the following industries: Facilities that manufacture narrow tubing, facilities that manufacture specialized products requiring continuous web cleaning, aerospace manufacturing and maintenance facilities, and military depot maintenance facilities.

This final rule also requires owners or operators of halogenated solvent cleaning machines that use any one of the halogenated solvents covered by this rule (*i.e.*, MC, PCE or TCE), with the exception of the halogenated solvent cleaning machines used by the above-noted industries, to ensure that facility-wide solvent emissions from all halogenated solvent cleaning activities are less than or equal to the limit for the single halogenated solvent specified in Table 2 of this Preamble.

This final rule also requires halogenated solvent cleaning machines that are constructed or reconstructed after August 17, 2006, with the exception of halogenated solvent cleaning machines associated with the above-noted industries, to comply with the 60,000 kg/yr MC equivalent emission limit upon the effective date of this rule or upon startup, whichever occurs later. The revised requirements apply in addition to the 1994 NESHAP.

For area sources subject to the 1994 NESHAP and constructed or reconstructed after August 17, 2006, the final rule revisions add to the previous 1994 NESHAP by requiring implementation of the 60,000 kg/yr MC equivalent facility-wide emission limit upon the effective date of this rule or upon startup, whichever occurs later. This final rule also limits the use of any one of the halogenated solvents covered by this rule (*i.e.*, MC, PCE or TCE), at area sources, to the limits for the single halogenated solvent specified in Table 2 of this Preamble. The area sources in the halogenated solvent cleaning source category that are subject to GACT are not subject to these additional standards. These area sources are cold batch cleaning machines.

When a facility's total halogenated solvent emissions from its degreasing operations exceed the applicable emission limits, the facility must implement means to comply with these amended standards. In addition, under this final rule, the 1994 NESHAP requirements for all halogenated solvent cleaning machines remain applicable. Compliance with the 60,000 kg/yr MC equivalent emission limit is demonstrated by determining the annual PCE, TCE, and MC emissions for all cleaning machines at the facility, using Equation 1 as necessary, and comparing to the emission limits in Table 2.

There are no other additional equipment monitoring or work practice requirements associated with the facility-wide annual emissions limit. Annual emissions of PCE, TCE, and MC are determined based on records of the amounts and dates of the solvents added to cleaning machines during the year, the amounts and dates of solvents removed from cleaning machines during the year, and the amounts and dates of the solvents removed from cleaning machines in solid waste. Records of the calculation sheets showing how the annual emissions were determined must be maintained. A facility will determine compliance with the standards by comparing their annual MC-equivalent emissions to the limits specified in Table 2 of this final rule.

TABLE 2.—SUMMARY OF THE FACILITY-WIDE ANNUAL EMISSION LIMITS

Solvents emitted	Final general halogenated solvent cleaning facility-wide annual emission limits in kg/yr	Final military maintenance facility-wide annual emission limits in kg/yr
PCE only	4,800	8,000
TCE only	14,100	23,500
MC only	60,000	100,000
Multiple solvents—Calculate the MC-weighted emissions using equation 1	60,000	100,000

Equation 1:

(kgs/yr of PCE emissions × A)+(kgs/yr of TCE emissions × B) + (kgs/yr of MC emissions) = MC weighted Emissions in kgs/yr

In this equation, the facility emissions of PCE and TCE are weighted according to their carcinogenic potency relative to that of MC. Thus, "A" in the equation is the ratio of the URE for PCE to the URE for MC, and the "B" in the equation is the ratio of the URE for TCE to the URE for MC. The value of "A" is 12.5 (see section C below). The value for "B" is 4.25.

2. What are the requirements for halogenated solvent cleaning machines at military depot maintenance facilities?

For existing halogenated solvent cleaning machines in use at military depot maintenance facilities where multiple halogenated solvents are emitted, the final rule sets a facility-wide emission limit of 100,000 kg/yr of MC equivalent emissions as indicated in Table 2 of this Preamble. This final rule also limits the use of any one of the halogenated solvents covered by this rule (*i.e.*, MC, PCE or TCE), to the limits for the single halogenated solvent specified in Table 2 of this Preamble. In

addition, the 1994 NESHAP requirements remain applicable.

For halogenated solvent cleaning machines that are constructed or reconstructed after August 17, 2006 and that are used at military depot maintenance facilities, the final rule revisions add to the previous 1994 NESHAP by requiring implementation of the 100,000 kg/yr MC equivalent emission limit upon the effective date of this rule or upon startup, whichever occurs later.

Military Depot Maintenance Facilities are Government-owned industrial centers that operate solely for the purpose of repairing, modifying, converting and refitting worn and/or damaged military assets for redistribution to military units and are subject to the 1994 NESHAP. Depot level maintenance includes the repair, fabrication, manufacture, rebuilding, assembly overhaul, modification, refurbishment, test, analysis, repair-process design, in-service engineering, upgrade, painting and disposal of parts, assemblies, subassemblies, software, components, or end items that require industrial shop facilities, tooling, support equipment, and/or personnel of higher technical skills, or processes beyond the military installation's organizational level capability.

3. What are the requirements for continuous web cleaners and halogenated solvent cleaning machines at narrow tube manufacturing and aerospace facilities?

The requirements set forth in this final rule are not applicable to continuous web cleaning machines, halogenated solvent cleaning machines that are located at narrow tubing manufacturing facilities, and the aerospace manufacturing and maintenance industry and facilities. Narrow tube manufacturing facilities primarily engage in the production of small diameter (mechanical and hypodermic size) cold drawn metallic, seamless tubes from materials such as stainless steel, nickel alloys, titanium and its alloys, and alloys of zirconium with a portion of the outside diameters 1/4" or less (a subset of NAICS 331210), and are subject to the 1994 NESHAP. Aerospace manufacturing and maintenance facilities manufacture, rework, or repair aircraft such as airplanes, helicopters, missiles, rockets, and space vehicles, and are subject to the 1994 NESHAP. The 1994 NESHAP requirements remain applicable to all the continuous web and halogenated solvent cleaning machines associated with the above-noted facilities.

For the above-noted facilities, we are adopting no changes to the 1994 NESHAP under CAA Section 112(f) because the current level of control called for by the existing NESHAP reduces HAP emissions to levels that present an acceptable level of risk, protects public health with an ample margin of safety, and prevents any adverse environmental effects. The finding regarding an "ample margin of safety" is based on a consideration of the additional costs of further control as represented by compliance with emissions limits adapted for each industry sector, considering availability of technology, costs and time to comply with further controls (see Section III.B., below for a discussion of our rationale for this final rule).

B. What is the rationale for the final rule?

Based on comments and data received on both the proposal and the NODA, we re-evaluated the risk, the technical feasibility, the costs of the proposed options, and the compliance time needed to implement the proposed options. This re-analysis focused especially on the four industry sectors discussed above. Additionally, in response to public comments we updated the risk assessment for the entire source category using the 2002 National Emissions Inventory (NEI) database, which was not available for the proposal. The following rationale presents the results of our re-analysis of the data.

1. Revision of the Baseline Risk Estimate

Based on public comment, we used the 2002 NEI inventory to re-analyze the risk from this source category. The resulting re-analysis of risk at the baseline emission level (*i.e.*, the level of emissions allowed by the 1994 MACT) indicated that the maximum individual cancer risk (MIR) associated with this source category is 100-in-a-million with an annual cancer incidence of 0.55. This is as compared to the 200-in-a-million MIR and 0.40 annual cancer incidence level that we presented at proposal, which was based on the 1999 NEI database. We consider both MIR values to be acceptable levels of maximum individual risk considering the number of people exposed at these levels and the absence of other adverse human and environmental health effects. We note that the MIR of 100-in-a-million (calculated using the 2002 NEI data) is the same regardless of the URE for PCE chosen for the risk analysis (*i.e.*, the CalEPA value or the OPPTS value, which results were contrasted at proposal). This is because PCE is not the only driver of the MIR risk level for the highest risk facilities.

Given the uncertainties associated with the development of emission inventories, neither the 1999 nor the 2002 NEI inventory should be considered as correct in an absolute sense or as suggesting temporal trends in degreasing machine populations or emissions. Rather, we consider them to be "snapshots" of the true long-term inventory of emissions for this source category, each carrying its own degree of uncertainty. As such, the derived risk assessment results compared above should be regarded as ranges within which the true risk metrics are likely to fall.

The revised population risk distribution at baseline emission levels shows that about 25 people are exposed to the MIR risk level, about 22,000 people are at estimated risks of ≥ 10-in-a-million risk level, and about 4,000,000 people are at estimated risks of ≥ 1-in-a-million. This is compared to approximately 90 people exposed to risks at the MIR level (200-in-a-million), about 42,000 people at estimated risks of ≥ 10-in-a-million risk level, and about 6,000,000 people at estimated risks of ≥ 1-in-a-million that we presented at proposal. Similar to the MIR and annual cancer incidence metrics, these values may be an indication of the uncertainty presented by the databases because, as earlier explained, both inventories are "snapshots" of the industry rather than an absolute reflection of the "current" state of the industry.

We did not reassess the environmental risks using the 2002 NEI inventory but believe that no "adverse environmental effects," as defined in CAA section 112(a)(7), would occur given the similarities of the human health risk results between the 1999 NEI data and 2002 NEI data and the fact that we showed in the proposal that no adverse environmental effects would likely occur using the 1999 NEI inventory.

2. Rationale for the 60,000 kg/yr MC Equivalent Emission Limit

EPA is promulgating a facility-wide emission limit of 60,000 kg/yr (MC equivalent emissions) applicable to emissions from all new and existing halogenated solvent cleaning machines that are subject to the 1994 NESHAP, with the exception of halogenated solvent cleaning machines used by the following industry sectors: Narrow tubing manufacturing, facilities that manufacture specialized products requiring continuous web cleaning, aerospace manufacturing and maintenance, military depot

maintenance operations, and cold batch cleaning machines (which are subject to GACT). Area sources operating halogenated solvent cleaning machines that are subject to GACT also are not required to comply with the facility-wide emission limits. This final rule reflects our decision that the 60,000 kg/yr MC equivalent emission limit from the August 17, 2006 proposal provides an ample margin of safety to protect public health and prevents adverse environmental effects.

In response to public comments received on our proposal and subsequent NODA, we re-examined the data and assumptions used to estimate the risk and compliance costs presented in the Preamble to our proposed rule. We determined that certain significant data and assumptions that we used to develop our cost estimates at proposal were either no longer relevant, not reflective of more recent inventory data, or not valid. As a result, we re-evaluated risks using the more recent inventory data and modified our cost estimates in response to public comment. The most important change we made is that we re-analyzed the risk metrics and costs using the halogenated solvent cleaning facilities in the finalized 2002 NEI, but removing facilities in four specific industry sectors—aerospace manufacture and maintenance facilities, narrow tube manufacturing facilities, facilities using continuous web cleaning machines, and military equipment maintenance facilities—from the database for the purpose of estimating the risks and compliance costs associated with the remaining facilities (Sections III.A.3 and III.B.3 explain our rationale for removing the facilities in these industry sectors from this analysis).

Other changes we made to our cost estimates in response to public comment are as follows:

- We used the finalized 2002 NEI database containing facility and emissions data as the source of our baseline emissions estimates. We removed aerospace manufacture and maintenance facilities, narrow tube manufacturing facilities, facilities using continuous web cleaning machines, and military equipment maintenance facilities from the database for the purpose of estimating the compliance costs for the remaining facilities. (Sections III.A.3 and III.B.3 explain our rationale for removing these facilities from this analysis.)
- We changed our assumptions about the percent reductions in emissions that can be achieved by vacuum-to-vacuum machines from 97 percent to 95 percent.
- In the proposal, we assigned no operation and maintenance cost to vacuum-to-vacuum machines. Based on public comment, our cost estimates for this final rule incorporate annual operation and maintenance costs of $18,832 for each machine.
- We updated the cost per gallon of PCE and TCE based on information provided by commenters representing manufacturers of solvents and the narrow tube manufacturing industry.
- We added a carbon adsorption device (CAD) option that assumes a 30 percent control in emissions. We did not have this option in the cost assumptions we made at proposal. We received comments that this option may be available for some industries but that it is at least ten times more expensive than the retrofit options we costed for the proposal.
- We reduced the number of units for which solvent switching could be a compliance option from 30 percent, used in the proposal, to 15 percent. We also corrected our method for calculating the emission reduction impacts and solvent savings associated with solvent switching.

After re-assessing the risk and calculating revised cost estimates, we re-examined our decision as to what level of control is necessary to provide an ample margin of safety to protect human health and to prevent adverse environmental effects, as required by the second step of the residual risk process under CAA section 112(f)(2). We considered the re-assessed risk estimates and the other health information along with additional factors consistent with the 1989 Benzene NESHAP (54 FR 38044, September 14, 1989), such as cost, technological feasibility, uncertainties and other relevant factors as discussed at proposal. We re-analyzed the risk metrics using the halogenated solvent cleaning facilities in the 2002 NEI, but removing aerospace manufacture and maintenance facilities, narrow tube manufacturing facilities, facilities using continuous web cleaning machines, and military depot maintenance facilities.

At proposal we had presented two options for emission limits that would apply to all facilities in the category subject to the 1994 MACT standards—25,000 kg/yr MC equivalent and 40,000 kg/yr MC equivalent. We estimated that the 25,000 kg/yr limit would result in an emissions reduction of 6,778 tons/year, thereby reducing the MIR to 10-in-a million and reducing cancer incidence by 0.14–0.27 cases annually (depending on which URE we use for PCE), at an annual cost savings of $4.9 million annually or a cost savings of $724/ton HAP reduced. Comments received included support for and against this level of emissions reduction. Similarly, at proposal we estimated that applying the 40,000 kg/yr limit to facilities in the entire source category would result in an emissions reduction of 5,911 tons/yr, reducing the MIR to 20-in-a million and reducing cancer incidence by 0.12–0.23 cases annually, at an annual cost savings of $5.9 million annually or a cost savings of $1,000/ton HAP reduced.[1]

In developing the final rule, we initially re-examined the 25,000 kg/yr and 40,000 kg/yr levels of control for the subset of the category that excludes the four specific industry sectors identified above, using costing assumptions revised based on public comment as described above. This re-analysis uses the 2002 NEI data rather than the 1999 NEI data used in the proposal. We observed that although the overall reductions in MIR and cancer incidence at these levels would be similar to those estimated at proposal for the entire category, the substantial cost savings estimated at proposal would change to a net cost for both emission limits. This is a result of both our use of certain cost assumptions at proposal that have been amended for analyzing the cost of the final rule and the fact that four industry sectors are now being considered separately in this final rule. Specifically, for the 25,000 kg/yr limit, our analysis of the subset of the category that excludes the four specific industry sectors shows the same reduction in MIR (to 10-in-a-million) and similar estimated reduction in cancer incidence, 0.24 cases annually, as we showed at proposal. In contrast, our cost analysis for this subset of the source category shows a total annualized cost (not savings) of about $1.2 million, or a cost of about $520 per ton HAP reduced (we estimate 2,351 tons HAP reduced at this level). Similarly, for the 40,000 kg/yr limit, our revised analysis shows the

[1] In considering these revised cost estimates, it should be noted that there may be inherent uncertainties or anomalies in the availability of information that underlie our costs for our options, regardless of whether the estimates be positive costs or net cost savings. There may also be other factors that are not reflected in these estimates, however. For example, these estimates are largely based on a 15-year equipment life for existing affected cleaners (20-year for new cleaners) and a discount rate of 7 percent. If industry determines that a shorter equipment life for the controls considered in this analysis is appropriate based on perceived uncertainty of future availability of these solvents, then the opportunity cost of capital will be higher and our estimates of net cost savings may be altered. If these controls are in operation longer than expected by industry, however, then a longer equipment life would be appropriate and our estimates of costs, which may be net costs or net savings, may also be altered.

same reduction in MIR (to 20-in-a-million), and a similar estimated reduction in cancer incidence, 0.21 cases annually, as we showed at proposal, but at an annualized cost (not savings) of $130,000, or a cost of about $74 per ton HAP reduced (we estimate 1,759 tons HAP reduced at this level). The incremental tons of HAP reduced is nearly 600 tons with the incremental cost of about $1,800 per ton HAP reduced.

Because we estimated that the cost of achieving the 25,000 kg/yr and 40,000 kg/yr emissions limits would be considerably greater than what we had projected for this rulemaking at proposal, we additionally evaluated the next less stringent emission limit that was considered and presented in the proposal, but not selected as one of our two proposed options for limiting emissions from the entire category—a 60,000 kg/yr MC equivalent facility-wide emission limit. For the subset of the category that excludes the four specific industry sectors, we estimated that the 60,000 kg/yr level reduces the MIR to between 20-in-a million and 50-in-a million and reduces cancer incidence by about 0.19 cases/yr. These risk reductions are estimated to be achieved at total annualized cost savings of just over $1.3 million, or a savings of $832/ton of HAP reduced (we estimate 1,594 tons HAP reduced at this level).

To more fully analyze the implications of the various emission limits, we calculated the overall and incremental annualized cost per cancer case avoided. In this case, we compared the proposed 40,000 kg/yr option and the next less-stringent alternative, the 60,000 kg/yr MC equivalent emission limit. Given the overall reduction in incidence from the baseline of 0.21 cancer cases/yr at the 40,000 kg/yr level and the total annualized cost of $130,000, the overall cost per cancer case avoided is about $620,000.[2] For the 60,000 kg/yr level, there is an estimated overall reduction in incidence of 0.19 cases/yr and a total annualized cost savings of just over $1.3 million, resulting in an overall savings of almost $7 million per cancer case avoided. While these cost estimates for the overall reductions from current levels of control appear to be modest (given the estimated cost savings of intermediate control levels), the incremental reduction in emissions and risk of going from the 60,000 kg/yr to the more stringent 40,000 kg/yr level are small and the corresponding cost-effectiveness estimates of these incremental reductions are unacceptably high. The incremental incidence avoided between the 40,000 kg/yr level and the 60,000 kg/yr level is 0.02 cases. The annualized incremental cost between the two levels is about $1.5 million, with resulting incremental cost per cancer case avoided of about $73 million. (Annual operation and maintenance and annualized capital costs of $1.9 million per year and an estimated costs savings for solvent recovery of $0.4 million per year.)

After considering revisions to the risk and cost estimates presented at proposal, we believe that the 60,000 kg/yr MC equivalent emission limit for those halogenated solvent cleaning machines not identified as being in use by one of the four sectors discussed in Section III.A.3., above, protects public health with an ample margin of safety and prevents adverse environmental effects. Specifically, the 60,000 kg/yr level reduces 90 percent of the HAP emissions reduced at the 40,000 kg/yr level. The 60,000 kg/year emission limit achieves reductions in MIR and cancer incidence that are similar to those expected at the 25,000 kg/yr and 40,000 kg/yr emission levels. The incremental reduction in emissions with a 40,000 kg/yr level instead of 60,000 kg/yr imposes an incremental cost of $1.5 million per year. The incremental cost per ton of this reduction is roughly $9,000/ton. Moreover, in comparing the 40,000 kg/yr and the 60,000 kg/yr emission limits, the incremental cost per cancer case avoided, $73 million/case, is substantial, supporting our conclusion that the $60,000 kg/yr emission limit provides an ample margin of safety consistent with the Benzene NESHAP.

3. Rationale for the Requirements for Halogenated Solvent Cleaning Machines at Military Depot Maintenance Facilities

For halogenated solvent cleaning machines in use at military depot maintenance facilities, the final rule sets a facility-wide emission limit of 100,000 kg/yr (MC equivalent emissions). In addition, the 1994 NESHAP requirements remain applicable.

For halogenated solvent cleaning machines at these facilities that are constructed or reconstructed after August 17, 2006, the final rule revisions add to the previous 1994 NESHAP by requiring implementation of the 100,000 kg/yr MC equivalent emission limit upon the effective date of this rule or upon startup, whichever occurs later.

We based this decision on comments received from one such facility that we considered representative of these types of military facilities that maintain and restore military weapons systems. They indicated an increase in maintenance and restoration levels due to current worldwide military activities and that they could not meet either of the proposed emission limits within the proposed two-year compliance period. In additional comments in response to the NODA, and in subsequent meetings with the Agency, they indicated that they could meet the 100,000 kg/yr emission limit within a three-year compliance timeframe. We then projected that implementation of the 100,000 kg/yr MC equivalent emission limit will reduce the MIR from halogenated solvent cleaning machines associated with a military depot maintenance facility from about six-in-a-million to about three-in-a-million with an estimated reduction in annual cancer incidence of 0.002 cancer cases per year. An analysis of the costs for only this facility which was based on information from the 2002 NEI shows that the annual cost effectiveness of complying with this limit results in a cost savings of about $625/ton with annualized cost savings of approximately $55,761. Therefore, we believe that a requirement for these facilities to meet a 100,000 kg/yr MC equivalent emission limit is technically feasible, provides an annual and long-term cost savings, provides an ample margin of safety to protect public health and prevents adverse environmental effects.

4. Rationale for Our Decisions Regarding Continuous Web Cleaners and Halogenated Solvent Cleaning Machines at Narrow Tube Manufacturing and Aerospace Facilities

The requirements set forth in this final rule are not applicable to continuous web cleaning machines, halogenated solvent cleaning machines that are associated with the narrow tubing manufacturing industry, and aerospace manufacturing and maintenance industry and facilities. The requirements of the 1994 NESHAP and its subsequent amendments (where relevant) remain applicable to all the continuous web and halogenated solvent cleaning machines associated with the above-noted facilities.

We received comments from these three sectors on the proposal, in response to the NODA, and in subsequent meetings with

[2] For comparison purposes, we estimated that compliance with the requirements of the National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities Final Rule (71 FR 42727, July 27, 2006), would result in an annualized cost of about $7 million to achieve a cancer incidence reduction of 2 cancer cases per year. This yields a cost of $3.5 million per cancer case avoided based on the CalEPA unit risk estimate for PCE.

representatives of these industries. They submitted information that stressed the unique nature of their cleaning operations, the technical infeasibility, the uncertainty of our original cost estimates, the processes involved, including review of their process changes by other federal agencies such as FDA and FAA (see Section IV.A. for additional discussion), and the difficulty they would experience in complying with the proposed emission limits within the proposed timeframe. Based on new information they provided in response to the NODA, including new cost information, we re-analyzed the costs for each of these three sectors and estimated the annual cost effectiveness of complying with emission limits they provided in comments.

For the Aerospace sector, we estimated an MIR of 30-in-a-million and an annual cancer incidence of 0.066 at their baseline emission level. We then projected that implementation of the 100,000 kg/yr MC equivalent limit (the maximum reduction we discussed in the proposal) would reduce the MIR from halogenated solvent cleaning machines associated with this sector to about 20-in-a-million with a reduction to their annual cancer incidence to about 0.03 cancer cases annually. Our revised cost estimate showed a cost effectiveness of $2,000/ton with a total annualized cost of nearly $630,000.

For the narrow tube manufacturers, we estimated an MIR of 70-in-a-million with an annual cancer incidence of 0.08 at their baseline level of emissions. Based on comments from this industry indicating that they could reasonably accomplish a 10 percent reduction in their current emission levels within a three-year compliance time, we developed risk and cost estimates for that level of reduction. We have estimated that the MIR would decrease to approximately 60-in-a-million with very little change expected in the annual cancer incidence. The annual cost effectiveness for complying with an overall 10 percent reduction in total emissions limit would be a cost of over $3,600/ton with total annualized costs of nearly $700,000.

For the continuous web cleaners, we estimated a baseline MIR risk level of about 30-in-a-million with an annual cancer incidence of 0.03 cases. Comments from this industry suggested they could achieve an 80 percent overall control efficiency compared to their current emission levels, within a three-year compliance period. The current NESHAP limit requires a 70 percent overall control efficiency. To achieve the 80 percent overall efficiency, facilities would be required to reduce emissions by 33 percent ((1–70%) – (1–80%) / (1–70%) = 33%). We developed risk and cost estimates for that level of reduction. We have estimated that under this scenario, the MIR would decrease to approximately 20-in-a-million with and the annual cancer incidence would decrease to 0.02 cases annually. The annual cost effectiveness of complying with the 80 percent overall emission control efficiency rate is over $3,400/ton with a total annualized costs of over $600,000.

In summary, we are adopting no changes to the 1994 NESHAP, under CAA Section 112(f) for the halogenated solvent cleaning machines used by the above-noted specific industry sectors (*i.e.*, aerospace, narrow tube manufacturers, and the facilities that use continuous web cleaning machines) because the current level of emissions control called for by the existing NESHAP both reduces risk to acceptable levels and provides an ample margin of safety to protect public health. Further, additional standards are not necessary to prevent adverse environmental effects. The finding regarding an "ample margin of safety" is based on a consideration of the relatively small reductions in health risks likely to result from the feasible emission reductions we evaluated, the additional costs required to achieve further control, the lack of technically feasible control options for these sectors, and the time required to comply with any requirements.

C. What is the compliance schedule?

In this final rule, in accordance with CAA section 112(i)(3), we are promulgating a compliance deadline of three years from the effective date of this final rule for all existing halogenated solvent cleaning machines and for all existing halogenated solvent cleaning machines at military depot maintenance facilities. Facilities described in Section III.A.3 above are not subject to further requirements beyond the 1994 NESHAP.

At proposal, we determined that CAA section 112(i) was the controlling provision that addresses compliance deadlines for existing sources with regard to standards promulgated under CAA sections 112(d)(6) and 112(f)(2). See 71 FR 47684–86. We hereby incorporate our discussion by reference. In the NODA, we asked for comments on the issue of whether a two year compliance deadline was sufficient time to comply with the co-proposed facility-wide emission limits. We received significant comments on this compliance deadline issue.

We are persuaded by the commenters representing the general population that use halogenated solvent cleaning machines that existing sources will need more than 2 years to comply with the final revised standards. Affected facilities would have to plan their control strategy, purchase and install the control device(s), and subsequently, bring the control device(s) online. We, therefore, believe that for the remaining halogenated solvent cleaning facilities, this final compliance deadline of three years is more reasonable and realistic than the proposed two year compliance deadline.

D. What is the final decision on the applicable unit risk value?

At proposal, we explained that the Agency's IRIS health assessment for PCE is currently being revised. Therefore, we requested comment on the use of the CalEPA URE,[3] the OPPTS URE,[4] or other values in deriving the PCE emission limit for the final rule (71 FR 47680). We received comments both supporting and opposing our use of the CalEPA URE for PCE.

For those situations where a particular chemical does not have a cancer potency value in IRIS, we have established a prioritization process for accessing other health assessment information (as described in our "Residual Risk Report to Congress" on pages 56 through 58). This hierarchy includes peer reviewed cancer potency values from EPA as well as from other agencies that conduct chemical carcinogenicity assessments such as the California Environmental Protection Agency (CalEPA). See also our responses to comments on this issue in the final Coke Oven Batteries NESHAP (70 FR 19998–20000, (April 15, 2005)). In this final rulemaking, we have chosen to use the CalEPA URE in preference to the OPPTS value for a number of reasons. CalEPA's PCE cancer unit risk value was derived using two different approaches for estimating the metabolized dose in humans, whereas the OPPTS value incorporated a single model of metabolism. Additionally, while the CalEPA approach allowed for the consideration of variability and uncertainty, the OPPTS approach did not. We have used both the CalEPA and OPPTS UREs for PCE in the risk

[3] California Department of Health Services (CDHS), *Health Effects of Tetrachloroethylene (PCE)*, Berkeley, CA, April 1992. (Available in the rulemaking docket.)

[4] U.S. Environmental Protection Agency, *Cleaner Technologies Substitutes Assessment: Professional Fabricare Processes* (EPA 744–B–98–001), June 1998. (Available at *http://www.epa.gov/dfe/pubs/garment/CTSA/*.)

characterizations for the dry cleaning residual risk rulemaking (71 FR 42723) and for this rulemaking (71 FR 47670; see also the risk document in the rulemaking docket). However, for the purposes of this rulemaking, we have chosen to use the CalEPA URE to implement the facility emission limits. Explicit consideration of variability and uncertainty is more consistent with EPA's current approach for conducting risk assessments. EPA also uses the CalEPA URE in the 1999 National-Scale Air Toxics Assessment (available at: *http://www.epa.gov/ttn/atw/nata1999/*), in Superfund cleanup decisions, and in EPA's Air Toxics Risk Assessment Reference Library (available at: *http://www.epa.gov/ttn/fera/risk_atra_main.html*; dose-response values in Appendix C at: *http://www.epa.gov/ttn/fera/data/risk/vol_1/appendix_c.pdf.*

We have the authority to revisit (and revise, if necessary) any rulemaking if there is sufficient evidence that changes within the affected industry or significant improvements to the science suggest that the public might experience significantly more or less risk than estimated in the risk assessment prepared for the rulemaking (See CAA section 301). In particular, it may become necessary at some time in the future to revise the facility emission limits if the pending IRIS assessments result in significant changes to the UREs for PCE, TCE, or MC.

Additionally, while we have chosen to use the CalEPA URE for PCE for implementing this rule, this should not be interpreted as a precedent for all future rules. As was stated earlier, in the dry cleaning residual risk rulemaking (71 FR 42723) and in this rulemaking, we used both the CalEPA and OPPTS values to characterize the risk. When there is uncertainty, it is EPA's preference to provide a range of values. However, for the purposes of this rulemaking, a single value was needed to implement the facility emission limits. EPA's choice of the CalEPA value does not mean that this is the only value to be considered while the EPA IRIS assessment is pending.

E. What is EPA's finding on the CAA section 112(d)(6) review requirements?

We stated in the proposal that in the technology review under CAA section 112(d)(6) we did not identify any additional control technologies beyond those that are already in widespread use within the source category (*e.g.*, freeboard refrigeration devices, extended freeboards, working mode and downtime covers). We concluded that the proposed rule changes would satisfy both CAA section 112(d)(6) and 112(f)(2). See 71 FR 47685.

Since the August 17, 2006 proposal, we have not identified any significant developments in practices, processes, or control technologies. We have discovered, however, that affected industries are researching the development of halogenated solvent cleaning machines and alternate cleaning technologies. At some time in the future these technologic developments could lead to significant technologies relevant to the CAA section 112(d)(6) analysis, but we understand that to date the engineering and implementation of such technology has not been proven to satisfy the performance needs of the industry coupled with the low-emission directives of the agency. We therefore conclude that the final facility-wide emissions limits we are promulgating today satisfy our obligations under both CAA sections 112(d)(6) and 112 (f)(2).

IV. Responses to Significant Comments

A. Significant Comments on the Proposal

During the public comment period, EPA received significant comments, new data, and information concerning program elements for which we specifically sought public comments. We received favorable and unfavorable comments on both proposed emission limits. Commenters provided substantial information on the use of the methylene chloride equivalency equation. We received significant comments on the implementation of the emission limits from commenters representing narrow tube manufacturing facilities, aerospace manufacturing and maintenance facilities, military depot maintenance facilities, facilities that use multiple solvent cleaning machines, and facilities that use continuous web cleaning machines.

All of the comments, information, and data submitted by commenters are compiled in the Response to Comments document available in the Air Docket ID No. EPA–HQ–OAR–2002–0009. Some of the more significant comments are discussed below.

1. Emission Limit Option 1 or Option 2

Comment: While four commenters supported the proposed Option 1 (40,000 kg/yr MC equivalent emission limit), other commenters encouraged EPA to set relative standards. Another commenter, an association of state air program administrators, believed that Option 2 (25,000 kg/yr of MC equivalent emission limit) still presented unacceptably high risks; but noted that it was preferable to Option 1. Three commenters supported our proposed Option 2. According to the commenters, Option 2 would provide significant emissions reductions and greater protection of public health, safety, and welfare. In addition to lowering the potential cancer and non-cancer chronic health risk associated with exposure to the three HAPs, the additional reductions of trichloroethylene (TCE) under Option 2 would likely augment the State's efforts to reach attainment with the 8-hour ozone standard since TCE is identified as an ozone precursor.

One commenter recognized the reductions in the number of people exposed to cancer risk and the capital costs between Option 1 and the more stringent Option 2. The commenter stated that under Option 2 the numbers of affected sources are greater than the number of affected sources under Option 1, but that EPA determined that those affected sources complying with Option 2 would still save money because the annual solvent savings were projected to exceed the annualized capital and operating costs. The commenter added that even at a financial cost, Option 2 would be warranted, and that given the financial savings, Option 2 was the only reasonable choice. One commenter stated that the proposed facility-wide emission limits would leave source owners only two compliance options: (1) Establish internal production restrictions or (2) install add-on capture and control equipment to ensure operating flexibility. Another commenter requested that EPA exempt batch cold cleaning machines operating with capture and control devices that are subject to federally-enforceable monitoring conditions in a Title V permit.

Response: As stated in Section II of the Preamble, we presented and discussed our evaluation of four other emission limits that would reduce residual risk. These emission limits were 100,000 kg/yr, 60,000 kg/yr, 15,000 kg/yr and 6,000 kg/yr (71 FR 47680–81). In this final rule, as stated in Section II.A. of the Preamble, we are promulgating the 60,000 kg/yr facility-wide MC equivalent emission limit. EPA's risk assessment for the proposal and an updated risk assessment for the final rule using data from EPA's 2002 NEI database show that the maximum individual risk (MIR) and population risks associated with the majority of halogenated solvent cleaning machines would be reduced by adopting the 60,000 kg/yr MC-equivalent emission limit. Based on the more recent assessment using the 2002 NEI, the MIR

would be reduced from 100-in-a-million to between 20 and 50-in-a-million and the total number of people with risks greater than 1-in-a-million would also be reduced from 4,000,000 people to between 500,000 and 1,000,000. Our cost analyses at proposal and the more recent revisions to the cost estimates based on the 2002 NEI show that these emission and risk reductions are technically feasible within the three-year time for compliance, and facilities would experience a cost savings implementing the emission limit. Therefore, we believe that the 60,000 kg/yr facility-wide emission limit (expressed as MC equivalent emissions) applied to the halogenated solvent cleaning machines, except where noted, provides an ample margin of safety to protect the public's health because it significantly reduces cancer risks, prevents adverse environmental effects, and given the level of the risk reductions, is technically feasible and can be accomplished at reasonable costs. EPA is not exempting batch cold cleaning machines that operate with capture and control devices that are subject to Title V permitting requirements.

2. Equation for MC Equivalents

Comment: Two commenters supported EPA's toxicity-weighted approach for calculating the facility-wide annual emission limits for affected sources, except where otherwise noted, that use more than one of the three HAPs subject to the proposed Subpart T residual risk rule. This toxicity-weighted calculation was proposed as Equations 1 and 9 in the Preamble, and proposed 40 CFR 63.471(a)(2), respectively. In our August 17, 2006 proposal, EPA requested comment on this methodology (71 FR 47675). Another commenter was concerned about the use of the methylene chloride equivalent. The commenter stated that the use of this term was somewhat misleading because rather than a toxic equivalent, this methodology reflects a weighted-emission approach using toxicity-weighted emission rates. The commenter further stated that while EPA conservatively added the cancer and noncancer toxicity-weighted emissions rates, the scaling factors we used were simply the ratio of the cancer unit-risk estimates and noncancer reference concentrations multiplied by the post-MACT emission rate or exposure level. The commenter also stated that because EPA did not specifically conduct toxicological comparisons (common mode of action and metabolites and possible synergistic interactions among the components of the mixture) for PCE, TCE and MC, we should be careful not to use the term "methylene chloride equivalent" as a "toxic equivalent," because the latter is a specific term associated with a supporting body of literature and a documented methodology. Another commenter noted that because the current recordkeeping and annual reports requirements, under 40 CFR 63.467 and 63.468 (f-g), were inapplicable to batch cold cleaning machines, our proposed methodology may not be suitable for all batch cold cleaning machines and requested flexibility in calculating emissions so long as the alternate methodology was scientifically sound and documented.

Response: In this final rule, we are finalizing as proposed the use of Equation 1 (and Equation 9) to calculate the MC equivalent for implementing the 60,000 kg/yr emission limit or the 100,000 kg/yr emission limit. EPA believes this methodology will facilitate the use of an annual emissions limit for multiple HAPs and allow flexibility in reducing the facility-wide emissions to meet this emissions limit. For cold batch cleaning machines at area sources, the requirements in the final rule do not apply.

3. Use of CalEPA or OPPTS URE for Implementation of the Emission Limit

Comment: Some commenters that use large halogenated solvent cleaning machines recommended that EPA not promulgate either Option 1 or 2 of the proposed rule, but rather defer promulgation of a final rule until completion of the IRIS re-evaluations of the URE for PCE.

One commenter believed that EPA included two different facility-wide annual emission limits for PCE because the IRIS URE was not available and will not be available before 2008. The commenter supported the use of CalEPA URE because it was clearly more health protective and more appropriate than the OPPTS URE value.

One commenter stated several reasons why EPA should use the CalEPA URE: (1) EPA's Air Toxics Risk Assessment Reference Library recommended the use of the CalEPA URE for PCE, (2) the EPA Office of Air Quality Planning and Standards (OAQPS) recommended the use of the CalEPA URE in situations in which there are no IRIS data available (see EPA's "Prioritization of Data Sources for Chronic Exposure" Web site), and (3) OAQPS used the CalEPA URE for PCE when conducting the 1999 risk assessment for the National-Scale Air Toxics Assessment. They believed that EPA has an established precedent for use of the CalEPA URE and recommended that it be used for this residual risk standard as well.

Three commenters, one identifying itself as operating two continuous web cleaning lines in the world's largest integrated production of aluminum and aluminum semi-fabricated products stated that the two PCE UREs differ by a factor of ten and that EPA's selection of the applicable URE would obviously have a significant impact on control options available to their facility. They expressed concern that EPA would finalize an emissions limit by selecting an inappropriate URE and prior to completion of the IRIS reassessment for PCE. According to the commenter, the fact that the final IRIS URE "may be different from both the CalEPA and OPPTS values", means that inappropriate or unnecessary emission reduction strategies could be required as a result of EPA's promulgating the wrong PCE facility-wide limit in a final rule.

Another commenter suggested that EPA delay promulgation of this final rule until completion of IRIS assessments for PCE and TCE. One commenter stated that while EPA referenced both the OPPTS and the CalEPA UREs, there was little or no mention made of other URE studies conducted for PCE which would potentially indicate a different URE. The commenter stated the same is believed to be true regarding the URE for TCE.

Response: EPA has explained that when a particular chemical does not have a cancer potency value in IRIS, we have established a prioritization process for assessing other health assessment information (as described in our "Residual Risk Report to Congress" on pages 56 through 58). This hierarchy includes peer reviewed cancer potency values from EPA as well as from other agencies that conduct chemical carcinogenicity assessments such as CalEPA. See also our response to comments on this issue in the final Coke Oven Batteries NESHAP (70 FR 19998–20000, (April 15, 2005)).

Because we have not yet issued a final IRIS health assessment for PCE, we are using the CalEPA unit risk estimate (URE) of 5.9×10^{-6} $(ug/m^3)^{-1}$ to implement the emission limit for PCE in this final rule. See section III.D. of this Preamble for further discussion of our decision to use the CalEPA cancer URE.

We also have the authority to revisit (and revise, if necessary) any rulemaking if sufficient evidence becomes available that changes within the affected industry or significant improvements to the underlying science suggest that the public is exposed to significantly more or less risk than

estimated in the risk assessment prepared for this rulemaking (See CAA section 301). See also Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk Rules (71 FR 17712, 17715, (April 7, 2006). In particular, it may become necessary at some time in the future to revise the facility emission limits if the pending IRIS assessments result in significant changes to the UREs for PCE, TCE, or MC.

Additionally, while we have chosen to use the CalEPA URE for PCE for implementing this rule, this should not be interpreted as a precedent for all future rules. As was stated earlier, in the dry cleaning residual risk rulemaking (71 FR 42723) and in this rulemaking, we used both the CalEPA and OPPTS values to characterize the risk. When there is uncertainty, it is EPA's preference to provide a range of values. However, for the purposes of this rulemaking, a single value was needed to implement the facility emission limits. EPA's choice of the CalEPA value does not mean that this is the only value to be considered while the EPA IRIS assessment is pending.

4. Compliance Deadline

Comment: The majority of facilities that use halogenated solvent cleaning machines suggested that EPA should allow at least three years for existing sources to comply with the new requirements. Two commenters contended that EPA should be consistent with the HON rule [5] and provide affected facilities three years after the effective date of the promulgated standard to comply. Another commenter stated that the narrow tubing manufacturers could not comply with the proposed compliance period because compliance would require between one and two years to evaluate non-regulated solvents and an additional two to three years to obtain FDA and air permit approvals and implement the necessary equipment modifications. All commenters stated that sources subject to this new rule would need time to evaluate their compliance options; conduct feasibility testing (for solvent substitution) to ensure they can still achieve customer specifications; and design, build, and/or install any equipment or facility modifications potentially required. They stated that our proposed two year compliance deadline would be insufficient time for the regulated sources to comply. Two commenters stated that the proposed two year compliance time frame was not sufficient time for the installation of vacuum-to-vacuum machines. The commenters stated that even if the technology existed, that in order to meet the proposed two year compliance deadline, they would be required to take the following measures: (1) Conduct initial research and development effort to determine a control strategy; (2) perform a pilot study using the selected control strategy; (3) demonstrate to their customers that the resulting product meets contract specifications; (4) get acceptance by their customers that the change meets contract specifications; (5) design engineering work to develop the selected equipment and apply for air pollution control and other permits; (6) obtain permits to install the selected equipment; (7) order the equipment; (8) fabricate the equipment; (9) prepare the shop floor for installation of equipment; (10) receive and install the equipment; and (11) place the equipment in operation.

Three other commenters believed that the proposed two years compliance schedule did not provide sufficient time for the affected facilities to fully assess the impacts and develop approved alternatives. The commenters requested an extension of the compliance period. They stated that EPA has authority to allow up to three years for affected facilities to comply and that permitting authorities have authority to grant an additional one year for compliance purposes, under CAA section 112(i).

A large military depot maintenance facility commented that the proposed compliance time allowed in the proposed rule was inadequate. They also agreed with the Preamble discussions as to whether EPA could allow up to three years for existing sources to comply with the proposed limits. The commenter recommended that EPA allow a three-year compliance deadline.

Two commenters supported EPA's proposed two-year compliance deadline. One of the commenters, however, pointed out that existing solvent cleaning machines could receive a one year extension of time from permitting authorities. The commenter believed that the Congressional intent behind the compliance deadlines in CAA section 112(f) was to insure an expedited compliance schedule (90 days with a possible two-year extension) for controlling emissions from facilities that result in unacceptable risk levels. Two States provided comments supporting the proposed two year compliance deadline and one commenter advocated a 90-day compliance period.

Response: In this final rule, in accordance with CAA section 112(i)(3), EPA is promulgating a three-year compliance deadline from the effective date of this rule for all the existing affected sources. As explained in Section III.C. of the Preamble, we believe that CAA section 112(i) is the controlling provision addressing compliance deadlines for existing sources with regard to standards promulgated under CAA sections 112(d)(6) and (f)(2). EPA believes this will give owners or operators of solvent cleaning machines the necessary time to evaluate technologies for controlling emissions and possible alternatives to halogenated HAP solvent cleaning.

Comment: One commenter stated that proposed § 63.460(i) would allow sources that only have existing halogenated solvent cleaning machines two years to comply, but if they construct or reconstruct a single machine after August 17, 2006, they would lose the two-year compliance period. The commenter recommended that any facility that has existing halogenated solvent cleaning machines and that exceeds the proposed facility wide emission limits should be allowed two years from the date of the final rule to comply with the standard, even if one or more halogenated solvent cleaning machines are constructed or reconstructed after August 17, 2006.

Another commenter stated that if the Agency finalized the proposed rule, the compliance schedule should be amended to (1) Require new facilities constructed after the date of promulgation to be in compliance upon startup; (2) consider new facilities constructed prior to the date of promulgation to be existing facilities; (3) allow existing degreasing facilities that installed new equipment after the date of proposal, but prior to the date of promulgation, ten years to come into compliance with any new requirements consistent with CAA section 112(i)(7), and (4) allow the maximum amount of time possible for existing Halogenated Solvent Cleaning facilities to come into compliance. This commenter alluded to a three-year timeframe. The commenter cited one example of where the installation of new equipment at an existing facility would require additional or redesigned floor space and thus would require additional time for compliance.

Response: As stated in the earlier response, and in Section III.C. of this Preamble, we believe that it is reasonable to conclude that CAA section 112(i) is the controlling provision

[5] National Emission Standards for Organic Hazardous Air Pollutants from the Synthetic Organic Chemical Manufacturing Industry, (71 FR 76603) (December 21, 2006)).

addressing compliance deadlines for existing sources with regard to standards promulgated under CAA section 112(d)(6) and 112(f)(2). Thus, in this final rule, in accordance with CAA section 112(i)(3), EPA is promulgating a three-year compliance deadline from the effective date of this rule for existing sources. Further, for purposes of today's rule, existing sources are affected facilities (as defined in § 63.461) on which construction or reconstruction began on or before August 17, 2006. New sources are affected facilities that commence construction or reconstruction after August 17, 2006. This is consistent with CAA Section 112(i)(1)-(3). Additionally, "construction" and "reconstruction," are defined at 40 CFR 63.2. However, changes to the emission controls at a facility made to comply with existing source standards in today's rule do not trigger the reconstruction threshold.

5. Applicability of Control Requirements

Comment: One commenter that uses continuous web cleaning machines stated that it had installed two carbon adsorption devices (CAD) to address the TCE reductions required by the 1994 NESHAP. According to the commenter, even an upgrade of the systems would likely not enable the facilities to achieve either proposed emissions limit. The commenter suggested that for facilities that use continuous web cleaning machines, EPA should evaluate a range of emission reduction limits. The commenter stated that this method would have been consistent with the alternative standards set for the continuous web cleaning machines by the 1994 NESHAP.

Response: In light of this and similar comments by the aerospace and narrow tubing industries, EPA issued a NODA to gather specific data on the technical feasibility and costs of complying with the proposed emission limits, if feasible, and the period of time required to comply with the proposed emissions limit (71 FR 75184, (December 14, 2006)). EPA has re-evaluated the technical feasibility, costs and other factors that relate to facilities operating continuous web cleaning machines. Consequently, in this final rule, we are not promulgating any facility-wide emission limits for facilities that operate continuous web cleaning machines, facilities that operate halogenated solvent cleaning machines for the aerospace manufacturing and maintenance industry, and the narrow tubing manufacturing industry.

Comment: Numerous commenters from both the narrow tubing manufacturing industry that use MC, PCE and TCE, and airline maintenance facilities and aerospace industry that use PCE stated that switching to TCE or MC would be an unsuitable compliance option. They stated that facilities have procedural requirements for the higher vapor temperature of PCE and that TCE and MC's vapor temperature is inadequate for proper cleaning. The commenters stated that many original equipment manufacturers have not approved the use of alternative degreasing solvents. The commenters also stated that changing solvents involved a rigorous approval process by the original equipment manufacturers and the Federal Aviation Administration (FAA) in order to ensure that safety and quality criteria are met. The commenters stated that such an approval process could take more than two years.

The commenter also stated that EPA's proposed retrofit options for freeboard ratios, working mode covers and freeboard refrigeration devices are not expected to be sufficient to enable the facility to comply with the proposed facility-wide emission limits of the proposed rule. The commenter also stated that there are few manufacturers of vacuum-to-vacuum degreasing machines and they were not aware of this technology effectively cleaning parts of specific types and sizes. According to the commenter, similar facilities that installed the technology incurred costs of over $1 million with new annualized costs of approximately $80,000 per year. The commenter was concerned that compliance with the proposed standards would be achieved by using expensive technology, that has high capital costs and operating costs and that may not be proven effective or reliable for the operations of subject facilities.

Response: In response to this comment and certain comments discussed below, EPA issued a NODA (71 FR 75184, (December 14, 2006)) to gather more information pertinent to the halogenated solvent machines used by the aerospace industry, narrow tubing manufacturing industry, and the facilities that use continuous web cleaning machines. Responses to the NODA provided significant data and information that have led EPA to determine that it is both technologically infeasible and not cost effective for these industries to implement any further emission controls or requirements. Consequently, as stated in Section III.A.3., of the Preamble, we are not promulgating any facility-wide emission limits for halogenated solvent cleaning machines used by the aerospace manufacturing and maintenance industry, the narrow tubing manufacturing industry and for continuous web cleaning machines.

Comment: Two commenters associated with the aerospace industry stated that the FAA, Food and Drug Administration (FDA) and the Nuclear Regulatory Commission (NRC) guidelines for safety and quality control often dictate the types of solvents and materials that may be used in aerospace operations. According to the commenters, solvent cleaning criteria determined the quality of adhesion between aircraft assemblies and components and the various coatings, primers, sealants, and adhesives later applied to their surfaces, and improper degreasing could cause loss of coating adhesion and ultimate failure of specific aircraft component parts. The commenters also stated that they had explored solvent alternatives such as aqueous cleaners, and had encountered incompatibilities with FAA guidelines, such as inability to meet the degree of cleaning required, incompatibility of the parts being cleaned with the cleaning solution, longer required cleaning time, and problems associated with moisture left on parts being cleaned. The commenter stated that these regulatory and product specifications frequently dictated or otherwise limited aerospace cleaning options to PCE or TCE. However, some aerospace facilities maintain their PCE cleaning capacity because certain, very specific aerospace parts cannot be processed with MC or alternative solvents.

Response: In response to this comment, as earlier explained, EPA issued a NODA (71 FR 75184, (December 14, 2006)) to gather more information pertinent to the halogenated solvents cleaning machines used by the aerospace industry, narrow tubing manufacturing industry, and the facilities that use continuous web cleaning machines. Responses to the NODA provided significant information that has led EPA to conclude that it is both technologically infeasible and not cost effective for the above-noted facilities to implement any further emission controls or requirements. (See Section III.A.3. of the Preamble on costs of compliance). EPA is also persuaded that some halogenated solvent cleaning processes for the aerospace and narrow tubing industry are controlled by FAA, FDA, the NRC guidelines, and from protocols of original equipment manufacturers. Therefore, EPA is concluding in this final rule that solvent switching from PCE or TCE to MC may not be a viable option in some instances for the aerospace industry.

Consequently, as stated earlier in Section III.A.3., of this Preamble, EPA is not promulgating facility-wide emission limits for halogenated solvent machines used by the aerospace manufacturing and maintenance industry, the narrow tubing manufacturing industry and for continuous web cleaning machines.

Comment: Commenters from the narrow tube manufacturing industry stated that they use "one of a kind" machines in their degreasing operations. They described these machines as very large, some with dimensions approaching 110 ft. long by 10 ft. deep and 42 inches wide, with a capacity of 7,000 gallons of solvent. According to the commenters, these machines also heat the solvent, usually TCE, to its boiling point while condenser coils prevent evaporation by forming a cold air blanket over the cleaning machine in order to limit emissions. In addition, they explained that these machines are covered when not in use.

They also stated that the installation of vacuum-to-vacuum cleaning machines is not a feasible option because of their products' sizes and the lack of engineering information to establish whether machines of such size can be engineered and produced. They stated that EPA's proposed requirements would require them to design, obtain permits, develop and install these systems within two years.

Response: In response to this comment, as earlier explained, we issued a NODA (71 FR 75184, (December 14, 2006)) to gather more information pertinent to the halogenated solvent cleaning machines used by the aerospace industry, narrow tubing manufacturing industry, and the facilities using continuous web cleaning machines. Responses to the NODA provided significant information that has led EPA to determine that it is both technologically infeasible and not cost effective for the above-noted facilities to implement any further emission controls or requirements. EPA is also persuaded that it may be quite difficult for the above-noted industries to reduce emissions through chemical or physical means and technology applications to the levels required by our final promulgated emissions limits. Accordingly, due to the costs associated with compliance, technical feasibility, and other factors, EPA has determined that the current MACT requirements provided for the narrow tubing manufacturing industry both reduce HAP emissions to levels that both pose acceptable risk and protect public health with an ample margin of safety. As stated earlier in Section III.A.3., of the Preamble, EPA is not promulgating facility-wide emission limits for halogenated solvent cleaning machines used by the narrow tubing industries.

Comment: Two commenters stated that switching from PCE and/or TCE to MC (indicated as being lower risk) as a compliance alternative under the proposed revisions would likely result in an increased danger to public health and, more specifically, potentially increase the danger from employee exposure to MC emissions. The commenter stated that because employee exposure to MC is specifically regulated by the Occupational Safety and Health Administration (OSHA), switching to MC would be an error. According to the commenter, this is because applicable OSHA regulations would limit and/or restrict MC and would lead to increased employer costs, a fact the commenter believed EPA did not consider. One commenter stated that some halogenated solvent cleaning machines may have the potential for undetected fugitive emissions. The commenter added that the necessary monitoring for adequate employee protection from overexposure to MC would be far more expensive, more extensive, and more difficult to implement than monitoring for TCE.

Response: Before proposal, EPA was aware of the requirements of the Occupational Health and Safety Administration concerning worker safety when MC is used. 29 CFR part 1910, which are the applicable OSHA regulations, require employers to make an initial determination of each employee's exposure to MC. If the employer determines that employees are exposed below the action level, employers are required to make a record of the determination. Conversely, if the employees are exposed to MC above the action levels, employers are required to perform exposure monitoring.

In addition, EPA did not consider any costs associated with MC monitoring at proposal. EPA believes, however, that a facility would not incur costs if MC emissions do not exceed the OSHA levels. If a facility experiences worker exposure of MC emissions over the OSHA level, the facility incurs costs to develop a control plan for fugitive emissions and possibly implement an employee medical monitoring plan. To account for the possibility of increased costs, we reduced the number of units assumed to use solvent switching.

6. Costs Associated With Compliance

Comment: Seven commenters, from the aerospace and narrow tube manufacturing sectors, stated that EPA had underestimated its cost basis for vacuum-to-vacuum technology in the proposed rule. One commenter stated that because EPA's estimation used the costs for small halogenated solvent cleaning machines and applied the credit for cost reduction from recovered solvent to the large halogenated solvent cleaning machines with large amounts of recovered solvent, the estimate erroneously yielded a false return on investment. The commenter stated that discussions with manufacturers of available vacuum-to-vacuum units suggested costs approximately five times higher than the assumptions used by EPA for each unit, and this was assuming that the manufacturers could develop scaled-up units suitable for narrow tubing manufacturers. The commenter stated that because the larger size of their products would require construction of the new unit while maintaining operation, facilities would need to undergo building expansion. The commenter anticipated that installation costs, including building and required utilities and infrastructure, would likely be approximately three times the equipment cost. According to the commenter, assuming the technology was successful, EPA's capital cost basis was approximately fifteen times below its likely cost range. The commenter further stated that EPA's assumption of 97 percent solvent recovery was unlikely with regard to hypothetical future large units that would require storage and movement of solvent between storage tanks, solvent cleaning machines and other ancillary equipment. The commenter concluded that EPA's assumptions of the project payback were unrealistic both for large operations, whose capital cost was underestimated, and for small operations, whose solvent recovery payback would be smaller than the average figures used in the analysis.

Response: In response to this comment, as explained earlier, EPA issued a NODA (71 FR 75184, (December 14, 2006)) to gather more information on the costs of complying with the proposed standards by the aerospace industry, narrow tubing manufacturing industry, and the facilities that use continuous web cleaning machines. Responses to the NODA provided significant information that has led EPA to determine that it is both technologically infeasible and not cost effective for the above-noted facilities to implement any further emission controls or requirements.

As earlier stated, EPA is also persuaded that some solvent cleaning processes for the aerospace and narrow tubing industry are controlled by protocols from the FAA, FDA, NRC and

from protocols to satisfy original equipment manufacturers' specifications. As earlier stated, EPA has also concluded in this final rule that solvent switching from PCE or TCE to MC may not be a viable option in some instances for the aerospace industry. As also explained earlier in Section III.B. of the Preamble, EPA has re-analyzed the cost assumptions made at proposal for the aerospace industry separate from the halogenated solvent cleaning machines that are covered by this final rule, and has determined that due to costs, technical feasibility, and other factors requiring additional controls, would not be feasible at this time. Consequently, as stated earlier in section III.A.3 of the Preamble, we are not promulgating facility-wide emission limits for halogenated solvent cleaning machines used by the narrow tubing and aerospace manufacturing and maintenance industries.

Comment: Commenters that use continuous web cleaning machines stated that EPA's analysis of the technology and cost impacts of the two proposed emission limits failed to consider the impacts on continuous web machines. The commenters stated that while EPA identified numerous compliance options, solvent switching from PCE to TCE or MC would be the sole compliance option for continuous web cleaning machines. The commenters further stated that EPA was correct to conclude that neither retrofits nor machine replacement would be an available compliance option for continuous web cleaners; however, the commenters stated that "EPA should not have concluded that solvent switching would be an available option for continuous web cleaners." The commenters further stated that switching from TCE to MC is not an available option because "MC reacts with chemically active metals such as aluminum." The commenters also stated that MC is incompatible with some of the gaskets and seals in pumps, ports and manifold systems. The commenters added that MC is less stable as a continuous web cleaning solvent and would require additional monitoring and probably additional stabilization control systems. Additionally, the commenters stated that MC is not readily adsorbed by the carbon in carbon adsorption devices and, as such, solvent switching would require reconfiguration and possibly rebuilding of the carbon adsorption devices. According to the commenters, MC requires longer dwell time in the carbon beds, which would in turn require a greater carbon surface area and larger carbon filtration systems. The commenters also stated that quantities of TCE would react with MC and that facilities would need to conduct a complete purging of systems in order to prevent cross contamination. The commenters further stated that such purging would include the removal of significant production line components, which would lead to increased compliance costs.

The commenters also stated that EPA estimated a 29 percent increase in solvent consumption if switching from TCE to MC. The commenters, however, expected much higher increases. The commenters explained that because steel that is placed in cleaning machines is slightly heated above ambient temperature, any slight temperature elevation would cause MC to vaporize more readily than TCE. The commenters claimed that increases in solvent consumption rate would ultimately create elevated vapor concentrations in the carbon adsorption device thereby making recovery more difficult. The commenters further claimed that even though MC is cheaper per unit volume, more MC would be required to achieve the same level of cleaning.

The commenters also maintained that add-on control equipment, retrofits and machine replacement technologies identified in the proposed rule are for the typical halogenated solvent cleaning machines that were subject to the 1994 NESHAP, and not continuous web cleaning machines or systems. The commenters stated that modifications such as modifying freeboard ratios, adding working mode covers, or retrofitting freeboard refrigeration devices are inapplicable because no freeboard exists in continuous web cleaning machines, which are enclosed, with the exception of entrance and exit points during normal operations. The commenters further stated that vacuum-to-vacuum machines are only appropriate for batch cleaners. Because of these technical issues, the commenters stated that EPA did not evaluate the costs and technological feasibility of the facility-wide emission limits for the continuous web cleaning machines.

Response: In response to this comment, as stated earlier, EPA issued a NODA (71 FR 75184, (December 14, 2006)) to gather more information on the costs of complying with the proposed standards by the aerospace industry, narrow tubing manufacturing industry, and the facilities using continuous web cleaning machines. As also stated earlier, responses to the NODA-provided significant information has led EPA to re-evaluate costs of installing CADs and vacuum-to-vacuum machines. EPA has determined that compliance by continuous web cleaning machines with either the proposed 40,000 kg/yr limit or the 60,000 kg/yr MC equivalent limit would not be cost effective and either limit may be technically infeasible in some instances. Consequently, as stated in Section III.A.3 of this Preamble, EPA is not requiring continuous web cleaning machines to comply with the facility-wide emission limits we are promulgating for this final rule. EPA is concluding that the current level of control by the existing NESHAP both reduces HAP emissions to levels that present an acceptable risk and provides an ample margin of safety to protect public health and prevent adverse environmental effects.

Comment: One commenter, an industry association representing producers and users of halogenated solvents, indicated that MC is not compatible with some substrates because of its aggressive nature. In addition, the commenter stated that MC's low boiling point shortens the effective cleaning time and makes it ineffective for light-gauge metals where incomplete rinsing action may cause staining. According to the commenter, the low boiling point of MC also makes it less effective on stubborn soils, including high-melting point waxes and pitches and grossly contaminated parts. The commenter stated that PCE's higher boiling point makes it ideal for these applications. According to the commenter, PCE is also a popular choice for closed-loop equipment, where PCE's inherent stability reduces the possibility of hydrolysis.

The commenter also stated that while MC has the lowest vapor loss rate from an idling halogenated solvent cleaning machine, its low vapor density makes it the most difficult to control in a working degreaser where air movements generally increase losses. The commenter also stated that MC has the lowest vapor recovery rates in carbon adsorption systems used to collect solvents from many web and in-line machines. In addition, the commenter stated that MC users are subject to a comprehensive OSHA standard that requires a medical surveillance and removal program not required for PCE and TCE users.

Response: EPA recognizes that there are chemical and physical limitations when considering solvent switching as a method to reduce emissions in compliance with both the proposed and final facility-wide emission limits we are promulgating in this final rule. In the proposed rule, EPA assumed 30

percent of facilities would switch to a less potent solvent; however, significant comments have led us to re-evaluate these assumptions. Consequently, with regard to our solvent switching analysis, for this final rule, EPA has reduced the number of units for which solvent switching is an option from 30 percent to 15 percent. The cost analysis in Section III.B. of the Preamble to this final rule reflects this change.

7. General Comments

Comment: A number of commenters stated that the 1999 NEI data did not reflect current emission levels and were not a sufficient basis for assessing technical or economic feasibility. Some believed that the 1999 NEI database was obsolete and provided an incomplete emission database when used as a primary source of data for halogenated solvent emissions. The commenter stated that the industry had changed since 1999 due to local, regional, and State regulatory pressures. The commenter indicated that the most significant change since 1999 was the phase out of TCA manufacture for emissive use, which effectively eliminated its use for solvent cleaning. The commenters pointed out that EPA had access to the 2002 NEI database and encouraged EPA to re-evaluate the risk assessment using the updated database.

Response: In response to public comments we received on the August 17, 2006 rule proposal, we reassessed the risks associated with the halogenated solvent source category using the 2002 NEI inventory. The proposal was based on the 1999 inventory. These data were not available at the time the proposal was being developed.

Comment: One commenter stated that EPA established a MACT standard for the continuous web subcategory in December 1999 and therefore, Section 112(f) risk analysis for the subcategory is not required until December 2007. The commenter stated that the continuous web subcategory was established five years after the standard for the other halogenated solvent machines. According to the commenter EPA's proposed rule fails to recognize that under this requirement EPA has eight years from December 3, 1999 (or by December 3, 2007) to conduct the residual risk evaluation for the continuous web subcategory.

Response: Section 112(f)(2)(A) requires the Administrator to promulgate applicable standards "within 8 years after promulgation of standards," under section 112(d). We read this provision as allowing for our promulgation of standards, under section 112(f), within 8 years of the effective date of section 112(d) requirements, rather than within 8 years of the compliance date of the section 112(d) requirements. (See for example, section 112(f)(3) ("the Administrator shall establish a compliance date or dates * * * which shall provide for compliance as expeditiously as practicable but in no event later than three years *after the effective date of such standard.*" (Emphasis added)). The effective date of the Halogenated Solvent Cleaning NESHAP is December 2, 1994, and not December 3, 1999, as suggested by the commenter, although we subsequently made certain clarifications and amendments to these requirements. Our obligation to promulgate residual risk standards for this source category is therefore past, and we are now operating under a consent decree that required our promulgation of today's rule on or before December 15, 2006, subsequently extended to April 16, 2007. We also believe that there is nothing in the Act that precludes our completion of the residual risk review prior to 8 years after promulgation of section 112(d) standards.

Comment: One commenter stated that EPA had used a very simplistic model to perform the emissions evaluations which may be acceptable for an initial screening, but that the Agency had failed to provide information to either validate its approach or any indication as to whether the presented risk levels exceed the upper bound limit of 100-in-a-million using the correct facility information such as stack parameters. The commenter requested that EPA review the seven facilities with an estimated cancer risk greater than 100-in-a-million to determine whether the use of average stack parameters was appropriate and to revise the proposed rule accordingly. The commenter also requested that EPA add an option allowing facilities to conduct site-specific emission modeling to determine if a facility meets or exceeds the allowable MIR, which would depend on which option EPA finalized. Subsequently, EPA could use this modeling to set a site-specific facility limit that is higher than either proposed options.

Response: The choice of the proposed emission limits and the final emission limit is based on the level of risk reduced, cost and technical feasibility to achieve a particular emission limit. While we acknowledge the uncertainty inherent in the NEI data used, its effect on risk is not the only consideration for the proposed emission limits. In spite of the fact that perhaps 50 percent of the release parameters in the 1999 NEI database may be defaults, our understanding of this source category and our best engineering judgment suggested the data were reasonable to use in our risk assessment, (*e.g.*, the range of stack heights was appropriate for these sources). We also acknowledged that while our risk assessment was likely to overestimate risks, this overestimate was not likely to be large because of the many variables and assumptions used in the assessment that would yield lower estimated risk levels, (*e.g.*, the use of a probabilistic method for evaluating population risks). Therefore, a focused evaluation of the release parameters of a few facilities at the upper end of the risk spectrum, while possibly having some effect on their individual risk levels, is not likely to affect our overall conclusions about the level of risk from the entire source category.

Concerning the site specific emission modeling, EPA did not incorporate in the proposed rule an approach that would allow site specific modeling. Instead, EPA assessed risk on a source category basis. EPA also did not incorporate in the proposed rule an approach a low-risk alternative for compliance.

V. Responses to Significant Comments on EPA's December 14, 2006, Notice of Data Availability (NODA)

A. Emission Limits

Comment: Two commenters from the aerospace industry submitted available compliance options for the 40,000 kg/yr MC equivalent emission limit. One option involved switching from HAP chlorinated solvents to n-propyl bromide. Another option involved the facilities switching to an alkaline degreasing system with ultrasonic wash tanks.

One aerospace facility, which had a large operation with multiple halogenated solvent cleaning machines, submitted very detailed descriptions of each machine, the options available and the associated costs of implementation. For their multiple machines, they presented twelve emissions reduction options, five of which reduced their emissions to below the 40,000 kg/yr MC equivalent limit. The compliance options include a combination of machine covers, extension areas, additional drain time for parts, installing larger or additional carbon absorption systems and switching some current machines with vacuum-to-vacuum machines. The commenter indicated that completing these

compliance options would take six years or more.

Response: EPA recognizes that a few small aerospace facilities may operate with emissions at or below both the proposed and final promulgated emission limits. In the proposal, EPA assumed solvent switching and other technologies could be applied at a reasonable cost. EPA has discovered, however, that this industry is bound to the use of chlorinated solvents and solvent switching is not a viable option for compliance. As earlier stated, EPA also recognized that the affected facilities cannot undertake all the necessary modifications within the three-year compliance period. EPA also notes that all these considerations are true for the final promulgated 60,000 kg/yr emission limit.

Comment: Two commenters that use continuous web cleaning machines maintained that they could not comply with either of the proposed emission limits. Both facilities stated that they had installed carbon absorption devices, which operated at about 99 percent control efficiency, but that most of their emissions could not be captured by these devices because of the nature of continuous web cleaning machines. According to the commenters, fugitive emissions occur in different locations along production lines and along the cleaning process. The commenters provided some possible additions to their cleaning systems that would achieve additional reductions, but they did not provide information on the emission levels they could attain. The commenters stated that there are limited available technologies to capture emissions and that it would be technically difficult for them to capture a significant portion of their emissions. The commenters also maintained that attaining a degree of control rather than meeting an emission limit is a more appropriate measure of their emission reduction capability.

Response: EPA recognizes that continuous web machines are designed differently from general halogenated solvent cleaning machines, *i.e.*, batch and in-line cleaning machines. As explained in earlier responses, we have determined that it is both technologically infeasible and not cost effective for continuous web cleaning machines to comply with our final promulgated emissions limit. As also stated in Section III.A.3. of the preamble, in this final rule, we are not setting any emissions limits for facilities that use continuous web cleaners. As also explained earlier, we are concluding that the current level of control for continuous web cleaning machines called for by the existing NESHAP reduces HAP emissions to levels that present an acceptable risk, protects public health with an ample margin of safety, and prevents adverse environmental effects.

Comment: We received significant comments from five narrow tubing manufacturers. These commenters presented very significant and compelling reasons as to why they could not meet the proposed emission limits. The commenters indicated that carbon absorption systems were the only available feasible control technology but that installation would result in only a maximum of 25 percent overall emissions reduction. The commenters stated that vacuum-to-vacuum machines have not been engineered or tested to the sizes that are required for their specific industrial processes. They claimed that such large vacuum-to-vacuum machines are not available from machine manufacturers. One commenter stated that after five years of research and design they may be able to achieve the 100,000 kg/yr MC equivalent emission limit.

Response: EPA is persuaded that narrow tube manufacturing facilities are the most technically challenged in reducing emissions to the levels called for by either our proposed or final promulgated 60,000 kg/yr emission limit. EPA has also determined that this industry is bound to the use of chlorinated solvents and solvent switching is not a viable option for compliance. Furthermore, EPA is persuaded that vacuum-to-vacuum technology has not developed to a point where this industry can install these machines into their processes with certainty of performance. Therefore, EPA has concluded in this rule that this industry could only achieve both the proposed and final promulgated emissions limits by implementing newly engineered and untested technology. Consequently, as explained earlier in Section III.A.3. of the Preamble, EPA is adopting no changes to the 1994 NESHAP for the halogenated solvent cleaning machines used by the narrow tubing industry, and we are concluding that the current level of control by the existing NESHAP reduces HAP emissions to levels that present an acceptable risk, protects public health with an ample margin of safety, and prevents adverse environmental effects.

B. Cost Impacts

Comment: One aerospace facility maintained that the application of various technologies would result in 85 percent overall emissions reduction at capital costs of between $1.1 and $1.7 million, for this particular facility, but that it would need considerable more time beyond the proposed two years compliance period to implement the proposed emissions limits.

Response: As a result of the comments on compliance costs, EPA re-evaluated the ability of the aerospace industry to feasibly implement in a cost effective manner other emission limits we discussed at proposal but did not propose (ranging from 60,000 kg/yr to 250,000 kg/yr MC equivalent emission limits). We relied on commenters' submissions to assist us in revising our cost estimates for complying with these emissions limits by the aerospace industry and also relied on it in part in applying cost assumptions to the remainder of the other industries that use halogenated solvent cleaning machines.

The results indicated that implementing additional emission control levels, (ranging from 60,000 kg/yr to 250,000 kg/yr MC equivalent emission limits), within a three-year compliance period would result in total capital costs of over $9 million with a cost effectiveness of about $2,000/ton of solvent used. Furthermore, EPA calculated the total annualized costs for each cancer case avoided would be more than $17.5 million for the 100,000 kg/yr MC equivalent emission limit. Therefore, EPA is concluding in this final rule that the NESHAP requirements for aerospace manufacturing and maintenance degreasing machines, provide an ample margin of safety and that the requirements set forth in this final rule are not applicable to halogenated solvent cleaning machines that are associated with the aerospace manufacturing and maintenance industry and facilities. Under this final rule, the 1994 NESHAP requirements remain applicable to all the halogenated solvent cleaning machines associated with the aerospace manufacturing and maintenance facilities.

Comment: Commenters that use continuous web cleaning machines projected the capital costs of complying with the proposed emission limits (through "additions" to their production lines) at about $1,000,000.

Response: EPA recognizes the unique character of continuous web cleaning machines and is persuaded that technical emission control choices are limited to CADs to attain significant emission reductions. EPA has assumed that CADs may only achieve a 10 to 30 percent overall reductions in facility-wide emissions. Therefore, CAD alone would be insufficient for purposes of complying with the final promulgated

emissions limit. We have taken this into consideration in promulgating the final rule.

Comment: The narrow tube manufacturing industry calculated their costs of compliance with the proposed emission limits on the basis of installing CAD and researching and designing new and untested vacuum-to-vacuum technology. They indicated that capital costs for CAD installation ranged from $200,000 to $1,800,000. They also indicated that while this option is technically feasible it would only achieve 10 to 30 percent maximum in overall facility emissions reductions. The commenters further indicated that compliance with the proposed limits would require engineering new technology or relying on vacuum-to-vacuum machines, but that after conferring with vacuum-to-vacuum machine manufacturers, the cost estimates were more than $4,600,000 in capital costs with about $578,000 for operating costs. One facility, which produces specialized narrow tubing for medical applications, projected costs for vacuum-to-vacuum machines installation at $10.5 million and estimated that it would require between five and six years for the evaluation of the machines' cleaning performance. The commenters also stated that end-loading machines would require additional building space for loading and unloading tube bundles with lengths of 80 to 110 feet.

Response: EPA is persuaded that the narrow tubing industry is confronted with the biggest technological hurdle in achieving emissions reductions for purposes of achieving either the proposed or final promulgated emission limits. EPA is persuaded that emission control choices, for the narrow tubing industry, are limited to CAD, in order to attain the most significant emission reductions within the three-year compliance time frame. EPA is also persuaded that CAD may only achieve a 10 to 30 percent overall reductions in facility-wide emissions. Therefore, we have determined that installation of CAD alone would not control emissions to the level of either the proposed or final promulgated emission limits. We have also taken into consideration the costs for developing technology that will reduce emissions to both the proposed and final promulgated emissions limits. EPA has amended its cost analysis for this group of facilities and has determined that a cost effectiveness of over $3,600/ton, when joined with EPA's estimate of over $87 million in annual costs for each cancer case avoided, is unreasonable. Therefore, EPA is concluding in this final rule that the NESHAP requirements for narrow tube manufacturing provide an ample margin of safety, prevent adverse environmental effects and that the requirements set forth in this final rule will not be applicable to halogenated solvent cleaning machines associated with the narrow tubing manufacturing industry. Under this final rule, the 1994 NESHAP requirements remain applicable to all continuous web and halogenated solvent cleaning machines used by narrow tubing and aerospace manufacturing and maintenance facilities.

C. Compliance Schedule

Comment: Aerospace industries maintained that a five-year minimum compliance period would be necessary to investigate technology and protocol changes in order to comply with the proposed 40,000 kg/yr limit. A commenter from the narrow tubing industry suggested between five and ten years as necessary for them to investigate the probability of applying technology to reduce emissions to a significant amount, to either of the proposed emission limits.

The narrow tube manufacturing commenters stated that their machines are unique, indicated the non-availability of feasible emission reductions technology for either proposed emission limits and recommended that EPA allow the industry five to ten years for research and development of specific vacuum-to-vacuum technology for the specific needs of their industry.

Response: As stated in responses to earlier comments, EPA has considered these comments as significant and after re-evaluating compliance costs, technical feasibility and other factors, is concluding that, for the aerospace manufacturing and maintenance industry, narrow tube manufacturing industry, and facilities using continuous web cleaning machines, the current level of control provided by the existing NESHAP both reduces HAP emissions to levels that present an acceptable risk and provides an ample margin of safety to protect public health.

VI. Impacts

For sources required to comply with the 60,000 kg/yr MC equivalent emission limit, the national capital costs to reach compliance with the final rule are estimated to be $15,000,000 with annualized cost savings of $1.3 million. The capital costs for individual facilities would range from $15,000 to $800,000 with an average cost of about $200,000. More than 60 percent of the facilities implementing control technology would recognize a cost savings primarily from solvent savings. Capturing and controlling HAP emissions is a pollution prevention approach where emissions reduction translate into less PCE, TCE and MC consumption and reduced operating costs primarily because facilities would need to purchase less solvents. Using the 2002 NEI database, the maximum individual cancer risk is estimated to be reduced from 100-in-1 million to between 20 and 50-in-a-million (using both OPPTS and CalEPA potency values). The rule is expected to reduce cancer incidence from 0.55 cases annually to 0.36 cases annually, a reduction in cancer incidence of 0.19 cases annually.

EPA also estimates that to comply with the 100,000 kg/yr MC equivalent emission limit, military depot maintenance facilities are expected to incur $540,000 in capital costs with annualized savings of about $56,000. Using the 2002 NEI database, the maximum individual cancer risk is estimated to be reduced from six-in-a-million to three-in-a-million. The emission limit for military depot maintenance facilities is expected to reduce cancer incidence by 0.002 cases annually.

VII. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is a "significant regulatory action." Executive Order (EO) 12866 gives the Office of Management and Budget (OMB) the authority to review regulatory actions that are categorized as "significant" under section 3(f) of the EP, *i.e.*, those actions that are likely to result in a rule that may raise novel legal and policy issues arising out of mandates in CAA section 112(f)(2) and 112(d)(6). Accordingly, EPA submitted this action to OMB for review under EO 12866 and any changes made in response to OMB recommendations have been documented in the docket for this action.

In addition, EPA prepared an analysis of the potential costs and benefits associated with this action. This analysis, which is briefly summarized in Section III.B. of the Preamble, is contained in National Cost Impacts Memorandum. A copy of the analysis is available in the docket for this action.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. Owners

or operators will continue to keep records and submit required reports to EPA or the delegated State regulatory authority. Notifications, reports, and records are essential in determining compliance and are required, in general, of all sources subject to the 1994 Halogenated Solvent Cleaning NESHAP. Owners or operators subject to the 1994 Halogenated Solvent Cleaning NESHAP continue to maintain records and retain them for at least 5 years following the date of such measurements, reports, and records. Information collection requirements that were promulgated on December 2, 1994 in the Halogenated Solvent Cleaning NESHAP prior to the 2005 proposed amendments, as well the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all owners or operators subject to national emission standards, are documented in EPA ICR No. 1652.05. The Office of Management and Budget (OMB) has previously approved these information collection requirements contained in the existing regulations 40 CFR part 63 subpart T under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* and has assigned OMB control number 2060–0273, EPA ICR number 1652.05. A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, Collection Strategies Division; U.S. Environmental Protection Agency (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR part 9 and 48 CFR part 15.

We have established a public docket for this action, which includes the ICR, under Docket ID number EPA–HQ–OAR–2003–0009, which can be found in *http://www.regulations.gov.* This final decision will not change the burden estimates from those developed and approved in 1994 for the national emission standard.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impact of the final action on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration's (SBA) regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

As mentioned earlier in this Preamble, facilities across several industries use halogenated solvents to degrease their products, therefore a number of size standards are utilized in this analysis. For the industries represented in this analysis, the employment size standard varies from 500 to 1,500 employees. The annual sales standard is as low as 4 million dollars and as high as 150 million dollars.

After considering the economic impacts of this final rule on small entities, we have concluded that this action will not have a significant economic impact on a substantial number of small entities. This conclusion is based on the economic impact of the final rule to affected small entities in the entire halogenated solvent cleaning source category. The final rule is expected to affect 125 ultimate parent entities that will be regulated as major sources. Forty of the parent entities, or approximately one-third, are defined as small according to the SBA small business size standards. None of the small firms has an annualized cost of more than 0.7 percent of sales associated with meeting the requirements for major sources, and 16 of the forty affected small firms are estimated to incur no costs or have cost savings associated with compliance with the final rule. For more information, please consult the economic impact analysis for this rulemaking.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted.

Before we establish any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

We have determined that this final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, this final rule is not subject to the requirements of sections 202 and 205 of the UMRA.

EPA has determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments because it contains

no requirements that apply to such governments or impose obligations upon them.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism," (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

This final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected halogenated solvent cleaning facilities are owned or operated by State or local governments. Thus, Executive Order 13132 does not apply to the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribe Governments" (65 FR 67249, November 9, 2000), requires us to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" is defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and the Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

This final rule does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this final decision.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

This final decision is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866, the Agency believes this action represents reasonable further efforts to mitigate risks to the general public, including effects on children. This conclusion is based on our assessment of the imposed emission limits that would reduce chlorinated solvent impacts on human health associated with exposures to halogenated solvent cleaning operations.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not a "significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy.

This final rule will have a negligible impact on energy consumption because about ten percent of entities using halogenated solvent cleaning will have to reduce emissions through a range of activities involving simple process changes to the installation of additional emission control equipment or special low emitting machines to comply. The cost of energy distribution should not be affected by the final rule at all since the standards do not affect energy distribution facilities. We also expect that there would be no impact on the import of foreign energy supplies, and no other adverse outcomes are expected to occur with regards to energy supplies. Further, we have concluded that this final rule is not likely to have any significant adverse energy effects.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113, 12(d) (15 U.S.C. 272 note), directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

This final revision to the 1994 NESHAP for halogenated solvent cleaning do not include requirements for technical standards beyond what the NESHAP requires. Therefore, the requirements of the NTTAA do not apply to this action.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule amendment and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of this final rule amendment in the **Federal Register**. The final rule amendment is not a "major rule" as defined by 5 U.S.C. 804(2). This final rule is effective on May 3, 2007.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: April 16, 2007.

Stephen L. Johnson,

Administrator.

■ For reasons stated in the Preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[Amended]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart T—[Amended]

■ 2. Section 63.460 is amended by revising paragraphs (c), (d), and (g) and adding paragraph (i) to read as follows:

§ 63.460 Applicability and designation of source.

* * * * *

(c) Except as provided in paragraph (g) of this section, each solvent cleaning machine subject to this subpart that commenced construction or reconstruction after November 29, 1993 shall achieve compliance with the provisions of this subpart, except for § 63.471, immediately upon start-up or by December 2, 1994, whichever is later.

(d) Except as provided in paragraph (g) of this section, each solvent cleaning machine subject to this subpart that commenced construction or reconstruction on or before November 29, 1993 shall achieve compliance with the provisions of this subpart, except for § 63.471, no later than December 2, 1997.

* * * * *

(g) Each continuous web cleaning machine subject to this subpart shall achieve compliance with the provisions of this subpart, except for § 63.471, no later than December 2, 1999.

* * * * *

(i) The compliance date for the requirements in § 63.471 depends on the date that construction or reconstruction of the affected facility commences. For purposes of this paragraph, affected facility means all solvent cleaning machines, except solvent cleaning machines used in the manufacture and maintenance of aerospace products, solvent cleaning machines used in the manufacture of narrow tubing, and continuous web cleaning machines, located at a major source that are subject to the facility-wide limits in Table 1 of § 63.471(b)(2), and for area sources, affected facility means all solvent cleaning machines, except cold batch cleaning machines, located at an area source that are subject to the facility-wide limits in Table 1 of § 63.471(b)(2).

(1) Each affected facility that was constructed or reconstructed on or before August 17, 2006, shall be in compliance with the provisions of this subpart no later than May 3, 2010.

(2) Each affected facility that was constructed or reconstructed on or after August 17, 2006, shall be in compliance with the provisions of this subpart on May 3, 2007 or immediately upon startup, whichever is later.

■ 3. Section § 63.471 is added to Subpart T to read as follows:

§ 63.471 Facility-wide standards.

(a) Each owner or operator of an affected facility shall comply with the requirements specified in this section. For purposes of this section, affected facility means all solvent cleaning machines, except solvent cleaning machines used in the manufacture and maintenance of aerospace products, solvent cleaning machines used in the manufacture of narrow tubing, and continuous web cleaning machines, located at a major source that are subject to the facility-wide limits in paragraph (b)(2) of this section, and for area sources, affected facility means all solvent cleaning machines, except cold batch cleaning machines, located at an area source that are subject to the facility-wide limits in paragraph (b)(2) of this section.

(b)(1) Each owner or operator of an affected facility must maintain a log of solvent additions and deletions for each solvent cleaning machine.

(2) Each owner or operator of an affected facility must ensure that the total emissions of perchloroethylene (PCE), trichloroethylene (TCE) and methylene chloride (MC) used at the affected facility are equal to or less than the applicable facility-wide 12-month rolling total emission limit presented in Table 1 of this section as determined using the procedures in paragraph (c) of this section.

TABLE 1.—FACILITY-WIDE EMISSION LIMITS FOR FACILITIES WITH SOLVENT CLEANING MACHINES

Solvents emitted	Facility-wide annual emission limits in kg—for general population degreasing machines	Facility-wide annual emission limit in kg for military depot maintenance facilities
PCE only [a]	4,800	8,000
TCE only	14,100	23,500
MC only	60,000	100,000
Multiple solvents—Calculate the MC-weighted emissions using equation 1	60,000	100,000

[a] PCE emission limit calculated using CalEPA URE.

Note: In the equation, the facility emissions of PCE and TCE are weighted according to their carcinogenic potency relative to that of MC. The value of A is 12.5. The value for B is 4.25.

$$WE=(PCE\times A)+(TCE\times B)+(MC) \quad \text{(Eq. 9)}$$

Where:

WE = Weighted 12-month rolling total emissions in kg (lbs).

PCE = 12-month rolling total PCE emissions from all solvent cleaning machines at the facility in kg (lbs).

TCE = 12-month rolling total TCE emission from all solvent cleaning machines at the facility in kg (lbs).

MC = 12-month rolling total MC emissions from all solvent cleaning machines at the facility in kg (lbs).

(c) Each owner or operator of an affected facility shall on the first operating day of every month, demonstrate compliance with the applicable facility-wide emission limit on a 12-month rolling total basis using the procedures in paragraphs (c)(1) through (5) of this section. For purposes of this paragraph, "each solvent cleaning machine" means each solvent cleaning machine that is part of an affected facility regulated by this section.

(1) Each owner or operator of an affected facility shall, on the first operating day of every month, ensure that each solvent cleaning machine system contains only clean liquid solvent. This includes, but is not limited to, fresh unused solvent, recycled solvent, and used solvent that has been cleaned of soiled materials. A fill line must be indicated during the first month the measurements are made. The solvent level within the machine must be returned to the same fill-line each month, immediately prior to calculating monthly emissions as specified in paragraphs (c)(2) and (3) of this section. The solvent cleaning machine does not have to be emptied and filled with fresh unused solvent prior to the calculations.

(2) Each owner or operator of an affected facility shall, on the first operating day of the month, using the records of all solvent additions and deletions for the previous month, determine solvent emissions (E_{unit}) from each solvent cleaning machine using equation 10:

$$E_{unit} = SA_i - LSR_i - SSR_i \quad \text{(Eq. 10)}$$

Where:

E_{unit} = the total halogenated HAP solvent emissions from the solvent cleaning

machine during the most recent month i, (kilograms of solvent per month).

SA_i = the total amount of halogenated HAP liquid solvent added to the solvent cleaning machine during the most recent month i, (kilograms of solvent per month).

LSR_i = the total amount of halogenated HAP liquid solvent removed from the solvent cleaning machine during the most recent month i, (kilograms of solvent per month).

SSR_i = the total amount of halogenated HAP solvent removed from the solvent cleaning machine in solid waste, obtained as described in paragraph (c)(3) of this section, during the most recent month i, (kilograms of solvent per month).

(3) Each owner or operator of an affected facility shall, on the first operating day of the month, determine SSR_i using the method specified in paragraph (c)(3)(i) or (c)(3)(ii) of this section.

(i) From tests conducted using EPA reference method 25d.

(ii) By engineering calculations included in the compliance report.

(4) Each owner or operator of an affected facility shall on the first operating day of the month, after 12 months of emissions data are available, determine the 12-month rolling total emissions, ET_{unit}, for the 12-month period ending with the most recent month using equation 11:

$$ET_{unit} = \left[\sum_{j=1}^{12} E_{unit}\right] \quad \text{(Eq. 11)}$$

Where:

ET_{unit} = the total halogenated HAP solvent emissions over the preceding 12 months, (kilograms of solvent emissions per 12-month period).

E_{unit} = halogenated HAP solvent emissions for each month (j) for the most recent 12 months (kilograms of solvent per month).

(5) Each owner or operator of an affected facility shall on the first operating day of the month, after 12 months of emissions data are available, determine the 12-month rolling total emissions, $ET_{facility}$, for the 12-month period ending with the most recent month using equation 12:

$$ET_{facility} = \left[\sum_{j=1}^{i} ET_{unit}\right] \quad \text{(Eq. 12)}$$

Where:

$ET_{facility}$ = the total halogenated HAP solvent emissions over the preceding 12 months for all cleaning machines at the facility, (kilograms of solvent emissions per 12-month period).

ET_{unit} = the total halogenated HAP solvent emissions over the preceding 12 months for each unit j, where i equals the total number of units at the facility (kilograms of solvent emissions per 12-month period).

(d) If the applicable facility-wide emission limit presented in Table 1 of paragraph (b)(2) is not met, an exceedance has occurred. All exceedances shall be reported as required in § 63.468(h).

(e) Each owner or operator of an affected facility shall maintain records specified in paragraphs (e)(1) through (3) of this section either in electronic or written form for a period of 5 years. For purposes of this paragraph, "each solvent cleaning machine" means each solvent cleaning machine that is part of an affected facility regulated by this section.

(1) The dates and amounts of solvent that are added to each solvent cleaning machine.

(2) The solvent composition of wastes removed from each solvent cleaning machines as determined using the procedure described in paragraph (c)(3) of this section.

(3) Calculation sheets showing how monthly emissions and the 12-month rolling total emissions from each solvent cleaning machine were determined, and the results of all calculations.

(f) Each owner or operator of an affected facility shall submit an initial notification report to the Administrator no later than May 3, 2010. This report shall include the information specified in paragraphs (f)(1) through (5) of this section.

(1) The name and address of the owner or operator of the affected facility.

(2) The address (*i.e.*, physical location) of the solvent cleaning machine(s) that is part of an affected facility regulated by this section.

(3) A brief description of each solvent cleaning machine at the affected facility including machine type (batch vapor, batch cold, vapor in-line or cold in-line), solvent/air interface area, and existing controls.

(4) The date of installation for each solvent cleaning machine.

(5) An estimate of annual halogenated HAP solvent consumption for each solvent cleaning machine.

(g) Each owner or operator of an affected facility shall submit to the Administrator an initial statement of compliance on or before May 3, 2010. The statement shall include the information specified in paragraphs (g)(1) through (g)(3) of this section.

(1) The name and address of the owner or operator of the affected facility.

(2) The address (*i.e.*, physical location) of each solvent cleaning machine that is part of an affected facility regulated by this section.

(3) The results of the first 12-month rolling total emissions calculation.

(h) Each owner or operator of an affected facility shall submit a solvent emission report every year. This solvent emission report shall contain the requirements specified in paragraphs (h)(1) through (h)(3) of this section.

(1) The average monthly solvent consumption for the affected facility in kilograms per month.

(2) The 12-month rolling total solvent emission estimates calculated each month using the method as described in paragraph (c) of this section.

(3) This report can be combined with the annual report required in § 63.468(f) and (g) into a single report for each facility.

BILLING CODE 6560–50–P

labor monitoring system they intend to market.

II. What is The Environmental Impact Of This Rule?

The agency has determined under 21 CFR 25.34(b) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Thus, neither an environmental assessment nor an environmental impact statement is required.

III. What is The Economic Impact Of This Rule?

FDA has examined the impacts of the final rule under Executive Order 12866 and the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Public Law 104–4). Executive Order 12866 directs agencies to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). The agency believes that this final rule is not a significant regulatory action under the Executive order.

The Regulatory Flexibility Act requires agencies to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because classification of this device into class II will relieve manufacturers of the cost of complying with the premarket approval requirements of section 515 of the act (21 U.S.C. 360e), and may permit small potential competitors to enter the marketplace by lowering their costs, the agency certifies that the final rule will not have a significant economic impact on a substantial number of small entities.

Section 202(a) of the Unfunded Mandates Reform Act of 1995 requires that agencies prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing "any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year." The current threshold after adjustment for inflation is $122 million, using the most current (2005) Implicit Price Deflator for the Gross Domestic Product. FDA does not expect this final rule to result in any 1–year expenditure that would meet or exceed this amount.

IV. Does This Final Rule Have Federalism Implications?

FDA has analyzed this final rule in accordance with the principles set forth in Executive Order 13132. FDA has determined that the rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, the agency has concluded that the rule does not contain policies that have federalism implications as defined in the Executive order and, consequently, a federalism summary impact statement is not required.

V. How Does This Rule Comply with the Paperwork Reduction Act of 1995?

This final rule contains no collections of information. Therefore, clearance by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 is not required.

VI. What References are on Display?

The following reference has been placed on display in the Division of Dockets Management (HFA–305), Food and Drug Administration, 5630 Fishers Lane, rm. 1061, Rockville, MD 20852, and may be seen by interested persons between 9 a.m. and 4 p.m., Monday through Friday.

RIN 2060–AN10

National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks; National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: EPA is taking direct final action on amendments to the National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks (Automobiles and Light-Duty Trucks NESHAP) which were promulgated on April 26, 2004, under the authority of section 112(d) of the Clean Air Act. The direct final rule amends provisions in the Automobiles and Light-Duty Trucks NESHAP to clarify the interaction between the Automobiles and Light-Duty Trucks NESHAP and the National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products (Plastic Parts NESHAP), to clarify the meaning of certain regulatory provisions, and to correct certain errors identified in the regulatory text. EPA is also taking direct final action on amendments to the Plastic Parts NESHAP to clarify that screen printing is not subject to that rule.

DATES: The direct final rule is effective on June 25, 2007 without further notice,

unless EPA receives adverse written comment or a public hearing is requested. If we receive adverse comment or a request for a public hearing, we will publish a timely withdrawal in the **Federal Register** informing the public that this rule, or the relevant provisions of this rule, will not take effect. Written comments must be received on or before May 24, 2007 unless a public hearing is requested by May 4, 2007. If a public hearing is requested, written comments must be received on or before June 8, 2007. If anyone contacts EPA requesting to speak at a public hearing, a public hearing will be held on May 9, 2007.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2002–0093, by one of the following methods:

- *www.regulations.gov:* Follow the on-line instructions for submitting comments.
- *E-mail: a-and-r-docket@epa.gov* and *salman.dave@epa.gov.*
- *Fax:* (202) 566–1741 and (919) 541–0246.
- *Mail:* U.S. Postal Service, send comments to: Air and Radiation Docket (6102T), 1200 Pennsylvania Avenue, NW., Washington, DC 20460. Please include a total of two copies.
- *Hand Delivery:* In person or by courier, deliver comments to: Air and Radiation Docket (6102T), EPA West, Room 3334, 1301 Constitution Avenue, NW., Washington, DC 20004. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information. Please include a total of two copies.

We request that you also send a separate copy of each comment to the contact person listed below (see **FOR FURTHER INFORMATION CONTACT**).

Instructions. Direct your comments to Docket ID No. EPA–HQ–OAR–2002–0093. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be confidential business information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or e-mail. The *www.regulations.gov* Web site is an "anonymous access" system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through *www.regulations.gov*, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket, visit the EPA Docket Center homepage at *http://www.epa.gov/epahome/dockets.htm.*

Docket: All documents in the docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, *e.g.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA West Building, Room 3334, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For further information contact Mr. David Salman, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), Research Triangle Park, NC 27711; telephone number (919) 541–0859; fax number (919) 541–0246; e-mail address: *salman.dave@epa.gov.*

SUPPLEMENTARY INFORMATION:

Why is EPA using a direct final rule? EPA is publishing this rule without a prior proposed rule because we view this as a noncontroversial action and anticipate no adverse comment. This direct final rule amends provisions in the Automobiles and Light-Duty Trucks NESHAP to clarify the interaction between the Automobiles and Light-Duty Trucks NESHAP and the Plastic Parts NESHAP, to clarify the meaning of certain regulatory provisions, and to correct certain errors identified in the regulatory text. The direct final rule also amends the Plastic Parts NESHAP to clarify that screen printing is not subject to that rule.

However, in the "Proposed Rules" section of today's **Federal Register**, we are publishing a separate document that will serve as the proposed rule if adverse comments are received on this direct final rule or a public hearing is requested, and the direct final rule is, therefore, withdrawn. We will not institute a second comment period on the proposed rule. Any parties interested in commenting must do so at this time. For further information about commenting on this direct final rule, see the **ADDRESSES** section of this document.

If EPA receives adverse comment or a public hearing is requested, we will publish a timely withdrawal in the **Federal Register** informing the public that this direct final rule will not take effect. We would address all public comments in any subsequent final rule based on the proposed rule.

If we receive adverse comment on a distinct provision of this rulemaking, we will publish a timely withdrawal in the **Federal Register** indicating which provisions we are withdrawing. The provisions that are not withdrawn will become effective on the date set out above, notwithstanding adverse comment on any other provision.

Submitting CBI. Do not submit this information to EPA through *www.regulations.gov* or e-mail. Clearly mark the part or all of the information that you claim to be CBI. For CBI information on a disk or CD ROM that you mail to EPA, mark the outside of the disk or CD ROM as CBI and then identify electronically within the disk or CD ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information so marked will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS* code	Examples of potentially regulated entities
Industry	336111	Automobile manufacturing.
	336112	Light truck and utility vehicle manufacturing.
	336211	Motor vehicle body manufacturing.
	336120	Heavy duty truck manufacturing.
	323113	Commercial screen printing.

*North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria of the rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's direct final action will also be available on the WWW through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the NESHAP will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg/*. The TTN at EPA's Web site provides information and technology exchange in various areas of air pollution control.

Public Hearing. If a public hearing is held, it will be held at 10 a.m. at the EPA's Environmental Research Center Auditorium, Research Triangle Park, NC, or at an alternate site nearby.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the direct final rule amendments is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by June 25, 2007. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal proceeding brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
II. Amendments
A. Applicability
B. Recordkeeping
C. Electrodeposition Primer
D. Transfer Efficiency
E. Equations
F. Monitoring
G. Uncounted Capture and Control
H. Definitions
III. Statutory and Executive Order Reviews
A. Executive Order 12866, Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility
D. Unfunded Mandates Reform Act
E. Executive Order 13132, Federalism
F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

On April 26, 2004, we issued the final Automobiles and Light-Duty Trucks NESHAP (69 FR 22602). The final NESHAP established standards to control organic hazardous air pollutant (HAP) emissions from new and existing automobile and light-duty truck surface coating operations. This action amends the final Automobiles and Light-Duty Trucks NESHAP to clarify the interaction between that rule and the Plastic Parts NESHAP, to clarify the meaning of certain regulatory provisions, and to correct certain errors in the regulatory text. On April 19, 2004, we issued the final Plastic Parts NESHAP (69 FR 20968). The final NESHAP established standards to control organic hazardous air pollutant (HAP) emissions from new and existing plastic parts coating operations. Today's action amends the Plastic Parts NESHAP to clarify that screen printing is not subject to that rule. None of the amendments will have any effect on the stringency of the rules.

II. Amendments

All of the amendments discussed below are amendments to the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII), except for one amendment to the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP) which is discussed at the end of section II.A. "*Applicability.*"

A. Applicability

Plastic or composite body parts are used in many automobiles and light-duty trucks. These parts are typically fabricated (molded, stamped, formed, etc.) and prime coated at plastic or composites molding facilities, and then sent to automobile or light-duty truck assembly facilities where they receive an additional prime coat and topcoat. The coating activities at plastic or composites molding facilities were considered in the development of the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP) and are subject to that regulation. The coating activities at automobile or light-duty truck assembly facilities were considered in the development of the final Automobiles and Light-Duty Trucks NESHAP and are subject to that regulation.

The application of "topcoat to new automobile or new light-duty truck bodies or body parts for new automobiles or new light-duty trucks" is used as an applicability criterion in 40 CFR 63.3081(b) of the final Automobiles and Light-Duty Trucks NESHAP. The intent of this applicability criterion was to keep the coating of plastic or composite body parts at plastic or composites molding facilities, which is subject to the Plastic Parts NESHAP, from being subject to the Automobiles and Light-Duty Trucks NESHAP. The structure of this applicability criterion was based on our knowledge, at the time, of the application of prime coat to plastic or composite body parts at plastic or composites molding facilities. Specifically, at the time we developed the applicability criterion, we were unaware of any application of topcoat to plastic or composite body parts occurring at plastic or composites molding facilities.

We have since learned that there is some application of topcoat to plastic or composite body parts at plastic or composites molding facilities. The applicability criterion in 40 CFR 63.3081(b) of the Automobiles and Light-Duty Trucks NESHAP, therefore, could have the unintended consequence of making coating at plastic and composite molding facilities subject to Automobiles and Light-Duty Trucks NESHAP. We have amended 40 CFR 63.3081(b) and added a definition of "plastic or composites molding facility" to clarify that the application of topcoat to plastic or composite body parts at a

plastic or composites molding facility does not trigger applicability of this subpart as long as all of the body parts topcoated at the plastic or composites molding facility for use in new automobiles or new light-duty trucks were fabricated (molded, stamped, formed, etc.) at that facility or at another plastic or composites molding facility with the same owner or operator, none of the new vehicles in which these body parts are used are assembled at the plastic or composites molding facility, and the plastic or composites molding facility does not topcoat all of the body parts for any single new automobile or new light-duty truck.

We are also amending the Plastic Parts NESHAP because there has been some confusion as to whether that NESHAP regulates screen printing. Specifically, the definition of the term "coating" in the Plastic Parts NESHAP includes the word "ink." Some screen printing is done on plastic. Screen printing on plastic, however, is part of the printing and publishing source category. The printing and publishing source category is addressed in the National Emission Standards for the Printing and Publishing Industry (40 CFR part 63, subpart KK). We are, therefore, amending 40 CFR 63.4481 of the Plastic Parts NESHAP to clarify that screen printing is not subject to the Plastic Parts NESHAP.

B. Recordkeeping

After publication of the final Automobiles and Light-Duty Trucks NESHAP, a question was raised about the types of records required to be kept under 40 CFR 63.3130(o). The question was whether these records were limited to operating instructions, or whether other records, such as construction blueprints, also needed to be maintained. We have amended 40 CFR 63.3130(o) to clarify that the operating instructions for each add-on control device and each continuous parameter monitoring system must be kept on-site for the life of the equipment in a location readily available to plant operators and inspectors.

C. Electrodeposition Primer

An electrodeposition primer tank or system typically contains tens of thousands of gallons of material. As a result, monthly material usage for electrodeposition primer is typically determined by tracking additions to the tank or system over the month. This contrasts to other coating operations, such as topcoat or primer-surfacer, where monthly usage of each material is typically determined by tracking additions to a small (*e.g.*, 500 gallon) day tank over the month and the change in the amount of material in the day tank from the beginning of the month to the end of the month.

After publication of the final rule, we were asked if we could clarify that material usage and other parameters relevant to electrodeposition primer are determined based upon additions to the tank or system over the month. We have amended 40 CFR 63.3161(e) to clarify that for electrodeposition primer the mass fraction of organic HAP, density and volume of each material used is to be determined for each material added to the tank or system during the month. We have amended 40 CFR 63.3161(f) to clarify that for electrodeposition primer the volume fraction of coating solids is to be determined for each material added to the tank or system during the month.

The determination of capture efficiency is discussed in 40 CFR 63.3165 of the final rule. The introductory text to 40 CFR 63.3165 of the final rule states that a bake oven air seal is not considered a natural draft opening to a permanent total enclosure or a temporary total enclosure provided the direction of air movement across the interface between the bake oven air seal and the bake oven is into the bake oven. This includes electrodeposition bake oven air seals. Capture of emissions from electrodeposition bake ovens is also discussed in 40 CFR 63.3171(f) of the final rule. After publication of the final rule, we were asked if we could clarify that electrodeposition bake oven air seals were intended to be considered in the same manner under 40 CFR 63.3171(f) as they are considered in 40 CFR 63.3165 introductory text. We have amended 40 CFR 63.3171(f) to clarify that an electrodeposition bake oven air seal is not considered a natural draft opening provided the direction of air movement across the interface between the bake oven air seal and the bake oven is into the bake oven.

D. Transfer Efficiency

The final rule requires that transfer efficiency be determined for many coatings used in automobile or light-duty truck coating operations. The final rule states that transfer efficiency may be determined using ASTM Method D5066–91 (Reapproved 2001), Standard Test Method for Determination of the Transfer Efficiency Under Production Conditions for Spray Application of Automotive Paints-Weight Basis (incorporated by reference, see 40 CFR 63.14), or the guidelines presented in Protocol for Determining Daily Volatile Organic Compound Emission Rate of Automobile and Light-Duty Truck Topcoat Operations, EPA–450/3–88–018 (Docket ID No. OAR–2002–0093 and Docket ID No. A–2001–22). The final rule provides default transfer efficiency values for electrodeposition primer coatings, glass bonding primers, glass bonding adhesives, and final repair coatings. The guidelines provide default transfer efficiency values for certain specialty or low-use coatings such as blackout and interior color.

After publication of the final rule, a question was raised about whether the default transfer efficiency values in the guidelines could be used for chip resistant edge primer, lower body anti-chip coating and underbody anti-chip coating. These types of coatings are not explicitly mentioned in the guidelines, because the guidelines do not discuss primer-surfacer operations in detail. We believe it is appropriate to apply the default transfer efficiency values in the guidelines to these types of coatings and are amending the rule accordingly. Similar to blackout, lower-body anti-chip coating and chip resistant edge primer are applied to relatively small areas of the vehicle. Underbody anti-chip coatings are typically applied with efficient airless applicators. Specifically, we have amended 40 CFR 63.3161(g) to provide default transfer efficiency values for these types of coatings. We have also added definitions of "chip resistant edge primer," "lower body anti-chip coating," and "underbody anti-chip coating," and revised the definitions of "anti-chip coating," "deadener," and "primer-surfacer" to better identify the types of coatings for which default transfer efficiency values can be used.

E. Equations

We have corrected Equation 5 in 40 CFR 63.3161(l) by removing "/100" from the end of the equation. This division by 100 is incorrect because the transfer efficiency (TE) is expressed as a decimal value rather than as a percentage.

We have revised Equation 4 in § 63.3165(e) by changing the symbol "Pi" to "Pv,i" to emphasize that the panel test result in this equation is expressed in mass (kg) of volatile organic compounds (VOC) per *volume* (liter) of coating solids deposited. This helps distinguish this equation from Equation 7 in 40 CFR 63.3165(e) where the symbol "Pm,i" is used to emphasize that the panel test result in that equation is expressed in *mass* (kg) of VOC per mass (kg) of coating solids deposited.

We have revised the description of the symbol "$Wvoc_{c,i}$" in Equations 6 and 7 in 40 CFR 63.3165(e) to specify that the guidelines for combining analytical

VOC content and formulation solvent content are in Section 9 of the Protocol for Determining Daily Volatile Organic Compound Emission Rate of Automobile and Light-Duty Truck Coating Operations (Protocol). The description of the symbol "$Wvoc_{c,i}$" in Equations 6 and 7 in 40 CFR 63.3165(e) of the final rule provided only a general reference to the Protocol.

We have corrected Equation 7 in 40 CFR 63.3165(e) by adding a multiplier of "100" to the numerator of the equation. This multiplier is needed in order for the result of the equation to be expressed as a percentage.

F. Monitoring

The temperature operating limits for thermal oxidizers, catalytic oxidizers and condensers are identified as "3-hour" operating limits in Table 1 of the final rule. The "3-hour" specification was inadvertently omitted from 40 CFR 63.3167(a)(2), (b)(2), and (d)(2) of the final rule. We have revised 40 CFR 63.3167(a)(2), (b)(2), and (d)(2) to clarify that these operating limits are 3-hour averages.

Catalyst activity testing and internal inspection of the catalyst are specified in 40 CFR 63.3167(b)(6) of the final Automobiles and Light-Duty Trucks rule. Similar specifications are provided in 40 CFR 63.4567(b)(4) of the Plastic Parts NESHAP. The specifications in the Plastic Parts NESHAP include an explanation of how to proceed if problems are found during annual catalyst activity testing or annual internal inspection of the catalyst. This explanation was inadvertently omitted from the final Automobiles and Light-Duty Trucks rule. We have revised 40 CFR 63.3167(b)(6) to explain how to proceed if problems are found during annual catalyst activity testing or annual internal inspection of the catalyst.

The exceptions provided in 40 CFR 63.3167(f), for capture devices that are part of a PTE or that capture emissions from a downdraft spray booth or from a flashoff area or bake oven associated with a downdraft spray booth, were inadvertently omitted from the entry for "Emission capture system that is not a PTE" in Table 1 of the final rule. We have revised Table 1 of the final rule to make the entry for "Emission capture system that is not a PTE" consistent with 40 CFR 63.3167(f) of the final rule and to correct a typographical error.

G. Uncounted Capture and Control

Some facilities have capture systems or add-on control devices installed and operated to control VOC emissions which they do not need to take into account in order to demonstrate compliance with the emission limitations for organic hazardous air pollutants in the final rule. After publication of the final rule, we were asked whether testing and monitoring requirements apply to capture systems or add-on control devices that are not taken into account in demonstrating compliance with the emission limitations for organic hazardous air pollutants in the final rule. Other surface coating NESHAP have separate compliance demonstration provisions for "emission rate without add-on control" and "emission rate with add-on control". We intended to provide the same flexibility in the Automobiles and Light-Duty Trucks NESHAP. We, therefore, have added new sections 40 CFR 63.3169 and 40 CFR 63.3174 and added a definition of "controlled coating operation" to clarify that the requirements for capture system or add-on control device reporting, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, or removal efficiency do not apply to capture systems or add-on control devices which the owner or operator *chooses not* to take into account when demonstrating compliance with the applicable emission limitations. If, at a later date, the owner or operator decides to take any such capture system or add-on control device into account when demonstrating compliance with the emission limitations, then, at that time, the owner or operator must comply with the reporting, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, or removal efficiency for that capture system or add-on control device.

H. Definitions

In addition to the definition changes described above, we have made several other changes to the definitions in the final rule. After publication of the final rule, we were asked if we could clarify that "bake oven air seals" may be present both on bake ovens associated with spray booths and on bake ovens associated with electrodeposition primer operations. We have revised the definition of "bake oven air seal" to clarify that both bake ovens associated with spray booth and electrodeposition primer bake ovens may have bake oven air seals. We have also revised the definition of "spray booth air seal" to make it consistent with the definition of "bake oven air seal." The definition of "bake oven air seal" referred to "entry or entry vestibule to or an exit or exit vestibule" whereas the definition of "spray booth air seal" inadvertently referred only to "entry vestibule or exit vestibule." We have revised the definition of "touchup bottle" to allow the container size to be up to 0.25 liters and to clarify that the applicator may be a brush or other non-atomizing applicator.

III. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

This action is not a "significant regulatory action" under the terms of Executive Order 12866 (58 FR 51735, October 4, 1993) and is therefore not subject to review under the Executive Order.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. OMB has previously approved the information collection requirements contained in the existing regulations (40 CFR part 63, subpart IIII) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0550, EPA ICR No. 2045.03. A copy of the Information Collection Request (ICR) may be obtained from Ms. Susan Auby by mail at the Office of Environmental Information, Collection Strategies Division (2822), EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Analysis

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's direct final rule on small entities, small entity is defined as: (1) A small business according to Small Business Administration size standards for companies identified by NAICS codes 336111 (automobile manufacturing) and 336112 (light truck and utility vehicle manufacturing) with 1,000 or fewer employees or by NAICS code 323113 (commercial screen printing) with 500 or fewer employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. Based on the above definition, there are no small entities presently engaged in automobile and light-duty truck surface coating. While there are small entities presently engaged in commercial screen printing, today's direct final rule amendments would not impose any requirements on commercial screen printers.

After considering the economic impacts of the final rule on small entities, EPA has concluded and hereby certifies that this action will not have a significant economic impact on a substantial number of small entities. This is based on the observation that this action affects no small entities since none are engaged in the surface coating of automobiles and light-duty trucks, and no requirements are imposed on commercial screen printers.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The direct final rule amendments add no additional burden on sources. Thus, the direct final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. No facilities subject to the direct final rule amendments are owned by State or local governments. Therefore, State and local governments will not have any direct compliance costs resulting from the direct final rule amendments. Furthermore, the direct final rule amendments do not require these governments to take on any new responsibilities. Thus, Executive Order 13132 does not apply to the direct final rule amendments.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, because we are not aware of any Indian tribal governments or communities affected by the direct final rule amendments. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying to those regulatory actions that concern health or safety risks, such

that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The direct final rule amendments are not subject to Executive Order 13045 because they are based solely on technology performance.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355 (May 22, 2001)) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

The direct final rule amendments do not involve technical standards. Therefore, EPA is not considering the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the direct final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule amendments in the **Federal Register**. A "major rule" cannot take effect until 60 days after it is published in the **Federal Register**. The direct final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule amendments will be effective on June 25, 2007.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, and Reporting and recordkeeping requirements.

Dated: April 18, 2007.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, Title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart IIII—[Amended]

■ 2. Section 63.3081 is amended by revising paragraph (b) to read as follows:

§ 63.3081 Am I subject to this subpart?

* * * * *

(b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.3082, that, except as noted in paragraph (b)(1) of this section, is located at a facility which applies topcoat to new automobile or new light-duty truck bodies or body parts for new automobiles or new light-duty trucks, and that is a major source, is located at a major source, or is part of a major source of emissions of hazardous air pollutants (HAP). You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.3082, in which you choose to include, pursuant to § 63.3082(c), any coating operations which apply coatings to new other motor vehicle bodies or body parts for new other motor vehicles; parts intended for use in new automobiles, new light-duty trucks, or new other motor vehicles; or aftermarket repair or replacement parts for automobiles, light-duty trucks, or other motor vehicles; and the affected source is located at a facility that is a major source, is located at a major source, or is part of a major source of emissions of HAP. A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (Mg) (10 tons) or more per year or any combination of HAP at a rate of 22.68 Mg (25 tons) or more per year.

(1) You are not subject to this subpart if you meet all of the criteria of paragraphs (b)(1)(i) through (iii) of this section:

(i) Your coating operation is located at a plastic or composites molding facility;

(ii) All of the body parts topcoated at your facility for use in new automobiles or new light-duty trucks were fabricated (molded, stamped, formed, etc.) at your facility or at another plastic or composites molding facility which you own or operate, and none of the new vehicles in which these body parts are used are assembled at your facility; and

(iii) You do not topcoat all of the body parts for any single new automobile or new light-duty truck at your facility.

(2) [Reserved]

* * * * *

■ 3. Section 63.3130 is amended by revising paragraph (o) to read as follows:

§ 63.3130 What records must I keep?

* * * * *

(o) For each add-on control device and for each continuous parameter monitoring system, a copy of the equipment operating instructions must be maintained on-site for the life of the equipment in a location readily available to plant operators and inspectors. You may prepare your own equipment operating instructions, or they may be provided to you by the equipment supplier or other third party.

■ 4. Section 63.3161 is amended by:

■ a. Revising paragraph (e);

■ b. Revising paragraph (f) introductory text;

■ c. Adding a new sentence at the end of paragraph (g); and

■ d. Revising paragraph (l) to read as follows:

§ 63.3161 How do I demonstrate initial compliance?

* * * * *

(e) *Determine the mass fraction of organic HAP, density, and volume used.* Follow the procedures specified in § 63.3151(a) through (c) to determine the mass fraction of organic HAP and the density and volume of each coating and thinner used during each month. For electrodeposition primer operations, the mass fraction of organic HAP, density, and volume used must be determined for each material added to the tank or system during each month.

(f) *Determine the volume fraction of coating solids for each coating.* You must determine the volume fraction of coating solids (liter of coating solids per liter of coating) for each coating used during the compliance period by a test or by information provided by the supplier or the manufacturer of the material, as specified in paragraphs (f)(1) and (2) of this section. For electrodeposition primer operations, the volume fraction of solids must be determined for each material added to the tank or system during each month. If test results obtained according to paragraph (f)(1) of this section do not agree with the information obtained under paragraph (f)(2) of this section, the test results will take precedence unless, after consultation, the facility demonstrates to the satisfaction of the enforcement authority that the facility's data are correct.

(g) * * * For blackout, chip resistant edge primer, interior color, in-line repair, lower body anti-chip coatings, or underbody anti-chip coatings, you may assume 40 percent transfer efficiency for air atomized spray, 55 percent transfer efficiency for electrostatic spray and high volume-low pressure spray, and 80 percent transfer efficiency for airless spray.

* * * * *

(l) *Calculate the total volume of coating solids deposited.* Determine the total volume of coating solids deposited, liters, in the combined electrodeposition primer, primer-surfacer, topcoat, final repair, glass bonding primer, and glass bonding adhesive operations plus all coatings and thinners, except for deadener materials and for adhesive and sealer materials that are not components of glass bonding systems used in coating operations added to the affected source pursuant to § 63.3082(c) using Equation 5 of this section:

$$V_{sdep} = \sum_{i=1}^{m} (Vol_{c,i})(V_{s,i})(TE_{c,i}) \qquad \text{(Eq. 5)}$$

Where:

V_{sdep} = Total volume of coating solids deposited during the month, liters.

$Vol_{c,i}$ = Total volume of coating, i, used during the month, liters.

$V_{s,i}$ = Volume fraction of coating solids for coating, i, liter solids per liter coating, determined according to § 63.3161(f).

$TE_{c,i}$ = Transfer efficiency of coating, i, determined according to § 63.3161(g), expressed as a decimal, for example 60 percent must be expressed as 0.60.

M = Number of coatings used during the month.

* * * * *

■ 5. Section 63.3165 is amended by:

■ a. Revising Equation 4 in paragraph (e) introductory text;

■ b. Revising Equation 6 in paragraph (e)(2); and

■ c. Revising paragraph (e)(3) to read as follows:

§ 63.3165 How do I determine the emission capture system efficiency?

* * * * *

(e) * * *

$$CE_i = (P_{v,i})(V_{sdep,i})(100)/(VOC_i) \qquad \text{(Eq. 4)}$$

Where:

CE_i = Capture efficiency for coating, i, or for the group of coatings, including coating, i, for the flash-off area or bake oven for which the panel test is conducted, percent.

$P_{v,i}$ = Panel test result for coating, i, or for the coating representing coating, i, in the panel test, kg of VOC per liter of coating solids deposited.

$V_{sdep,i}$ = Volume of coating solids deposited per volume of coating used for coating, i, or composite volume of coating solids deposited per volume of coating used for the group of coatings including coating, i, in the spray booth(s) preceding the flash-off area or bake oven for which the panel test is conducted, liter of coating solids deposited per liter of coating used, from Equation 5 of this section.

VOC_i = Mass of VOC per volume of coating for coating, i, or composite mass of VOC per volume of coating for the group of coatings including coating, i, kg per liter, from Equation 6 of this section.

* * * * *

(2) * * *

$$VOC_i = (D_{c,i})(Wvoc_{c,i}) \qquad \text{(Eq. 6)}$$

Where:

VOC_i = Mass of VOC per volume of coating for coating, i, or composite mass of VOC per volume of coating for the group of coatings including coating, i, used during the month in the spray booth(s) preceding the flash-off area or bake oven for which the panel test is conducted, kg VOC per liter coating.

$D_{c,i}$ = Density of coating, i, or average density of the group of coatings, including coating, i, kg coating per liter coating, density determined according to § 63.3151(b).

$Wvoc_{c,i}$ = Mass fraction of VOC in coating, i, or average mass fraction of VOC for the group of coatings, including coating, i, kg VOC per kg coating, determined by Method 24 (appendix A to 40 CFR part 60) or the guidelines for combining analytical VOC content and formulation solvent content presented in Section 9 of "Protocol for Determining Daily Volatile Organic Compound Emission Rate of Automobile and Light-Duty Truck Topcoat Operations," EPA–450/3–88–018 (Docket ID No. OAR–2002–0093 and Docket ID No. A–2001–22).

(3) As an alternative, you may choose to express the results of your panel tests in units of mass of VOC per mass of coating solids deposited and convert such results to a percent using Equation 7 of this section. If you panel test representative coatings, then you may convert the panel test result for each representative coating either to a unique percent capture efficiency for each coating grouped with that representative coating by using coating specific values for the mass of coating solids deposited per mass of coating used, mass fraction VOC, transfer efficiency, and mass fraction solids in Equations 7 and 8 of this section; or to a composite percent capture efficiency for the group of coatings by using composite values for the group of coatings for the mass of coating solids deposited per mass of coating used and average values for the mass of VOC per volume of coating, average values for the group of coatings for mass fraction VOC, transfer efficiency, and mass fraction solids in Equations 7 and 8 of this section. If you panel test each coating, then you must convert the panel test result for each coating to a unique percent capture efficiency for that coating by using coating specific values for the mass of coating solids deposited per mass of coating used, mass fraction VOC, transfer efficiency, and mass fraction solids in Equations 7 and 8 of this section. Panel test results expressed in units of mass of VOC per mass of coating solids deposited must be converted to percent capture efficiency using Equation 7 of this section:

$$CE_i = (P_{m,i})(W_{sdep,i})(100)/(Wvoc_{c,i}) \quad \text{(Eq. 7)}$$

Where:

CE_i = Capture efficiency for coating, i, or for the group of coatings including coating, i, for the flash-off area or bake oven for which the panel test is conducted, percent.

$P_{m,i}$ = Panel test result for coating, i, or for the coating representing coating, i, in the panel test, kg of VOC per kg of coating solids deposited.

$W_{sdep,i}$ = Mass of coating solids deposited per mass of coating used for coating, i, or composite mass of coating solids deposited per mass of coating used for the group of coatings, including coating, i, in the spray booth(s) preceding the flash-off area or bake oven for which the panel test is conducted, kg of solids deposited per kg of coating used, from Equation 8 of this section.

$Wvoc_{c,i}$ = Mass fraction of VOC in coating, i, or average mass fraction of VOC for the group of coatings, including coating, i, kg VOC per kg coating, determined by Method 24 (appendix A to 40 CFR part 60) or the guidelines for combining analytical VOC content and formulation solvent content presented in Section 9 of "Protocol for Determining Daily Volatile Organic Compound Emission Rate of Automobile and Light-Duty Truck Topcoat Operations," EPA–450/3–88–018 (Docket ID No. OAR–2002–0093 and Docket ID No. A–2001–22).

* * * * *

■ 6. Section 63.3167 is amended by:
■ a. Revising the second sentence of paragraph (a)(2);
■ b. Revising paragraph (b)(2);
■ c. Revising paragraph (b)(6); and
■ d. Revising the second sentence of paragraph (d)(2) to read as follows:

§ 63.3167 How do I establish the add-on control device operating limits during the performance test?

* * * * *

(a) * * *

(2) * * * This average combustion temperature is the minimum 3-hour average operating limit for your thermal oxidizer.

* * * * *

(b) * * *

(2) Use all valid data collected during the performance test to calculate and record the average temperature just before the catalyst bed and the average temperature difference across the catalyst bed maintained during the performance test. The minimum 3-hour average operating limits for your catalytic oxidizer are the average temperature just before the catalyst bed maintained during the performance test of that catalytic oxidizer and 80 percent of the average temperature difference across the catalyst bed maintained during the performance test of that catalytic oxidizer, except during periods of low production, the latter minimum operating limit is to maintain a positive temperature gradient across the catalyst bed. A low production period is when production is less than 80 percent of production rate during the performance test of that catalytic oxidizer.

* * * * *

(6) You must develop and implement an inspection and maintenance plan for your catalytic oxidizer(s) for which you elect to monitor according to paragraph (b)(4) or (b)(5) of this section. The plan must address, at a minimum, the elements specified in paragraphs (b)(6)(i) through (iii) of this section.

(i) Annual sampling and analysis of the catalyst activity (*i.e.*, conversion efficiency) following the manufacturer's or catalyst supplier's recommended procedures. If problems are found during the catalyst activity test, you must replace the catalyst bed or take other corrective action consistent with the manufacturer's recommendations.

(ii) Monthly external inspection of the catalytic oxidizer system, including the burner assembly and fuel supply lines for problems and, as necessary, adjust the equipment to assure proper air-to-fuel mixtures.

(iii) Annual internal inspection of the catalyst bed to check for channeling, abrasion, and settling. If problems are found during the annual internal inspection of the catalyst, you must replace the catalyst bed or take other corrective action consistent with the manufacturer's recommendations. If the catalyst bed is replaced and is not of like or better kind and quality as the old catalyst, then you must conduct a new performance test to determine destruction efficiency according to § 63.3166. If a catalyst bed is replaced and the replacement catalyst is of like or better kind and quality as the old catalyst, then a new performance test to determine destruction efficiency is not required and you may continue to use the previously established operating limits for that catalytic oxidizer.

* * * * *

(d) * * *

(2) * * * This average condenser outlet gas temperature is the maximum 3-hour average operating limit for your condenser.

* * * * *

■ 7. Section 63.3169 is added to read as follows:

§ 63.3169 What are the requirements for a capture system or add-on control device which is not taken into account when demonstrating compliance with the applicable emission limitations?

You may have capture systems or add-on control devices which you choose not to take into account when demonstrating compliance with the applicable emission limitations. For any such capture system or add-on control device, you are not required to comply with the requirements of §§ 63.3093, 63.3100, 63.3110, 63.3120, 63.3130, 63.3131, and 63.3160 through 63.3168 with regard to notification, reporting, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, or removal efficiency. If, at a later date, you decide to take any such capture system or add-on control device into account when demonstrating compliance with the emission limitations, then at that time you must comply with the requirements of §§ 63.3093, 63.3100, 63.3110, 63.3120, 63.3130, 63.3131, and 63.3160 through 63.3168 with regard to notification, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, and removal efficiency, as applicable, for that capture system or add-on control device.

■ 8. Section 63.3171 is amended by revising paragraph (f) to read as follows:

§ 63.3171 How do I demonstrate initial compliance?

* * * * *

(f) *Capture of electrodeposition bake oven emissions.* You must show that the electrodeposition bake oven meets the criteria in sections 5.3 through 5.5 of Method 204 of appendix M to 40 CFR part 51 and directs all of the exhaust gases from the bake oven to an add-on control device. For purposes of this showing, an electrodeposition bake oven air seal is not considered a natural draft opening provided you demonstrate that the direction of air movement across the interface between the bake oven air seal and the bake oven is into the bake oven. You may use lightweight strips of fabric or paper, or smoke tubes to make such demonstrations. You cannot count air flowing from an electrodeposition bake oven air seal into an electrodeposition bake oven as air flowing through a natural draft opening unless you elect to treat that

electrodeposition bake oven air seal as a natural draft opening.

* * * * *

■ 9. Section 63.3174 is added to read as follows:

§ 63.3174 What are the requirements for a capture system or add-on control device which is not taken into account when demonstrating compliance with the applicable emission limitations?

You may have capture systems or add-on control devices which you choose not to take into account when demonstrating compliance with the applicable emission limitations. For any such capture system or add-on control device, you are not required to comply with the requirements of §§ 63.3093, 63.3100, 63.3110, 63.3120, 63.3130, 63.3131, and 63.3160 through 63.3168 with regard to notification, reporting, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, or removal efficiency. If, at a later date, you decide to take any such capture system or add-on control device into account when demonstrating compliance with the emission limitations, then at that time you must comply with the requirements of §§ 63.3093, 63.3100, 63.3110, 63.3120, 63.3130, 63.3131, and 63.3160 through 63.3168 with regard to notification, reporting, recordkeeping, performance tests, monitoring, operating parameters, capture efficiency, add-on control device efficiency, destruction efficiency, and removal efficiency, as applicable, for that capture system or add-on control device.

■ 10. Section 63.3176 is amended by:

■ a. Revising the definitions of "Anti-chip coating," "Bake oven air seal," "Controlled coating operation," "Deadener," "In-line repair," "Primer-surfacer," "Spray booth air seal," and "Touchup bottle."

■ b. Adding in alphabetical order definitions of "Chip resistant edge primer," "Lower body anti-chip coating," "Plastic or composites molding facility," and "Underbody anti-chip coating" to read as follows:

§ 63.3176 What definitions apply to this subpart?

* * * * *

Anti-chip coating means a specialty type of coating designed to reduce stone chipping damage. Anti-chip coating may be applied to broad areas of the vehicle or to selected vehicle surfaces that are most vulnerable to impingement by stones and other road debris. Anti-chip coating is typically applied after the *electrodeposition primer* and before the *topcoat*. Anti-chip coating is a type of *primer-surfacer*.

* * * * *

Bake oven air seal means an entry or entry vestibule to or an exit or exit vestibule from a bake oven which isolates the bake oven from the area immediately preceding (for an entry or entry vestibule) or immediately following (for an exit or exit vestibule) the bake oven. No significant VOC generating activity takes place in a bake oven air seal. Fresh air is supplied into a bake oven air seal and is then directed in part into the bake oven and in part into the area immediately preceding or immediately following the bake oven. All types of bake ovens, including ovens associated with spray booths and electrodeposition primer bake ovens, may have bake oven air seals.

* * * * *

Chip resistant edge primer means an *anti-chip coating* applied to the leading edge of parts such as the hood or roof.

* * * * *

Controlled coating operation means a *coating operation* from which some or all of the organic HAP emissions are routed through a *capture system* and an *add-on control device* which are taken into account when demonstrating compliance with an emission limitation in this subpart.

* * * * *

Deadener means a specialty coating applied to selected vehicle surfaces primarily for the purpose of reducing the sound of road noise in the passenger compartment.

* * * * *

In-line repair means the operation performed and coating(s) applied to correct damage or imperfections in the topcoat on parts that are not yet on a completely assembled motor vehicle. The curing of the coatingspplied in these operations is accomplished at essentially the same temperature as that used for curing the previously applied topcoat. Also referred to as high bake repair or high bake reprocess. In-line repair is considered part of the topcoat operation.

* * * * *

Lower body anti-chip coating means an *anti-chip coating* applied to lower body surfaces such as rocker panels, valence panels, lower portions of doors, or lower portions of fenders.

* * * * *

Plastic or composites molding facility means a facility where the purchase cost of capital equipment used for plastic or composites molding, including presses, tooling, and associated material processing and handling equipment, is greater than the purchase cost of capital equipment used for the surface coating of new automobile or new light-duty truck bodies or body parts for new automobiles or new light-duty trucks.

Primer-surfacer means an intermediate protective coating applied on the *electrodeposition primer* and under the *topcoat*. Primer-surfacer provides adhesion, protection, and appearance properties to the total finish. Primer-surfacer may also be called *guide coat* or *surfacer*.

Anti-chip coating is a type of primer-surfacer.

* * * * *

Spray booth air seal means an entry or entry vestibule to or exit or exit vestibule from a spray booth which isolates the spray booth from the area immediately preceding (for an entry or entry vestibule) or immediately following (for an exit or exit vestibule) the spray booth. No coating application or other VOC generating activity takes place in a spray booth air seal. Fresh air is supplied into a spray booth air seal and is then directed in part into the spray booth and in part into the area immediately preceding or immediately following the spray booth.

* * * * *

Touchup bottle means a coating container with a volume of 0.25 liter or less used with a brush or other non-atomizing applicator.

* * * * *

Underbody anti-chip coating means an *anti-chip coating* applied to the underbody or wheel wells primarily for the purpose of protecting these areas of the vehicle from stone chipping.

* * * * *

■ 11. Table 1 to subpart IIII of part 63 is amended by revising entry 7 to read as follows:

TABLE 1 TO SUBPART IIII OF PART 63—OPERATING LIMITS FOR CAPTURE SYSTEMS AND ADD-ON CONTROL DEVICES

For the following device * * *	You must meet the following operating limit * * *	And you must demonstrate continuous compliance with the operating limit by
*	*	*
7. Emission capture system that is not a PTE.	a. The average gas volumetric flow rate or duct static pressure in each duct between a capture device and add-on control device inlet in any 3-hour period must not fall below the average volumetric flow rate or duct static pressure limit established for that capture device according to § 63.3167(f). This applies only to capture devices that are not part of a PTE that meets the criteria of § 63.3165(a) and that are not capturing emissions from a downdraft spray booth or from a flashoff area or bake oven associated with a downdraft spray booth.	i. Collecting the gas volumetric flow rate or duct static pressure for each capture device according to § 63.3168(g); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour average gas volumetric flow rate or duct static pressure for each capture device at or above the gas volumetric flow rate or duct static pressure limit.

Subpart PPPP—[Amended]

■ 12. Section 63.4481 is amended by revising paragraph (c) introductory text and adding paragraph (c)(17) to read as follows:

§ 63.4481 Am I subject to this subpart?

* * * * *

(c) This subpart does not apply to surface coating or a coating operation that meets any of the criteria of paragraphs (c)(1) through (17) of this section.

* * * * *

(17) Screen printing.

* * * * *

Regulation of Fuels and Fuel Additives: Extension of the Reformulated Gasoline Program to Illinois Portion of the St. Louis, Illinois-Missouri Ozone Nonattainment Area

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: Under section 211(k)(6) of the Clean Air Act, the Administrator of EPA shall require the sale of reformulated gasoline (RFG) in an ozone nonattainment area classified as marginal, moderate, serious or severe upon the application of the Governor of the state in which the nonattainment area is located. This final action extends the Act's prohibition against the sale of conventional gasoline (*i.e.*, gasoline that is not RFG) to the Illinois portion of the St. Louis, Illinois-Missouri moderate ozone nonattainment area. The Agency will implement this prohibition for refiners and all other persons in the fuel distribution system other than retailers and wholesale purchaser-consumers on June 1, 2007. For retailers and wholesale purchaser-consumers, EPA's final action implements the prohibition on July 1, 2007. As of the compliance date for retailers and wholesale purchaser-consumers, this area will be treated as a covered area for all purposes of the Federal RFG program.

DATES: This final rule is effective April 20, 2007.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2006–0841. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air Docket, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Kurt Gustafson, Transportation and Regional Programs Division (Mail Code 6406J), Environmental Protection Agency, 1200 Pennsylvania Ave, NW., Washington, DC 20460; telephone number: 202–343–9219; fax number: 202–343–2800; e-mail address: *gustafson.kurt@epa.gov*.

SUPPLEMENTARY INFORMATION: Under section 211(k)(6) of the Clean Air Act, as amended (Act), the Administrator of EPA must require the sale of reformulated gasoline in an ozone nonattainment area classified as Marginal, Moderate, Serious, or Severe upon the application of the governor of the state in which the nonattainment area is located. This final action extends the prohibition set forth in section 211(k)(5) against the sale of conventional (*i.e.*, non-reformulated) gasoline to the Illinois portion of the St. Louis, Illinois-Missouri moderate ozone nonattainment area. For all persons other than retailers and wholesale purchaser-consumers (*i.e.*, refiners, importers,and distributors), this rule establishes the implementation date of the prohibition in Section 211(k)(5) as June 1, 2007. For retailers and wholesale purchaser-consumers, this rule establishes the implementation date of the prohibition in section 211(k)(5) on July 1, 2007. As of the implementation date for retailers and wholesale purchaser-consumers, the Illinois portion of the St. Louis, Illinois-Missouri ozone nonattainment area will be a covered area for all purposes in the Federal RFG program.

The final preamble and regulatory language are also available electronically from the **Federal Register** Web site or via the docket at the *http://www.regulations.gov* site listed above.

General Information

Does This Action Apply to Me?

This action may affect you if you produce, distribute, or sell gasoline for use in the Illinois portion of the St. Louis, Illinois-Missouri ozone nonattainment area.

The table below gives some examples of entities that may have to comply with the regulations. However, since these are only examples, you should carefully examine these and other existing regulations in 40 CFR part 80. If you have any questions, please contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section above.

RIN 2060–AN10

National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: EPA is taking direct final action on amendments to the National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks (Automobiles and Light-Duty Trucks NESHAP) which were promulgated on April 26, 2004, under the authority of section 112(d) of the Clean Air Act. The direct final rule amendments provide the option of including surface coating of heavier motor vehicles under this rule. This action also makes direct final rule amendments to the National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products (Miscellaneous Metal Parts NESHAP) and the National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products (Plastic Parts NESHAP) to maintain consistency between these rules and the Automobiles and Light-Duty Trucks NESHAP.

DATES: The direct final rule is effective on February 20, 2007 without further notice, unless EPA receives adverse written comment by January 22, 2007 or by February 5, 2007 if a public hearing is requested by January 2, 2007. If adverse comments are received, EPA will publish a timely withdrawal in the **Federal Register** indicating which amendments, sections, or paragraphs will become effective and which are being withdrawn due to adverse comment. If anyone contacts EPA requesting to speak at a public hearing, a public hearing will be held on January 8, 2007.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0093. All documents in the docket are listed in the *www.regulations.gov index*. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *http://www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to make hand deliveries or visit the Public Reading Room to view documents. Consult

EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* for current information on docket operations, locations, and telephone numbers. The Docket Center's mailing address for U.S. mail and the procedure for submitting comments to *www.regulations.gov* are not affected by the flooding and will remain the same.

Public Hearing. If a public hearing is held, it will be held at 10 a.m. at the EPA's Environmental Research Center Auditorium, Research Triangle Park, NC, or at an alternate site nearby.

FOR FURTHER INFORMATION CONTACT: For further information contact Mr. David Salman, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), Research Triangle Park, NC 27711; telephone number (919) 541–0859; fax number (919) 541–0246; e-mail address: *salman.dave@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS* code	Examples of potentially regulated entities
Industry	336111	Automobile manufacturing.
	336112	Light truck and utility vehicle manufacturing.
	336211	Motor vehicle body manufacturing.
	336120	Heavy duty truck manufacturing.

*North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria of the rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of today's direct final Automobiles and Light-Duty Trucks NESHAP will also be available on the WWW through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the NESHAP will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg/.* The TTN at EPA's Web site provides information and technology exchange in various areas of air pollution control.

Comments. We are publishing the direct final rule amendments without prior proposal because we view the amendments as noncontroversial and do not anticipate adverse comments. However, in the Proposed Rules section of this **Federal Register** notice, we are publishing a separate document that will serve as the proposal to amend the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII), the Miscellaneous Metal Parts NESHAP (40 CFR 63, subpart MMMM), and the Plastic Parts NESHAP (40 CFR 63, subpart PPPP) if material adverse comments are filed. Instructions for submitting comments are provided in that document. If we receive any material adverse comments on one or more distinct amendments, we will publish a timely withdrawal in the **Federal Register** informing the public which provisions will become effective, and which provisions are being withdrawn due to material adverse comment. We will address all public comments in a subsequent final rule, should the EPA determine to issue one. Any of the distinct amendments in today's direct final rule for which we do not receive material adverse comment will become effective on the previously mentioned date. We will not institute a second comment period on the direct final rule amendments. Any parties interested in commenting must do so at this time.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the direct final rule amendments is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by February 20, 2007. Under section 307(d)(7)(B) of the CAA, only an objection to the direct final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal proceeding brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
II. Amendments
III. Statutory and Executive Order Reviews
A. Executive Order 12866, Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Analysis
D. Unfunded Mandates Reform Act
E. Executive Order 13132, Federalism
F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

On April 26, 2004, we issued the final Automobiles and Light-Duty Trucks NESHAP (69 FR 22602). The final NESHAP established standards to control organic hazardous air pollutant (HAP) emissions from new and existing automobile and light-duty truck surface coating operations. Today's action amends the final rule by adding an option to include the coating of heavier vehicle bodies and parts for heavier vehicles in the affected source under this NESHAP. We are also making direct final rule amendments to the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM), and the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP) to maintain consistency between these rules and the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII). None of the amendments will have any discernable effect on the stringency of the rules.

II. Amendments

The discussion in this section of the preamble pertains to the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII) unless otherwise noted as applying to the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM) or the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP). Each of these rules has an early 2007 compliance date for existing sources.

The main focus of the final rule is the coating of new automobile or new light-duty truck bodies, and body parts for new automobiles or new light-duty trucks. The final rule also allows the owner or operator of an automobile and light-duty truck coating affected source to include in that affected source any coating operation which applies coatings to parts intended for use in new automobiles or new light-duty trucks or as aftermarket repair or replacement parts for automobiles or light-duty trucks which would otherwise be subject to the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM) or the Plastic Parts NESHAP (40 CFR part 63,

subpart PPPP). This makes it possible for such a facility to demonstrate compliance with requirements applicable to all of these activities within the final rule rather than having to demonstrate compliance with two or three rules.

Some automobile and light-duty truck surface coating facilities also coat heavier vehicle bodies or body parts for heavier vehicles. The heavier vehicle bodies or body parts for heavier vehicles may be coated using the same equipment and materials that are used to coat automobile and light-duty truck bodies or body parts for automobiles and light-duty trucks. The final rule does not currently provide an option for including the coating of heavier vehicle bodies or body parts for heavier vehicles in the automobile and light-duty truck affected source. Lacking such an option, a facility which coats automobiles or light-duty trucks and also coats heavier vehicle bodies or body parts for heavier vehicles would be subject to the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII) and also would be subject to the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM) or the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP). Adding the option of including the coating of heavier vehicle bodies or body parts for heavier vehicles in the automobile and light-duty truck affected source would make it possible for such a facility to demonstrate compliance with requirements applicable to all of these activities within the final rule rather than having to demonstrate compliance with two or three rules.

Some facilities that coat only heavier vehicle bodies or body parts for heavier vehicles have paint shops that are designed and operated in the same manner as paint shops that are used to coat automobile and light-duty truck bodies and body parts for automobiles and light-duty trucks. The permit requirements for these heavier vehicle paint shops are often structured in the same way as permit requirements for automobile and light-duty truck paint shops. The volatile organic compounds (VOC) compliance demonstration procedures that are used for these heavier vehicle paint shops are often the same as the VOC compliance demonstration procedures that are used for automobile and light-duty truck paint shops and very similar to the HAP compliance demonstration procedures in the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII). Without the option of including these heavier vehicle paint shops under the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII), these heavier vehicle paint shops will have to demonstrate compliance both with VOC requirements using automobile and light-duty truck procedures and HAP requirements using very different procedures as specified in the other NESHAP. Adding the option of including the coating of heavier vehicle bodies or body parts for heavier vehicles in the automobile and light-duty truck affected source would make it possible for such a facility to demonstrate compliance with HAP requirements using the very similar procedures in the Automobiles and Light-Duty Trucks NESHAP (40 CFR part 63, subpart IIII).

We, therefore, have amended the final rule by adding an option to include the coating of heavier vehicle bodies, body parts for heavier vehicles, and parts for heavier vehicles in the affected source under this NESHAP. The direct final amendments use the term "other motor vehicle" which is defined as "a self-propelled vehicle designed for transporting persons or property on a street or highway that has a gross vehicle weight rating over 8,500 pounds." The emissions limits in the Automobiles and Light-Duty Trucks NESHAP (40 CFR 63, subpart IIII) are more stringent than the emissions limits in the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM) and the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP). As a result, any heavier vehicle coating operation that is included in this NESHAP will be required to achieve the same or greater organic HAP emission reduction than it would have been required to achieve under the other NESHAP. The first monthly compliance period for existing sources in the Automobiles and Light-Duty Trucks NESHAP begins on April 26, 2007 and ends on May 31, 2007. The first 12-month compliance period for existing sources in the Miscellaneous Metal Parts NESHAP begins on January 2, 2007 and ends on February 29, 2008. The first 12-month compliance period for existing sources in the Plastic Parts NESHAP begins on April 19, 2007 and ends on May 31, 2008. We believe the earlier start of the first compliance period for existing sources in the Miscellaneous Metal Parts NESHAP is inconsequential, particularly since the first compliance period for existing sources in the Automobiles and Light-Duty Trucks NESHAP will end sooner and continuous compliance with the Automobiles and Light-Duty Trucks NESHAP will be demonstrated on a monthly basis as opposed to the 12-month rolling basis used in the other two rules.

We have amended the Miscellaneous Metal Parts NESHAP (40 CFR part 63, subpart MMMM) to allow the coating of metal heavier vehicle bodies, metal body parts for heavier vehicles, and metal parts for heavier vehicles to comply with the Automobiles and Light-Duty Trucks NESHAP (40 CFR 63, subpart IIII) in lieu of complying with the Miscellaneous Metal Parts NESHAP. We have amended the Plastic Parts NESHAP (40 CFR part 63, subpart PPPP) to allow the coating of heavier plastic vehicle bodies, plastic body parts for heavier vehicles, and plastic parts for heavier vehicles to comply with the Automobiles and Light-Duty Trucks NESHAP (40 CFR 63, subpart IIII) in lieu of complying with the Plastic Parts NESHAP.

III. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

The Office of Management and Budget (OMB) initially notified EPA that it considered this action a "significant regulatory action" within the meaning of Executive Order 12866 (58 FR 51735, October 4, 1993). Nevertheless, after reviewing information regarding this action, OMB waived review of this action.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. This action adds optional provisions to the final standards. OMB has previously approved the information collection requirements contained in the existing regulations (40 CFR part 63, subpart IIII) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0550, EPA ICR No. 2045.02. A copy of the Information Collection Request (ICR) may be obtained from Ms. Susan Auby by mail at the Office of Environmental Information, Collection Strategies Division (2822), EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. You also may download a copy from the Internet at *http://www.epa.gov/icr*. Include the ICR number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology

and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Analysis

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the direct final rule amendments.

For purposes of assessing the impacts of today's direct final rule on small entities, small entity is defined as: (1) A small business according to Small Business Administration size standards for companies identified by NAICS codes 336111 (automobile manufacturing) and 336112 (light truck and utility vehicle manufacturing) with 1,000 or fewer employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. Based on the above definition, there are no small entities presently engaged in automobile and light-duty truck surface coating.

After considering the economic impacts of the final rule on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. This is based on the observation that the final rule affects no small entities since none are engaged in the surface coating of automobiles and light-duty trucks.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows us to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The direct final rule amendments provide the option of including surface coating of heavier motor vehicles under this rule and, therefore, add no additional burden on sources. Thus, the direct final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. No facilities subject to the direct final rule amendments are owned by State or local governments. Therefore, State and local governments will not have any direct compliance costs resulting from the direct final rule amendments. Furthermore, the direct final rule amendments do not require these governments to take on any new responsibilities. Thus, Executive Order 13132 does not apply to the direct final rule amendments.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes, because we are not aware of any Indian tribal governments or communities affected by the direct final rule amendments. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective

and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The direct final rule amendments are not subject to Executive Order 13045 because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because they are not likely to have a significant adverse effect on the supply, distribution, or use of energy. The direct final rule amendments provide the option of including surface coating of heavier motor vehicles under this rule and, therefore, add no additional burden on sources. We have, therefore, concluded that the direct final rule amendments are not likely to have any adverse energy effects.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law No. 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS. The direct final rule amendments do not involve technical standards. Therefore, EPA is not considering the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the direct final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. The direct final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule amendments will be effective on February 20, 2007.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, and Reporting and recordkeeping requirements.

Dated: December 18, 2006.

Stephen L. Johnson,

Administrator.

For the reasons set out in the preamble, Title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart IIII—[Amended]

■ 2. Section 63.3080 is revised to read as follows:

§ 63.3080 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for facilities which surface coat new automobile or new light-duty truck bodies or body parts for new automobiles or new light-duty trucks. This subpart also establishes NESHAP for facilities which surface coat new other motor vehicle bodies or body parts for new other motor vehicles which you choose to include in your affected source pursuant to § 63.3082(c). This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

■ 3. Section 63.3081 is amended by revising paragraph (b) to read as follows:

§ 63.3081 Am I subject to this subpart?

* * * * *

(b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.3082, that is located at a facility which applies topcoat to new automobile or new light-duty truck bodies or body parts for new automobiles or new light-duty trucks, and that is a major source, is located at a major source, or is part of a major source of emissions of hazardous air pollutants (HAP). You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.3082, in which you choose to include, pursuant to § 63.3082(c), any coating operations which apply coatings to new other motor vehicle bodies or body parts for new other motor vehicles; parts intended for use in new automobiles, new light-duty trucks, or new other motor vehicles; or aftermarket repair or replacement parts for automobiles, light-duty trucks, or other motor vehicles; and the affected source is located at a facility that is a major source, is located at a major source, or is part of a major source of emissions of HAP. A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (Mg) (10 tons) or more per year or any combination of HAP at a rate of 22.68 Mg (25 tons) or more per year.

* * * * *

■ 4. Section 63.3082 is amended by revising paragraphs (c) and (e) to read as follows:

§ 63.3082 What parts of my plant does this subpart cover?

* * * * *

(c) In addition, you may choose to include in your affected source, and thereby make subject to the requirements of this subpart, any coating operations, as defined in § 63.3176, which would otherwise be subject to the National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products (subpart MMMM of this part) or the National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products (subpart PPPP of this part) which apply coatings to new other motor vehicle bodies or body parts for new other motor vehicles, parts intended for use in new automobiles, new light-duty trucks, or new other motor vehicles, or aftermarket repair or replacement parts for automobiles, light-duty trucks, or other motor vehicles.

* * * * *

(e) An affected source is a new affected source if:

(1) You commenced its construction after December 24, 2002; and

(2) The construction is of a completely new automobile and light-duty truck assembly plant, automobile and light-duty truck paint shop, automobile and light-duty truck topcoat operation, other motor vehicle assembly plant, other motor vehicle paint shop, or other motor vehicle topcoat operation where previously no automobile and light-duty truck assembly plant, automobile and light-duty truck assembly paint shop, or automobile and light-duty truck assembly topcoat operation had existed; and

(i) No other motor vehicle assembly plant, other motor vehicle paint shop, or other motor vehicle topcoat operation had existed previously; or

(ii) No previously existing other motor vehicle assembly plant, other motor vehicle paint shop, or other motor vehicle topcoat operation is subject to this subpart; or

(iii) If the facility was previously not a major source for HAP, no previously existing other motor vehicle assembly plant, other motor vehicle paint shop, or other motor vehicle topcoat operation is made part of the affected source under this subpart.

* * * * *

■ 5. Section 63.3110 is amended by revising paragraph (b) to read as follows:

§ 63.3110 What notifications must I submit?

* * * * *

(b) You must submit the Initial Notification required by § 63.9(b) for a new or reconstructed affected source no later than 120 days after initial startup or 120 days after June 25, 2004, whichever is later. For an existing affected source, you must submit the Initial Notification no later than 1 year after April 26, 2004. Existing sources that have previously submitted notifications of applicability of this rule pursuant to § 112(j) of the CAA are not required to submit an Initial Notification under § 63.9(b) except to identify and describe all additions to the affected source made pursuant to § 63.3082(c). If you elect to include the surface coating of new other motor vehicle bodies, body parts for new other motor vehicles, parts for new other motor vehicles, or aftermarket repair or replacement parts for other motor vehicles in your affected source pursuant to § 63.3082(c) and your affected source has an initial startup before February 20, 2007, then you must submit an Initial Notification of this election no later than 120 days after initial startup or February 20, 2007, whichever is later.

* * * * *

■ 6. Section 63.3176 is amended by:

■ a. Removing the definition of "Automobile and/or light-duty truck assembly plant".

■ b. Adding in alphabetical order definitions for "Automobile and light-duty truck assembly plant," "Other motor vehicle," and "Other motor vehicle assembly plant" to read as follows:

§ 63.3176 What definitions apply to this subpart?

* * * * *

Automobile and light-duty truck assembly plant means a facility which assembles automobiles or light-duty trucks, including coating facilities and processes.

* * * * *

Other motor vehicle means a self-propelled vehicle designed for transporting persons or property on a street or highway that has a gross vehicle weight rating over 8,500 pounds. You may choose to make the coating of other motor vehicles subject to this subpart pursuant to § 63.3082(c).

Other motor vehicle assembly plant means a facility which assembles other motor vehicles, including coating facilities and processes.

* * * * *

Subpart MMMM—[Amended]

■ 7. Section 63.3881 is amended by revising the last sentence of paragraph (d) to read as follows:

§ 63.3881 Am I subject to this subpart?

* * * * *

(d) * * * Surface coating operations on metal parts or products (e.g., parts for motorcycles or lawnmowers) not intended for use in automobiles, light-duty trucks, or other motor vehicles as defined in § 63.3176 cannot be made part of your affected source under subpart IIII of this part.

* * * * *

Subpart PPPP—[Amended]

■ 8. Section 63.4481 is amended by revising the last sentence of paragraph (d) to read as follows:

§ 63.4481 Am I subject to this subpart?

* * * * *

(d) * * * Surface coating operations on plastic parts or products (e.g., parts for motorcycles or lawnmowers) not intended for use in automobiles, light-duty trucks, or other motor vehicles as defined in § 63.3176 cannot be made part of your affected source under subpart IIII of this part.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 180

[EPA–HQ–OPP–2006–0935; FRL–8105–6]

Flucarbazone–sodium; Pesticide Tolerance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes a tolerance for combined residues of flucarbazone-sodium, 4,5-dihydro-3-methoxy-4-methyl-5-oxo-N-[[2(trifluoromethoxy)phenyl] sulfonyl-1H-1,2,4-triazole 1-carboxamide, sodium salt and its N-desmethyl metabolite in or on wheat, forage at 0.30 parts per million (ppm); wheat, grain at 0.01 ppm; wheat, hay at 0.10 ppm; and wheat, straw at 0.05 ppm; and combined residues of flucarbazone–sodium and its metabolites converted to 2-(trifluoromethoxy) benzene sulfonamide and calculated as flucarbazone-sodium in or on milk at 0.005 ppm; meat and meat byproducts (excluding liver) of cattle, goats, hogs, horses, and sheep at 0.01 ppm; and liver of cattle, goats, hogs, horses, and sheep at 1.5 ppm. Arysta LifeScience North America Corporation, 15401 Weston Parkway, Suite 150, Cary, NC 27513 requested this tolerance under the Federal Food, Drug, and Cosmetic Act (FFDCA), as amended by the Food Quality Protection Act of 1996 (FQPA).

DATES: This regulation is effective December 22, 2006. Objections and requests for hearings must be received on or before February 20, 2007, and must be filed in accordance with the instructions provided in 40 CFR part 178 (see also Unit I.C. of the **SUPPLEMENTARY INFORMATION**).

ADDRESSES: EPA has established a docket for this action under docket identification (ID) number EPA–HQ–OPP–2006–0935. All documents in the docket are listed in the index for the docket. Although listed in the index, some information is not publicly available, e.g., Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly

technical standards (e.g., specifications of materials, performance, design, or operation; test methods; sampling procedures; and related management systems practices) that are developed or adopted by voluntary consensus standards bodies.

This rule does not use technical standards. Therefore, we did not consider the use of voluntary consensus standards.

Environment

We have analyzed this rule under Commandant Instruction M16475.lD, and Department of Homeland Security Management Directive 5100.1, which guides the Coast Guard in complying with the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321–4370f), and have concluded that there are no factors in this case that would limit the use of a categorical exclusion under section 2.B.2 of the Instruction. Therefore, this rule is categorically excluded, under figure 2–1, paragraph (32)(e) of the Instruction, from further environmental documentation. Under figure 2–1, paragraph (32)(e), of the Instruction, an "Environmental Analysis Check List" and a "Categorical Exclusion Determination" are not required for this rule

List of Subjects in 33 CFR Part 117 Bridges.

■ For the reasons discussed in the preamble, the Coast Guard proposes to amend 33 CFR part 117 as follows:

PART 117—DRAWBRIDGE OPERATION REGULATIONS

■ 1. The authority citation for part 117 continues to read as follows:

Authority: 33 U.S.C. 499; Department of Homeland Security Delegation No. 0170.1; 33 CFR 1.05–1(g); section 117.255 also issued under the authority of Pub. L. 102–587, 106 Stat. 5039.

■ 2. In § 117.465, paragraphs (b), (c), (d), (e), and (f) are redesignated paragraphs (c), (d), (e), (f) and (g). A new paragraph (b) is added and paragraph (a) introductory text is revised to read as follows:

§ 117.465 Lafourche Bayou.

(a) The draws of the following bridges shall open on signal; except that, from August 15 through May 31, the draw need not open for the passage of vessels Monday through Friday except Federal holidays from 7 a.m. to 8:30 a.m.; from 2 p.m. to 4 p.m.; and from 4:30 p.m. to 5:30 p.m.:

* * * * *

(b) The draw of the Valentine bridge, mile 44.7 at Valentine, shall open on signal; except that, from 6 p.m. to 6 a.m., the draw shall open on signal if at least four hours advance notification is given. During the advance notification period, the draw shall open on less than four hours notice for an emergency and shall open on demand should a temporary surge in water traffic occur.

* * * * *

Dated: December 8, 2006.

Joel R. Whitehead,

Rear Admiral, U. S. Coast Guard, Commander, Eighth Coast Guard District.

National Emission Standards for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: In 1994, EPA promulgated national emission standards for hazardous air pollutants (NESHAP) for the synthetic organic chemical manufacturing industry. This rule is commonly known as the hazardous organic NESHAP (HON) and established maximum achievable control technology standards to regulate the emissions of hazardous air pollutants from production processes that are located at major sources.

The Clean Air Act directs EPA to assess the risk remaining (residual risk) after the application of the maximum achievable control technology standards and to promulgate additional standards if required to provide an ample margin of safety to protect public health or prevent an adverse environmental effect. The Clean Air Act also requires us to review and revise maximum achievable control technology standards, as necessary, every 8 years, taking into account developments in practices, processes, and control technologies that have occurred during that time.

On June 14, 2006, EPA proposed two options regarding whether to amend the current emission standards for synthetic organic chemical manufacturing industry units. This action finalizes one of those options, and reflects our decision not to impose further controls and not to revise the existing standards based on the residual risk and technology review. It also amends the existing regulations in certain aspects.

DATES: This final rule is effective on December 21, 2006.

ADDRESSES: *Docket:* EPA has established a docket for the final rule under Docket ID No. EPA–HQ–OAR–2005–0475. All documents in the docket are listed on the www.regulations.gov Web site. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically at *http://www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to make hand deliveries or visit the Public Reading Room to view documents. Consult EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* for current information on docket operations, locations, and telephone numbers. The Docket Center's mailing address for U.S. mail and the procedure for submitting comments to *www.regulations.gov* are not affected by the flooding and will remain the same.

FOR FURTHER INFORMATION CONTACT: For further information contact Mr. Randy McDonald, U.S. EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), Research Triangle Park, NC 27711, telephone (919)541–5402, fax (919) 541–0246, e-mail *mcdonald.randy@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by the final rule are synthetic organic chemical manufacturing industry (SOCMI) facilities that are major sources of hazardous air pollutant (HAP)

emissions. The final rule affects the following categories of sources:

Category	NAICS* Code	Examples of potentially regulated entities
Industry	325	Chemical manufacturing facilities.

*North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by the final rule.

World Wide Web (WWW). In addition to being available in the docket, electronic copies of the final rule are available on the WWW through the Technology Transfer Network Web site (TTN). Following signature, EPA posted a copy of the final rule on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final rulemaking is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by February 20, 2007. Under CAA section 307(d)(7)(B), only an objection to the final rulemaking that was raised with reasonable specificity during the period for public comment may be raised during judicial review. Moreover, under CAA section 307(b)(2), the rule's requirements may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20460.

Organization of this Document. This preamble is organized as follows:

I. Background Information
A. What Is the Statutory Authority for These Actions?
B. What Did We Propose?
II. Risk and Technology Review
A. Final Decision
B. Summary of Changes to the Rule
III. Responses to Significant Comments
A. Data Collection
B. Risk Determination
C. Administrative Requirements
D. Impacts Estimation
E. Clarification Changes
IV. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution or Use
I. National Technology Transfer Advancement Act
J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations
K. Congressional Review Act

I. Background Information

A. What is the statutory authority for these actions?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of HAP from stationary sources. In the first stage, after EPA has identified categories of sources emitting one or more of the HAP listed in CAA section 112(b), CAA section 112(d) calls for us to promulgate national performance or technology-based emission standards for those sources. For "major sources" that emit or have the potential to emit any single HAP at a rate of 10 tons or more per year or any combination of HAP at a rate of 25 tons or more per year, these technology-based standards must reflect the maximum reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts) and are commonly referred to as maximum achievable control technology (MACT) standards. We first published the MACT standard for SOCMI on April 22, 1994, at 59 FR 19402 (codified at 40 CFR part 63, subparts F, G, H, and I). EPA is then required to review these technology-based standards and to revise them "as necessary, taking into account developments in practices, processes, and control technologies," no less frequently than every 8 years, under CAA section 112(d)(6).

The second stage in standard-setting is described in CAA section 112(f). This provision requires, first, that EPA prepare a Report to Congress discussing (among other things) methods of calculating risk posed (or potentially posed) by sources after implementation of the MACT standards, the public health significance of those risks, the means and costs of controlling them, actual health effects to persons in proximity to emitting sources, and recommendations as to legislation regarding such remaining risk. EPA prepared and submitted this report (Residual Risk Report to Congress, EPA–453/R–99–001) in March 1999. The Congress did not act on any of the recommendations in the report, thereby triggering the second stage of the standard-setting process, the residual risk phase.

CAA Section 112(f)(2) requires us to determine, for each CAA section 112(d) source category, whether the MACT standards protect public health with an ample margin of safety. If the MACT standards for HAP "classified as a known, probable, or possible human carcinogen do not reduce lifetime cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than 1-in-1 million," EPA must promulgate residual risk standards for the source category (or subcategory) as necessary to provide an ample margin of safety to protect public health. EPA may also adopt more stringent standards, if necessary, to prevent an adverse environmental effect (defined in CAA section 112(a)(7) as "any significant and widespread adverse effect * * * to wildlife, aquatic life, or natural resources * * *."), after considering cost, energy, safety, and other relevant factors.

B. What did we propose?

On June 14, 2006 (71 FR 34422), we proposed two options regarding whether to revise the current emission standards for new and existing SOCMI process units. The first proposed option would have imposed no further controls, based on a proposed finding that the existing standards protect public health with an ample margin of safety and prevent adverse environmental effects. Moreover, under the first option, we proposed that no further tightening of current standards was "necessary" in

light of developments in practices, processes, and control technologies.

The second proposed option would have required further reductions of organic HAP at certain process units, based on a proposed finding that additional controls were reasonable in order to protect public health with an ample margin of safety. This option was also based on a proposed finding that, in order to further reduce risks, tightening of current standards was "necessary" after taking into account developments in practices, processes, and control technologies. The second option would have applied additional controls for equipment leaks and controlled some storage vessels and process vents that are not required to be controlled under the current rule. The proposed changes under Option 2 are summarized in the table below:

Emission source	Proposed changes to standards
Storage vessels	A Group 1 storage vessel also includes storage vessels that store one or more HAP listed in table 38 to subpart G of part 63, and has a combined HAP emission rate greater than 4.54 megagrams per year (5.0 tons HAP per year) on a rolling 12-month average.
Process vents	A Group 1 process vent also includes process vents for which the vent stream emits one or more HAP listed in table 38 to subpart G of part 63, and the total resource effectiveness index value is less than or equal to 4.0.
Equipment leaks	For chemical manufacturing process units (CMPU) containing at least one HAP listed in table 38 to subpart G of part 63, monthly monitoring of equipment components is required until the process unit has fewer than 0.5 percent leaking valves in gas/vapor service and in light liquid service.

II. Risk and Technology Review

A. Final Decision

We conclude in this rulemaking that there is no need to revise the HON rule under the provisions of either section 112(f) or 112(d)(6) of the CAA. This conclusion essentially reflects our decision to select Option 1 from the proposal, except for certain minor technical amendments we are adopting that are discussed later.

We are adopting no changes to the current HON rule under CAA section 112(f) because the current level of control called for by the existing MACT both reduces HAP emissions to levels that present an acceptable level of risk and protects public health with an ample margin of safety. The finding regarding an "ample margin of safety" is based on a consideration of the additional costs of further control (as represented by Option 2) and the relatively small reductions in health risks that are achieved by that alternative.

As explained at proposal, we judge that the level of risk from the current HON rule is acceptable for the following reasons. The maximum individual lifetime cancer risk is estimated to be 100-in-1 million, and this level of risk occurs at only two facilities. There are no people with estimated cancer risks greater than 100-in-1 million resulting from exposure to HON HAP emissions, which is the presumptively acceptable level of maximum individual lifetime cancer risk under the 1989 Benzene NESHAP criteria. The HON process units at 32 facilities are estimated to pose cancer risks greater than 10-in-1 million, with 9,000 people estimated to be exposed in this risk range. The HON process units at the remaining 206 facilities are estimated to pose cancer risks of 10-in-1 million or less. For the exposed population, total annual cancer incidence is estimated at 0.14 cases per year. The Hazard Index (HI) values (representing long-term noncancer public health risks) barely exceed 1, with only 20 people estimated to be exposed to HI levels greater than 1. We also found minimal concern for noncancer effects from short-term inhalation exposures from HAP. The lifetime cancer risk and noncancer adverse health effects estimated from multipathway exposure are also well below levels generally held to be of concern. Finally, after considering costs, energy, safety, and other relevant factors, it is not necessary to tighten HON requirements in order to prevent adverse environmental effects, or to account for developments in practices, processes, and control technologies.

In determining that the current HON rule protects public health with an ample margin of safety, we have determined that the estimated annual costs of Option 2 ($6 million per year) would be unreasonable given the minor associated improvements in health risks. Baseline cancer incidence under the current HON rule is estimated at 0.14 cases per year. Proposed Option 2 would reduce incidence by about 0.05 cases per year. Statistically, this level of risk reduction means that Option 2 would prevent one cancer case every 20 years. At proposal we estimated costs to be $13 million per year for Option 2. Based on public comments, we revised one of the Option 2 control requirements and the costing procedure for equipment leaks and this resulted in a revised cost estimate $6 million per year. Even at the $6 million per year cost, we consider the cost of Option 2 to be unreasonable given the level of incidence reduction achieved. The changes in the distribution of risks do not warrant the additional costs. The maximum individual cancer risk under Option 2 would be reduced from 100-in-1 million to 60-in-1 million. The cancer risks for 450,000 people would be shifted to levels below 1-in-1 million. Further, changes in the distribution of risk—that is, the aggregate change in risk across the population—reduces risk by only 0.05 cancer cases per year. This result suggests that Option 2 would yield very small changes in individual risk for most of the affected population. For this reason, the estimates of the shift in risk distribution do not serve as particularly effective measures of the change in health risk. Finally, the maximum HI is barely above 1.0 and would be reduced from above 1.0 to below 1.0 for only 20 people. We conclude that this degree of additional public health protection is not warranted in light of the costs to industry of compliance with proposed Option 2. Consequently, we have determined that it is not reasonable to impose any additional controls to provide an ample margin of safety to protect public health.

In the technology review, we did not identify any significant developments in practices, processes, or control technologies since promulgation of the original standards in 1994. We concluded that imposing additional controls under proposed Option 2 would achieve, at best, minimal emission and risk reductions. Option 2 would reduce organic HAP emissions by 1,700 tons per year, reduce cancer incidence by 0.05 cases per year, and reduce HI below 1 for about 20 individuals. We estimate that no one is currently exposed to emissions from HON sources causing cancer risks exceeding 100-in-1 million, the presumptively acceptable level for individual lifetime cancer risk under the Benzene NESHAP. (The relationship

between residual risk and the CAA section 112(d)(6) review is explained in our proposal at 72 FR 34436.) Thus, because of the lack of any significant developments in practices, processes, or technologies, and the limited effect in reducing public health risk, we find that additional controls are not warranted under CAA section 112(d)(6).

B. Summary of Changes to the Rule

While we are making no changes to the control requirements of the existing standards based on the residual risk and technology review, we are publishing three technical amendments under CAA section 112(d)(2) designed to clarify provisions of the existing rule and provide for effective implementation. At proposal, we solicited comments on a list of rule clarifications. After considering public comments, we have decided not to adopt some of the proposed changes at this time. We may consider some of these proposed changes again in the future, in which case we intend to provide an additional opportunity to comment on them. However, we are finalizing one minor change on which we solicited comments. We are also making two minor changes for which we did not solicit comments but which were recommended by commenters. We are also clarifying in this preamble that liquid streams generated from control devices (e.g., scrubber effluent) are wastewater. No rule changes are necessary for this clarification.

1. Group Status Changes for Wastewater

The revised rule clarifies the requirement to redetermine Group status for wastewater streams if process or operational changes occur that could reasonably be expected to change the wastewater stream from a Group 2 to a Group 1 stream. Examples of such process changes include, but are not limited to, changes in production capacity, production rate, feedstock type, or catalyst type; or whenever there is replacement, removal, or addition of recovery equipment. Although 40 CFR 63.100(m) generally applies to Group 2 wastewater streams becoming Group 1, this change clarifies requirements for redetermining group status for wastewater by including provisions analogous to those in 40 CFR 63.115(e), which requires redetermination of total resource effectiveness index value (TRE) for process vents due to process or operational changes.

2. Removal of Methyl Ethyl Ketone (MEK) from HON Tables

In the final rule we have removed MEK from Tables 2 and 4 of 40 CFR part 63, subpart F and tables 9, 34, and 36 of 40 CFR part 63, subpart G. MEK was removed from the HAP list on December 19, 2005 (70 FR 75047). At that time, MEK was not removed from various applicability tables in the HON, 40 CFR part 63, subparts F and G.

3. Vapor Balancing for Storage Tanks

In the final rule we have decided to waive all notification and reporting requirements for owners or operators of facilities where railcars, tank trucks, or barges, which are part of the vapor balancing control option, are reloaded or cleaned. We are also allowing off-site reloading and cleaning operations to comply with monitoring, recordkeeping, and reporting provisions of any other applicable 40 CFR part 63 standards in lieu of the monitoring, recordkeeping, and reporting in the HON. These provisions have been added to other MACT standards because the vapor balancing provisions provide owners and operators flexibility in meeting the requirements of the MACT standards without sacrificing the level of emission reductions being achieved. Further, making these changes provide consistency between similar emission sources being controlled under similar rules.

These amendments reflect a logical outgrowth of our proposed rule, and are reasonable decisions made in response to public comments we received regarding these issues.

III. Responses to Significant Comments

The proposal provided a 60-day comment period ending August 14, 2006. We received comments from 34 commenters. Commenters included State agencies, industry, industry trade groups, environmental groups, and individuals. We have summarized the significant comments below. A complete summary of comments and our responses can be found in the public docket for the promulgated rule, EPA–HQ–OAR–2005–0475.

A. Data Collection

Comment: One commenter stated that a major flaw in the risk assessment is that EPA failed to use its CAA section 114 authority to collect data for the risk assessment and, instead, used "voluntary, fragmentary, 7-year-old industry-submitted data from well under half of the affected facilities." The commenter stated that the 1999 Residual Risk Report to Congress emphasizes the need for site-specific data for more refined assessments, and that EPA has not collected such data in the risk assessment for the HON. The commenter stated that the purpose of the risk assessment was to determine the residual risk from SOCMI facilities, and that the data EPA used to perform the assessment was not of the type and quality to achieve that objective.

Response: The CAA does not specify the type of data, or the method of acquiring it, that EPA must use for conducting residual risk assessments under CAA section 112(f). EPA can use data other than those gained through its CAA section 114 authority, if doing so enables the agency to determine the remaining risks presented after application of MACT standards. At the time EPA was considering options for data collection, the industry trade association (American Chemistry Council) volunteered and prepared questionnaires to member companies. EPA reviewed the questionnaire and determined that the information requested by it would greatly facilitate our conducting a residual risk assessment. The data received through the questionnaire represented a significant fraction of the facilities in the source category (approximately 44 percent), and include site-specific data on emissions sources, locations, and release parameters. Where emission release parameter data were missing, EPA used environmentally protective defaults in the modeling. While it is true that the data are now 7 years old, a significant amount of time was needed to collect and analyze the data, run the models, analyze the results, and prepare the rulemaking package. Moreover, the mere age of the data does not necessarily affect its utility for assessing whether sources that have achieved compliance with MACT continue to present risks of concern, given that the essential question addressed by our assessment is whether the MACT controls themselves are adequately protective of public health with an ample margin of safety.

Comment: One commenter stated that EPA has performed no analysis to determine that the industry data used in the risk assessment are representative of the source category as a whole. The commenter stated that for EPA to adequately satisfy CAA section 112(f), it must be able to accurately identify the risk associated with the most exposed individual and accurately estimate risk more generally from sources within the source category. The commenter stated that, to do this, EPA must have sufficient data regarding all of the important factors for estimating risk (including size, quantity of emissions, the specific characteristics of emission points, proximity, and population density of surrounding communities, important meteorological and

topological data, co-located emission sources, ambient background levels, etc.). The commenter stated that the factor of 2.3 that EPA used to scale up the population risk from the assessed facilities to the entire source category is arbitrary and unreasonable because it assumes constant population density.

Response: The data used in the assessment were obtained from all responses to the industry questionnaire, and include site-specific data on emissions sources, locations, and release parameters. The data represent a significant fraction of the category (approximately 44 percent), and include sources with high and low emissions, sources that are geographically proportional to the entire source category, and sources that emit nearly all organic HAP thought to be emitted from the category.

While the emissions data obtained through the industry questionnaire cannot be proven to be proportional to the emissions from the entire source category, EPA does have whole-facility emissions data for 226 facilities (the entire source category is estimated at 238 facilities) in the National Emissions Inventory (NEI), and we performed a screening-level risk assessment using these data to determine if there were HON facilities posing greater public health risks than those included in the industry data. Although the NEI data were for the whole facility (and not just the HON emission points), we used NEI data codes (MACT codes, Standard Industrial Classification codes, and Source Classification Codes) to judge whether risks estimated using the NEI data could be attributed to the HON source category. We found that the highest risks from using the NEI data were of the same order of magnitude as those estimated using the industry data. Based on this general corroboration with the NEI data, we concluded that the industry data were the most detailed and comprehensive data available that were specific to the source category, and that the data were appropriate for use in conducting the residual risk assessment.

EPA did use a factor of 2.3 to estimate population risk associated with facilities not included in the industry data. This factor is simply the ratio of the total number of HON facilities to the number of facilities in the industry data, and reflects our expectation, based on further comparison to the NEI data, that on average, the population densities around the facilities not in the industry data are similar to the densities around the facilities that were in the industry data. We estimate that there are 61.6 million people living within the 50-kilometer modeling radius of the 105 HON facilities included in the industry data. An estimated 82.8 million people live within the 50-kilometer modeling radius of the 226 HON facilities modeled using the NEI data. Accordingly, the sources in the industry-supplied data are located near 75 percent of the total exposed population, but represent 44 percent of the total number of facilities in the industry. This comparison indicates that many of the facilities not in the industry data are located in less densely populated areas or in the same areas as the facilities included in the industry data. Therefore, the population densities around the modeled facilities appear to be representative.

In the risk assessment, EPA showed that facilities with overlapping modeling domains (facility "clusters") did not lead to significantly higher estimated risks to the individual most exposed because such risks are generally driven by the nearest facility. However, facility clusters did increase the numbers of individuals within certain cancer risk ranges. Although the total population around all facilities in the source category is not a factor of 2.3 greater than the total population around the facilities in the industry data, the additional facilities would increase the risks to some of the same segments of the population, resulting in higher risk to individuals in the population.

B. Risk Determination

Comment: One commenter believed that EPA has misinterpreted the CAA by adopting the 1989 Benzene two-step framework to set residual risk standards under the 1990 CAA. The commenter concluded that the proper interpretation is that CAA section 112(f)(2)(A) specifies 1-in-1 million as a bright line and mandates promulgation of standards to reach at least this level of health protection. The commenter believed that CAA section 112(f)(2)(B) merely leaves standing, those relevant rules that were promulgated under section 112 as it existed prior to the 1990 CAA. The commenter disagreed with EPA's position that Congressional inaction ratifies EPA's interpretation of CAA section 112(f)(2)(B). The commenter believed that Congressional failure to respond to the EPA Report to Congress, which provided notification of the intent to utilize the 1989 Benzene two-step approach, does not justify overriding the plain statutory language of CAA section 112(f).

Response: We disagree with the commenter. Our policy on using the Benzene NESHAP for implementing CAA section 112(f) has been fully explained in the Coke Oven Batteries NESHAP (see 70 FR 19992, April 15, 2005) and the Residual Risk Report to Congress, and our approach here is fully consistent with our prior practice. The commenter's argument that the statute requires CAA section 112(f) residual risk standards to reduce cancer risk to the most exposed individual to less than 1-in-1 million lacks a basis in the statutory text or in policy. CAA Section 112(f)(2)(A), in stating that EPA is to conduct residual risk rulemaking if the "lifetime excess cancer risk to the individual most exposed to emissions from a source in a category or subcategory" is greater than 1-in-1 million, does not establish what the level of the standard must be other than to require them to "provide an ample margin of safety to protect public health in accordance with this section (as in effect before the date of enactment of the CAA Amendments of 1990) [* * *]." Read in light of CAA section 112(f)(2)(B)'s express preservation of EPA's pre-enactment interpretation of CAA section 112, Congress clearly preserved EPA's ability to apply the same two-step formulation established by the Benzene NESHAP in making future "ample margin of safety" determinations under CAA section 112(f)(2).

Under that test, there is no single risk level establishing what constitutes an ample margin of safety. Rather, the Benzene NESHAP approach codified in CAA sections 112(f)(2)(A) and (B) is deliberately flexible, requiring consideration of a range of factors (among them estimates of quantitative risk, incidence, and numbers of exposed persons within various risk ranges; scientific uncertainties; and weight of evidence) when determining acceptability of risk (the first step in the ample margin of safety determination (54 FR 38045, September 14, 1989). Determination of an ample margin of safety, the second step in the process, requires further consideration of these factors, plus consideration of technical feasibility, cost, economic impact, and other factors (54 FR 38046, September 14, 1989). As we stated in our "Residual Risk Report to Congress" (EPA–453/R–99–001) issued under CAA section 112(f)(1), we do not consider the 1-in-1 million individual cancer risk level as a "bright line" mandated level of protection for establishing residual risk standards, but rather as a trigger point to evaluate whether additional reductions are necessary to provide an ample margin of safety to protect public health. This interpretation is supported by the language in the preamble to the Benzene NESHAP, which was

incorporated by Congress in CAA sections 112(f)(2)(A) and (B).

The Report to Congress was intended, among other things, to explain how EPA would implement CAA section 112(f) by investigating the methods available for assessing public health risks after the technology-based standards were applied and explaining any uncertainties in the methods. Congress also asked us to make recommendations for changes to the CAA section 112(f) as a result of the investigation. A plain reading of the CAA section 112(f)(2)(A) indicates that if, based on the report, Congress judged that residual risk standards were unnecessary or that the analytical methods for implementing the provisions were inadequate, then Congress would enact revisions to CAA section 112(f). The choice by Congress not to respond to the report clearly indicates that we should proceed with our general approach as explained in our Report to Congress.

We consequently believe that the commenter's bright line approach is not supported by the statute, and is incorrect as a matter of law. It is true that the Senate version of CAA section 112(f) mandated elimination of lifetime risks of carcinogenic effects greater than 1-in-10 thousand to the individual in the population most exposed to emissions of a carcinogen. (See "A Legislative History of the Clean Air Act Amendments of 1990," pages 7598 and 8518.) However, this version of the legislation was not adopted. We believe that the rejected Senate version of CAA section 112(f) shows that Congress considered mandating a level of risk reduction and chose not to do so.

In any event, EPA has concluded that the flexible approach to risk acceptability and ample margin of safety set forth in the Benzene NESHAP is reasonable and appropriate in light of the complex judgments EPA must make under CAA section 112(f).

Comment: One commenter argued that CAA section 112(f)(2)(A) very clearly prohibits using cost as a consideration for standards promulgated to provide an ample margin of safety to protect public health. CAA Section 112(f)(2)(A) directs EPA to promulgate standards in order to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The commenter maintained that this construction allows cost as a consideration only for standards designed to prevent an adverse environmental effect where such standards are more stringent than necessary to protect human health with an ample margin of safety. As part of their argument, the commenter cited the Supreme Court decision in *American Trucking Associations* v. *Whitman* (2001), which addressed ambient air quality standards established under section 109 of the CAA, as providing precedent that cost cannot be considered in developing regulations to protect public health with a margin of safety. The commenter claimed that this court decision abrogated the District of Columbia Circuit decision on *Vinyl Chloride*, upon which the Benzene two-step policy is based. They also pointed out that the 1990 CAA removed the statutory language that *Vinyl Chloride* relied upon heavily. The commenter pointed out that unlike the previous CAA, section 112(f) of the 1990 CAA does not contain the phrase "* * * set the standard at the level which in [the Administrator's] judgment provides an ample margin of safety to protect public health." The commenter claimed that exclusion of the specific requirement to use judgment invalidates the basis of *Vinyl Chloride*.

Response: The clear reading of CAA section 112(f) allows us to take cost into consideration within the context of the two-step policy of the 1989 Benzene NESHAP. The stipulation in CAA section 112(f)(2)(A) that costs, energy, safety, and other factors can be taken into consideration in setting standards to prevent an adverse environmental effect does not mean that costs cannot be taken into consideration in determining standards to protect public health. To the contrary, CAA section 112(f)(2)(A) states that residual risk standards are to provide an ample margin of safety to protect public health "in accordance with this section (as in effect before the date of enactment of the Clean Air Act Amendments of 1990)." This formulation, coupled with CAA section 112(f)(2)(B), which states that nothing in CAA section 112(f)(2)(A) or any other part of CAA section 112 shall be construed as affecting the EPA's interpretation of this section as set forth in the preamble to the 1989 Benzene NESHAP, reflects Congress' endorsement of the Benzene NESHAP approach, including the use of costs in determining an ample margin of safety.

The court decision cited by the commenter, *American Trucking Association* v. *Whitman*, has no relevance to decisions on ample margin of safety made under section 112 of the CAA. That case addressed the consideration of cost in the context of setting national ambient air quality standards under CAA section 109. The *American Trucking Association* v. *Whitman* decision does not specifically address, nor does it apply (nor could it have, as a matter of jurisdiction, since the court was not faced with an issue requiring a ruling on an interpretation of CAA section 112), to the different statutory requirements for regulating HAP under CAA section 112 or to any prior judicial precedent interpreting CAA section 112. Also, we do not read the 1990 CAA as overturning or otherwise disapproving of the court's decision in *Vinyl Chloride*. By directing us under CAA sections 112(f)(2)(A) and (B) to follow the 1989 Benzene NESHAP policy, the 1990 CAA requires the Administrator to use judgment both in establishing risk levels that constitute a safe level of exposure and in balancing costs against remaining risks for determining an ample margin of safety. Therefore, by eliminating the wording in CAA section 112(f)(2)(A) to use "judgment," Congress eliminated a redundant specification and did not remove the legal basis of the *Vinyl Chloride* decision.

Comment: Several commenters contended that revising the HON pursuant to CAA section 112(d)(6) is not necessary and not justified. The commenters stated that EPA's Option 2 would revise the MACT beyond-the-floor decisions, that emission reductions to be gained from Option 2 are significantly overstated, and that the emission reduction does not justify the cost. Several commenters noted that Option 2 alternatives do not represent any "developments in practices, processes, and control technologies" but rather simply reflect an apparent decision by EPA that higher cost options that were rejected in the original beyond-the-floor analysis are now somehow acceptable.

Response: We do not agree that in reviewing a standard under CAA section 112(d)(6), the CAA mandates that only the question of whether newly developed emission control measures have been identified since the publication of the MACT standards be addressed. CAA Section 112(d)(6) requires that EPA review and revise standards "as necessary." As we explain later, the instruction to revise "as necessary" indicates that EPA should use judgment in this regulatory decision, and is not precluded from considering additional relevant factors, such as risk and the evolution of costs of previously considered measures. At the time of a MACT determination, the beyond-the-floor decision is made without knowledge of the level of risks posed by an industry. In the subsequent reviews of the standards, we have substantial discretion in weighing all of the relevant factors, including all

available control measures that are more stringent than that required by the current NESHAP, emission reductions, public health risk impacts, costs, and any other relevant factors to determine what further controls, if any, are necessary.

Comment: Several commenters contended that the application of CAA section 112(d)(6) should incorporate the framework of CAA section 112(f)(2) because this approach would require the Administrator to weigh the potential for future risk reduction under CAA section 112(d)(6) against the cost of that reduction in the same manner as set forth in the second step of the 1989 Benzene NESHAP rule. One commenter added that technology reviews that focus solely on the cost-per-ton of additional emission controls and do not consider the risk reduction potential could result in the imposition of technology controls that yield very little, if any, benefit. Another commenter stated that when a MACT standard achieves protection of public health with an ample margin of safety and prevents adverse environmental effects, as is the case with the HON, no further revisions are "necessary" even if there have been developments in control technologies. The commenter believed that a determination of ample margin of safety and no adverse environmental effects alone is sufficient to determine that revision of the standard is not necessary under CAA section 112(d)(6). The commenter supported EPA's position that risk benefits are appropriate to consider under the CAA section 112(d)(6) decision.

Another commenter rejected EPA's interpretation that the term "revise as necessary" allows EPA to import into its 8-year evaluation the consideration of cost and risk. The commenter maintained that emission standards adopted under CAA section 112(d)(2) themselves were the product of a technology-driven evaluation that did not incorporate cost as a factor in the initial stages, and did not permit consideration of risk at all. The commenter continued that EPA has illegally substituted a risk/cost analysis for the requirement to perform an analysis of the technical feasibility of emission controls to establish the level of control of the best performing HON sources.

Response: We have addressed the relationship between CAA sections 112(f) and 112(d) in other recent rulemakings, as well as in the proposal for today's final rule. See, *e.g.*, our response to comments document for the Dry Cleaning Facilities Residual Risk Rule (71 FR 42727, July 27, 2006) (EPA's Summary of Public Comments and Responses to the Proposed Rule is located at docket no. EPA–HQ–OAR–2005–0155). As we explained in our proposal (see 71 FR 34436, June 14, 2006), the findings that underlie a CAA section 112(f) risk determination will often be key factors in making any subsequent CAA section 112(d)(6) technology review determinations. While our action today makes no changes to control requirements under the HON and it is, therefore, not necessary to respond to their individual points, we disagree with the commenters who state that a determination under CAA section 112(f) of an ample margin of safety and no adverse environmental effects alone will, in all cases, necessarily cause us to determine that a revision is not necessary under CAA section 112(d)(6). Our decision today should not be viewed as a departure from our general view, articulated in the proposal, that in some cases, even if risk factors remain the same from one round of CAA section 112(d)(6) review to another, changes in costs of or in the availability of control technology may be sufficient to alter a previous conclusion about whether to impose further controls.

In response to the commenter who claimed we may not consider risks or costs at all under CAA section 112(d)(6), we continue to interpret the use of the phrase "as necessary" in that section as conferring discretion on the agency to exercise its judgment as to what factors may drive an evaluation of available practices, processes, and control technologies. The ambiguous term "as necessary" inherently requires an EPA comparison between control measures and some goal or end. As the first rounds of both CAA section 112(f) residual risk and CAA section 112(d) technology review occur 8 years following MACT, it is reasonable to interpret these duties as being compatible with and informative of each other, and for the ultimate goal of revising standards as needed to protect public health with an ample margin of safety as influencing what we determine is generally "necessary," in terms of whether to impose further technological controls under CAA section 112(d)(6).

Comment: One commenter contended that, for residual risk assessments, EPA may not rely on actual emissions, which represents "over-control" of emissions, with no comparison to allowable emissions. The commenter stated that if sources are being over-controlled as EPA suggests, then EPA's analysis of risk underestimates the risk remaining after implementation of the HON. The commenter added that the assessment required in CAA section 112(f)(2)(A) is of the "standards" adopted under CAA section 112(d). If the current "standards" are not adequate to protect public health with an ample margin of safety, more stringent standards are necessary. The commenter claimed that, if sources are over-controlling, but nothing in the CAA section 112(d) standards would prevent backsliding, the statute requires EPA to adopt more stringent limits to maintain that over-control. If the over-control occurs because State or local agencies have adopted tighter limits, the commenter concluded that more stringent limits are feasible, and EPA must either (a) adopt those limits nationally to provide uniform protection or (b) explain why such standards would be infeasible.

Several commenters agreed with EPA that, for this source category, the use of 1999 actual emissions data rather than allowable emissions do not lead to an underestimating of risk. The commenters pointed out that the conservatism of the health benchmark values and the exposure estimates outweigh any potential underestimation of emission levels based on using actual emissions, and added that EPA emission data based on actual emissions is conservatively high since the Toxics Release Inventory shows a reduction in emissions since 1999.

Response: EPA's position on the use of both allowable and actual emissions is fully discussed in the final Coke Oven Batteries NESHAP (70 FR 19998–19999, April 15, 2005). There we explained that modeling the allowable levels of emissions is inherently reasonable since they reflect the maximum level sources could emit and still comply with national emission standards. But we also explained that it is reasonable to consider actual emissions, where data on them is available, in both steps of the Benzene NESHAP analysis in order to avoid overestimating emissions and their risks (including incidence) and to account for how sources typically strive to perform better than required by standards to allow for process variability and not exceed standards due to emissions increases on individual days. Failure to consider these data in risk assessments, we said, would unrealistically inflate risk levels.

The preamble to the proposed HON residual risk standards included a discussion of actual versus allowable emissions from HON emission points (71 FR 34428). We explained that, for this source category, using available data on actual emissions enabled us to approximate allowable emissions, and that basing the analysis on actual

emissions here provided an acceptable method for determining the remaining risks to public health and the environment after application of the MACT standards. In the HON proposal preamble, we acknowledged that there is some uncertainty regarding the differences between actual and allowable emissions. For some emission points, it was not possible to estimate allowable emissions from available information. A requirement to determine the applicability of controls for some emission points was intentionally not included in the HON because it was seen as an unnecessary burden for points that would be controlled anyway. For these emission points there is no readily available data that can be used to determine the applicability of control requirements. Without such data, there is no accurate way to determine allowable emissions under the current rule. However, for equipment leaks which represent the most significant impact on the cancer risk at the HON facilities, the standards are work practice standards and the actual emissions and allowable emissions are likely the same for equipment in the leak detection and repair program required by the HON. More frequent monitoring of equipment components (for example, monthly instead of quarterly) could result in actual emissions being lower than allowable emissions, but few, if any, sources monitor more frequently than required by the HON.

We concluded that there is no reason to believe that there is either a substantial amount of overcontrol of Group 1 sources or voluntary control of Group 2 sources such that actual emissions are not a reasonable approximation of allowable emissions. Rather, actual emissions appear to reflect the results of our prior application of MACT (allowing for process variability), and no evidence in the record suggests that sources could make changes that significantly increase their emissions and risks but still comply with MACT control requirements. Consequently, basing the risk analysis on actual emissions in this case enabled us to determine the remaining risks to public health and the environment after application of the specific MACT standards applicable to HON sources.

Comment: One commenter argued that EPA must address inorganic HAP. The Risk Assessment acknowledges that inorganic HAP, such as hydrochloric acid and chlorine, may be emitted from HON sources, but that these compounds were not considered because data were not available to characterize emissions. The commenter argued that EPA cannot rely on the circular justification that the original HON regulated only organic HAP. The commenter argued that the residual risk provisions of CAA section 112(f) direct EPA to estimate the remaining risk for the regulated categories, whatever chemicals that risk may encompass. The commenter added that EPA's attempt to screen out inorganic HAP from further risk assessment by looking at these emissions in isolation is invalid. The commenter contended that EPA must look at the combined target organ specific HI from all emissions allowed under the current standards, including inorganic emissions, to determine if the residual risk is acceptable. Moreover, the commenter stated that EPA cannot avoid the consideration of emission controls for inorganics based only on a screening analysis; such control decisions for both the residual risk and the CAA section 112(d)(6) determination must consider other factors such as costs and feasibility.

Response: We acknowledge that inorganic HAP (such as hydrochloric acid and chlorine) are emitted from some HON sources and that these pollutants require consideration even though they were not regulated HAP in the existing NESHAP. We stated in the preamble to the proposed rule that inorganic HAP were not considered in the primary assessment because data were not available to characterize emissions. However, we conducted an additional analysis using information in the NEI to estimate the risk from the entire plant site at which the HON processes are located. The NEI contains information on both organic and inorganic HAP emitted from each facility. EPA estimated hazard indices (total, not target organ specific) for each of the 226 HON facilities for which NEI data were available. There were many instances where inorganic HAP were responsible for hazard indices exceeding 1, but there were no instances where the inorganic HAP were associated with HON processes. Therefore, EPA concluded that not including inorganic HAP in the primary risk assessment did not affect the results of the analysis, and that no further assessment of inorganic HAP emissions was necessary in order to determine whether remaining risks from HON sources after application of MACT are at acceptable levels. Furthermore, as discussed earlier in the preamble, it is not reasonable to impose any additional controls to provide an ample margin of safety to protect public health.

C. Administrative Requirements

Comment: One commenter argued that EPA has not appropriately addressed impacts on children and other sensitive receptors. The commenter stated that even though EPA acknowledged in the risk assessment that children face greater exposure and are more susceptible to the adverse health effects from airborne contaminants, these factors were not addressed. The commenter stated that EPA determined that "[t]he proposed rule is not subject to the Executive Order (13045: Protection of Children From Environmental Health Risks and Safety Risks) * * * because the Agency does not have reason to believe the environmental health or safety risks addressed by this action present a disproportionate risk to children." This commenter contended that this conclusion is based on our assessment of the information on the effects on human health and exposures associated with SOCMI operations. The commenter could not find such an assessment referenced in the Risk Assessment. The commenter also stated that EPA ignored the effects on other sensitive receptors, *e.g.*, active adults.

Response: First, since this rulemaking is not economically significant under Executive Order 12866, Executive Order 13045 does not apply to this matter.

EPA acknowledges that population subgroups, including children, may have the potential for risk greater than the general population due to greater relative exposure and/or greater susceptibility to the toxicant. With respect to exposure, the risk assessment implicitly accounts for this greater potential for exposure by assuming lifetime (rather than simply childhood) exposure, which would tend to yield higher estimates of risks. The exposure assessment described the maximum modeled lifetime exposure of residents near HON facilities. The exposed population was conservatively presumed to be exposed to airborne concentrations at their residence continuously, 24 hours per day for a full lifetime, including childhood.

With regard to children's potentially greater susceptibility to non-cancer toxicants emitted by HON facilities, the assessment relied on Agency (or comparable) hazard identification and dose-response values which have been developed to be protective for all subgroups of the general population, including children. For example, a review [1] of the chronic reference value

[1] A Review of the Reference Dose and Reference Concentration Process. U.S. Environmental

process concluded that the Agency's reference concentration (RfC) derivation processes adequately considered potential susceptibility of different subgroups with specific consideration of children, such that the resultant RfC values pertain to the full human population "including sensitive subgroups," a phrase which is inclusive of childhood.

On the issue of cancer dose-response values, our revised cancer guidelines and new supplemental guidance recommend applying default adjustment factors to account for exposures occurring during early-life exposure to those chemicals thought to cause cancer via a mutagenic mode of action. For these chemicals, the supplemental guidance indicates that, in lieu of chemical-specific data on which age or life-stage specific risk estimates or potencies can be determined, default "age dependent adjustment factors" can be applied when assessing cancer risk for early-life exposures to chemicals which cause cancer through a mutagenic mode.[2] However, at the present time, we have not determined whether any of the HAP emitted by the HON source category cause cancer via a mutagenic mode of action. While several of the HON pollutants may be carcinogenic by such a mechanism, our policy is not to apply these adjustment factors unless we have completed a peer-reviewed assessment that explicitly makes this determination after consideration of the full scientific literature.

Although we are not yet certain whether or not a childhood potency adjustment is needed, the estimated risks must also be considered in the context of the full set of assumptions used for this risk assessment. For example, we used a health-protective assumption of a 70-year exposure duration in our risk estimates; however, using the national average residency time of 12 years would reduce the estimate of risk by roughly a factor of 6. Our unit risk estimates for HAP are considered a plausible upper-bound estimate; actual potency is likely to be lower and some of which could be as low as zero. After considering these and other factors, we continue to consider the risks from emissions after application of the current HON rule to be acceptable (within the meaning of the Benzene NESHAP decision framework discussed at 69 FR 48339–48340, 48347–48348, August 9, 2004). As mentioned in the recently published cancer guidelines, we will continue to develop and present, to the extent practicable, an appropriate central estimate and appropriate lower and upper-bound estimates of cancer potency. Development of new methods or estimates is a process that will require independent peer review.

Comment: One commenter argued that EPA failed to adequately address environmental effects or to comply with the requirements of the Endangered Species Act (ESA). The commenter objected to EPA's assumption in the ecological assessment that the aquatic and terrestrial communities surrounding HON sources were healthy and unaffected by other stressors. Additionally, the commenter claimed that EPA is on record acknowledging its obligation to comply with the ESA during the residual risk phase of the air toxics program, and yet EPA failed to do so.

Response: The commenter is correct that EPA has publicly agreed that the consultation requirements of the ESA potentially apply to CAA section 112(f) residual risk rulemakings. *See Sierra Club* v. *EPA*. 353 F.3d 976 (District of Columbia Circuit, 2004). This is because CAA section 112(f)(2)(A) provides us with authority to tighten NESHAP, after consideration of costs and other relevant factors, to prevent an "adverse environmental effect." CAA section 112(a)(7) defines this term to mean "any *significant and widespread* adverse effect, which may reasonably be anticipated, to wildlife, aquatic life, or other natural resources, including adverse impacts on *populations* of endangered or threatened species or significant degradation of environmental quality *over broad areas*" (emphasis added). Therefore, CAA section 112(f) clearly provides EPA discretion to promulgate a residual risk rule in a manner that inures to the benefit of listed species (see 50 CFR 402.03), at least in cases where adverse environmental effects are of a significant magnitude.

However, under section 7(a)(2) of the ESA and the implementing regulations promulgated by the Fish and Wildlife Service and the National Marine Fisheries Service (collectively, the Services), an action agency such as EPA has a duty to initiate consultation with the services only where it determines that its action may have an impact (either beneficial or adverse) on listed threatened or endangered species or on their designated critical habitat. Where the action agency determines that its action will have no such effect, the consultation duty is not triggered. For the HON residual risk rulemaking, based on the ecological risk analysis we discuss below, EPA has determined that its action has no effect, either adverse or beneficial, on listed species or their critical habitat.

We conducted a screening-level ecological risk analysis to assess the affects of persistent and bioaccumulative toxic HAP emissions on aquatic and terrestrial receptors. Only two HAP, hexachlorobenzene and anthracene, were estimated to pose any potential for exposures via routes beyond direct inhalation. All ecological hazard quotient (HQ) values are well below levels of concern, with the highest HQ being 0.05 from benthic/sediment exposure by aquatic life to anthracene. The highest hexachlorobenzene HQ is 0.02 from surface water exposure by aquatic life. HQ values of equal to or less than 1.0 are indicative of no effect. EPA concluded that these levels are not high enough to constitute "significant and widespread" adverse environmental effects as defined in CAA section 112(a)(7), and that there is not an effect on threatened or endangered species or on their critical habitat within the meaning of the ESA, as implemented at 50 CFR 402.14(a). Therefore, EPA concluded that a consultation with the Services regarding endangered species was not necessary. The statement regarding communities being unaffected by other toxic chemicals or environmental stressors was meant to convey that the assessment considered only the contribution of HON emissions to media concentrations.

D. Impacts Estimation

Comment: One commenter contended that EPA overestimated the costs for controlling process vents, equipment leaks, and storage vessels. The commenter also contended that EPA

Protection Agency. Risk Assessment Forum. EPA/630/P–02/002F. December 2002.

[2] The "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" recommends applying default adjustment factors to early life stage exposures to carcinogens acting through a mutagenic mode of action. The Supplemental Guidance recommends an integrative approach that can be used to assess total lifetime risk resulting from lifetime or less-than-lifetime exposure during a specific portion of a lifetime. The following adjustments represent the approach suggested in the Supplemental Guidance: (1) For exposures before 2 years of age (i.e., spanning a 2-year time interval from the first day of birth up until a child's second birthday), a 10-fold adjustment; (2) for exposures between 2 and less than 16 years of age (i.e., spanning a 14-year time interval from a child's second birthday up until their sixteenth birthday), a 3-fold adjustment; and (3) for exposures after turning 16 years of age, no adjustment. Assuming a constant lifetime exposure, incorporation of these adjustment factors would increase the estimate of lifetime cancer risk by roughly 60 percent (factor of 1.6). If exposures were from 3 years to 73 years, the adjustment factor would be less than 1.6. If exposures were from 16 years to 86 years, no adjustment would be necessary.

should have selected more stringent control options for these sources, such as lower leak definitions for equipment leaks. Other commenters expressed their view that EPA underestimated costs of controlling each of the sources by using outdated costs and inappropriate assumptions.

Response: Cost algorithms and information used for the cost impacts analysis were based on previous EPA studies and rulemaking actions and are well documented and accepted. Costs from previous years were scaled to 2001 dollars using engineering cost indices to account for inflation. We consider the cost information that we used to estimate impacts to be appropriate for this analysis and are not underestimated. We would also like to clarify that we analyzed control options with more stringent requirements for each source (e.g., requiring lower equipment leak percent leakers and leak definitions), but determined the emission reductions and risk reductions did not warrant the costs.

However, in response to the comments, we re-evaluated Option 2. Before rejecting the option overall, we decided to modify Option 2 to eliminate the high cost sources. We also re-evaluated the assumptions used in the cost analysis to reflect a range of likely costs rather than the most costly results.

At proposal, we estimated that sources having any amount of Table 38 HAP would be required to meet Option 2. We re-analyzed the costs of controlling process vents and equipment leaks assuming a trigger level of 5 percent Table 38 HAP. Additionally, we analyzed the impacts of reducing the TRE from a value of 4 from proposal to a value of 2. At proposal we calculated repair costs for leaking valves on a monthly basis. For the re-analysis, we assumed there would be no additional costs of repairing leaking valves because the frequency of repair would not change from the current HON when sources successfully repair valves on their existing schedule. At proposal, we calculated the annual cost of valve monitoring assuming all sources would have to monitor monthly. This assumption would provide the highest cost estimates. For the re-analysis, we calculated the annual cost of valve monitoring assuming that half of the sources would be able to conduct quarterly monitoring and half would still conduct monthly monitoring.

The resulting total annual cost for a re-evaluated Option 2 was estimated to be $6 million, less than half the $13 million annual cost of Option 2, as proposed. After considering these lower annual costs, EPA decided that the cost of further control still was not justified considering the small reduction in health risk resulting from HAP emission reductions achieved by Option 2.

E. Clarification Changes

Comment: Several commenters argued that many of EPA's proposed clarifications in the solicitation of public comments are significant, will result in additional costs and burdens with no identified environmental benefit, and are inconsistent, in some cases, with current rule language and 12 years of HON implementation. These commenters maintained these changes must be adopted through a formal rulemaking process.

Response: We have decided not to adopt some of the proposed clarifying changes at this time. If we further consider them, we will provide another opportunity to collect public comments on the specific regulatory language. However, we have decided that one of the proposed minor changes will not have any impact on costs of compliance, and are therefore adopting it in this final rule: Re-determining the group status of wastewater streams whenever process or operational changes occur. We are also making two minor changes not specifically discussed in the proposal but for which we received comments urging their adoption: removal of MEK from tables in subparts F and G to 40 CFR part 63, and waiving recordkeeping requirements for off-site reloading or cleaning operations that take part in the vapor balancing compliance option for storage tanks. These changes are discussed in Section II.B of this preamble.

We are also clarifying in this preamble that liquid streams generated from control devices (e.g., scrubber effluent) are wastewater. We notified the public at proposal that we intended to incorporate this clarification in the rule. However, commenters affirmed that the regulatory text already clarifies this and additional rule language is unnecessary. Therefore, no rule clarification language was added.

IV. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the Office of Management and Budget (OMB) deems the final rule to be a "significant regulatory action" because it raises novel legal and policy issues. Accordingly, EPA submitted the final rule to OMB for review. Changes made in response to OMB recommendations have been documented in the docket.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The action does not require any further control of sources and the amendatory changes are estimated to have at most minor costs. However, OMB has previously approved the information collection requirements contained in the existing regulations, 40 CFR part 63, subparts F, G, and H, under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0443, EPA ICR number 1854.04. A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, Collection Strategies Division; U.S. Environmental Protection Agency (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of the final rule on small entities, small

entity is defined as: (1) A small business as defined by the Small Business Administration; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise that is independently owned and operated and is not dominant in its field.

For sources subject to the final rule, the relevant NAICS and associated employee sizes are as follows:

NAICS 32511—Petrochemical Manufacturing—1,000 employees or fewer.

NAICS 325192—Cyclic Crudes and Intermediates Manufacturing—750 employees or fewer.

NAICS 325199—All Other Organic Chemical Manufacturing—1,000 employees or fewer.

After considering the economic impacts of the final rule on small entities, EPA has determined that this action will not have a significant economic impact on a substantial number of small entities. This action finalizes our decision not to impose further controls and not to revise the existing rule. Consequently, there are no impacts on any small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act (UMRA) of 1995, Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if EPA publishes with the final rule an explanation why that alternative was not adopted.

Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed, under section 203 of the UMRA, a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any one year. Thus, the final rule is not subject to the requirements of sections 202 and 205 of the UMRA. This action finalizes our decision not to impose further controls and not to revise the existing rule. Consequently, there are not costs associated with this action. In addition, today's final decision does not significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, today's final decision is not subject to section 203 of UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected SOCMI facilities are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have Tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175. No tribal governments own SOCMI facilities subject to the HON. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997), applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The final rule is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866, and because the Agency does not have reason to believe the environmental health or safety risks addressed by the final rule present a disproportionate risk to children. This conclusion is based on our assessment of the information on the effects on human health and exposures associated with SOCMI operations.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that this final decision is not likely to have any adverse energy impacts.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113; 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

The final rule does not involve technical standards beyond those already provided under the current rule. Therefore, EPA did not consider the use of any VCS.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, requires Federal agencies to consider the impact of programs, policies, and activities on minority populations and low-income populations. According to EPA guidance, agencies are to assess whether minority or low-income populations face risks or a rate of exposure to hazards that are significant and that "appreciably exceed or is likely to appreciably exceed the risk or rate to the general population or to the appropriate comparison group" (EPA, 1998).

The Agency has recently reaffirmed its commitment to ensuring environmental justice for all people, regardless of race, color, national origin, or income level. To ensure environmental justice, we assert that we shall integrate environmental justice considerations into all of our programs and policies, and, to this end, have identified eight national environmental justice priorities. One of the priorities is to reduce exposure to air toxics. At proposal, EPA requested comment on the implications of environmental justice concerns relative to the two options proposed since some HON facilities are located near minority and low-income populations. We received one comment regarding environmental justice concerns that is addressed in the response to comments document.

K. Congressional Review Act.

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. The final rule is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule is effective December 21, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: December 15, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 63—[Amended]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart F—[Amended]

Table 2—[Amended]

■ 2. Table 2 to subpart F of part 63 is amended by removing the entry for "Methyl ethyl ketone (2–Butanone)."

Table 4—[Amended]

■ 3. Table 4 to subpart F of part 63 is amended by removing the entry for "Methyl ethyl ketone (2–Butanone)."

Subpart G—[Amended]

■ 4. Section 63.119 is amended by revising paragraph (g)(7)(ii) and adding paragraph (g)(7)(iv) to read as follows:

§ 63.119 Storage vessel provisions—reference control technology.

* * * * *

(g) * * *

(7) * * *

(ii) If complying with paragraph (g)(6)(i) of this section, comply with the requirements for closed vent system and control device specified in §§ 63.119 through 63.123. The notification and reporting requirements in § 63.122 do not apply to the owner or operator of the offsite cleaning or reloading facility.

* * * * *

(iv) After the compliance dates specified in § 63.100(k) at an offsite reloading or cleaning facility subject to paragraph (g) of this section, compliance with the monitoring, recordkeeping, and reporting provisions of any other subpart of this part 63 constitutes compliance with the monitoring, recordkeeping, and reporting provisions of paragraph (g)(7)(ii) or paragraph (g)(7)(iii) of this section. You must identify in your Notification of Compliance Status report required by § 63.152(b), the subpart to the part 63 with which the owner or operator of the reloading or cleaning facility complies.

■ 5. Section 63.132 is amended by adding paragraphs (c)(3) and (d)(3) to read as follows:

§ 63.132 Process wastewater provisions—general.

* * * * *

(c) * * *

(3) The owner or operator of a Group 2 wastewater shall re-determine group status for each Group 2 stream, as necessary, to determine whether the stream is Group 1 or Group 2 whenever process changes are made that could reasonably be expected to change the stream to a Group 1 stream. Examples of process changes include, but are not limited to, changes in production capacity, production rate, feedstock type, or whenever there is a replacement, removal, or addition of recovery or control equipment. For purposes of this paragraph (c)(3), process changes do not include: Process upsets; unintentional, temporary process changes; and changes that are within the range on which the original determination was based.

(d) * * *

(3) The owner or operator of a Group 2 wastewater shall re-determine group status for each Group 2 stream, as necessary, to determine whether the stream is Group 1 or Group 2 whenever process changes are made that could reasonably be expected to change the stream to a Group 1 stream. Examples of process changes include, but are not limited to, changes in production capacity, production rate, feedstock type, or whenever there is a replacement, removal, or addition of recovery or control equipment. For purposes of this paragraph (d)(3), process changes do not include: Process upsets; unintentional, temporary

process changes; and changes that are within the range on which the original determination was based.

■ 6. Table 9 to subpart G of part 63 is amended by removing the entry for "Methyl ethyl ketone (2–Butanone)."

Table 34—[Amended]

■ 7. Table 34 to subpart G of part 63 is amended by removing the entry for "Methyl ethyl ketone (2–Butanone)."

Table 36—[Amended]

■ 8. Table 36 to subpart G of part 63 is amended by removing the entry for "Methyl ethyl ketone (2–Butanone)."

[FR Doc. E6–21869 Filed 12–20–06; 8:45 am]
BILLING CODE 6560–50–P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 635

[I.D. 121206B]

Atlantic Highly Migratory Species; Atlantic Bluefin Tuna Fisheries

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule; inseason retention limit adjustment.

SUMMARY: NMFS has determined that the daily Atlantic bluefin tuna (BFT) retention limits for the Atlantic tunas General category should be adjusted to provide reasonable opportunity to harvest the General category January time-period subquota. Therefore, NMFS increases the daily BFT retention limits for the entire month of January, including previously scheduled Restricted Fishing Days (RFDs), to provide enhanced commercial General category fishing opportunities in all areas while minimizing the risk of an overharvest of the General category BFT quota.

DATES: The effective dates for the BFT daily retention limits are provided in Table 1 under **SUPPLEMENTARY INFORMATION**.

FOR FURTHER INFORMATION CONTACT: Brad McHale, 978–281–9260.

SUPPLEMENTARY INFORMATION: Regulations implemented under the authority of the Atlantic Tunas Convention Act (16 U.S.C. 971 *et seq.*) and the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act; 16 U.S.C. 1801 *et seq.*) governing the harvest of BFT by persons and vessels subject to U.S. jurisdiction are found at 50 CFR part 635.

The 2006 BFT fishing year began on June 1, 2006, and ends May 31, 2007. The final initial 2006 BFT specifications and General category effort controls were published on May 30, 2006 (71 FR 30619). These final specifications divided the General category quota among three subperiods (June through August, the month of September, and October through January) in accordance with the 1999 Highly Migratory Species Fishery Management Plan (1999 FMP) (May 29, 1999; 64 FR 29090), and implementing regulations at § 635.27. The final initial 2006 BFT specifications increased the General category retention limit to three fish for the June though August time-period, as well as established the following General category RFD schedule: all Saturday and Sundays from November 18, 2006, through January 31, 2007, and Thursday November 23, 2006, and Monday December 25, 2006, inclusive.

Due to the large amount of available quota and the low catch rates, NMFS extended the three-fish retention limit through September (71 FR 51529, August 30, 2006), October (71 FR 58287, October 3, 2006), November (71 FR 64165, November 1, 2006), and December (71 FR 68752, November 28, 2006) to enhance fishing opportunities while minimizing the risk of exceeding available quota. On October 2, 2006, NMFS published a final rule (71 FR 58058) implementing the Consolidated Highly Migratory Species Fishery Management Plan (HMS FMP). The HMS FMP revised the General category time-period subquota allocation scheme by dividing the coastwide General category into the following five distinct time-periods; June through August, September, October through November, December, and January of the following year. The effective date of these time-periods and their associated subquota was November 1, 2006.

Daily Retention Limits

Pursuant to this action and the final initial 2006 BFT specifications, noted above, the daily BFT retention limits for Atlantic tunas General category are as follows:

TABLE 1. EFFECTIVE DATES FOR RETENTION LIMIT ADJUSTMENTS

Permit Category	Effective Dates	Areas	BFT Size Class Limit
General	December 1 - 31, 2006, inclusive	All	Three BFT per vessel per day/trip, measuring 73 inches (185 cm) curved fork length (CFL) or larger
	January 1 - 31, 2007, inclusive	All	Three BFT per vessel per day/trip, measuring 73 inches (185 cm) CFL or larger
	February 1 through May 31, 2007, inclusive	All	CLOSED

Adjustment of General Category Daily Retention Limits

Under § 635.23(a)(4), NMFS may increase or decrease the General category daily retention limit of large medium and giant BFT over a range from zero (on RFDs) to a maximum of three per vessel to allow for a reasonable opportunity to harvest the quota for BFT. As part of the final specifications on May 30, 2006 (71 FR 30619), NMFS adjusted the commercial daily BFT retention limit, in all areas, for those vessels fishing under the General category quota, to three large medium or giant BFT, measuring 73 inches (185 cm) or greater curved fork length (CFL), per vessel per day/trip. This retention limit, which was to remain in effect through August 31, 2006, inclusive, was extended through September, October, November, and December via separate actions published in the **Federal Register**. From January 1 - 31, 2007, inclusive, the General category daily BFT retention limit was scheduled to

Part IV

Environmental Protection Agency

40 CFR Part 63
National Emission Standards for Hazardous Air Pollutants From the Portland Cement Manufacturing Industry; Final Rule and Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2002–0051; FRL–8256–4]

RIN 2060–AJ78

National Emission Standards for Hazardous Air Pollutants From the Portland Cement Manufacturing Industry

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: On June 14, 1999, under the authority of section 112 of the Clean Air Act (CAA), EPA promulgated national emission standards for hazardous air pollutants (NESHAP) for new and existing sources in the Portland cement manufacturing industry. On December 15, 2000, the United States Court of Appeals for the District of Columbia Circuit (D.C. Circuit) remanded parts of the NESHAP for the Portland cement manufacturing industry to EPA to consider, among other things, setting standards based on the performance of the maximum achievable control technology (MACT) floor standards for hydrogen chloride (HCl), mercury, and total hydrocarbons (THC), and metal hazardous air pollutants (HAP).

EPA published a proposed response to the court's remand on December 2, 2005. We received over 1700 comments on the proposed response. This action promulgates EPA's final rule amendments in response to the court's remand and the comments received on the proposed amendments.

DATES: This final rule is effective on December 20, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0051. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, e.g., confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at EPA Docket, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for EPA Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Keith Barnett, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Metals and Minerals Group (D243–02), Research Triangle Park, NC 27711; telephone number (919) 541–5605; facsimile number (919) 541–3207; e-mail address *barnett.keith@epa.gov*.

SUPPLEMENTARY INFORMATION:

I. General Information

A. *Does this action apply to me?* Entities potentially affected by this action are those that manufacture Portland cement. Regulated categories and entities include:

TABLE 1.—REGULATED ENTITIES TABLE

Category	NAICS [1]	Examples of regulated entities
Industry	32731	Owners or operators of Portland cement manufacturing plants.
State	None	None.
Tribal associations	None	None.
Federal agencies	None	None.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. This table lists the types of entities that may potentially be regulated by this action. To determine whether your facility is regulated by this action, you should carefully examine the applicability criteria in 40 CFR 63.1340 of the rule. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. *Judicial Review.* The NESHAP for the Portland Cement Manufacturing Industry were proposed in December 2, 2005 (70 FR 72330). This action announces EPA's final decisions on the NESHAP. Under section 307(b)(1) of the CAA, judicial review of the final NESHAP is available only by filing a petition for review in the U.S. Court of Appeals for the D.C. Circuit by February 20, 2007. Under section 307(d)(7)(B) of the CAA, only an objection to a rule or procedure raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final NESHAP may not be challenged separately in any civil or criminal proceeding brought to enforce these requirements.

C. *How is this Document Organized?* The information presented in this preamble is organized as follows:

I. General Information
II. Background
III. Summary of the *National Lime Association* v. *EPA* Litigation
IV. EPA's Final Action in Response to the Remand
  A. Determination of MACT for Mercury Emissions
  B. Determination of MACT for HCl Emissions
  C. Determination of MACT for THC Emissions
  D. Evaluation of a Beyond-the-Floor Control Option for Non-Volatile HAP Metal Emissions
V. Other Rule Changes
VI. Responses to Major Comments
VII. Summary of Environmental, Energy, and Economic Impacts
  A. What facilities are affected by the final amendments?
  B. What are the air quality impacts?
  C. What are the water quality impacts?
  D. What are the solid waste impacts?
  E. What are the energy impacts?
  F. What are the cost impacts?
  G. What are the economic impacts?

  G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks
  H. Executive Order 13211, Actions That Significantly Affect Energy Supply, Distribution, or Use
  I. National Technology Transfer and Advancement Act
  J. Congressional Review Act

II. Background

Section 112(d) of the CAA requires EPA to set emissions standards for major stationary sources based on performance of the MACT. The MACT standards for existing sources must be at least as stringent as the average emissions limitation achieved by the best performing 12 percent of existing sources in the category or subcategory or the best performing five sources for source categories with less than 30 sources (CAA section 112(d)(3)(A) and (B)). This level is called the MACT floor. For new sources, MACT standards must be at least as stringent as the control level achieved in practice by the best controlled similar source (CAA section 112(d)(3)). EPA also must consider more stringent "beyond-the-floor" control options. When considering beyond-the-floor options, EPA must consider not only the maximum degree of reduction in emissions of HAP, but must take into account costs, energy, and non-air quality health environmental impacts when doing so.

On June 14, 1999 (64 FR 31898), in accordance with these provisions, EPA published the final rule entitled "National Emission Standards for Hazardous Air Pollutants From the Portland Cement Manufacturing Industry" (40 CFR part 63, subpart LLL).[1]

The legacy public docket for the final rule is Docket No. A–92–53. The final rule provides protection to the public by requiring Portland cement manufacturing plants to meet emission standards reflecting the performance of the MACT. Specifically, the 1999 final rule established MACT-based emission limitations for particulate matter (as a surrogate for non-volatile HAP metals), dioxins/furans, and for greenfield[2] new sources, THC (as a surrogate for organic HAP). We considered, but did not establish limits for, THC for existing sources and HCl or mercury for new or existing sources. In response to the mandate of the D.C. Circuit arising from litigation summarized below in this preamble, on December 2, 2005, we proposed amendments addressing standards for these pollutants. We received over 1700 comments on the proposed amendments. Most of these comments were from the general public and addressed the lack of a mercury emission limitation in the proposed amendments. This final action reflects our consideration of these comments. We have previously amended the Portland Cement NESHAP. Consistent with the terms of a settlement agreement between the American Portland Cement Alliance and EPA, EPA adopted final amendments and certain interpretative clarifications to the rule on April 5, 2002 (76 FR 16614), July 5, 2002 (67 FR 44766), and December 6, 2002 (67 FR 72580). These amendments generally relate to the rule's applicability, and to the performance testing, and monitoring provisions of the rule. In this action, we are also amending the rule to re-insert two paragraphs relating to the applicability of the Portland cement new source performance standards that were deleted in error in a previous amendment.

It should be noted that the rule text presented in this notice includes parts of the rule that are not being amended. This is done because, in some cases, adding additional rule text reduces the possibility of errors in updating the Code of Federal Regulations.

III. Summary of the National Lime Association v. EPA Litigation

Following promulgation of the NESHAP for Portland cement manufacturing, the National Lime Association and the Sierra Club filed petitions for review of the standards in the D.C. Circuit. The American Portland Cement Alliance, although not a party to the litigation, filed a brief with the court as *amicus curiae*. The court denied essentially all of the petition of the National Lime Association, but granted part of the Sierra Club petition.

In *National Lime Association* v. *EPA*, 233 F. 3d 625 (D.C. Cir. 2000), the court upheld EPA's determination of MACT floors for particulate matter (PM) (as a surrogate for non-volatile HAP metals) and for dioxin/furan. However, the court rejected EPA's determination that it need not determine MACT floors for the remaining HAP emitted by these sources, namely, mercury, other organic HAP (for which THC are a surrogate), and HCl (233 F. 3d at 633). The court specifically rejected the argument that EPA was excused from establishing floor levels because no "technology-based pollution control devices" exist to control the HAP in question (*Id.* at 634). The court noted that EPA is also specifically obligated to consider other pollution-reducing measures including process changes, substitutions of materials inputs, or other modifications (*Id.*). The court remanded the rule to EPA to set MACT floor emission standards for HCl, mercury, and THC. (*Id.* At 641.)

The Sierra Club also challenged EPA's decision not to set beyond-the-floor emission limits for mercury, THC, and non-volatile HAP metals (for which PM is a surrogate). The court only addressed the absence of beyond-the-floor emission limits for non-volatile HAP metals since EPA was already being required to reconsider MACT floor emission standards for mercury, THC, and HCl, and thus, by necessity, also must consider whether to adopt beyond-the-floor standards for these HAP. The Sierra Club argued, and the court agreed, that in considering beyond-the-floor standards for non-volatile HAP metals, EPA considered cost and energy requirements but did not consider non-air quality health and environmental impacts as required by the CAA (*Id.* at 634–35). The court also found EPA's analysis of beyond-the-floor standards deficient in its assertion that there were no data to support fuel switching (switching to natural gas) as a viable option of reducing emissions of non-volatile HAP metals (*Id.* at 635).

IV. EPA's Final Action in Response to the Remand

A. Determination of MACT for Mercury Emissions

1. Floor Determinations

In developing the proposed amendments we systematically evaluated all possible means of developing a quantified floor standard for mercury emissions from these sources, including both back end technology-based pollution control devices and front end feed and fuel control. See *National Lime*, 233 F. 3d at 634 (finding that EPA had erred in examining only technological (i.e., back-end) controls in considering a level for a mercury floor). We also were unable to devise any type of work practice standard that would result in mercury emissions reductions (70 FR 72332—72335, December 2, 2005).[3]

In response to comments on the proposed standards, we have performed additional evaluations of potential floors for mercury emissions (and also performed additional evaluations of

[1] Cement kilns which burn hazardous waste are in a separate class of source, since their emissions differ from Portland cement kilns as a result of the hazardous waste inputs. Rules for hazardous waste-burning cement kilns are found at subpart EEE of part 63.

[2] A new greenfield kiln is a kiln constructed after March 24, 1998 at a site where there are no existing kilns.

[3] Indeed, most of the options EPA considered are really beyond-the-floor alternatives, because they reflect practices that differ from those now in use by any existing source (including the lowest emitters). (Coal switching, switching to natural gas, and raw material switching are examples.) In EPA's view, a purported floor standard which forces every source in a category to change its practices is a beyond-the-floor standard. Such a standard may not be adopted unless EPA takes into account costs, energy, and non-air health and environmental impacts. 70 FR 72335.

beyond-the-floor options for mercury control). We obtained additional mercury emissions test data during and after the two comment periods on the proposed amendments and once again evaluated setting a floor based on the median of the 12 percent of the kilns demonstrating the lowest mercury emissions in stack tests. We discuss each of these possibilities in turn below.

a. *Control of Mercury in Primary*[4] *Raw Materials and Fossil Fuels.* i. *Mercury Emission Levels Reflecting Raw Material and Fossil Fuel Contributions are Inherently Site-Specific.*

As stated at proposal, mercury emissions come from the predominant input to a cement kiln by volume: The limestone which is the chief raw material for the kiln.[5] Small amounts of mercury also are found in other raw material inputs to the process.[6] Fossil fuel, almost always coal, is the other source of mercury emissions. Mercury levels in limestone vary enormously, both within a single quarry and between quarries, the result being that a single source may be unable to replicate its own performance in different tests, and could not duplicate a second source's performance since a kiln lacks access to any other kiln's limestone. Mercury levels in coal likewise vary significantly, although mercury emissions due to coal are normally swamped by the emissions attributable to limestone (70 FR 72333–34).

In an attempt to quantify the potential variability, we looked to see if there were facilities with multiple stack tests for mercury. We do have multiple test results for one of the lowest mercury emitters in the data base. During the first test with the raw mill on[7] the facility was one of the lower emitting facilities in the source category demonstrating emissions of 7.8 micrograms per dry standard cubic meter (μg/dscm) (all test values are corrected to seven percent oxygen). During a second test 8 years later (reflecting raw materials from the same quarry) mercury emissions with the raw mill on were 60 μg/dscm, a variability factor of roughly 8 times. We could identify no facility operational changes between the times of the two tests that would account for this large difference in mercury emissions.

We also obtained data from a facility that was retested for mercury in July 2005, within 3 months of an initial test. With the raw mill on, mercury emissions averaged 0.00138 pounds per hour in the April test and 0.00901 pounds per hour in the July test, a variability factor of 7. With the raw mill off, emissions averaged 0.00823 pounds per hour in the April test and 0.0189 pounds per hour in the July test. We also noted that during the April test mercury emissions with the raw mill off were below mercury emissions with the raw mill on in the July test. Because it is known that when the raw mill is on the raw meal adsorbs mercury, thereby reducing measured mercury emissions in the short term, we can only assume that the uncontrolled variation in the mercury levels in the raw materials—all of which come from the same quarry—was so great between the two tests that it negated the effect of the operating condition of the raw mill.

We also assessed potential variability by examining daily variations in cement kilns' raw materials and fuel mercury contents. We obtained data from an operating facility that analyzed samples of raw material and fuel each day over a 30 day period. We calculated average daily emissions assuming all the mercury in the raw materials and fuel was emitted. The average daily emissions would vary from a low of 0.09 lb to a maximum of 16.44 lb, or a factor of 183 (See Summary of Mercury Test data in Docket 2002–0051).

These are enormous swings in variability.[8] Moreover, it is virtually certain that the variability reflected in these results fails to cabin the total raw material and emissions variability experienced by the plants in the source category, since we have only a handful of results. These data confirm our tentative conclusion at proposal that constantly changing concentrations of mercury in kiln inputs leave no reliable way to quantify that variability. 70 FR 72333.

In the proposed amendments we also evaluated requiring facilities to switch from coal to natural gas as a method to reduce mercury emissions, or requiring use of so-called clean coal (70 FR 72333–34). We tentatively concluded that this was not feasible on a national basis due to insufficient supply and lack of infrastructure, and reiterate that conclusion here. One commenter noted that petroleum coke was another fuel that is lower in mercury and is currently used as a cement kiln fuel. However, a mercury standard based on requiring fuel switching to petroleum coke suffers from the same defects as requiring facilities to switch to natural gas. This fuel may not be available in all areas of the country and there may not be sufficient availability of the fuel to replace a significant percentage of the coal burned in cement kilns. Petroleum coke is a byproduct of petroleum refining, therefore the supply is limited by the demand for refined petroleum fuels. Petroleum coke has a low volatile matter content which can lead to ignition problems if burned without a supplemental fuel. It also typically has a higher sulfur content than coal. This can adversely affect kiln refractory life and increase internal corrosion of the kiln shell. As previously noted, each individual facility has specific requirements for raw material additives based on the chemical composition of its limestone. The minerals present in the coal ash fulfill part of those requirements. Therefore, replacing part or all of the coal currently used at a facility with petroleum coke, which has almost no ash, may force the facility to incorporate additional raw material additives containing mercury to compensate for the loss of the coal ash.

Thus, we adhere to the tentative conclusion reached at proposal: front end feed and fuel control of cement kilns is inherently site specific, and basing limits on kiln performance in individual performance tests which reflect only those inputs will result in limitations that kilns can neither duplicate (another kiln's performance) nor replicate (its own).

[4] We discuss in section IV.A.1.c below floor determinations for cement kilns using secondary materials (utility fly ash) as raw materials, in place of primary materials.

[5] Limestone makes up approximately 75 percent of the mass input to the kiln. Typically the way a cement plant is sited is that a limestone quarry suitable for cement production and that is expected to provide many years of limestone is identified and the plant is built next to the quarry. There are cases where a cement plant may purchase small amounts of limestone to blend with the limestone from its quarry. However, this close proximity of the quarry and cement plant is an inherent part of the cement manufacturing process and, therefore, a cement plant does not have the flexibility to obtain the bulk of its limestone from any other source. See 70 FR 72333.

[6] Post-proposal review of available data on other mercury raw materials indicates that other feed materials also contribute some mercury, though, in most cases, less than limestone. Other raw materials include (but are not limited to): shale or clay to provide alumina; iron ore to provide iron; and sand to provide silica. These raw materials are used in lesser amounts than limestone, and a cement plant may have some flexibility in the sources of other raw materials. As noted in the preamble to the proposed amendments, there are cases where a facility made changes to their raw materials (other then limestone) to reduce mercury emissions. However, this type of control is site specific based on the available materials and the chemical composition of the limestone. The site specific factors preclude using this as a basis for a national rule (70 FR 72334).

[7] See section c. below discussing operation of the in-line raw mill and its implication for mercury control.

[8] Variability of emissions based on the operation of air pollution controls are typically lower that those shown above because air pollution controls are typically designed to meet certain percent reduction or outlet emissions levels and to account for variations in inlet conditions.

ii. *Implications of Permit Limits for Mercury.* There are currently 19 cement kilns (out of 70 cement kilns for which we reviewed permit requirements) that have permit limits for mercury. At first blush, it might be argued that these permit limits demonstrate that variability of mercury emissions can be controlled, since sources must comply with the limitations. It might further be argued that these permit limits are "emission limitations achieved," the statutory basis for establishing floors for existing sources under section 112(d)(3). Likewise, for new sources, the lowest permit limit is arguably a measure of performance of the "best controlled similar source" (the permit itself being the means of control). We have determined, however, that for most facilities, the permit limit was established based on an estimate provided by the facility of the annual amounts of mercury that would enter the kiln with the raw materials and fuels. One facility had a mercury limit based on its estimated annual emission from an emissions test, and one facility had a limit based on a State law, although in neither case did the resulting permit cause a cement kiln source to alter or otherwise modify its existing practices to meet the limit. Thus, we find no cases where a facility actually has had to take any steps, either through the imposition of process changes or add-on controls, to reduce its mercury emissions as a result of any of these permit limits. See "Summary of Cement Kiln Permit Data for Mercury" in the docket.

We considered the option of setting an emissions limit, either on a pounds per year (lb/yr) or a pound per ton of clinker basis, based on the median of the top 12 percent of the 17 kilns with permit limitations. However, we repeat that none of the facilities with permit limits were required to actually take action to reduce mercury emissions. Their limits were all based on site specific factors (expected maximum conceivable levels of mercury emissions), and were set at a level that did not require the imposition of add-on controls, feed or fuel substitution, or any other constraint. Any limit we set based on these permits would require that at least some facilities apply beyond-the-floor control technology to meet the limit since feed and fuel control via substitution is not possible. Such a standard would impermissibly apply beyond-the-floor emission control without consideration of costs and other non-air health and environmental impacts.

We also considered a limit where each facility would set their own site specific limit based on the same procedures the facilities with permits used: determining in the course of the permitting process what its maximum conceivable mercury emissions are likely to be based on the facility's raw material and fuel inputs, and tacking on an additional variability factor. However, this would require that we set a separate limit for each facility, with each facility being its own subcategory (i.e. a different type of facility) based on its site specific raw materials and fuels. See 70 FR 72334, alluding to this possibility. EPA has great discretion in deciding whether or not to subcategorize within a source category. We do not believe a decision to individually subcategorize is warranted considering the fact that the result will be no discernable environmental benefit because conduct will be unaltered. *Chemical Mfr's Ass'n* v. *EPA*, 217 F. 3d 861, 866–67 (D.C. Cir. 2000) (arbitrary and capricious for EPA to impose costly regulatory obligations without some showing that the requirement furthers the CAA's environmental goals).

Therefore, we have determined that even though these permit limits exist, they have not resulted in a quantifiable reduction of mercury emissions. Any option to develop a MACT floor for mercury with these limits would either result in an unnecessarily complex rule with no environmental benefit, or a rule which improperly imposes a *de facto* beyond-the-floor standard without the required consideration of costs, energy and non-air quality impacts.

iii. *Why not Average the Performance Test Data?* Some commenters stated that EPA must simply average the results of the 12 per cent lowest mercury performance test data to establish the floor for existing sources, and establish the new source performance floor at the level of the lowest test result. We rejected this approach at proposal, and do so here, because it fails to account for the variability of mercury levels in raw materials and fuels and hence variability in performance. See 70 FR 72335; see also 70 FR 59436 (Oct. 12, 2006). We must, of course, account for sources' variability in establishing a MACT floor. *Mossville Environmental Action Now* v. *EPA*, 370 F. 3d 1232, 1241–42 (D.C. Cir. 2004). The only way all kilns, including the kilns with the lowest emission levels in individual tests, could meet this type of standard continuously, as required, would be to install backend technology-based control equipment. However, this would be a *de facto* beyond-the-floor standard, adopted impermissibly because of failure to assess cost, energy, and non-air quality health and environmental impacts. See 70 FR 72335.

We are aware that in the case of the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters (Boiler NESHAP), we used short term emissions data and applied a variability factor to determine a floor for mercury emissions (69 FR 55236, September 13, 2004). We do not believe that approach is applicable to the Portland cement source category. First, in the case of the Boiler NESHAP the floor was based on performance of a control technology, fabric filters, which means that facilities were exercising some control over mercury emissions and variability could be realistically cabined and quantified, so that an emission limit could be replicable and duplicable. Though the majority of cement kilns also use fabric filters, the collected particulate in this source category consists of product and, to some extent, unprocessed raw materials. As a result most of the collected particulate is recycled back to the process, largely negating any impact of the particulate control technology on mercury emissions.[9] Second, the variabilities seen as a result of fuel inputs in the Boiler NESHAP are much lower than the variabilities indicated in the Portland cement industry where the mercury fuel variability is a distant second to the enormous variability of mercury in the raw materials. We do not believe the data exist to accurately quantify this variability.

Another option we considered was using long term data to set a floor. However, since, to our knowledge, continuous emission monitors for mercury have not been demonstrated on cement kilns, and none currently exist on cement kilns, there is no long term stack performance data on mercury emissions from cement kilns that we could use to set a numerical emissions limit. The only available long term data of which we are aware is from several facilities which have a requirement to perform monthly analyses of composited daily samples of fuels and raw materials to calculate a 12 month mercury emissions total. However, all these kilns are located in one state (Florida) with unrepresentatively low levels of mercury in limestone (so far as we can determine). We do not believe these data would be representative of

[9] As explained in the following section of the preamble, however, EPA has determined that the floor for both existing and new sources involves the removal from the kiln system of collected particulate under designated circumstances. In addition, the floor for new sources reflects reductions in mercury based on performance of a wet scrubber.

the source category as a whole. More basically, basing a standard on one set of kilns' raw material inputs still suffers from the defect that no facility has access to another's raw materials.

b. *Floors for Facilities Using Utility Fly Ash as Raw Material.* Some cement kilns use utility fly ash as an alternative raw material to replace shale or clay.[10] These kilns replace a natural material, shale or clay, with a secondary material (i.e. a recycled air pollution control residue), fly ash. Approximately 34 cement manufacturing facilities are currently using utility boiler fly ash as a feedstock. We reviewed the available data and have come to the conclusion that cement kilns using fly ash are a different type of kiln, within the meaning of section 112 (d) (1) of CAA, and that for cement kilns currently using fly ash, the current use would be considered the MACT floor. Our reasoning is as follows.

Use of fly ash can have an effect on mercury emissions since fly ash contains mercury in varying amounts. As discussed below, mercury emissions may be higher or lower depending on the amounts of mercury involved vis-à-vis the raw materials that would otherwise be used (if available). But as also explained more fully below, some cement kilns using fly ash do not have an alternative raw material source. Given that these kilns use a different raw material, not always replaceable, and that the material affects mercury emissions, we believe that these kilns are a separate kiln type, and hence a separate subcategory, for purposes of mercury emissions. For a similar conclusion see 64 FR at 52871 (Sept. 30, 1999) (cement kilns that choose to burn hazardous waste in place of fossil fuels are a separate source category for MACT purposes).

We attempted to determine if, in general, facilities that use fly ash have higher emissions of mercury than those that do not. An analysis of data for EPA's toxic release inventory and the National Emissions Inventory did not show differences significant enough that we could draw any definitive conclusions. We considered reviewing the available mercury emissions test data to determine if we could discern a trend. However, as previously discussed, we do not believe these data are representative of long term mercury emissions. We also attempted to obtain data on the important issue of the amounts and mercury contents of fly ash used relative to other raw materials. These data apparently do not exist, with one exception discussed in the next paragraph. We do know that the two highest mercury emitting facilities (in individual performance tests) do not use fly ash. Without data on the actual mercury contributions of all materials, we do not believe we can draw any valid general conclusions on the impact of the use of fly ash on mercury emissions.

We do have detailed data from one facility that used fly ash where 50 percent of the total mercury input to the kiln is in the fly ash. However, even for this facility, we cannot accurately quantify the impact on mercury emissions of the decision to replace the shale used at this facility with fly ash because we have been unable to obtain data on the mercury content of the shale the fly ash replaced. We also have no mercury analysis data from the time period when the facility used shale.

There are other factors to consider when we evaluate the environmental effects—generally quite positive—of substituting fly ash for shale or clay. First, fly ash in general has a lower organic material content than shale or clay. At the facility just mentioned, replacing the shale with fly ash reduced emissions of THC from around 80 parts per million by volume (ppmv) to 3 ppmv. Because fly ash can reduce kiln fuel consumption, it reduces emissions of sulfur dioxide (SO_2), oxides of nitrogen (NO_X), and carbon monoxide (CO_2). Using fly ash as a kiln feed reduces the landfill requirements for disposal of utility fly ash. Use of fly ash reduces cement plant power consumption because it is usually fine enough that it can be added directly to the kiln rather then being ground in a mill. Use of fly ash also reduces fuel consumption because compared to the raw materials it typically replaces it is already highly calcined; it does not have the same types of large crystals as the raw materials it replaces (this improves burnability); some fly ashes have lower metal alkali content, thus avoiding hard burning to drive off alkali metals and reducing the need to operate the alkali bypass; it is drier than quarried materials, thus saving fuel used to dry materials. Many domestic cement plants have high pyrites in their quarry, especially in the shale or clay. In most cases, this pyrite is the main source of SO_2 emissions from the kiln. Using fly ash can significantly reduce the SO_2 emissions that result from pyrite in the raw materials. It also reduces the energy required for the quarring, milling, and transporting of the shale or clay prior to its use as a feedstock, as well as the associated air emissions.

It should also be noted that there are at least two new facilities whose permits specifically require use of fly ash as their alumina source, as they have no source for shale or clay, the primary material alternatives for alumina. Finally, a facility that currently uses fly ash may not be able to return to using the natural (i.e. primary) raw materials it replaced. For example, if the replaced raw materials were shale, the shale quarry may now be closed and the facility may not have access to a suitable shale supply.

Given the lack of any data to positively state the impact of fly ash on mercury emissions for the source category in general, as well as the positive environmental effects of using fly ash, there is no basis for a floor standard based on substituting other potential raw materials (such as shale or clay) for fly ash. At the same time, we do not see any means of identifying a floor for existing fly ash users based on substituting different fly ash types reflecting different mercury content. The recycled fly ash is not fungible. Cement kilns must carefully select only fly ash with needed properties within a relatively small tolerance. Cement kilns also usually are limited to fly ash available from boilers which are reasonably close to the kiln (typically within a few hundred miles) or shipping expense becomes prohibitive. The fly ash selection process is involved; it has taken years for kilns to identify a suitable fly ash source. Accordingly, we evaluate fly ash like the other raw material inputs into cement kilns, and do not believe that a floor that is based on substitution of either raw materials or other fly ash is justified because the input is variable and uncontrollable. We discuss in section IV.A.2 below the one exception to this conclusion for fly ash where the mercury content has been artificially increased by sorbent injection.

c. *Control of Collected Particulate (Cement Kiln Dust).* There are two operation factors that impact measured mercury emissions at the kiln stack. These are the use of in-line raw mills and the recycling of cement kiln dust (CKD).

Many (but not all) kiln systems have in-line raw mills. In these systems the kiln exhaust gas is routed through the raw mill to dry the raw materials. This process results in mercury contained in the flue gas being adsorbed by the raw meal.[11] This results in an apparent

[10] Though these are also raw materials inputs, the mass of clay or shale is typically less than 15 percent of the mass input to the kiln. Limestone makes up approximately 80 percent of the mass input.

[11] More specifically, when the mill is on-line, the kiln gas containing volatilized mercury is used to

reduction if mercury emissions are being measured at the kiln stack. However, the captured mercury is reintroduced into the kiln which creates a recycle loop of mercury until the captured mercury eventually escapes and is emitted to the atmosphere. Also, raw mills do not run continuously. When the raw mill is turned off, this effect of raw meal adsorption of mercury is negated and mercury emissions appear to increase. However, the increase is actually mercury that would have previously been emitted but was captured by the raw meal and returned to the kiln. The net effect is that an in-line raw mill does not increase or reduce mercury emissions over the long term; it simply alters the time at which the mercury is released.

Mercury is also adsorbed on the CKD collected in the particulate control device, typically a fabric filter or an electrostatic precipitators (ESP). Because the collected CKD mainly consists of product, and sometimes small amounts of raw materials, the collected CKD is recycled back to the kiln to the extent possible. The portion that cannot be recycled to the kiln is either sent to a landfill, or used in some other manner (i.e. some type of beneficial use). Most facilities require that a portion of the CKD be removed from the kiln system rather than returned to the kiln. This is done to bleed the kiln system of alkali materials that build up as they circulate which would otherwise contaminate product and damage the kiln lining. This practice necessarily reduces the overall volume of mercury emitted by cement kilns, as noted by several commenters, since the entrained mercury in the CKD is no longer available for release from the kiln. The amount of reduction is kiln-specific, based on the level of alkali materials in the kiln's raw materials and required product specifications, and therefore not quantifiable on a national basis. Nor would kiln-by-kiln site-specific emission standards be warranted, for the same reasons that site-specific limits based on mercury levels on raw material and fuel inputs are not justified. EPA is instead determining that a floor standard for both existing and new sources is the work practice that cement kiln dust be removed from the kiln system at the point that recirculation causes adverse effect on product.

d. *Standards Based on Performance of Wet Scrubbers.* There are at least five cement kilns that have limestone (wet) scrubbers installed for control of SO_2. Commenters noted that based on experience with utility boilers, and other similar combustion devices, there is reason to expect that the scrubbers installed on cement kilns also remove oxidized mercury.

To our knowledge, we obtained all the available data on wet scrubber controlled facilities after the comment period on the proposed amendments. This consists of data from 2004 and 2005 tests at two facilities measured exclusively at the scrubber outlet. These data range from 0.42 to 30 μg/dscm. Variability of mercury emissions at the scrubber-equipped kilns for which we have multiple test data differs by orders of magnitude. These data fall within the range of test data from all kilns (those with wet scrubbers and those without wet scrubbers). We have no test data for mercury measured at the scrubber inlet. As a result, we cannot, on the basis of the current data, determine with absolute certainty (though we believe it is reasonably certain) if the outlet mercury emissions from the wet scrubber equipped kilns are a result of mercury removal by the scrubber, or simply reflect the amounts of mercury in the raw materials. We now discuss the implications of this information for purposes of existing and new source floors. Note that the following discussion assumes the scrubbers remove oxidized mercury for reasons discussed below.

First, there are an insufficient number of wet-scrubber equipped kilns on which to base an existing source floor. The scrubber-equipped kilns would represent the best performing sources since data from other kilns simply reflect the mercury levels in kiln inputs on the day of the test. There are 158 operating kilns, and the information available to us indicates that only five of them are equipped with wet scrubbers. The median kiln of the top 12 percent would, therefore, not be a scrubber equipped kiln.[12]

However, for new sources mercury emissions would not be uncontrolled—solely dependent on raw material mercury content—but rather would reflect performance of "the best controlled similar source" (section 112 (d)(3)). A kiln so-equipped would thus have the best performance over time, since variability in mercury attributable to raw material and fuel inputs would be controlled in part.[13]

We believe there is a reasonable basis that wet scrubbers remove oxidized mercury from cement kiln emissions. First, wet scrubbers are known to remove oxidized mercury in most combustion applications though removal rates vary. We have speciated mercury test data on two kilns that indicate that there is a significant amount of oxidized mercury in at least some cement kilns. See mercury emission test data for Holcim, Dundee, MI and Lafarge, Alpena, MI, in docket EPA–HQ–OAR–2002–0051. Second, the limited data we have from cement kilns equipped with wet scrubbers is among the lowest end-of-stack mercury data in our data base (although not the lowest), which could indicate that some removal mechanism is involved. An important caveat, however, is that these data are exclusively end-of-stack, without paired inlet concentrations. These data thus do not with absolute certainty demonstrate that mercury removal is occurring or how much.

We estimated the performance of the best performing scrubber, and hence the new source MACT floor, to be 41 μg/dscm (corrected to 7 percent oxygen) using the following rationale. First, we limited the analysis to data from wet scrubber equipped kilns because, as just

sweep the mill of the finely ground raw feed particles. Since the mill temperature is only about 90 to 120 °C during this operational mode, the fine PM can adsorb the mercury in the gas stream, and the particles containing condensed mercury are stored in the raw feed silos. This stored raw mix then is fed to the kiln. The captured mercury is again volatilized and returned in the gas stream to the raw mill, only to be captured again in the raw mill, as described above. This process continues as long as the raw mill is on-line, and the raw feed continues to adsorb additional mercury through this process.

[12] Choosing the median source for assessing an existing source floor here is a reasonable manner of determining "the average emission limitation achieved by the best performing 12 percent of existing sources" (section 112 (d)(3)). Not only can the statutory term "average" be reasonably interpreted to mean median, but it is appropriate to do so here in order not to adopt a *de facto* beyond the floor standard. If one were simply to combine the mercury emission levels of the kilns equipped with wet scrubbers with other kilns whose mercury levels reflect raw material and fuel mercury levels at the time of the performance test, the resulting limit would not be achievable over time by any source other than one with a wet scrubber. Ostensible best performers would consequently have to retrofit with back end control, since otherwise they could not consistently achieve the results of their own performance tests.

[13] That is, variability would no longer be purely a function of the happenstance of the amount of mercury in raw materials (and fossil fuels) used in the test condition. As explained more fully below, performance of wet scrubbers, however, is variable, based not only on operation of the device but on mercury levels in input materials. Wet scrubbers on utility boilers, for example, are documented to remove between 0 to 72 percent of incoming mercury. See Control of Mercury Emissions from Coal-Fired Electric Utility Boilers: Interim Report Including Errata available at *http://www.epa.gov/nrmrl/pubs/600r01109/600r01109.htm*. We should note, however, that because utility boilers do not have the significant levels of alkaline materials that are present in cement kilns, which alkaline materials would impede mercury oxidation and scrubber efficacy, we do not view utility boilers as a "similar source" for purposes of section 112(d)(1).

discussed, the wet scrubber equipped kilns represent the best performing sources, regardless of their actual outlet emissions levels in individual performance tests. Second, we ranked all the wet scrubber mercury emissions with the raw mill off. We believe this is appropriate because the condition of raw mill off represents a normal operating mode for a cement kiln (albeit the operating mode when mercury emissions would be highest, as discussed above in section a.i). We then took the mean raw mill off value for mercury emissions from a cement kiln in our (limited) data base, and added to it a variability factor to account for normal variation in emissions. This variability factor is the standard deviation of the data multiplied by 2.326 (the z statistic) to produce the 99th confidence interval. We looked to all of the data, rather than to the data from the single lowest emitting kiln, because there are too few data points from that kiln (or from any one kiln) to estimate that kiln's variability. Given that variability is known to occur, we believe that this is the best approximation of variability of the best performing kiln presently available.

The result of this analysis is a new source floor of 41 μg/dscm that must be met continuously (raw mill on and raw mill off) (see further discussion in section A.3 below). This is an emissions limit that we believe will not be exceeded 99 percent of the time by the best performing kiln whose performance is used to set the standard.

Because of the limited performance data characterizing performance of the lowest-emitting scrubber-equipped kiln, the rule also contains an alternative new source mercury floor. The best performing kiln is equipped with a wet scrubber, although there could be questions about its performance over time. Therefore, if a new source installs a properly designed and operated wet scrubber, and is unable to achieve the 41 μg/dscm standard, then whatever emission level the source achieves (over time, considering all normal sources of variability) would become the floor for that source. Based on the design of the wet scrubber that is the basis of the new source floor, this would be a packed bed or spray tower wet scrubber with a minimum liquid-to-gas ratio of 30 gallons per thousand cubic feet of exhaust gas.

In sum, we conclude that floors for mercury for all existing cement kilns should be to remove accumulated mercury-containing cement kiln dust from the system at the point product quality is adversely affected. The floor for new sources is to utilize this same work practice, and in addition, to meet a standard of either 41 μg/dscm or a site-specific limit based on performance of a properly designed and operated wet scrubber.

As just explained, the mercury data on which the new source floor is based are not only limited, but fails to definitively answer the critical question of whether wet scrubbers are removing oxidized mercury, and, if so, to what extent. We are taking immediate steps to address this issue and augment the data base. In an action published elsewhere in this **Federal Register**, we are granting reconsideration of the new source standard adopted in this rule, both due to substantive issues relating to performance of wet scrubbers and because information about their performance in this industry has not been available for public comment. We also have initiated actions to obtain inlet and outlet test data for cement kilns equipped with wet scrubbers in order to determine if these controls remove mercury, and to what extent. In addition, we are committing to completing this reconsideration process within one year from December 20, 2006.

2. Beyond-the-Floor Determinations

During development of the original NESHAP for Portland cement manufacturing, we conducted MACT floor and beyond-the-floor analyses for kiln and in-line kiln/raw mill mercury emissions (63 FR 14182, March 24, 1998 and 64 FR 31898, June 14, 1999). We also conducted a beyond-the-floor analysis for mercury, based on the performance of activated carbon injection with an additional PM control device. Costs for the system would include the cost of the carbon injection system and an additional fabric filter (FF) to collect the carbon separately from the CKD. Based on the low levels of mercury emissions from individual Portland cement kilns, as well as the high cost per ton of mercury removed by the carbon injection/FF system, we determined that this beyond-the-floor option was not justified (63 FR 14202, March 24, 1998).

At proposal, EPA again concluded tentatively that a beyond the floor standard based on performance of activated carbon is not justified (70 FR 72335). We have since reevaluated beyond-the-floor control options for mercury emissions. This evaluation included both process changes and add-on control technology.

There are two potential feasible process changes that have the potential to affect mercury emissions. These are removing CKD from the kiln system and, for the subcategory of kilns that currently use fly ash as a raw material, replacing the fly ash with a lower mercury raw material. Substituting raw materials or fossil fuels with lower-mercury inputs could in theory reduce mercury emissions, but this alternative is infeasible for the reasons explained at 70 FR 72333–72334.

Generally, once mercury enters a kiln system, it has five potential fates: it may remain unchanged and become part of the final product; it may react with raw materials and exit the kiln in the clinker; it may vaporize in the high temperature of the kiln and/or preheater; it may condense or react with the cement kiln dust and be removed from the system; or it may exit the kiln system in vapor form or be adsorbed to a dust particle through the stack. In general, mercury in the fuel becomes volatilized near the kiln's combustion zone and is carried toward the feed end of the system along with combustion gases. Some of the mercury compounds pass through the entire system and exit in vapor phase through a stack. However, as the flue gas cools, some mercury may adsorb/condense onto dust particles in the cooler regions of the kiln system. Much of this dust containing condensed mercury would then be captured by the PM control device and for most kiln systems, returned to the kiln.

We evaluated, requiring a facility to further reduce the recycling of CKD beyond the wastage already needed to protect product quality, the floor for both existing and new sources. For a 600,000 tpy (tpy) kiln the estimated total annual cost would be $3.7 million just for replacement of CKD (which is actually product) and disposal of additional solid waste. This cost does not account for the increased raw materials costs and energy costs associated with reducing the recycling of the CKD. The mercury emissions reduction would range from 0.012 to 0.055 tpy based on assumed CKD mercury concentrations of 0.33 and 1.53 parts per million (ppm) respectively. The cost per ton of mercury reduction would range from $67 million to $308 million. See Costs and Impacts of Wasting Cement Kiln Dust or Replacing Fly Ash to Reduce Mercury Emissions in docket EPA–HQ–OAR–2002–0051. We note that the median value for the mercury content of recycled CKD for one study was only 0.053 ppm. See the report Mercury and Lead Content in Raw Materials in docket EPA–HQ–OAR–2002–0051. This would indicate that for the majority of the facilities the costs per ton would be even higher that those presented above. In addition, we

estimate that wasting 50 percent of the recycled CKD would reduce the energy efficiency of the process by six percent due to the need to process and calcine additional feed to replace the wasted CKD. It is possible that in some cases the wasted cement kiln dust could be mixed with the cement product rather than landfilled, or that some other beneficial use could be found. This would reduce the costs and non-air adverse impacts of this option. However, there are currently barriers to directly mixing CKD with clinker due to product quality and product specification issues. We do not have data available to evaluate the potential for beneficial use of the CKD. Based on these costs, the adverse energy impacts, and the increased adverse waste disposal impacts (see 64 FR 45632, 45635–36 (Aug. 20, 1999) for examples of potential hazards to human health and the environment posed by disposal of cement kiln dust), we do not believe this beyond-the-floor option is justified and therefore are not selecting it.

As previously noted, for the subcategory of facilities that use utility boiler fly ash as a kiln feed we determined that the current use represented the MACT floor. We considered two beyond-the-floor options for this subcategory. One option was to ban the use of any fly ash if it resulted in a mercury emissions increase over a raw material baseline, and the second was to only ban the use of fly ash whose mercury content had been artificially increased through the use of a sorbent to capture mercury in the utility boiler flue gas.

If we were to ban the use of utility boiler fly ash for any case where it has been shown to increase mercury emissions from the kiln over a raw material baseline, facilities would have to revert to using their previous raw materials, or to find alternative raw materials that provide the same chemical constituents as the fly ash. As previously noted, if a facility replaces their shale or clay with fly ash, the quarry for that material may now be closed and it may not be possible to cost-effectively obtain the previously used raw materials. And for at least two new facilities, the original raw materials used at startup will include fly ash, so there is no previously used material with which to compare the mercury content of the fly ash. Due to the site specific costs associated with raw materials, we don't have any data to calculate the costs of the beyond-the-floor option for the industry as a whole. In one example, we estimated the cost as approximately $136 million per ton of mercury reduction. See Costs and Impacts of Wasting Cement Kiln Dust or Replacing Fly Ash to Reduce Mercury Emissions in docket EPA–HQ–OAR–2002–0051. Also, this option would mean that all the fly ash currently being used as a cement kiln feed would now potentially have to be landfilled. This would generate an additional 3 million tpy of solid waste, with potential adverse health and environmental impacts associated with management of these wastes. There would also be adverse environmental air and non-air quality health and environmental impacts associated with the mining of additional raw materials that would have to be utilized. In addition, the overall kiln efficiencies (i.e. the amount of fuel required per ton of clinker produced) at the facilities using fly ash would be expected to decrease if the fly ash were replaced with shale or clay. This decrease may be as large as 10 percent (See Site Visit to Lafarge Cement in Alpena Michigan in the docket).

Based on the cost, energy, and adverse non-air quality health and environmental impacts, we believe that banning the current use of utility boiler fly ash is not justified.

We also separately evaluated the use of fly ash from a utility boiler where activated carbon, or some other type of sorbent injection, has been used to collect mercury. This practice does not currently occur. See 70 FR 72344 (voicing concern about potential for increased mercury emissions from cement kilns were such fly ash to be used). The mercury concentration in this type of fly ash will vary widely. However, full scale testing of fly ash from utility boilers using various sorbent injection processes has indicated there is a potential for sorbent injection to significantly increase fly ash mercury content (Characterization of Mercury-Enriched Coal Combustion Residues from Electric Utilities Using Enhanced Sorbents for Mercury Control in the docket EPA–HQ–OAR–2002–0051). Testing to date has shown increases by a factor of 2 to 10, and in one case of a very low mercury fly ash the increase was by a factor of 70.

Data from 16 cement facilities currently using fly ash not reflecting sorbed mercury showed mercury concentrations in the fly ash from 0.002 ppm to 0.685 ppm with a median of 0.136 ppm. Data on the fly ash mercury content of currently operating utility boilers testing sorbent injection showed levels ranging from 0.071 ppm up to 1.529 ppm with a median level of 1.156 ppm, significantly higher than the fly ash currently in use. Therefore, we see a potential for fly ash with enhanced mercury content due to sorbent injection at the utility site to increase mercury emissions from cement kilns, and for the increase to be much more significant than emissions attributable to the current fly ash being used.

We do not see a ban on the use of this type of fly ash as significantly affecting the overall current beneficial uses of fly ash. First, we do not anticipate the widespread use of activated carbon injection ACI in the utility industry until 2010 or later. Therefore, both the cement industry and the utility industry will have a significant amount of time to adjust to this requirement. Second, a utility boiler that decides to apply ACI for mercury control has the option of collecting the fly ash from sorbent injection systems separately from the rest of the facility's fly ash (e.g., EPRI'S TOXECON system). Therefore, the utility boiler could continue to supply non-sorbent fly ash to a cement kiln even after the application of ACI for mercury control. Finally, technology is being developed that would allow the mineral-rich portion of fly ash to be separated from the high carbon/high mercury portion.

Based on these factors, we are banning the use of utility boiler fly ash in cement kilns where the fly ash mercury content has been increased through the use of activated carbon or any other sorbent unless the facility can demonstrate that the use of that fly ash will not result in an increase in mercury emissions over baseline emissions (i.e., emissions not using the mercury increased fly ash). The facility has the burden of proving there has been no emissions increase over baseline. This requirement, adopted as a beyond-the-floor control, applies to both existing and new sources.

We also reevaluated our analysis of potential control options based on add-on control technology. These were control options based on the use of a limestone scrubber, and ACI.

As previously noted there are at least five cement kilns that have limestone (wet) scrubbers. As discussed in section IV.A.1.d above, there is a reasonable basis for believing that the wet scrubbers remove the oxidized mercury. There are no data available to allow us to definitively estimate the percent reduction expected. We performed a cost analysis based on an assumed mercury removal efficiency of 42 percent, which is transferred (solely for purposes of analysis) [14] from

[14] As explained in section 1.d, there are no data to definitively state that the percent reduction achieved by wet scrubbers in the utility industry are

Continued

performance of wet scrubbers in the utility boiler category and represents the greatest degree of removal one could expect to be consistently achieved for Portland cement kilns. We also note that the wet scrubber will achieve cobenefits of reducing SO_2 and dioxins (although dioxin removal would be relatively modest since any removal would be incremental to that required by the existing MACT dioxin standard for Portland cement kilns). The results of that analysis for an existing model large kiln are as follows:

TABLE 1.—PACKED BED SCRUBBER—COSTS AND EMISSION REDUCTIONS

Clinker production in tpy (tpy)	Total annualized cost ($/yr)	Emissions reduction		
		SO_2 (tpy)	D/F (g/yr)	Hg (lb/yr)
600,000	1,542,000	297	0.11	16.8–147

Based on this analysis the cost per ton of mercury removed ranges from $21 million per ton to $184 million per ton, a result that is not at all cost effective. In addition, a wet scrubber for a large kiln will generate approximately 45,500 tpy of solid waste and require approximately 980,000 kilowatt hour per year (kWhr/year) of electricity.

Based on the significant cost impacts per ton of emission reduction, and the adverse energy and solid waste impacts, and the uncertainty of the actual mercury emission reductions, we do not consider this control option to be reasonable for existing sources.

At proposal, EPA discussed and rejected a beyond-the-floor option based on the use of activated carbon injection. See 70 FR 72335. Commenters noted that our costs for ACI had not been updated from the costs calculated in development of the original NESHAP. In response, we have now updated our ACI costs based on more recent information. The total annualized costs for a large new or existing kiln ranges from $510,000 to $676,000 per year. Assuming an 80 percent reduction in mercury emissions, the cost per ton of mercury removal ranged from $4 million to $42 million per ton for existing kilns. The wide range in cost per ton of removal is mainly influenced by the baseline mercury emissions. Based on the wide variation we have seen in actual mercury emissions in this source category, the actual cost per ton would also vary widely from site to site as shown above.

We also evaluated a beyond-the-floor option for new kilns based on combining ACI and a wet scrubber. The incremental cost of ACI in this application is $9 to $89 million per ton of mercury removed, which we regard as a very high cost.

Our cost estimates assumed 80 percent emissions reduction for mercury. Though we are reasonably certain that ACI will remove mercury from cement kiln exhaust gas, we have no data on the actual expected removal efficiency. Data are available for one emissions test on a cement kiln burning hazardous waste. In this test the mercury removal efficiency averaged 89 percent removal. However, the inlet mercury concentration during the test varied from 65 to 267 μg/dscm. A review of the data for the individual test runs implies that the percent reduction decreases as the inlet concentration decreases. Almost all the non-hazardous waste cement kilns tested had mercury concentrations well below 65 μg/dscm. Therefore, the long term performance of ACI on mercury emissions from cement kilns is very uncertain. We also note that the application of ACI to a cement kiln (either alone or in combination with a wet scrubber) will generate approximately 1,600 tpy of solid waste for a new or existing large kiln. Recycling of the waste would be unlikely due to the toxics content.

For existing sources we rejected a control option based on the performance of ACI due to the significant cost per ton of mercury removed, increased energy use, and the adverse non-air quality health and environmental impacts (in the form of additional mercury and organic-laden waste generated). For new sources we rejected the option based on the performance of ACI combined with a wet scrubber for essentially the same reasons: significant cost per ton of mercury removed, increased energy use and adverse non-air quality health and environmental impacts. For both new and existing sources we also rejected this control option due to the uncertainty of the actual performance levels achieved, which leads to uncertainty of the actual cost per ton of mercury emissions reduction. We also note that the application of ACI potentially could result in a THC emission reduction of up to 117 tpy per kiln, though in most cases the reduction would be approximately 30 tpy or less. This THC emissions reduction is based on an assumed control efficiency of 50 percent. We do not see these small THC emission reductions (of which organic HAP are a small subset) to be a reason to alter our tentative decision at proposal that a standard based on performance of ACI is not justified as a beyond-the-floor control option.

Finally, for greenfield new sources (sources being newly built at a site without other cement kilns), we considered the option of requiring such a kiln to be sited at a low-mercury quarry. This concept has intuitive appeal: such a new kiln is not tied to an existing source of limestone, and so can choose where to be sited. The difficulty is in quantifying this type of standard. We cannot presently quantify what 'high mercury quarry' or 'low mercury quarry' means, and cannot responsibly select an arbitrary number that might make it impossible to build a new cement kiln in major parts of the country.

3. Conclusion

In sum, we conclude that the standards for mercury for all existing cement kilns are to remove accumulated mercury-containing cement kiln dust from the system at the point product quality is adversely affected. The standard for new sources is to utilize this same work practice, and in addition, to meet a standard of either 41 μg/dscm or a site-specific limit based on performance of a properly designed and operated wet scrubber.

In addition, we are banning the use of utility boiler fly ash in cement kilns where the fly ash mercury content has been increased through the use of activated carbon or any other sorbent unless the facility can demonstrate that the use of that fly ash will not result in an increase in mercury emissions over baseline emissions (i.e., emissions not using the mercury increased fly ash).

representatie of the percent reduction in the Portland cement source category. We used this figure in beyond-the-floor analyses as an upper bound best case for potential emission reductions.

Because the final standard is more stringent than the standard EPA proposed, the compliance date for sources which commenced construction after December 2, 2005, and before promulgation of this final rule is three years from December 20, 2006. See section 112(i)(2). New sources that commence construction after the date of promulgation of today's action must comply with the final rule upon start-up. However, as we are reconsidering the new source mercury standard and plan to take final action on that reconsideration in no more than a year and as construction of a new kiln generally takes at least 20–24 months, it is unlikely that any new source will be subject to the standard before completion of reconsideration.

We are also requiring that new sources demonstrate compliance by doing mercury emission testing with the raw mill off and with the raw mill on. The reason to test under both conditions is that (as explained in section A.1.c above) one other operation factor besides wet scrubber performance affecting emissions is the recycling of CKD. A facility could cut off CKD recycling for purposes of meeting the emission limit during testing with raw mill off, and then start recycling after the test which could result in the emissions limit being exceeded. We could simply limit CKD recycling to the level during the raw mill off test, but we believe this would potentially and needlessly restrict the ability of a facility to recycle CKD during raw mill on operation. During the test under each condition, the facility must record the amount of CKD recycle. The amount of CKD recycle becomes an operating limit not to be exceeded.

The limit for new sources adopted here also applies to both area and major new sources. We have applied this limit to area sources consistent with section 112(c)(6).

For facilities that elect to meet mercury emissions limits using ACI, we are incorporating the operating and monitoring requirements for ACI that are applicable when ACI is used for dioxin control.

B. Determination of MACT for HCl Emissions

In developing the 1999 Portland Cement NESHAP we concluded that no add-on air pollution controls were being used whose performance could be used as a basis for the MACT floor for existing Portland cement plants. For new source MACT, we identified two kilns that were using alkaline scrubbers for the control of SO2 emissions. But we concluded that because these devices were operated only intermittently, their performance could not be used as a basis for the MACT floor for new sources. Alkaline scrubbers were then considered for beyond-the-floor controls. Using engineering assessments from similar technology operated on municipal waste combustors and medical waste incinerators, we estimated costs and emissions reductions. Based on the costs of control and emissions reductions that would be achieved, we determined that beyond-the-floor controls were not warranted (63 FR 14203, March 24, 1998).

In the proposed amendments, we reexamined establishing a floor for control of HCl emissions from new Portland cement sources. Since promulgation of the NESHAP, wet scrubbers have been installed and are operating at a minimum of five Portland cement plants. See section IV.A.1.d above. For the reasons described above, this is an insufficient number of scrubbers on which to base an existing source floor for this category (id.). We did, however, propose to base the floor for new sources on the performance of continuously operated alkaline scrubbers, and proposed emissions levels of 15 ppmv at the control device outlet, or a 90 percent HCl emissions reduction measured across the scrubber, as the new source floor.

We also reexamined the MACT floor for existing sources. The only potential controls identified as a floor option was the operation of the kiln and PM control device themselves. Because the kiln and PM control system contain large amounts of alkaline CKD, the kilns themselves remove a significant amount of HCl (which reacts with the CKD and is captured as particulate). See 70 FR 72337 and 69 FR 21259 (April 20, 2004). We proposed as a floor the operation of the kiln and PM control as a work practice standard.

We also evaluated requiring the use of an alkaline scrubber as a beyond-the-floor control option for existing sources. We found that the costs and non-air quality health and environmental impacts were not reasonable for the emissions reductions achieved.

We also solicited comment on adopting alternative risk-based emission standards for HCl pursuant to section 112(d)(4) of the CAA (70 FR 72337). We suggested two possible approaches for establishing such standards. Under the first approach an alternative risk-based standard would be based on national exposure standards determined by EPA to ensure protection of public health with an ample margin of safety, and to be protective of the environment. For reasons discussed below we have decided to adopt this approach. Under the second approach, which we are not adopting, site specific risk analyses would be used to establish standards on a case-by case basis.

After careful consideration of the comments on the proposed amendments, we are not requiring control of HCl emissions from cement kilns under section 112(d). Under the authority of section 112(d)(4) of the CAA, we have determined that no further control is necessary because HCl is a "health threshold pollutant," and human health is protected with an ample margin of safety at current HCl emission levels. The following explains the statutory basis for considering health thresholds when establishing standards and the basis for today's decision, including a discussion of the risk assessment conducted to support the decision.

Section 112 of the CAA includes exceptions to the general statutory requirement to establish emission standards based on MACT. Of relevance here, section 112(d)(4) allows us to develop risk-based standards for HAP "for which a health threshold has been established" provided that the standards achieve an "ample margin of safety." Therefore, we believe we have the discretion under section 112(d)(4) to develop standards which may be less stringent than the corresponding technology-based MACT standards for threshold hazardous air pollutants emitted by some source categories. See 67 FR 78054, December 20, 2002 and 63 FR 18765, April 15, 1998.

In evaluating potential standards for HCl for this source category, we seek to assure that emissions from every source in the category result in exposures not causing adverse effects, with an ample margin of safety, even for an individual exposed at the upper end of the exposure distribution. The upper end of the exposure distribution is calculated using the "high end exposure estimate," defined as a plausible estimate of individual exposure for those persons at the upper end of the exposure distribution, conceptually above the 90th percentile, but not higher than the individual in the population who has the highest exposure. We believe that assuring protection to persons at the upper end of the exposure distribution is consistent with the "ample margin of safety" requirement in section 112(d)(4).

Our decision not to develop standards for HCl from cement kilns is based on the following. First, we consider HCl to be a threshold pollutant. See 63 FR 18767, 67 FR 78054, and 70 FR 59407, October 12, 2005. Second, we have defined threshold values for HCl in the

form of an Inhalation Reference Concentration (RfC) and acute exposure guideline level (AEGL). Third, HCl is emitted from cement kilns in quantities that result in human exposure in the ambient air at levels well below these threshold values with an ample margin of safety. Finally, there are no adverse environmental effects associated with HCl emissions from cement kilns. The bases and supporting rationale for these conclusions are as follows.

For the purposes of section 112(d)(4), several factors are considered in our decision on whether a pollutant should be categorized as a health threshold pollutant. These factors include evidence and classification of carcinogenic risk and evidence of noncarcinogenic effects. For a detailed discussion of factors that we consider in deciding whether a pollutant should be categorized as a health threshold pollutant, please see the April 15, 1998, **Federal Register** document (63 FR 18766). In the April 15, 1998, action cited above, we determined that HCl, a Group D pollutant, is a health threshold pollutant for the purpose of section 112(d)(4) of the CAA (63 FR 18753).

The Portland Cement Association (PCA) conducted a risk assessment to determine whether the emissions of HCl from cement kilns at the current baseline levels resulted in exposures below the threshold values for HCl. We reviewed the risk assessment report prepared by the PCA and believe that it uses a reasonable and conservative methodology, is consistent with EPA methodology and practice, and reaches a reasonable conclusion that current levels of HCl emissions from cement kilns would be well under the threshold level of concern even for assumed worst-case human receptors.

The PCA analysis evaluated long-term and short-term ambient air concentrations resulting from emissions of HCl from Portland cement kilns in order to quantify potential non-cancer risks associated with such emissions, as well as to characterize potential ecological effects of those emissions. The approach is based on the USEPA guidance document entitled "A Tiered Modeling Approach for Assessing the Risks Due to Sources of Hazardous Air Pollutants" (USEPA 1992) (Tiered Modeling Approach) and is consistent with EPA risk characterization guidance "Air Toxics Risk Assessment Reference Library—Volume 2—Facility-Specific Assessment" (USEPA, 2004). The PCA conducted dispersion modeling for 67 cement plants and 112 cement kilns, representing about two-thirds of all operating cement plants in the U.S., using stack parameter data provided by cement companies and conservative assumptions regarding (among other factors) HCl stack concentrations, operating conditions, receptor locations, and dispersion characteristics. The kilns for which data were provided cover a full range of kiln types, operating conditions, and stack parameters. The three-tiered modeling approach consists of:

- Tier 1—Lookup tables.
- Tier 2—Screening dispersion modeling.
- Tier 3—Detailed dispersion modeling.

The concentration estimates from each modeling tier should be more accurate and less conservative than the previous one. As a result, the level of complexity of the modeling and data input information required for each tier is greater than for the previous tier. If a plant showed emissions below the threshold concentration in any tier, that plant was not included in the next tier of modeling.

In order to evaluate potential health impacts it is necessary to establish long term concentration thresholds. The RfC is a long-term threshold, defined as an estimate of a daily inhalation exposure that, over a lifetime, would not likely result in the occurrence of significant noncancer health effects in humans. We have determined that the RfC for HCl of 20 micrograms per cubic meter ($\mu g/m^3$) is an appropriate threshold value for assessing risk to humans associated with exposure to HCl through inhalation (63 FR 18766, April 15, 1998). Therefore, the PCA used this RfC as the threshold value in their exposure assessment for HCl emitted from cement kilns.

The general approach was that actual release characteristics were used for stack height, stack diameter, exit temperature, and exit velocity, based on information provided by the individual facilities modeled by the PCA. The analyses performed under each tier assumed worst case operating scenarios, such as maximum production rate and 24 hours per day, 365 days per year operation, and that all kilns were located 10 meters from the property boundary line. HC1 emission rates were assumed to be 130 ppmv for all kiln types. This is an extremely conservative number. Hydrogen chloride emission rates are below 10 ppmv at most facilities, and the highest value for which we have data is below 45 ppmv. In the Tier 2 analyses, worse case metrological conditions were assumed. Further, it is important to note that these predicted impacts are located adjacent to facility property lines, many times in locations where chronic exposure is not expected. Impacts at potential residential locations would be expected to be significantly below those presented in the analysis.

The PCA study generated estimates of chronic (annual average) concentrations for comparison to the relevant health reference values or threshold levels. Chronic exposures were compared to the RfC of 20 $\mu g/m^3$ for long-term continuous exposure.

Noncancer risk assessments typically use a metric called the Hazard Quotient (HQ) to assess risks of exposures to noncarcinogens. The HQ is the ratio of exposure (or modeled concentration) to the health reference value or threshold level (i.e., RfC or REL). HQ values less than 1 indicate that exposures are below the health reference value or threshold level and are likely to be without appreciable risk of adverse effects in the exposed population. HQ values above 1.0 do not necessarily imply that adverse effects will occur, but that the potential for risk of such effects increases as HQ values exceed 1.0.

For the PCA assessment, if the HQ was found to be less than one for any of the tiers using conservative defaults and modeling assumptions, the analysis concluded with that tier. On the other hand, if the HQ exceeded one, analysis proceeded to subsequent tiers.

The Tier 1 modeling resulted in an HQ above 1 for most facilities. Therefore, a Tier 2 analysis was required. In the Tier 2 analysis, all facilities except for five showed an HQ below 1.

For the five facilities with an HQ above 1, additional data were obtained on the actual HCl and stack moisture concentrations at these facilities and the Tier 2 modeling analysis was rerun. The refined Tier 2 analysis resulted in HQ values of 0.30 or less for all five facilities.

Thus, we have evaluated and are comfortable with PCA's calculations and feel confident that exposures to HCl emissions from the facilities in question are unlikely to ever exceed an HQ of 1.0. Therefore, we believe that the predicted exposures from these facilities should still be protective of human health with an ample margin of safety. Put another way, total exposures for nearby residents would not exceed the short-term or long-term health based threshold levels or health reference values. Similarly, based on the PCA analysis we believe that the acute exposure to HC1 for these facilities would not exceed the short-term, health-based threshold level.

The standards for emissions must also protect against significant and widespread adverse environmental

effects to wildlife, aquatic life, and other natural resources. The PCA did not conduct a formal ec0ological risk assessment. However, we have reviewed publications in the literature to determine if there would be reasonable expectation for serious or widespread adverse effects to natural resources.

We consider the following aspects of pollutant exposure and effects: toxicity effects from acute and chronic exposures to expected concentrations around the source (as measured or modeled), persistence in the environment, local and long-range transport, and tendency for biomagnification with toxic effects manifest at higher trophic levels.

No research has been identified for effects on terrestrial animal species beyond that cited in the development of the HCl RfC. Modeling calculations indicate that there is little likelihood of chronic or widespread exposure to HCl at concentrations above the threshold around cement manufacturing plants. Based on these considerations, we believe that the RfC can reasonably be expected to protect against widespread adverse effects in other animal species as well.

Plants also respond to airborne HCl levels. Chronic exposure to about 600 µg/m3 can be expected to result in discernible effects, depending on the plant species. Further, in various species given acute, 20 minute exposures of 6,500 µg/m3, field studies report different sensitivity to damage of foliage. The maximum modeled long-term HCl concentration (less than 100 $\mu g/m^3$) is well below the 600 $\mu g/m^3$ chronic threshold, and the maximum short-term HCl concentration (less than 1600 $\mu g/m^3$) is well below the 6,500 $\mu g/m^3$ acute exposure threshold. Therefore, no adverse exposure effects on plant species are anticipated.

HCl is not considered to be a strongly persistent pollutant or one where long range transport is important in predicting its ecological effects. In the atmosphere, HCl can be expected to be absorbed into aqueous aerosols, due to its great affinity for water, and removed from the troposphere by rainfall. Toxic effects of HCl to aquatic organisms would likely be due to the hydronium ion, or acidity. Aquatic organisms in their natural environments often exhibit a broad range of pH tolerance. Effects of HCl deposition to small water bodies and to soils will primarily depend on the extent of neutralizing by carbonates or other buffering compounds. Chloride ions are essentially ubiquitous in natural waters and soils so minor increases due to deposition of dissolved HCl will have much less effect than the deposited hydronium ions.

In conclusion, acute and chronic exposures to expected HCl concentrations around cement kilns are not expected to result in adverse environmental toxicity effects. HC1 is not persistent in the environment. Effects of HCl on ponds and soils are likely to be local rather than widespread. Finally, HCl is not believed to result in biomagnification or bioaccumulation in the environment. Therefore, we do not anticipate any adverse ecological effects from HCl.

The results of the exposure assessment showed that exposure levels to baseline HCl emissions from cement production facilities are well below the health threshold value. Additionally, the threshold values, for which the RfC and AEGL values were determined to be appropriate values, were not exceeded when considering conservative estimates of exposure resulting from cement kiln emissions as well as considering background exposures to HCl and therefore, represent an ample margin of safety. Furthermore, no significant or widespread adverse environmental effects from HCl are anticipated. Therefore, under authority of section 112(d)(4), we have determined that further control of HCl emissions from new or existing cement manufacturing plants under section 112(d) is not necessary.

C. Determination of MACT for THC Emissions

1. Floor Determinations

THC serve as a surrogate for non-dioxin organic HAP emissions for this source category. During the development of the 1999 Portland Cement NESHAP, EPA identified no add-on air pollution control technology being used in the Portland cement industry whose performance could be used as a basis for establishing a MACT floor for controlling THC emissions from existing sources. EPA did identify two kilns using a system consisting of a precalciner (with no preheater), which essentially acts as an afterburner to combust organic material in the feed. The precalciner/no preheater system was considered a possible basis for a beyond-the-floor standard for existing kilns and as a possible basis for a MACT floor for new kilns. However, this system was found to increase fuel consumption relative to a preheater/precalciner design, to emit six times as much SO_2, two and one half times as much NO_X, and 1.2 times as much CO_2 as a preheater/precalciner kiln of equivalent clinker capacity. Taking into account the adverse energy and environmental impacts, we determined that the precalciner/no preheater design did not represent MACT (63 FR 14202, March 24, 1998). We also considered feed material selection for existing sources as a MACT floor technology and concluded that this option is not available to existing kilns, or to new kilns located at existing plants because these facilities generally rely on existing raw material sources located close to the source due to the cost of transporting the required large quantities of feed materials. However, for new greenfield kilns, feed material selection as achieved through appropriate site selection and feed material blending is demonstrated and is the basis for new source MACT (63 FR 14202, March 24, 1998).

In our proposed amendments we reexamined MACT for THC for both new and existing facilities. We proposed to adopt the same standards for Portland cement kilns as are applicable to kilns that fire hazardous waste (40 CFR 63.1220(a)(5)). Those standards are based on using good combustion conditions to destroy hazardous air pollutants in fuels. Our rationale for proposing to adopt these standards was that the THC and carbon monoxide (CO) standards guarantee that the kiln will operate under good combustion conditions and will minimize formation (and hence, emissions) of non-dioxin organic HAP from fuel combustion. We believed that the control of THC emissions from cement kilns which do not fire hazardous waste should be no more difficult to control than emissions for kilns that do fire hazardous waste because GCP are maintainable by either type of kiln, and the hazardous waste cement kilns would be the more challenged in that regard. Because we had no data upon which to set a different standard, and because we believed these levels were indicative of good combustion in any case, the adoption of the standards for cement kilns firing hazardous waste was deemed appropriate.

We continue to believe that good fuel combustion conditions are indicative of the performance of the median of the best performing 12 percent of existing sources for controlling non-dioxin organic HAP. However, based on comments received on the proposed amendments, and additional emission data analysis, we believe our proposed quantified method of monitoring good fuel combustion, i.e. setting specific THC or CO levels, was flawed.

Industry commenters had noted that the majority of the THC emissions from a cement kiln main stack result from the

introduction of feed materials into the cold end of the kiln. These emissions are essentially a function of the organic content of the raw materials, and cannot be controlled using GCP, which is the basis of our MACT floor. At proposal we agreed with this assessment (and continue to agree with it), but believed that the fact that cement kilns that burn hazardous waste can meet these standards indicated that the proposed level could be met by all cement kilns under good combustion conditions, even considering the fact that good combustion cannot control THC or CO emissions emanating from organic materials in the feed. We also believed that by allowing a facility to monitor CO as a surrogate for THC, we had provided sufficient flexibility to account for variations in feed material organic content.

We have reevaluated these assumptions. First, we obtained additional THC emission data from several facilities. These data demonstrate that there are certain cement facilities where THC emissions, with no indication of poor fuel combustion practices, exceed 20 ppmv. The data also indicate that achieving the 100 ppmv CO level, even for cement kilns with low organic content feed and good fuel combustion conditions, is not possible without use of a control device. See Lehigh CO and THC data in docket EPA-HQ-OAR–2002–0051. Moreover, the analogy with hazardous waste-burning cement kilns breaks down. If a cement kiln that fires hazardous waste cannot meet the THC or CO limits in the Hazardous Waste Combustor (HWC) NESHAP due to organic materials in their feed, they can (and have) simply stopped firing hazardous waste. This can either be done permanently, or temporarily anytime the kiln operator notes that THC or CO emissions are approaching the emission limits. This option is not available to cement kilns that do not fire hazardous waste; they cannot stop making cement without ceasing business altogether. This would mean that facilities with higher levels of organic materials in the raw materials would be forced to adopt some type of add-on control to meet the emissions limits. As we have previously stated, we believe this would result in the imposition of a beyond-the-floor standard without the mandated consideration of costs and other impacts. See 70 FR 72335.

As a result, although we adhere to our approach at proposal that the MACT floor for control of non-dioxin organic HAP at existing sources is operating under good combustion conditions, we are adopting a different means of demonstrating that good fuel combustion conditions exist.

In the final amendments, we are requiring that existing kilns and in-line kilns/raw mills must implement GCP designed to minimize THC from fuel combustion. GCP include training all operators and supervisors to operate and maintain the kiln, calciner, and pollution control systems in accordance with good engineering practices. The training shall include operating the kiln, calciner, and pollution control system in a manner to minimize excess emissions.

We have also reexamined the proposed MACT floor for new sources. There are currently two cement kilns with add-on controls which reduce emissions of THC. At one facility, activated carbon is injected into the flue gas and collected in the PM control device. The carbon adsorbs some of the THC. The collected carbon is then reinjected into the kiln in a location that ensures destruction of the collected THC. However, the THC emissions from this facility are the highest for any facility for which we have data. Therefore, we do not consider this to represent the best controlled source. This same facility also has an alternative control scheme for THC of a limestone scrubber followed by a regenerative thermal oxidizer (RTO). However, these control devices have not operated continuously due to significant operation problems caused by the site specific constituents in the flue gas. (See e-mail from Michael D. Maillard, Michigan Department of Environmental Quality in docket EPA–HQ–OAQ–2002–0051.) Because these controls have not been demonstrated to have the ability to operate continuously, we cannot consider them as the basis for a new source MACT floor (or an emission standard, for that matter).

A second facility also has a limestone scrubber followed by an RTO. The scrubber is necessary to prevent fouling, plugging, and corrosion of the RTO. In this case the scrubber/RTO operates continuously and efficiently. This facility has been tested and showed VOC (essentially the same as THC) emission levels of 4 ppmv (at 7 percent oxygen), and currently has a permit limit for VOC of approximately 9 ppmv. The RTO has a guaranteed destruction efficiency of 98 percent of the combined emissions of CO and THC. Based on this information we believe this facility is the best controlled source, and that the performance of a limestone scrubber followed by an RTO is the basis for new source MACT floor for non-dioxin organic HAP, measured as THC. We explain below how we assess the long-term performance capabilities of this control device considering variable organic levels in raw materials and other process variabilities.

We are retaining the proposed THC emission limit of 20 ppmv measured at the main kiln stack as the MACT floor for all new or reconstructed kilns and inline raw mill/kilns. An alternative to the 20 ppmv floor level is that a facility may demonstrate a 98 percent reduction in THC emissions from uncontrolled levels—the level of emission reduction required by permit for the best performing source in the category. We have determined in other rules that a 20 ppmv outlet emissions level or 98 percent destruction efficiency represent the long term performance of an RTO under the varying conditions typically encountered in industrial applications. See Thermal Incinerators and Flares in Docket EPA–HQ–OAR–2002–0051. As noted above, the one cement facility with an RTO operating full-time has actual and permitted emission levels which are below 20 ppmv. However, the performance guarantee at this facility is based on the combined emissions of CO and THC. Therefore, all new facilities could meet the permitted emission levels of the one facility that has an RTO only if they all have the same levels of CO in the exhaust gas. We have no data to support that all new kilns will have sufficient CO in the exhaust streams to guarantee that they can meet the same level of performance as the one facility noted above, or, conversely that this one facility would continue to meet the same THC levels if CO levels in its exhaust gas differed. We thus believe long term performance for THC alone is better characterized based on the well-established data documenting performance of RTO for THC. Moreover, the percent reduction achievable by an RTO is dependent on the inlet concentration of organics. See Thermal Incinerators and Flares in Docket EPA–HQ–OAR–2002–0051. Thus, we believe that a limit based on the demonstrated performance of RTO under a variety of circumstances is the best measure of the long term performance of this device under the circumstances likely to be encountered by new cement kilns, especially varying levels of organics in the feed.

2. Beyond-the-Floor Determinations

In the December 2005, proposed amendments we considered beyond-the-floor options for existing sources of substituting raw materials with lower organic contents, but we determined this beyond-the-floor option was not feasible (70 FR 72340). We also considered a beyond-the-floor THC

standard of 20 ppmv based on the use of the scrubber/RTO control system. Based on the available data, we estimate that approximately 75 percent of existing kilns could meet a 20 ppmv standard without the addition of controls. For an existing preheater/precalciner kiln that could not meet a 20 ppmv standard without controls, the capital cost would be approximately $10.7 million and the total annualized cost would be approximately $3.9 million. The cost per ton of THC reduction would be in the area of $20,000, assuming an inlet concentration of about 63 ppmv. We estimate that approximately 5 percent of the THC is actually organic HAP. Therefore, the cost of organic HAP reduction would be $398,000 per ton. In addition, the energy use for one large kiln to operate an RTO would be approximately 99.7 billion British thermal units per year, a very high energy consumption rate. The wet scrubber required upstream of the RTO would also result in 40 million gallons per year of additional water usage and create 45,500 tpy of solid waste (from dewatered scrubber sludge). Based on the costs, significant adverse energy impacts, and adverse non-air quality health and environmental impacts, we do not believe a beyond-the-floor standard is justified.

We also examined a beyond-the-floor regulatory option based on the use of ACI for THC control. The total annual cost for this option would be $470,000 to $600,000 for an existing preheater/preclaciner kiln. The cost per ton of THC reduction would be in the area of $5,000, assuming an inlet concentration of about 63 ppmv. We estimate that approximately 5 percent of the THC is actually organic HAP. Therefore, the cost of organic HAP reduction would be $100,000 per ton. In addition, this control option would generate approximately 850 tpy of solid waste. Based on the high costs, energy impacts, and adverse non-air quality health and environmental impacts, we do not believe a beyond-the-floor standard is justified.

We did not examine a beyond-the-floor regulatory option for new sources because there are no controls that would, on average, generate a greater THC reduction than a combination of a wet scrubber/RTO. Thus, the floor level is also new source MACT.

3. Conclusion

In sum, we conclude that the standards for THC for all existing cement kilns is implementing GCP designed to minimize THC emissions from fuel combustion. The compliance date for this standard is one year from December 20, 2006. Because all facilities already have some type of training program, we believe one year is sufficient to comply with this requirement. See section 112(1)(3) (compliance dates for MACT standards "shall provide for compliance as expeditiously as practicable").

The standard for new sources is to meet a THC standard of either 20 ppmv or a 98 percent reduction in THC emissions from uncontrolled levels. However, as explained above, performance of a back-end control device (*i.e.* the RTO, preceded by an enabling scrubber) was not the basis of the proposed new source standard. Information that one kiln utilizes an RTO, as well as information regarding the technical capabilities of RTO, emerged following the public comment period and therefore has not previously been available for public comment. To afford opportunity for comment, EPA is itself immediately granting reconsideration of the new source standard for THC in a notice published elsewhere in today's **Federal Register**.

The original Portland Cement NESHAP contains a 50 ppmv THC emissions limit for new greenfield kilns, kilns/inline raw mills, and raw materials dryers. There are no situations we can identify where a 50 ppmv limit would be more stringent than a 98 percent reduction limit. Since this 50 ppm limit is less stringent than the new source standard we are adopting in this rule reflecting performance of an RTO, it is obviously not appropriate to retain it. We are thus finding that the floor for greenfield new sources (and all other new sources under this rule) is 20 ppm/98 percent THC, with one exception. This new source limit will, at least for some new facilities, require the application of a back end control. For this reason, we do not believe this limit should be applied retroactively to sources constructed prior to December 2, 2005, the date of proposal for the amendment. See the response to comment concerning new sources in section VI for our rationale for this decision. So for sources constructed prior to December 2, 2005, we are not amending the 50 ppmv THC limit.

Consistent with section 112(c)(6) we are applying the 20 ppmv/98 percent reduction limit to both major and area new sources. We are also applying the limit to raw materials dryers. We anticipate that all new kilns will be preheater/precalciner kilns with an inline raw mill (*i.e.* there will be no separate dryer exhaust). This is the design of the kilns that form the basis of new source MACT for THC. However, we see no reason that the floor level of control should not apply in the case where there is a separate raw material dryer. We note that in the original NESHAP, the 50 ppmv standard also applied to raw material dryers.

We are adopting our proposed requirement that compliance for a THC standard will be demonstrated using a CEM and a 1-hour averaging period. See 70 FR 72340. The previous 50 ppmv standard for new greenfield sources was based on a monthly average. We believe a monthly average was appropriate for that standard (and are retaining monthly averaging for kilns subject to that standard) because the standard's basis is selection of raw materials. There can be significant short term variations in raw materials, even if a facility can meet the standard in the long term. In the case of these final amendments the required level of performance is based on an emissions control technology. Therefore, we do not anticipate the same type of short term variability that existed with the previous 50 ppmv standard.

Because the final standard is more stringent than the standard EPA proposed, the compliance date for sources which commenced construction after December 2, 2005, and before promulgation of this final rule is 3 years from December 20, 2006. See section 112(i)(2). We consider the final standard to be more stringent than the proposed standard because it is based on the performance of a control device (notwithstanding that the numeric limit is the same as proposed), and now controls both THC emissions from fuel combustion and THC emissions resulting from the organic materials in the kiln feed, and is more likely to result in significant costs and changes in operation than the proposed standard.

For new sources that elect to meet THC emissions limits using ACI, we are incorporating the operating and monitoring requirements for ACI that are applicable when ACI is used for dioxin control.

D. Evaluation of a Beyond-the-Floor Control Option for Non-Volatile HAP Metal Emissions

In our MACT determination for PM (the surrogate for non-volatile HAP metals), we concluded that well-designed and properly operated FF or ESP designed to meet the new source performance standards (NSPS) for Portland cement plants represent the MACT floor technology for control of PM from kilns and in-line kiln/raw mills. Because no technologies were identified for existing or new kilns that would consistently achieve lower

emissions than the NSPS, EPA concluded that there was no beyond-the-floor technology for PM emissions (63 FR 14199, March 24, 1998).

In *National Lime Association* v. *EPA,* the court held that EPA had failed to adequately document that substituting natural gas for coal was an infeasible control option, and also that EPA had not assessed non-air quality health and environmental impacts when considering beyond-the-floor standards for HAP metals (233 F. 3d at 634–35). As a result, the court remanded the beyond-the-floor determination for HAP metals for further consideration by EPA.

We presented our reexamination of a beyond-the-floor MACT control standard for HAP metals in the preamble to the proposed amendments, addressing the remand by showing that substitution of fuel or feed materials are either technically infeasible or cost prohibitive and therefore that a beyond-the-floor standard for HAP metals is not reasonable. (See 70 FR 72340–72341). We also indicated that non-air health and environmental impacts would be minimal, as would energy use implications (*id.* at 72341). We received no data in the comments on the proposed amendments that have altered our previous analysis. Therefore, we are not including a beyond-the-floor PM standard in these final amendments.

V. Other Rule Changes

On April 5, 2002, we amended the introductory text of 40 CFR 63.1353(a) to make it more clear that affected sources under the Portland Cement NESHAP were not subject to 40 CFR part 60, subpart F (67 FR 16615, April 20, 2002). In making this change, we inadvertently deleted paragraphs (a)(1) and (2) of 40 CFR 63.1353. The language in these paragraphs is still necessary for determining the applicability of 40 CFR part 60, subpart F. We proposed to reinstate these paragraphs as originally written in the final rule. We received no comments on this issue and are therefore reinstating the two paragraphs as proposed.

In the proposed amendments we requested comment on amending language published on April 5, 2002, whose purpose was to clarify that crushers were not subject to this NESHAP. The PCA believed that there had been misinterpretation of the amended rule text. However, we explained in the proposed amendments that we believe the PCA interpretation is not reasonable when reading the entire final NESHAP. However, we agreed that the rule language as written is conceivably open to more than one interpretation. See 70 FR 72341.

We proposed two resolutions to this issue. They were:

(1) Changing the wording of 40 CFR 63.1340(c) to make it clear that all raw materials storage and handling is covered by the NESHAP, but that crushers (regardless of their location) are not.

(2) Including crushers as an affected source in the Portland Cement NESHAP and incorporating the current requirements applicable to crushers contained in 40 CFR part 60, subpart OOO (and correspondingly, exempting crushers covered by the Portland Cement NESHAP from 40 CFR part 60, subpart OOO).

We received several comments from State and local agencies supporting our contention that the intent of the rule language at issue was to exclude crushers, and that our interpretation of the rule language was correct. We considered simply deleting the (potentially) confusing language and adding clarifying language that a crusher located after raw materials storage would be covered by this subpart. However, we have not been able to identify any facilities where the crusher is located after raw materials storage. In addition, we do not have data to determine the impacts of adding coverage of this piece of equipment to this subpart. For that reason, we are modifying the language in § 63.1340(c) to state that crushers are not covered by this subpart regardless of their location. There are currently no regulations that regulate existing crushers in this application. New crushers would potentially be subject to the requirements of 40 CFR 60, subpart OOO.

VI. Responses to Major Comments

This section presents a summary of responses to major comments. A summary of the comments received and our responses to those comments may be found in Docket ID No. EPA–HQ–OAR–2002–0051.

Comment: According to several commenters, EPA's proposal did not satisfy the mandate issued by the DC Circuit Court of Appeals. On EPA's analysis of MACT for mercury, HCl, and THC; EPA's beyond-the-floor analysis; and the risk-based exemptions from HCl standards, one commenter states they are unlawful, arbitrary, capricious, and irrelevant. These commenters state that the court was clear in its directive to EPA that the absence of technology-based pollution control devices for HCl, mercury, and THC did not excuse EPA from setting emission standards for those pollutants.

Response: Although we disagree with the premise of this comment, the comment is moot because we are setting standards for all HAP which was addressed by the court's mandate. We agree that the court stated the absence of technology-based pollution control devices for HCl, mercury, and THC did not excuse EPA from setting emission standards for those pollutants. In response to the court's opinion, we have evaluated all possibilities of setting standards, including technology based control, fuel and raw materials changes, and process modifications. We believe this evaluation is what the court intended. See 70 FR 72335.

Comment: Regarding EPA's rejection of beyond-the-floor standards for each HAP, one commenter states that EPA's reasoning is both unrelated to the relevant statutory mandate and arbitrary and capricious, as well as completely ignoring currently available control measures of which EPA is aware and which would result in reductions of emissions of mercury, HCl, THC and other HAP.

Response: Where we have rejected beyond-the-floor standards we have evaluated all available control methods that have been demonstrated for this source category. We also evaluated control technologies that have not been demonstrated, but that we have reason to believe may be effective (such as ACI). With one exception, which is banning the use of fly ash with elevated mercury contents that result from sorbent injection where such a practice would increase mercury emissions, in no case did we find that a beyond-the-floor standard was justified ("achievable" in the language of section 112(d)(2)) taking into consideration costs, energy, and non-air quality health and environmental impacts.

Comment: According to one commenter, EPA's refusal to set mercury standards demonstrates contempt of court. The commenter states that EPA's reconsideration of MACT for mercury did not satisfy the court's directive to establish emissions standards and not just reconsider the issue.

Citing the CAA's requirements to set emission standards for each HAP listed in 112(b) and, as directed in 112, for each category of sources for the HAP applying the maximum achievable degree of reduction, the commenter states that EPA's decision to not set mercury emission standards is unlawful.

Response: EPA strongly disagrees with the commenter's characterization of the proposed standards in the proposed rule. EPA issued the proposed rule consistent with the court's

instructions in the remand. In response to comments received, however, EPA has modified the proposal and adopted specific standards for each HAP covered by the court's mandate. Thus, this comment is moot, even accepting the commenter's premise (which EPA does not), since EPA is establishing standards (in the sense the commenter uses the term) for each HAP covered by the court's mandate. Moreover, as explained in other parts of this preamble, EPA has carefully analyzed many different possibilities for setting standards for the HAP covered by the remand, examining not only technology-based back end controls but control of inputs to cement kilns as well. We believe that our action fully satisfies both the letter and spirit of the court's mandate.

Comment: The commenter above states that EPA's arguments for not setting mercury standards are without merit and provide several justifications for its view. First the commenter states that EPA's arguments for not setting mercury standard are irrelevant because EPA has a clear statutory obligation to set mercury standard and any reason for not doing so must be invalid.

Response: This comment is now moot, as just explained.

Comment: According to the same commenter, EPA's view as to what is achievable cannot replace the CAA requirement to set MACT floors reflecting what the best performing sources are achieving. The commenter states that the CAA mandates a floor reflecting the average emission limitation achieved by the best performing 12 percent of the existing sources (for which the Administrator has emissions information) and not what EPA believes would be achievable. The commenter states that the court expressly required EPA to set emission standards based on what the best performers are actually achieving and not what EPA thinks is achievable.

Response: As *Mossville* and earlier cases make clear, because MACT standards (based on floors or otherwise) must be met at all times, the standards must reflect maximum possible variability (assuming proper design and operation of the various control mechanisms). See discussion at 70 FR 72335 and 70 FR 59436.

Comment: The same commenter disagrees with EPA's argument that the governing case law (*National Lime Ass'n* and *CKRC*) did not involve facts where the levels of performance tests are dependent entirely on composition of raw materials and fuel and cannot be replicated or duplicated. The commenter states that the governing case law addresses that exact issue: EPA's decision not to set mercury standards; and fourth the commenter claims EPA mistakenly cites the Copper Smelters (*Sierra Club*) and PVC MACT cases (*Mossville*) as justification for its approach. According to the commenter, these cases pertain to beyond-the-floor standards and do not apply to floor standards, which require EPA to set floors at emission levels that the best sources achieved, regardless of what EPA thinks is achievable.

Response: The commenter's reading of *Mossville* is not correct. The case involved a floor standard. See 370 F. 3d at 1240–42. We explained at proposal why we believe the discussion of raw materials in Sierra Club is also applicable to a floor determination. See 70 FR at 72335 n. 4.

Comment: The commenter further states that EPA's argument that its emissions data do not reflect performance over time, merely relates to the sufficiency of EPA's data. The commenter states that EPA is required to develop an approach to setting a floor standard, including collecting more emissions data if needed.

Response: Floor standards are to reflect the performance of sources "for which the Administrator has emissions information" (section 112(d)(3)), which provision does not create an obligation to gather a specified amount of information. Moreover, not only must MACT standards, including standards reflecting the MACT floor, reflect performance variability but EPA may reasonably estimate what that variability can be, and is not limited to stack emissions measured in single performance tests as the commenter apparently believes. See *Mossville,* 370 F. 3d at 1242 (setting standard at a level slightly higher than the highest data point experienced by a best performing source "reasonably estimates the performance of the best * * * performing sources"). Most basically, because MACT standards must be met at all times, a standard must reflect performance variability that occurs at all times, and this variability is simply not accounted for in single stack test results for mercury from a cement kiln.

Comment: The same commenter disagrees with EPA's position that setting the floor at emission levels achieved by the relevant best sources would require kilns to install back-end controls, thus bypassing beyond-the-floor requirements of achievability, considering cost and other statutory factors. Contrary to EPA's position, the commenter argues that sources are using low mercury fuel and feed and some kilns are using controls that reduce mercury emissions, albeit they may not be doing so deliberately to reduce mercury emissions. According to the commenter, whether the sources are achieving low mercury emissions levels through deliberate measures or coincidentally are statutorily irrelevant.

Response: We disagree with all the points raised in the comment above and preceding comments that EPA's arguments for not setting mercury standards are without merit. As noted above, we believe we have met the court's directive by evaluating all available methods of mercury control, including changes to fuels, raw materials, and process controls. We do not agree that the court directed us to set standards regardless of the facts, nor do we agree that section 112(d)(3) of the CAA requires us to set floor standards that cannot be met without requiring even the best performing facilities to apply beyond-the-floor controls—controls not used by any sources in the source category, even those which are ostensibly the best performing (i.e. the lowest emitters in individual performance tests).

The commenter correctly noted that we are required to set standards based on facilities for which the administrator has emissions information. However, as explained previously in the notice, the emissions levels in the data available to the administrator are mainly influenced by factors that are beyond the control of the facilities tested, and the test results can neither be replicated by the individual facilities nor duplicated by other facilities. In addition, these are short term data that we believe are not indicative of the sources' long term emissions. The commenter states that we should get better data. However, they do not indicate how we would be able to perform this task given the fact that there are no long term data available for mercury emissions from cement kilns: We know of no case where any cement facility has applied mercury continuous emission monitoring (CEM) technology, or gathered any long term emissions data we could use to set a national standard. (We do note, however, that we are ourselves granting reconsideration of the new source standard for mercury, in part to initiate field testing of cement kilns equipped with wet scrubbers.)

The commenter further states that docket records for Portland cement, the hazardous waste standards, and electric utilities demonstrate that various pollution controls have the ability to reduce mercury emissions. We agree with this comment in part. We believe both ACI and wet scrubbers will reduce mercury from cement kilns (and the floor for mercury for new sources is

based on performance of a wet scrubber). We did evaluate these controls as beyond-the-floor control options and determined, based on what we consider reasonable assumptions of their performance, that requiring facilities to apply these controls was not achievable, within the meaning of section 112(d)(2) of the CAA, after considering costs, energy impacts, and non-air quality health and environmental impacts.

We also agree that fabric filters and ESPs can reduce mercury emissions because there is some mercury retained in the collected CKD. As explained earlier, we agree that this forms the basis of a MACT floor (and standard), although the degree of mercury reduction is site-specific based on the rate of recycling per kiln. Because the amount of emission reduction associated with the practice is site specific and not directly measurable, we are expressing the standard as a work practice. We also explained why requiring further reductions based on more CKD wastage is not justified as a beyond-the-floor standard based on considerations of cost and adverse non-air quality health and environmental impacts (increased waste generation and disposal), as well as increased energy use.

In no case did we find that any of the control options discussed by the commenter could be considered as the basis for a MACT floor for new or existing sources (with the two exceptions just noted) for reasons previously discussed.

We also note that the HWC NESHAP does have mercury limits. However, these limits are achieved by controlling the mercury input of the hazardous waste feed (through source separation, blending, or other means). Therefore, any comparison of the mercury limits for cement kilns that burn hazardous waste with cement kilns that do not is misplaced.[15]

The commenter notes that cement kilns are achieving superior mercury emissions through a variety of different means, and further states that whether they are doing this intentionally is legally irrelevant. The comment is correct that the reason for application of a particular control technique is irrelevant. *National Lime,* 233 F. 3d at 640. But the commenter fails to consider that even in the case where a facility applies some type of control scheme, and that scheme happens to also reduce a particular HAP, the facility is taking specific actions that results in a reduction of the pollutant. For example, a facility that installs a thermal oxidizer to reduce total hydrocarbons also reduces organic HAP, even though the thermal oxidizer may not have been installed for purposes of HAP reduction. However, the facility is still taking a specific action that reduces HAP emissions. Also, another facility can install a similar control device and expect to achieve the same result. Results thus can be duplicated from site to site.

In the case of cement kilns, the "actions" being taken that in some cases may reduce mercury emissions are the result of site specific factors that cannot necessarily be duplicated elsewhere. For example, facility A may achieve lower mercury emissions than facility B simply because the limestone quarry used by facility A has a lower mercury content (at least on the day of the respective performance tests). Facility A is not achieving lower mercury emissions deliberately, but it is still achieving a lower level. However, because facility B does not have access to facility A's quarry, it would have to use some other control technique to match facility A's mercury emissions. The commenter never disputes that requiring facility B (and quite possibly A) to match the performance will require installation of a control device not used in the industry. As explained at proposal and earlier in the preamble, this amounts to an impermissible de facto beyond-the-floor standard.

The commenter also states that the best performing kilns are achieving lower mercury emission using a variety of methods, but does not offer any data or analysis as to what these methods are, or how other facilities could duplicate the performance of the lower emitting facilities without adding some type of back end controls. In addition, due to the wide variation in emissions level due to variations in raw materials, we have no data to show conclusively that even if back end controls were applied that kilns with higher mercury emissions due to higher mercury contents in their limestone could achieve the same emissions levels as facilities with naturally occurring low mercury limestone used in the (one-time, snapshot) performance test.

Comment: Regarding EPA's rejection of a beyond-the-floor mercury standard on the basis of low levels of mercury emissions and high costs of reducing emissions, one commenter states that the CAA requires that EPA's standards must reflect the "maximum degree of reduction that is achievable" considering the "cost of achieving such emission reduction" and other enumerated statutory factors. According to the commenter, the only relevant factors regarding the cost measures are: (1) Whether it is too costly to be "achievable"; and (2) whether it would yield additional reductions, i.e., without the measure, the standard would not reflect the "maximum" achievable degree of reduction. The commenter states that EPA does not claim that the use of ACI would not be achievable, only that ACI is not "justified." This position, according to the commenter, contravenes the CAA and exceeds EPA's authority and would allow EPA to avoid properly determining the maximum degree of reduction achievable considering cost and the other enumerated factors.

Response: We disagree with the commenter's interpretation.

The statute requires that EPA consider "the cost of achieving such emission reduction" (section 112 (d)(2)) in determining the maximum emission reduction achievable. This language does not mandate a specific method of taking costs into account, as the commenter would have it, but rather leaves EPA with significant discretion as to how costs are to be considered. See *Husqvarna AB* v. *EPA*, 254 F. 3d 195, 200 (D.C. Cir. 2001). In that case, the court interpreted the requirement in section 213 (a) (3) of the CAA (which mirrors the language in section 112(d)(2))that nonroad engines "achieve the greatest degree of emission reduction achievable through the application of [available] technology * * * giving appropriate consideration to the cost of applying such technology", and held that this language "does not mandate a specific method of cost analysis". The court therefore "f[ound] reasonable EPA's choice to consider costs on the per ton of emissions removed basis".

Moreover, where Congress intended that economic achievability be the means of assessing the reasonableness of costs of technology-based environmental standards, it says so explicitly. See Clean Water Act section 301 (b) (2) (A) (direct dischargers of toxic pollutants to navigable waters must meet standards reflecting "best available technology economically achievable" (emphasis added). There is no such explicit directive in section 112 (d)(2). EPA accordingly does not accept the commenter's interpretation.

Comment: Several comments support EPA's decision not to develop either an existing or new source floor for mercury. The commenters state that an achievable floor cannot be developed

[15] Indeed, the entire reason that hazardous waste burning cement kilns are a different source category is the impact and potential controllability of the hazardous waste inputs. See 64 FR at 52871.

because wide variation in mercury concentrations in raw materials and fuels used by cement kilns would make compliance impossible. One commenter also agrees with EPA's statement that a national conversion of cement kilns to natural gas is not possible due to serious supply problems and the lack of an adequate natural gas infrastructure.

Response: We agree with these comments that the Agency cannot establish a floor based on raw material or fuel inputs.

Comment: One commenter restates its original position that EPA's arguments regarding its inability to establish floors are irrelevant, unlawful and arbitrary. The commenter states that evidence made available since the original comment period closed confirms that: (1) Some kilns perform better than others; (2) consistent and predictable differences in emission levels can be attributed to differences in the raw materials, fuel, kiln design and control technology; and (3) additional measures for controlling mercury emissions are available to kilns. The commenter states that there is evidence that: (a) Some kilns use raw materials that are consistently higher or lower in mercury than other kilns as evidenced by a cement kiln in Tehachapi, California that uses limestone from a quarry adjacent to an abandoned mercury mine and consistently reports high (2000 lb/yr) mercury emissions—other kilns have consistently lower mercury levels because they use raw materials with low mercury levels; (b) there are many measures by which mercury emissions can be reduced as exemplified by Holcim's statement that mercury emissions can be controlled by careful input control and EPA's acknowledgement that mercury emissions are affected by the use of mercury-contaminated fly ash—as only 39 of 112 plants choose to use fly ash, the commenter states that a plant's deliberate choice about using fly ash (as well as the choice by some to burn tires, or choosing to burn a rank of coal lower in mercury, and use of by products from steel mills and foundries and flue gas dryer sludge) results in consistent and predictable differences in their mercury emissions; (c) wet kilns emit more mercury than dry kilns (twice as much according to EPA), showing that the kiln design results in a consistent and predictable difference in mercury emissions; and (d) additional emissions data confirm that some kilns are achieving consistently better emission levels than others. Several comments were received regarding the adequacy of the emissions data used in EPA's analyses. Several commenters state that EPA should collect data on mercury emissions and then determine mercury limits based on data. Recommendations for collecting additional data included soliciting test data from State and local agencies. Several commenters state that EPA should conduct a new MACT floor and beyond-the-floor evaluation based on current and complete data—including data from state and local agencies where cement plants are located—on mercury emissions from Portland cement plants. According to one commenter, EPA explained that its decision not to set mercury standards was due to a lack of emissions data while in reality it chose not to gather data under an incorrect statutory interpretation that it did not have to set standards if it believed there was no control technology available. The commenter states that now EPA has access to more mercury emissions data than it initially claimed including: (1) Toxic release inventory (TRI) data based on mercury stack monitoring by 35 plants and, (2) as indicated by EPA, data on mercury content of coal fly ash, shale, and clay that is either already available or can be easily obtained from existing sources—the commenter notes that Florida DEP reports that kilns collect several samples of the mercury levels in their raw materials on a daily basis.

Response: We disagree that our arguments regarding the inability to establish floors are irrelevant, unlawful and arbitrary. We agree that some kilns emit less mercury than others in individual performance tests. The argument that these kilns consistently perform better over time than other kilns is not correct, however, as shown in section IV.A.1.a above, where we showed that one of the lowest emitting kilns in a single test was one of the highest emitting in a later test due to raw material mercury variability. We thus do not believe it is appropriate to use the term "perform better then others" because this implies that the emission levels achieved are the result of some controllable action or otherwise will perform over time at some predictable level. A facility cannot achieve a performance level similar to another facility by varying its inputs because, as previously discussed, one facility does not have access to another's raw materials (or fuels), and therefore cannot be expected to necessarily achieve the same mercury emissions levels based on input control. The commenter acknowledges that facilities have significant variations in raw materials mercury content.

The commenter also notes that only some facilities choose to use fly ash which results in predictable and consistent differences in mercury emissions. While the statement that only some facilities use fly ash is correct, there are no data to indicate that the use of fly ash results in consistent and predictable differences in mercury emissions. All the raw materials and fuels that enter the kiln affect mercury emissions. The decision to use fly ash may or may not affect mercury emissions based on the mercury content of the raw materials the fly ash replaces. The only way to predict the impact on mercury emissions of fly ash for the plant currently using this material would be to obtain long term detailed raw materials and fuel analyses for every plant, including analyses of the replaced materials. However, in many cases the replaced materials may no longer be available. Neither are the data available for the current materials being used. In no way does the use of fly ash make the mercury emissions any more consistent than for facilities not using fly ash, or vice versa. All kilns are still subject to uncontrollable variations in raw materials and fuels, of which fly ash is only a small part. In fact, the two facilities with the highest measured mercury emissions do not use fly ash, and one of these facilities, which happens to have 30 days of feed materials analyses for mercury, shows significant variations in mercury emissions. There are no data to support any contention that using fly ash will inevitably result in a mercury emissions increase at any specific site.

The commenter also stated that kiln design—wet versus dry—affects mercury emissions. There are no data to support that statement, nor are we aware of any reason a wet or dry kiln would perform differently with respect to mercury emissions. The information referred to by the commenter is from the TRI. These data do not differentiate between kilns that burn hazardous waste, which are a different class of kiln subject to different regulations, and those that do not. Cement kilns that burn hazardous waste tend to be wet kilns and also tend to have higher mercury emission than kilns that do not burn hazardous waste, because of higher mercury levels in the hazardous waste fuels burned by these kilns. Therefore, the data cited by the commenter do not support their conclusion.

Several commenters also suggested that EPA collect additional emission test data from State and local agencies. We collected additional data, and have begun the process of gathering more. See section IV.A.1.b above, and the separate notice in today's **Federal Register** announcing reconsideration of

the new source standard for mercury. We believe data in the record conclusively show that because of the variations in raw materials mercury content show that any mercury limit based on these data would not be achievable on a continuous basis, even by the kilns that form the basis of the floor, without the requirement of applying beyond-the-floor back end control technology. The TRI monitoring data referenced by one commenter is actually short term tests. To our knowledge, there are no cement kilns using mercury continuous monitors. The data the commenter referenced from Florida are daily samples, but they are only analyzed on a monthly basis. In any case, any emission limit based on these data would not solve the problem that other facilities do not have access to the same raw materials.

Comment: In commenting on the adequacy of EPA analysis of the MACT floor for existing and new sources, several comments were received recommending that EPA give further consideration to requiring the use of emission control technology for reducing mercury emissions.

Several commenters state that EPA's analysis should have considered wet scrubbers, dry scrubbers, wet absorbent injection, dry absorbent injection, and fly ash retorting with mercury controls. One commenter states that in evaluating the MACT floor, EPA should establish a link between mercury emissions and existing controls for sulfur and particulate matter and examine potential co-benefit reductions. According to the commenter, this would be similar to the approach used by EPA in establishing the initial mercury caps in the Clean Air Mercury Rule (CAMR). The commenter believes that specific control equipment will result in a percent reduction of mercury whether the mercury is from feedstock or from fuel. Standards could be expressed as a desired percent control achieved using a specific control technology combination for sulfur and particulate matter as was done in the coal-fired electric steam generating unit determinations. The commenter states that such an approach is necessary to determine a new source standard for Portland cement kilns. The commenter included the tables that were developed for the percent reduction determination for electric utilities. One commenter states that more than 60 U.S. and 120 international waste-to-energy plants fueled with municipal or industrial waste or sewage sludge use sorbent injection ahead of fabric filters to remove mercury from flue gases. The sorbents used include activated carbon, lignite coke, sulfur containing chemicals, or combinations of these compounds. Sorbent injection systems are demonstrated at the Holcim Dundee plant which is limited by its permit to 115 lb/yr mercury, most of which is assumed to be from coal. Mercury limits are also in place under the hazardous waste combustor rule (70 FR 59402): 120 μg/dscm for new or existing cement kilns; 130 μg/dscm for hazardous waste incinerators; 80 μg/dscm for large municipal waste combustors. The commenter states that these limits set a precedent for establishing more stringent mercury emission limits and that there are abatement technologies available to exceed requirements. The commenter provided emissions data for several U.S. cement kilns as well as emissions data from cement kilns operating in Europe. The commenter states that sorbent injection control technology is proven for mercury control and states that this technology has been demonstrated on full-scale demonstrations in the electric generating sector. According to the commenter, activated carbon is also used to remove SO_2, organic compounds, ammonia, ammonium, HCl, hydrogen fluoride, and residual dust after an ESP or FF and that the spent or used sorbent can be used as a fuel in the kiln and the particles are trapped in the clinker. The commenter notes that a cement manufacturer in Switzerland, fueled with renewable sludge waste, used activated carbon to achieve up to 95 percent reduction in SO_2 which correlates to an emission rate of less than 50 $\mu g/m^3$.

One commenter states that EPA should also consider pre-combustion technology for coal that has been demonstrated in the utility sector. One such technology, pre-combustion coal beneficiation, transforms relatively low cost, low rank western coal (lignite or subbituminous) into a cleaner more efficient energy source (k-Fuel™). This technology applies heat and pressure to reduce moisture and can increase heat value by 30–55 percent for low rank coals. The result is higher output per ton of coal while lowering emissions including reduction in mercury content by up to 70 percent or more and reduced emissions of SO_2 and NO_X.

Response: We have reevaluated the available emission control technology for reducing mercury emissions. The commenters mentioned numerous control technologies including wet scrubbers, dry scrubbers, wet sorbent injection, dry sorbent injection, and fly ash retorting. Dry sorbent injection and fly ash retorting have not been applied to cement kilns. Therefore, they cannot be considered the basis of a MACT floor. Dry scrubbers and wet sorbent injection systems have been applied at one location each, but these systems do not operate continuously and would therefore not be considered as a floor technology. We evaluated the carbon injection system mentioned by the commenter. However, the configuration of this system is different from the configuration required to achieve a mercury reduction. The fact that the facility meets a specific mercury limit is not attributable to the sorbent injection system, which is configured for control of total hydrocarbons. (See section IV.C. on why this facility does not represent new source MACT for THC emissions.)

We also are aware that wet scrubber technology has been applied to at least five cement kilns, and therefore we did evaluate wet scrubbers as a floor technology for both new and existing sources and as a beyond-the-floor technology for existing sources. Our analysis and conclusions are set out in sections IV.A.1.d and IV.A.2 above.

We did not evaluate control technologies other than wet scrubbers and ACI as a potential beyond-the-floor technology. We have no data to indicate that these controls are any more efficient or cost effective than the controls we did evaluate. In addition the performance of these controls is less certain than either wet scrubbers or ACI.

The commenter also notes that mercury limits have been applied to other source categories and to cement kilns that burn hazardous waste. The application of an emission limit to another source category or class of cement kiln does not, in and of itself, indicate that a mercury emissions limit is required or appropriate here. With respect to the mercury standards for cement kilns that burn hazardous waste, as noted earlier, these standards are based exclusively on control of mercury levels in the hazardous waste fuel inputs, and hence are not applicable to the Portland cement kiln category. See 70 FR 59648. In addition, we note that the limits mentioned are well above the emission test data for all but two cement kilns that do not burn hazardous waste. Cement kilns that burn hazardous waste typically have stack gas concentrations of 43 to 196 μg/dscm resulting from the hazardous waste alone (69 FR 21251, April 20, 2004). These levels, which reflect only the mercury emissions attributable to the hazardous waste, are themselves higher then the majority of the emission levels from cement kilns that do not burn hazardous waste, the majority of which are below 43 to 196 μg/dscm. See "Summary of Mercury Test Data" in Docket EPA–HQ–OAR–

2002–0051. Therefore, we believe it is reasonable to assume that cement kilns that do not fire hazardous waste are much lower emitters of mercury than the hazardous waste-firing cement kilns.

The commenter also mentioned pre-combustion technology for mercury control, including k-Fuel. Coal cleaning is another option for removing mercury from the fuel prior to combustion. In some states, certain kinds of coal are commonly cleaned to increase its quality and heating value. Approximately 77 percent of the eastern and midwestern bituminous coal shipments are cleaned in order to meet customer specifications for heating value, ash content and sulfur content. See Mercury Study Report to Congress: Volume VIII: An Evaluation of Mercury Control Technologies and Costs, December 1997. Given the fact that most coal is already cleaned, we believe that any benefits of mercury reduction from coal cleaning are already being realized. There is only one k-Fuel production plant of which we are aware, so this fuel is not available in sufficient quantities to be considered as a potential alternative fuel. We are not aware of any widely available coals that have been subjected to more advanced coal cleaning techniques. We also note that advanced coal cleaning techniques have an estimated cost of approximately $140 million per ton of mercury reduction. These costs per ton of removal are higher than costs of other potential beyond-the-floor technologies such as ACI and wet scrubbers.

Comment: Several comments were received regarding the need for EPA to include in its analysis of the MACT floor the use of work practices alone or in combination with control technologies to reduce mercury emissions. Two commenters state that the work practice of wasting a portion of the control device catch, that is disposing of a portion of the catch rather than recycling it back to the kiln, can reduce total mercury emissions. One commenter cites a European report showing that lowering the gas temperature upstream of the baghouse accompanied by disposing of part of the catch is an effective measure in reducing mercury emissions. According to the commenter, material removal is already practiced at many kilns in the U.S. for other reasons than mercury removal. This occurs for example when CKD is wasted or when a bypass is used at kilns with preheaters to relieve buildups of volatile components, e.g., chlorides or sulfates. The commenter states that such kilns emit less mercury through the stack than kilns that do not waste CKD. The commenter cites a publication of the PCA documenting this. The two commenters state that one opportunity to avoid the recycling of CKD is by mixing it with clinker to make masonry and other types of cement. One commenter states that CKD has numerous beneficial uses and can be sold as a byproduct by cement plants. The commenter addresses some of the barriers to the practice of mixing materials with clinker to make materials for sale. In response to comments that the industry apply various non-ACI controls or work practices to reduce mercury emissions, one commenter states that none of these practices have been demonstrated to be effective in controlling mercury emissions from cement kilns.

One commenter states that EPA could consider prohibiting or limiting CKD recycling in cement kilns while requiring ACI in conjunction with existing particulate matter control devices. According to the commenter, this approach would avoid the expense of an additional control device and its associated waste stream. The commenter recognizes that there is a possibility that the mercury and carbon level in the CKD may cause it to be considered a hazardous waste.

Two commenters support the use of alternative feed and fuel materials as techniques for reducing mercury emissions. One commenter states that EPA's evaluation of low-mercury fuels should have included petroleum coke. According to the commenter, testing at one kiln has shown that petroleum coke contained significantly less mercury than the coal previously used to fuel the kiln. The commenter also suggested evaluating the increasing use of tire-derived fuel and its impact on mercury emissions. One commenter states that data are available that indicate that mercury content of fuel and feed used by kilns is not so variable that an upper limit for mercury in coal and feed could not be set by EPA. One commenter states that EPA should collect sufficient data on the variability of mercury in feed and fuel materials to actually determine what the variability is.

One commenter responded to comments recommending that kilns switch from coal to petroleum coke, fuel oil, and tire-derived fuel because these have lower mercury concentrations. The commenter states that limited supply, long distances, and permitting issues make it impossible to replace a significant percentage of the coal burned with alternative fuels. The commenter states, however, that the industry could utilize a much larger amount of these fuels if permitting barriers were lowered.

Response: We agree that reducing the recycling of CKD has, in some cases, been shown to reduce mercury emissions and that this practice creates a floor for both existing and new sources. See section IV.A.1.c above. The amount of CKD recycled versus the CKD wasted at any facility is based on the concentration of alkali metals in the raw materials. Also, the effect of this practice on mercury emissions will be highly variable because the amount of mercury present in the cement kiln dust varies from facility to facility. Thus, we have adopted a work practice standard which will reflect these site-specific practices. We also have evaluated a beyond-the-floor control option based on further reducing the recycling of CKD back to the cement kiln and determined it was not achievable (within the meaning of section 112 (d)(2)) after considering costs, energy impacts, and non-air quality health and environmental impacts. This would also be the case if one combined ACI and reduced or eliminated the recycling of CKD.

One commenter also suggested the use of lower mercury fuels, specifically petroleum coke, and setting a limit for mercury emission based on the upper bounds of the limits of mercury in the feed and fuel. The comment on petroleum coke is addressed above in section IV.A.1.a.i. We rejected this later option because it would set a limit that has no environmental benefit because it achieves no emissions reduction. See section I.A.1.b above. Another commenter mentioned the problems with setting a limit based on changes to fuels, namely that limited supply would preclude any MACT floor based on fuel switching, and would likewise preclude any beyond-the-floor option. We agree with those comments. See 70 FR 72334.

Comment: Several comments support EPA's decision not to set "beyond-the-floor" mercury standards for the following reasons: (1) Any possible activated carbon injection "back-end" control technology would be prohibitively expensive; (2) the cost per mass of mercury emissions reduced would be astronomical; and (3) the application of such possible activated carbon injection would generate additional solid waste and increase energy use.

Response: We agree with these comments for the reasons previously discussed.

Comment: A commenter states that in the beyond-the-floor evaluation, EPA failed to consider other control measures that reduce mercury emissions. The commenter cited coal cleaning, mercury-specific coal

treatments, optimization of existing control (the commenter supplied a list of optimizing technologies), as well as currently available control technologies such as enhanced wet scrubbing, Powerspan-ECO®, Advanced Hybrid Filter, Airborne Process, LoTox process, and MerCAP. According to the commenter, mercury reductions for these technologies range from 20 percent to over 90 percent. According to the commenter, EPA's failure to evaluate any of these measures is arbitrary and capricious and contravenes CAA 112(d)(2) which requires the agency to set standards reflecting the maximum degree of reduction achievable through the full range of potential reduction measures.

In a later comment, the same commenter states that EPA failed to satisfy the CAA by not considering end-of-stack controls. As an example of a controlled source, the commenter states that Holcim's Zurich plant successfully uses the Polvitec system, a carbon filter system that controls mercury as well as organic pollutants.

One commenter objects to EPA's refusal to set beyond-the-floor mercury standards as unlawful and arbitrary. The commenter states that EPA failed to consider eliminating the use of fly ash as a beyond-the-floor standard even though it is possible for kilns not to use fly ash—a majority of kilns do not use any fly ash—and not using fly ash would reduce mercury emissions. For example, the commenter states that more than half the mercury emissions from an Alpena, MI kiln are from fly ash. According to the commenter, kilns could also reduce mercury emissions by using cleaner fuel (e.g., natural gas), using coal with lower mercury content, refraining from the use of other mercury containing by-products from power plants, steel mills, and foundries, and refraining from the use of flue gas dryer sludge. One commenter recommends that EPA conduct a new beyond-the-floor evaluation based on up-to-date and complete data.

Response: We have conducted additional beyond-the-floor analyses for all demonstrated control techniques for cement kilns. This included banning use of utility boiler fly ash as feed to cement kilns, reducing the recycling of CKD, use of wet scrubbers, and use of ACI. The statement that not using fly ash would reduce mercury emissions is not supported by existing data, as explained in section IV.A.1.b above. These are discussed in section I.A.2 above. The commenters mentioned other additional control techniques including both add-on controls and coal cleaning. These are not demonstrated control technologies for this source category. In the case of any coal cleaning technology, we did not specifically evaluate these technologies. We know of no case where these technologies have been used in the cement industry, or any other industry, as the basis for control of mercury emissions, therefore they cannot be considered a floor technology. We also do not consider these technologies to be demonstrated to the point where we would consider them as the basis of a beyond-the-floor standard. As noted above, most coals are already cleaned. Coals that have been cleaned using advanced cleaning techniques are not generally available. In addition, data from an evaluation of advanced coal cleaning indicated that the costs were approximately $140 million per ton of mercury reduction. See Mercury Study Report to Congress: Volume VIII: An Evaluation of Mercury Control Technologies and Costs, December 1997.

Comment: Citing the information used to estimate costs and mercury reductions associated with ACI as outdated, unsupported and unexplained, one commenter states that EPA's estimates are inadequate and, furthermore, ignores the more recent ACI data used in EPA's power plant rulemaking.

Response: We have updated our ACI costs based on more recent information. As explained above in discussions of potential beyond-the-floor options based on performance of ACI, we still do not find such standards to be achievable within the meaning of section 112 (d)(2).

Comment: One commenter states that recent tests for mercury emission from Portland cement plants in New York and Michigan show that EPA does not have an accurate picture of mercury emissions from this industry. The commenter states that the lack of accurate information affected EPA's analysis of ACI as a beyond the floor control. The commenter recommends that EPA conduct additional stack testing to collect accurate emissions data.

One commenter also states that EPA does not provide information on the amount of mercury that would be reduced by ACI. The commenter states that self-reported mercury emission data provided by industry in EPA's TRI, appear to grossly underestimate actual kiln mercury emissions and provides examples of such under-reporting. Based on the limited emissions test data, the commenter states that actual mercury emissions data could be ten times greater than the TRI estimates. The commenter states that EPA's estimate of the cost of ACI and the amount of mercury that would be reduced are arbitrary and capricious and, therefore, so is EPA's reliance on cost per ton estimates as a basis for rejecting ACI as a beyond-the-floor technology.

Two commenters state that, given mercury's toxicity and the significant mercury emissions from Portland cement plants, they strongly disagree with EPA's conclusion that standards to limit mercury emissions are "not justified."

Response: The commenters did not provide data to support their claims that mercury emissions from this source category are significantly underestimated. We are aware that recent tests at several facilities have indicated that they had significantly underestimated their mercury emissions. In some cases the mercury emissions were significantly higher. We are also aware of recent tests where the measured mercury emissions were low, and in at least one case was actually below previous estimates. We do not agree that these few cases indicate that our current estimates of mercury emissions are significantly in error.

Comments: Several commenters state that EPA has ignored or undervalued non-air impacts. Commenters state that EPA should consider non-air environmental, economic, and societal impacts resulting from contamination of water bodies and their lost recreational and commercial fishing uses negatively affecting tourism and jobs; and neurological effects on children caused by mercury exposures among females of child-bearing age. According to commenters, local advisories against eating fish due to mercury tissue levels undercut efforts to encourage fish consumption as a way to reduce risk of heart disease. One commenter states that in failing to set maximum degree of reduction standards that are achievable, EPA did not consider the costs of not setting mercury standards, including the public health costs of increased exposure to mercury in children as well as the societal costs of contaminated water bodies, fish, and other wildlife.

Response: The purpose of 112(d) standards is to apply maximum achievable control technology. The consideration of impacts such as those discussed above is performed during the section 112(f) residual risk phase. See *Sierra Club* v. *EPA*, 353 F. 3d 976, 989–90 (D.C. Cir. 2004) (rejecting the commenter's argument). We have begun this analysis for this source category. The results of this analysis will be included in a separate rulemaking.

Comment: Several commenters raised concerns related to the local impacts of industrial mercury emissions. According to one commenter, the high temperature of cement kilns results in mercury emissions that fall out and are deposited much closer to the source than was previously thought. One commenter cites research that confirms that mercury disproportionately affects nearby residents and that shows that nearly 70 percent of the mercury in an area's rainwater comes from nearby coal-burning industrial plants. One commenter states that EPA did not consider impacts of mercury hot spots, citing Florida and EPA research showing a reduction in local and regional fish mercury levels when MACT standards for medical and municipal incineration were implemented. The commenter provided documentation of impacts on local environments of lowering local or regional mercury emissions. One commenter states that they are concerned over the documented levels of mercury in fish in their county and the fact that three recently permitted Portland cement plants in their county are permitted to emit over 400 lb/yr of mercury in addition to a coal fired electrical generating plant that emits over 70 lbs of mercury annually.

Response: These factors will be considered in the section 112(f) residual risk analysis discussed above. It is impermissible to consider these risk-based factors in setting the technology-based standards at issue here.

Comment: EPA solicited comments on a potential ban of the use of mercury-containing fly ash from utility boilers as an additive to cement kiln feed. Numerous commenters state that a ban is premature for several reasons, with their objections falling into one of several groupings: anti-Resource Conservation and Recovery Act (RCRA) policy to encourage recycling that is protective of human health and the environment, CAMR in litigation, mercury removal technology not yet developed, substitutes may be more harmful, and cost of a ban has not been considered. Due to these concerns about the completeness of data they believe are relevant to banning the use of fly ash as a cement plant raw material, the commenters suggest the fly ash ban be postponed and studied further for now.

Two commenters add that banning fly ash use, thereby requiring cement manufacturers to use substitutes for raw materials, cannot be used as the basis of a national rule due to the variability of mercury content of fly ash. These commenters also state that banning the use of fly ash could result in power companies having trouble finding ways to manage fly ash that would not increase impacts on land use and other ecosystem values. These commenters state that further study of such trade-offs is necessary.

Another commenter notes that approximately 2.5 million tons of fly ash is used annually in cement kilns, thus reducing the need for an equivalent amount of natural materials that would come from virgin sources. Another commenter notes that some configurations of coal-fired electric generating unit control equipment can reduce the level of ash-bound mercury, and that research is being conducted on methods that capture and stabilize mercury, producing a secondary waste product separate from the ash stream.

One commenter adds that the costs of replacing fly ash with other materials could be in excess of $10 million per ton of mercury removed. This commenter also states that the use of some alternate materials could result in emissions of HAP, including mercury, and increased emissions of criteria pollutants either directly or as the result of increased fuel usage per ton of clinker produced. One commenter agrees with EPA that fly ash from electric utility boilers may progressively contain more mercury as the electric utility industry reduces its mercury emissions. According to the commenter, some boiler fly ash is of a quality that allows it to be added directly as a raw material for concrete where most of the mercury is permanently bound; lower quality fly ash is unusable in concrete and instead is added as a raw material additive to the cement kiln. This commenter, however, recommends that EPA consider work practices, monitoring, and mercury controls rather than a ban on fly ash.

Two commenters state that data from TRI showing that 64 percent of kilns not using fly ash account for 60 percent of mercury emissions, while the 36 percent that do use fly ash account for about 40 percent of mercury emissions, do not justify a conclusion that fly ash feedstock from utility boilers that control mercury is a culprit in mercury emissions from cement kilns.

Two commenters, citing EPA's positing that wet kilns may emit more mercury than dry kilns, suggest that the driver for mercury emissions from kilns may be the type of kiln rather than the feedstock.

Two commenters note that EPA acknowledges that the proposed ban fails to consider the solid waste and economic impacts of diverting 2–3 million tons/yr from beneficial use to disposal in landfills, including the economic impacts of lost revenue from the sale of fly ash, landfill disposal fees, and the potential rate increases for electricity consumers; and the environmental impacts of relying on virgin feedstock—which contains mercury as well as organic compounds—including increased energy use, additional air emissions, and impacts on natural resources.

One commenter states that there are many advantages (a list of the environmental and energy benefits is included as part of the comment) associated with the use of fly ash as an alternative for some naturally occurring raw materials. The commenter states that they also understand the impacts that the use of fly ash may have on mercury emissions and are looking at approaches that may be used to minimize mercury emissions from use of fly ash. They state that they will provide additional information on a preferred approach should one be identified.

One commenter opposes a blanket ban on use of fly ash without regard to its source or the use of analysis to determine mercury content. The commenter agrees that setting mercury emission limits is inappropriate given the variability in concentration in raw materials and that it would be contrary to case law under CAA section 112. The commenter lists the manufacturing and environmental benefits of using fly ash as a substitute for other raw materials: reduced fuel consumption in kiln; reduced power consumption for grinding; reduce emissions of organics (THC) and combustion emissions (NO_X, SO_2, and CO); reduce need to dispose of fly ash; and reduced SO_2 emissions from reduced use of raw materials containing pyrites. The commenter states that in some regions, fly ash is the only source of aluminum for some cement plants. Also, they state that like other raw materials, the mercury content of fly ash can vary widely. The commenter recommends an approach that allows the use of fly ash if companies can demonstrate that mercury emissions will not be significantly impacted. Such an approach is being developed by the commenter and will be submitted to EPA as a supplement to their comments.

Response: We have considered the comments above and have come to the conclusion that a ban on the current use of utility boiler fly ash is not warranted. See section I.A.1.b above.

Comment: Several commenters are opposed to allowing the use of fly ash if it means increased mercury emissions. One commenter cited a study showing that fly ash mercury content can vary from 0.005 to 120 micrograms

per cubic gram of ash as evidence that EPA needs to limit the use of fly ash in cement and should also evaluate other additives, including cement kiln dust, for their mercury emissions potential. One commenter states that if the mercury in fly ash will cause the fly ash to be classified as a hazardous waste, its use should be banned until the fate of mercury in the cement manufacturing process is better understood.

One commenter states that EPA should take into consideration future increases in the mercury content of coal combustion products (CCP) resulting from the Clean Air Interstate Rule and the CAMR. They state that the higher mercury content of CCP used in producing Portland cement as well as the recycling of cement kiln dust could cause mercury emissions to increase.

Several commenters understand that fly ash is a necessary component in the manufacturing process, but believe measures should be implemented to avoid increased mercury emissions. One commenter recommends the use of fly ash as long as control requirements are included in the rule, e.g., work practice standards and other strategies to prevent an increase in mercury emissions from the fly ash. One commenter states that EPA should require either: (1) Carbon injection with fabric filtration without insufflation; or (2) treatment of the ash to remove and capture the mercury. According to the commenter, if these do not adequately reduce mercury emissions, the fly ash should not be used. Another commenter states that EPA should include provisions for pollution prevention plans, in which monitoring and testing of mercury sources are conducted and appropriate work practices or other measures are evaluated and implemented to control mercury emissions. The commenter states that the facility can then determine the least cost approach for achieving mercury reductions.

One commenter states that EPA needs to further investigate the practice of adding fly ash to understand the concentration of mercury being added and subsequent emissions of mercury. The commenter states that if alternatives are available, EPA should consider banning the use of fly ash.

Response: We received comments both for and against the use of utility boiler fly ash. As previously noted in this notice, we performed our own evaluation of the practice based on the available data. The result of our analysis was that even though we are aware of one facility where the use of fly ash contributes to approximately half of the facility's mercury emissions, we cannot state that this occurs at other cement kilns using fly ash. We also note numerous positive environmental effects of using fly ash in lieu of shale and clay, including increases in overall kiln energy efficiency, and a potential reduction in THC emissions. Given the lack of data that the use of fly ash adversely affects mercury emissions (i.e. causes an increase in emissions over raw materials that would be used in place of the fly ash) other then at one facility, and the other positive environmental benefits, we do not believe any action is warranted on fly ash use as currently practiced in the industry.

The commenters also expressed concern that as utility boilers apply ACI or other sorbents to reduce their mercury emissions, utility boiler fly ash will have significantly increased mercury concentrations, likely well in excess of levels in clay and shale that would be used in its place. We agree with this concern. As previously noted the available data indicate that ACI (or other sorbent) can significantly increase fly ash mercury content. For this reason, we have added a provision in the final rule to ban the use as a cement kiln feed utility boiler fly ash whose mercury content has been artificially increased through the use of sorbent injection, unless it can be shown that the use of this fly ash will not increase mercury emissions over a cement kiln's raw material baseline.

Comment: Regarding EPA's decision to not set HCl standards for existing kilns, a commenter states that EPA's action is unlawful, contemptuous of court, and arbitrary for all of the reasons cited above by the commenter in their comment on EPA's action on the mercury rule. In addition, the commenter also finds EPA's proposal regarding HCl unlawful and arbitrary for the following reasons.

The commenter states that EPA asserts that it "reexamined" the MACT floor for existing sources whereas the court directed EPA to "set" HCl standards. Thus, according to the commenter, EPA's stated reason for not setting HCl standards for existing kilns (the number of kilns equipped with scrubbers is insufficient to constitute 12 percent of the kilns) is irrelevant. According to the commenter, the approach EPA is required to take is to average the emission levels with those of the other best performing sources to set the floor. The commenter states that such a level would not reflect the performance of scrubbers, rather it would reflect the level achieved by the best performing sources as required by the CAA. The commenter states also that EPA's reasoning that the unavailability of low-chlorine feed or fuel justifies a decision not to set HCl standards for existing kilns is irrelevant, because EPA has an unambiguous legal obligation to set floors reflecting the HCl emission levels achieved by the relevant best performing kilns.

One commenter states that in setting work practice standards for HCl, EPA did not satisfy the CAA criteria that apply when it is "not feasible to prescribe or enforce an emission standard." The commenter states that a work practice standard is unlawful because EPA did not and could not claim that: (1) HCl cannot be emitted through a conveyance designed and constructed to emit or capture such pollutant or that such conveyance would be inconsistent with any existing law; or (2) the application of measurement methodology is not practicable due to technological and economic limitations.

Response: The comment is moot. EPA is not requiring section 112(d) control of HCl emissions since emissions of this HAP from cement kilns will remain protective of human health with an ample margin of safety and will not result in adverse effects on the environment, even under highly conservative worst case assumptions as to potential exposure. See section IV.B above, and CAA section 112(d)(4). The court's opinion does not address the possibility of using the section 112(d)(4) authority on considering technology-based standards for HCl and EPA's use of that authority violates nothing in either the letter or spirit of the court's mandate.

Comment: Two commenters took issue with EPA's proposed definition of "new" sources as it applies to the proposed HCl limits for new kilns. Regarding EPA's new source standards for HCl (15 ppmv or 90 percent HCl reduction), one commenter states that EPA has created a compliance loophole for kilns that commenced construction before December 2, 2005 and is unlawful. According to the commenter, the CAA defines new source where construction or reconstruction commenced after the Administrator "first" proposes regulations. The commenter states that EPA first proposed standards on March 24, 1998, and that any kiln at which construction or reconstruction was commenced after March 24, 1998, is a new source and must meet new source standards. The commenter states that EPA ignores that its violation of a clear statutory duty, (i.e., its failure to promulgate HCl standards in the 1998 rulemaking), is the reason that sources built after March 24, 1998, have not already installed

pollution controls necessary to meet new source HCl standards.

Response: We disagree with these comments. First, the comment is moot with respect to an HCl new source standard because, based on the authority of section 112(d)(4), EPA has determined that no such standard is required because emissions will be at levels which are protective of human health with an ample margin of safety, and will not have an adverse effect on the environment. However, the same issue of the applicability date for new sources is presented for mercury and THC, so we are responding to the comment.

The whole premise of new source standards being potentially more strict than for existing sources, and requiring new sources to comply immediately with those requirements (see section 112(d)(3) (new source floor criteria are more stringent than those for existing sources) and 112(i)(1)), is that these sources are being newly constructed and hence can immediately install the best pollution controls without incurring the time or the expense of retrofitting. Put another way, new sources know from the beginning of the construction effort what controls will be required, and do not have to incur the higher costs and the time-consuming disruptions normally associated with control retrofits. If we were to require "new sources" that commenced construction prior to December 2, 2005, to retroactively install controls because we have changed rule requirements, then these particular sources would have to bear retrofit costs that we do not believe were intended by the CAA. Immediate compliance would also be an impossibility.[16]

The commenter states that the statute mandates this result because a new source is defined as a source constructed or reconstructed after the Administrator "first proposes" regulations "establishing an emission standard" applicable to the source. The commenter thus concludes that the new source trigger date must be March 24, 1998, the proposal date of the 1999 rule. This reading makes no sense in the context of a court action which essentially required EPA to reexamine the entire issue, and re-determine what the standard should be. Under such circumstances, the only reasonable date for determining new source applicability for a resulting standard would be the date EPA proposes it. Moreover, even under the commenter's (strained) reading, EPA did not propose standards for mercury, hydrocarbons, or HCl for these sources in the 1998 proposal until December 2, 2005; this is why the rule was remanded by the D.C. Circuit.[17] Hence, for the HAP covered by this rule, the new source trigger date would be December 2, 2005, even under the commenter's reading. However, we repeat that we disagree with the commenter's interpretation because it results in situations antithetical to the underlying premise of a new source standard: namely that amendments to new source standards will result in existing sources having to comply immediately with both new source standards and immediate compliance dates. This would be both unfair and impossible. Congress simply cannot have intended this result.

Comments: Regarding the proposed work practice standards for existing kilns (operate at normal operating conditions and operate a particulate control device), one commenter states that there is not enough information to require "normal operating conditions" for kilns and air pollution control device. According to the commenter, "normal" kiln conditions may not be best for HCl removal. This commenter also states that existing operating & maintenance (O&M) and start up, shut down, and malfunction (SSM) plans already ensure normal operation. Other commenters state that this proposed work practice is arbitrary as there is no "normal operating condition" for all kilns in the U.S. The commenters state that a multitude of factors—combustion parameters, kiln design, raw material inputs, fuel characteristics, etc—make this requirement unworkable.

One commenter notes that 40 CFR 63.6(e) already requires plants to minimize emissions during an SSM event to the extent consistent with good air pollution practices and with safety considerations. The commenter states EPA should clarify that the proposed requirement to continuously operate kilns under normal conditions and operate a particulate control device is subject to the SSM provisions elsewhere in the NESHAP (section 63.6(e)). The same commenter later submitted another comment restating their position on HCl that standards for existing and new kilns are not necessary and do not represent the MACT floor.

Response: This comment is also moot given EPA's decision not to set a section 112(d) standard for HCl based on the authority of section 112(d)(4) of the CAA.

Comment: One commenter states that EPA has not demonstrated that it has examined the costs associated with alkaline scrubbers in establishing a MACT floor for new sources. The commenter states that EPA's scrubber costs are not representative of a wet scrubber that can meet limits of up to 90 percent control of SO_2. According to the commenter, EPA's cost are for dry or wet lime spray systems incapable of 90 percent reduction on preheater/precalciner kilns. The commenter provides capital and annualized costs for a 1 million tpy kiln of $18 to $25 million and $4.5 to $7 million, respectively. The commenter states that using EPA's range of 12 to 200 tpy of HCl removal, this translates to a cost of between $35,000 and $375,000 per ton of HCl removed. The commenter states that this range is higher than the range EPA considered unreasonable for existing kiln beyond-the-floor controls ($8,500 to $28,000 per ton removed). The commenter concludes that wet scrubbers are not a reasonable option.

The commenter adds that dry or wet lime spray systems can remove SO_2 prior to the raw mill but essentially perform the same function as the raw mill, and therefore achieve an incremental removal efficiency far below 90 percent. The commenter states that this would be less cost effective than EPA described for existing kiln beyond-the-floor technology.

Response: This comment is also moot in relation to HCl given EPA's decision not to set a section 112(d) standard for HCl based on the authority of section 112(d)(4) of the CAA. However, it now has relevance in regards to the costs of controlling mercury emissions because we evaluated wet scrubbers for mercury control from existing sources as a beyond-the-floor option and new sources as a floor option. We did further investigation of the potential costs of alkaline (wet) scrubbers and revised our cost estimates after proposal based on data developed as part of the Industrial Boiler NESHAP. The scrubber costs are based on alkaline scrubbers specifically designed to remove HCl and/or SO_2 from a coal-fired boiler and we have made the required adjustments in cost to account for differences in the flue gas

[16] As it happens, under this rule, the compliance date for sources which [0] commenced construction after December 2, 2005, and before promulgation of this final rule is 3 years because the standards adopted are more stringent than those proposed on December 2, 2005. See CAA section 112(i)(2). However, the same issue will arise should EPA adopt revised standards as a result of the periodic review mandated by section 112(d)(6). There is no indication that Congress intended the draconian result of sources constructed at the time of the initial MACT rule (which could be decades in the past for a section 112 (d)(6) revised standard) to be considered new sources.

[17] Greenfield cement kilns, for which EPA adopted a new source standard for THC in 1999, are a separate type of new source for purposes of this analysis.

characteristics of a cement kiln versus a coal-fired boiler.

Comment: One commenter states that EPA's proposed risk-based exemptions from HCl standards are unlawful, arbitrary and capricious. On the proposal to develop a single national risk-based HCl standard based on the RfC for HCl the commenter states no national risk-based HCl standard exists making it impossible to comment effectively on any provisions in the cement rule that might rely on a hypothetical future rulemaking. The commenter continues stating that any attempt to set risk-based standards on a national rule that does not exist and is not currently available for review, would contravene the CAA notice and comment requirements. The commenter states further that 112(d)(4) allows EPA to set health-based emission standards only for those pollutants for which a health threshold has been established, and that no cancer threshold has been set for HCl (nor is there any classification of HCl with respect to carcinogenicity and none exists). Also, the commenter states that no non-cancer threshold has been set for HCl and that the integrated risk information system (IRIS) RfC, on which EPA attempts to rely, does not purport to be an established threshold. According to the commenter, disclaimers in IRIS negate any notion that it provides an established threshold for HCl.

Response: We largely disagree with these comments. Section 112 of the CAA includes exceptions to the general statutory requirement to establish emission standards based on MACT. Of relevance here, section 112(d)(4) effectively allows us to consider risk-based standards for HAP "for which a health threshold has been established" provided emissions of the HAP are at levels that provide an "ample margin of safety." Therefore, we believe we have the discretion under section 112(d)(4) to develop standards which may be less stringent than the corresponding technology-based MACT standards for some categories emitting threshold pollutants, or not to set a standard if it is apparent that emissions from the source category (i.e. from any source in the category, or any potential new source) would remain protective of human health and the environment with an ample margin of safety and protective of the environment.

The data are inadequate to make a determination as to whether HCl is carcinogenic in either humans or animals, so EPA has not developed an assessment for carcinogenicity of HCl.

The IRIS noncancer assessment for HCl provides a RfC for inhalation. An RfC is an estimate (with uncertainty spanning perhaps an order of magnitude) of a daily inhalation exposure of the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.

The existence of a threshold for noncancer effects of HCl is established by general toxicological principles, i.e., that organisms are able to repair some amount of corrosive tissue damage of the type caused by HCl. If the damage does not exceed an organisms' ability to repair it, then no adverse effects will occur. Although the underlying data for HCl did not identify subthreshold exposures for chronic effects, this was due to experimental design issues rather than the absence of a threshold. EPA is unaware of any studies, theory, or experts that suggest HCl does not have a threshold for adverse effects.

Comment: Two commenters submitted comments on the need for HCl standards. According to the commenters, based on a risk analysis using 14 preheat/precalciner kilns at 13 cement plants using a range of in-stack HCl concentrations as well as a sensitivity analysis using higher hazardous waste kiln HCl concentrations, risks are well below the short-term and long-term thresholds. Based on this minimal risk, the commenters state that there is no need for an HCl standard for new kilns or the proposed operational standard for existing kilns. The commenters state that additional data will be submitted to demonstrate that there is minimal risk and no need for HCl standards.

As stated in its comments on the original proposal, one commenter states that a standard for HCl is not warranted for either existing or new sources. Since the close of the previous comment period, the commenter conducted a study to evaluate the long term and short term health risks of HCl emissions from 112 kilns at 67 plants. According to the commenter, risks were assessed using EPA modeling guidance and conservative modeling assumptions. The commenter states that based on their analysis, both chronic and acute risks are below acceptable levels and that none of the kilns studied have the potential to generate HCl emissions that result in air concentrations exceeding EPA's RfC threshold for chronic health effects or Cal EPA's reference exposure level threshold for acute effects. Based on these results, the commenter states that there is no justification for an HCl standard for new or existing cement kilns. The commenter included a copy of the health risk analysis with their comments. Another commenter refers to the above information submitted by another commenter that risks to health from HCl are well below levels acceptable for both chronic and acute impacts.

Response: As discussed in section IV.B above, we have reviewed the risk analysis provided by the commenter and agree that additional control of HCl is not required.

Comment: Regarding emission standards for THC, one commenter states that although EPA has proposed limits, they have not set standards for the main kiln stack at existing sources and new sources at existing plants. The commenter states that EPA's position on THC standards is unlawful, contemptuous of court, and arbitrary for the same reasons given by the commenter above regarding EPA position on mercury standards (see above). The same commenter in a later submission, states that the preamble to the proposed rule appears to indicate that EPA did not set emission standards for THC emissions from the kiln's main stack, although the regulatory text does specify emission limits for the kiln's main stack.

Response: Since EPA is setting standards for THC (as a surrogate for non-dioxin organic HAP), and also proposed to do so, this comment is not factually accurate (and, as noted in earlier responses, mischaracterizes the court's mandate in any case). In addition, as previously discussed, we do not agree with the commenter that the court's mandate required us to set standards regardless of the facts. The court noted that we had inappropriately limited our analysis to add-on back end control technologies. As is the case with mercury and HCl, setting some type of emission limits based on test data would mean that many facilities would have to apply a beyond-the-floor add-on control technology to meet the floor level of control without consideration of the costs, energy, and non-air health and environmental impacts.

Comments: One commenter states that EPA has improperly borrowed standards from its 1999 regulations for hazardous waste combustors, which were found unlawful and vacated [18] rather than setting standards that reflect the THC or CO emission levels actually achievable by the best performing sources (12 percent of cement kilns for existing and best performing cement kiln for new). The commenter states further that although maintaining good combustion

[18] This is incorrect; the THC rules for hazardous waste incinerators/cement kilns/lightweight aggregate kilns were not challenged and were therefore not vacated by the D.C. Circuit. See *CKRC*, 255 F.3d at 872.

conditions affects THC emissions, it is not the only factor that does so and cites the plants' selection of raw materials as affecting THC emissions. The commenter states that EPA's new greenfield source standard reflects that use of low organic feed materials affects THC emissions and also cites statements by Florida DEP and Holcim that selection of feed materials can affect THC emissions. The commenter states that EPA admits that add-on controls, e.g., ACI and scrubber/RTO (in use on two kilns), as well as precalciner/no preheater technology reduce THC emissions. According to the commenter, because these other factors can affect THC emissions, EPA has incorrectly set the floor based on good combustion control only. The commenter states that EPA concedes that cement kilns may be able to achieve better THC emission levels than through the use of good combustion alone when it discusses in the proposed rule that nonhazardous waste cement kilns should be "less challenged" than hazardous waste kilns in meeting the proposed limits and that the "lack of any hazardous waste feed for a non-hazardous waste (NHW) cement kiln should make it easier to control the combustion process." The commenter states that EPA did not account for the fact that nonhazardous waste burning kilns can control their combustion conditions and thus THC emission more easily than hazardous waste burning kilns, instead just borrowing the standard for hazardous waste burning kilns without attempting to show that the proposed limits reflect what is actually achievable by the relevant best performers. According to the commenter, EPA's arguments that it does not have to consider factors other than good combustion were rejected by the court as irrelevant and EPA must set the THC limits reflecting the average emission level that the best sources actually achieve.

Response: In the original NESHAP, we noted that THC emissions were primarily a function of the organic materials in the kiln feed. As we have previously discussed, a facility has a starkly limited ability to change their raw materials to reduce their organic content. The fact that individual facilities have successfully reduced organic contents of their feed materials to reduce THC emissions does not indicate that this option is available to all facilities. Therefore, we cannot use this option as the basis of a national standard for existing facilities.[19]

For new greenfield facilities we established in the 1999 rule that a facility would have the option to site the quarry at a location with low enough organic content that they could meet a 50 ppmv THC emissions limit. We determined that this was feasible because two facilities had already done so at the time we promulgated the original NESHAP. This limit was not remanded by the court and is currently in effect.

As we have previously discussed, we do not agree that the court decision compels us to set a THC standard that will require some sources to install a beyond-the-floor control technology under the guise of a floor standard. These facts have not changed from the original NESHAP.

However, at proposal we noted that facilities could control THC resulting from combustion of fuel.[20] We explained that the basis of the MACT floor for cement kilns firing hazardous waste was also good combustion, and these kilns had established limits for THC as a quantitative measure of good combustion conditions. Given the fact that both classes of kilns were using the same method of control, we proposed to apply the same limits to kilns that did not burn hazardous waste. We have no data, and none were supplied by the commenter, to make any judgments about whether or not kilns that do not burn hazardous waste could actually meet a more stringent standard. Because the standards are based on complete combustion of the fuel, and because of the extremely high temperatures in the end of the kiln where the fuels are introduced (both those that burn hazardous waste and those that do not), we believe that both types of kilns should achieve comparable complete destruction of organic materials present in the fuels under normal operating conditions reflecting good combustion. Simply because we state that controlling THC emissions from kilns that do not burn hazardous waste should be less difficult than controlling emissions from kilns that do burn hazardous waste does not imply that one type of kiln can achieve a measurably lower THC emission level than another.

Comments: Several commenters state that it is inappropriate to set THC floor limits based on a different source category, i.e., HWC. According to the commenters, at issue is the control of products of incomplete combustion (PIC) vs. control of hydrocarbons from feed materials. They state that HWC have the option ceasing to burn hazardous waste when exceeding the limit (and can do so easily using automatic waste feed cutoff systems) and that the HWC THC standard only applies when hazardous waste is being burned.

Three commenters state that the HWC MACT standards were based on EPA's RCRA Boiler and Industrial Furnace rules, which in turn were based on the need to safely manage hazardous waste, a need that is irrelevant to the facilities covered under the current proposal.

Response: We agree with this comment and have removed the proposed quantified limits for existing sources. We have not removed the limit for new sources because the basis of the new source floor (and standard) is performance of a RTO (preceded by a scrubber to enable the RTO to function). Application of an RTO (in series with a scrubber) would allow new cement kilns to meet a 20 ppmv standard, or to remove 98 percent of incoming organic HAP measured as THC.

Comment: Three commenters state that EPA has no empirical data demonstrating that any NHW kiln can achieve the proposed limits on a continuous basis. One commenter states that bench scale studies estimated that for varying organic levels, 47 percent of samples would have resulted in emissions that exceed the 20 ppmv limit.

Response: We agree with this comment and have removed the proposed limits for existing sources. We have not removed the limit of new sources because the basis for the new source floor is now the performance of a RTO. Application of an RTO would allow the facilities noted in the comment to meet a 20 ppmv standard.

Comment: Three commenters state that the contribution to THC/CO from raw materials outweighs the measure of THC/CO for good combustion of hazardous waste fuels. Thus, THC and CO are not useful indicators of good combustion. One commenter notes that available information shows that it is difficult to correlate HC and HAP emissions. The commenter further states that several studies show that neither THC nor CO is a reliable surrogate for good combustion or PIC or HAP emissions. According to the commenter, HC emissions are a function of: (1) Raw material organic content; (2) source of fuel and firing location; (3) temperature profile; (4) oxygen concentration; and (5) type of manufacturing process. One

[19] EPA could subcategorize each source based on its raw material organic content (each source being a different "type"), but rejects this alternative as being a paper exercise not producing environmental benefit.

[20] Fuel organics can be controlled because they are fed into the hot end of the kiln. Feed materials are fed into the other end of the kiln and therefore have the opportunity to vaporize and leave with the exhaust gas before they reach the portions of the kiln which are hot enough to combust them.

commenter states that the high temperatures required for the formation of cement clinker (>2700F) ensure as complete combustion of fuels as is possible.

Response: We agree with the comment that because organic contributions from processing raw materials is the chief contributor to measured THC levels (since such emissions are not combusted and hence are not largely destroyed), having a quantified limit for THC as a measure of good combustion is not appropriate for existing cement kilns that do not burn hazardous waste. We disagree with the more general statements regarding the appropriateness of a THC indicator for organic HAP, and indeed are continuing to utilize THC as an indicator for new sources. As noted in the proposal of the original NESHAP, the organic HAP component of THC emissions varies widely (63 FR 14196). However, THC emissions do contain organic HAP. Applying MACT to THC emissions will also control organic HAP, but will be less costly than attempting to set individual limits for each individual organic HAP (64 FR 31918).

We also agree with the comment that combustion conditions in the hot end of the kiln where fuels are fired should assure destruction of organics (including organic HAP) in the fuel. For this reason, we adhere to our position at proposal that good combustion conditions in the cement kiln should assure destruction of organic HAP in fuel and represents the measure of best performance for reducing emissions of organic HAP from existing cement kilns. As explained in section I.C above, we have chosen a different means of expressing good combustion conditions than the quantified THC limit which we proposed.

Comment: Three commenters state that it is inappropriate to apply limits for non-dioxin organic HAP when feed materials have varying levels of organics, which EPA acknowledges by setting THC limits only for new greenfield sources (EPA also applied variability of feed/fuel materials in justifying rules or lack of rules for mercury, HCl and non-mercury metals). Two commenters add that a Reaction Engineering study shows that organics emitted from kiln feed is extremely variable across the country with levels varying by over four orders of magnitude.

Response: We agree with these comments and have made appropriate changes in the final rule to the proposed floor for existing cement kilns' non-dioxin organic HAP emissions to account for the essentially uncontrollable variability in organic HAP levels in raw materials.

Comment: A commenter states that EPA failed to consider the reduction in THC as part of the beyond-the-floor analysis of ACI. According to the commenter, organic HAP potentially controlled by ACI include polychlorinated biphenyls, polycyclic organic matter, and polyaromatic hydrocarbons. According to the commenter, to determine the maximum degree of reduction in THC emissions that is achievable for cement kilns, the CAA requires that EPA evaluate the reductions achievable through the use of ACI.

One commenter states that: (1) EPA did not determine, as required by the CAA for beyond-the-floor standards, the maximum degree of reduction in THC emissions achievable through GCP; (2) EPA did not show that its standards reflect the maximum degree of reduction achievable through combustion controls in light of its findings that NHW burning kilns should be able to achieve the THC standards more easily than hazardous waste burning kilns; (3) EPA did not determine the maximum degree of reduction achievable through the judicious selection of raw materials although they acknowledge that such methods will control THC emissions and that kilns are already using it and can control THC emissions through the use of other materials such as fly ash and kilns can and do import raw materials from sources that are not co-located or immediately nearby; (4) EPA did not determine the degree of reduction achievable through the use of end-of-stack controls already in use in the cement industry, including ACI, which EPA only considered for mercury and dioxin control and which would reduce THC emissions significantly and also reduce mercury and dioxin emissions;[21] (5) EPA failed to determine the maximum degree of reduction achievable through the use of limestone scrubber/RTO even though the agency is aware that such devices can significantly reduce emissions of THC (as well as HCl) and are already in use in the industry and does not contend that they are too expensive; and (6) EPA failed to consider or determine the maximum degree of reduction achievable through the use of a carbon coke filter system such as the Polvitec system in use at Holcim's Zurich plant. For the reasons (1–7) listed above, the commenter states that EPA's beyond-the-floor analysis for THC contravenes CAA 112(d)(2) which requires that EPA's final standards reflect the maximum degree of reduction achievable through any and all reduction measures, and any claim that EPA's THC standard reflects the maximum achievable degree of reduction would be arbitrary and capricious in light of EPA's failure to consider these technologies or explain its decision not to base beyond-the-floor standards on any or all of them.

Response: We have no actual test data to establish the impact of ACI on THC emissions, but are using a figure of 50 percent, which reflects the best estimates of the one facility using ACI for organics control. As explained in section IV.C above, the facility in question is extremely unusual in that the uncontrolled THC emission levels are much higher than any other facility in the source category, so the 50 percent reduction figure is probably more efficient than would be achieved industry-wide. As explained in section IV.A.2 above, however, even assuming this degree of reduction, we did not find a beyond-the-floor option based on performance of ACI to be achievable within the meaning of section 112(d)(2).

The commenter also stated that we did not assess the maximum degree of THC reduction achievable by optimized combustion practices. There are no data available to perform this type of analysis and none were provided by the commenter. Moreover, THC levels significantly below those associated with good combustion conditions are not necessarily indicative of further organic HAP reductions. See discussion at 70 FR 59462–59463 (October 12, 2005).

We also did not evaluate the degree to which "judicious selection" of raw materials can be used to reduce THC emissions, except that we have previously established that a greenfield facility can limit THC emission to 50 ppmv by selection of limestone with sufficiently low organic materials contents. We are aware that cement production facilities can import some raw materials from sources other than those nearby. However, the fact that in some cases materials can be imported from a farther distance does not change the fact that each individual cement facility has specific raw materials needs based on their particular limestone and other raw materials. We do not have data, nor are data available, to develop a national rule that would cover every possible raw material substitution to reduce THC emissions.

The commenter also stated we did not assess the maximum degree of emission

[21] Since the rule already contains a standard for dioxin, incremental reductions attributable to use of ACI are quite small; see section IV.a.2 above.

reduction achievable through the use of end-of-stack controls. However, as previously discussed, there are no data available for us to perform this analysis for any controls other than an RTO. In the case of an RTO, we have evaluated its performance as a beyond-the-floor control for existing sources. In that case, we determined requiring a facility to apply an RTO as a beyond-the-floor option was not achievable, within the meaning of section 112(d)(2), due to the high costs and adverse energy utilization impacts. The new source standard for THC is based on performance of an RTO (in tandem with a scrubber), as discussed previously. We do not believe any further control is technically feasible.

The commenter also stated we had not considered the use of a carbon coke system. The source for this comment notes that there was one facility in Europe. We note the plant in question was designed to burn pelletized sewage sludge. The source of the comment does not indicate the performance or costs of this system. We assume it would perform similarly to a carbon adsorption system, which achieves emission reductions similar to those of an RTO. We believe that the wet scrubber/RTO system, which is demonstrated on a cement kiln in the United States, is a viable beyond-the-floor option. Given the lack of demonstration of a carbon coke filter in this country, the fact that we have a viable alternative as a beyond-the-floor option (an RTO), and the fact that the carbon coke filter is unlikely to perform any better than an RTO, we do not believe consideration of a carbon coke filter is warranted.

Comment: Several commenters oppose EPA's proposed regulation of area sources for THC. Three commenters state that there is no legal basis for regulating area sources. The commenters note that there is no "statement of basis and purpose" as required by CAA 307(d)(3).

One commenter recommends that EPA exempt area sources, which would experience the same cost as major sources with fewer benefits; or consider less stringent options, e.g., periodic stack test rather than CEM.

Response: As previously noted, in the original 1999 NESHAP for this source category we regulated THC emissions from area sources because the THC emissions from a cement kiln are likely to contain polycyclic organic matter. This pollutant is listed in section 112(c)(6) of the CAA as a pollutant. The commenter provided no data that would lead us to change this determination (63 FR 14193–94).

We also considered requiring periodic stack tests rather then THC CEM. However, the current rule already requires kilns at greenfield area sources to install a THC CEM. We could see no justification for allowing a more lenient THC monitoring option for new kilns at non-greenfield facilities.

Comment: One commenter states that the requirement for THC CEM will impose additional cost for no benefit. The commenter recommends that EPA eliminate numerical limits or require less costly monitoring options, e.g., periodic stack testing. The commenter recommends that if EPA does require CEM, extend the compliance date to at least 2 years because the State certification process requires more than 1 year.

Response: We have not adopted a requirement that existing sources install a THC monitor. For new sources, the compliance date is ordinarily the effective date of the rule or startup, whichever is later. See section 112(i)(1). However, in this case, because the new source standard is more stringent than proposed (see discussion in section IV.C.3 above), sources which commenced construction or reconstruction after December 2, 2005, but before December 20, 2006, will have until December 21, 2009 to comply. See section 112(i)(2).

Comment: Two commenters favor including all crushers in the Portland cement NESHAP and establishing emission limits for crushers based on the requirements in 40 CFR, subpart OOO, if they satisfy the requirements of the CAA. One commenter cites State requirements for primary crushers of 10 percent opacity, work practices, and a baghouse with outlet concentration of 0.01 grams per dry standard cubic feet; secondary crushers are subject to a 20 percent opacity limit. The commenter provided a copy of their State requirements for crushers at cement manufacturing facilities.

One commenter states that applicability based on location relevant to other sources is confusing and recommended that EPA put all appropriate requirements for the sources in one requirement and remove 63.1340(c) altogether.

Response: We agree that applicability based on location relevant to other sources is confusing. However, in our final determination on this issue we decided that crushers should not be covered under this NESHAP. The reasons are first, we have no definitive information that there are any facilities that currently have crushers after raw materials storage. Second, we have no data to set a floor for existing crushers that might potentially be covered. We considered using the current Nonmetallic Mineral NSPS, which established standards of performance for new crushers. But we have no data to determine if the NSPS for this source category would be an appropriate MACT floor. Finally, we believe we can resolve the issue by simply stating that crushers are not covered by this regulation. It was never our intent that this rule regulate equipment typically associated with another source category.

Comment: One commenter states that all of the raw material handling and storage, except crushing, should be covered by the Portland cement NESHAP. They state that the only non-metallic mining activities subject to the NSPS subpart OOO are at the quarry and at the crusher. The commenter states that under the alternative interpretation offered by EPA, several steps characteristic of cement manufacturing would not be included in subpart LLL, for example the "on-line" measurement devices such as cross-belt neutron analyzers that are used in the preblending and proportioning steps. The commenter states further that the raw mix fed to the raw mill is the product of the very careful instrumentally-aided proportioning and blending operation that is one of the most important series of steps in the cement manufacturing process.

Response: We agree with this comment.

VII. Summary of Environmental, Energy, and Economic Impacts

A. What facilities are affected by the final amendments?

We estimate that there are approximately 94 cement plants currently in operation. These 94 plants have a total of 158 NHW cement kilns. We estimate that 20 new kilns with a capacity of 20,900,000 tpy of clinker capacity will be subject to the final amendments by the end of the fifth year after promulgation of the amendments. Note that national impacts are based on the estimated capacity increase, not on a specific number of model kilns.

B. What are the air quality impacts?

For existing kilns, we estimate that the impacts of the amendments will essentially be zero because we believe that all existing kilns are already performing the work practices prescribed in the amendments. For the 20 new kilns the variation in mercury and hydrocarbon emissions from kilns makes it difficult to quantify impacts on a national basis with any accuracy.

For mercury emissions we estimate a new kiln with a capacity of 650,000 typ of clinker will have an emission reduction ranging from zero to 280 lb/yr. We estimate the national mercury emissions reduction to be 1300 to 3000 lb/yr in the fifth year after promulgation.

Reported hydrocarbon emission test results range from less than 1 ppmv dry basis (at 7 percent oxygen) to over 140 ppmv dry basis (Docket A–92–53) measured at the main kiln stack. For 52 kilns tested for hydrocarbon emissions (Docket A–92–53), approximately 25 percent had emissions of hydrocarbons that exceeded the 20 ppmv THC limit at the main stack. The average hydrocarbon emissions for the kilns exceeding 20 ppmv was 62.5 ppmv. Assuming that most new kilns will be sited at existing locations this would imply that 15 out of 20 new kilns will have no THC emissions reduction as a result of the THC Standard. For a new kiln that, in the absence of the standard, would emit near the average hydrocarbon level of 62.5 ppmv, the application of new source MACT consisting of an RTO would result in a reduction of about 196 tpy for a 650,000 tpy kiln. We also estimate that for 15 percent of the new kiln capacity will have uncontrolled emissions that exceed the 20 ppmv limit, but will use alternatives to application of an RTO (such as ACI) to meet the THC emissions limit. These kilns will achieve an emissions reduction of approximately 103 tpy for a new 650,000 tpy new kiln. The total national reduction will be 1100 tpy in the fifth year after promulgation of the standard.

The THC and mercury standards for new sources will also result in concurrent control of SO_2 emissions. For kilns that elect to use an RTO to comply with the THC emissions limit it is necessary to install an alkaline scrubber upstream of the RTO to control acid gas and to provide additional control of PM. We estimate that approximately 25 percent of the additional capacity built in the next five years will have to install wet scrubbers for mercury control, and 10 percent will install a wet scrubber/RTO system for THC control. The SO_2 emissions reductions for a new 650,000 tpy kiln will be approximately 320 tpy, and is estimated as 3640 nationally.

Note that we have determined that reducing SO_2 emissions also results in a reduction in secondary formation of fine PM because some SO_2 is converted to sulfates in the atmosphere. Therefore, the THC standards will also result in a reduction in emissions of fine PM.

In addition to the direct air emissions impacts, there will be secondary air impacts that result in the increased electrical demand generated by new sources' control equipment. These emissions will be an increase in emissions of pollutants from utility boilers that supply electricity to the Portland cement facilities. Assuming two new kilns will install a scrubber followed by an RTO, three will install an ACI system, and five will install wet scrubbers, we estimate these increases to be 105 tpy of NO_x, 47 tpy of CO, 157 tpy of SO_2, and 5 tpy of PM at the end of the fifth year after promulgation.

C. What are the water quality impacts?

There should be no water quality impacts for the proposed amendments. The requirement for new sources to use alkaline scrubbers upstream of the RTO will produce a scrubber slurry liquid waste stream. However, we are assuming the scrubber slurry produced will be dewatered and disposed of as solid waste. Water from the dewatering process will be recycled back to the sc in the form of aqueous discharges, addition of a scrubber will increase water usage by about 41 million gallons per year (gyps) for each new 650,000 tpy kiln that installs a scrubber, or a national total of 460 million gyps.

D. What are the solid waste impacts?

The solid waste impact will be the generation of scrubber slurry that is assumed to be dewatered and disposed of as solid waste, and solid waste from the ACI systems. The amount of solid waste produced is estimated as 519,300 tpy in the fifth year after promulgation of the amendments.

E. What are the energy impacts?

Requiring new kilns to install and operate alkaline scrubbers and RTO will result in increased energy use due to the electrical requirements for the scrubber and increased fan pressure drops, and natural gas to fuel the RTO. We estimate the additional electrical demand to be 41 million kWhr per year and the natural gas use to be 271 billion cubic feet by the end of the fifth year.

F. What are the cost impacts?

The final rule amendments should impose minimal costs on existing sources. These costs will be recordkeeping costs to document CKD wastage. The costs for new sources include the THC monitor and recordkeeping costs for CKD wastage on all new kilns, a wet scrubber for mercury control on five new kilns, and a wet scrubber/RTO on two of the new kilns. The estimated capital cost for a new 650,000 tpy kiln to install a THC monitor is $140,000, to install a wet scrubber is $2.7 million, and to install a wet scrubber/RTO is $10.7 million. For kilns where the uncontrolled THC emissions are below 40 ppmv, we are assuming they will opt for a lower cost THC control, such as ACI. The estimated capital cost for ACI applied to a new 650,000 tpy kiln is $1.0 to $1.6 million. The total estimated national capital cost at the end of the fifth year after promulgation is $64 to $67 million.

The estimated annualized cost per new 650,000 tpy kiln is an estimated as $34,000 to $37,000 for kilns a THC monitor, $470,000 to $597,000 for ACI, $1.4 to $1.5 million for a wet scrubber, and $3.6 to $3.9 million for a wet scrubber/RTO. National annualized costs by the end of the fifth year will be an estimated $26 to $28 million.

G. What are the economic impacts?

EPA conducted an economic analysis of the amendments to the NESHAP which have cost implications. For existing sources the only requirement with any cost implication is the requirement to keep records of CKD wastage. These costs are very small. We assessed earlier Portland cement regulations with greater per source costs, and those costs did not have a significant effect on the cost of goods produced. Since the conditions that produced those conclusions still exist today, EPA believes these new regulations will not have a discernible impact on the Portland cement market for existing sources.

For new sources, both the magnitude of control costs needed to comply with the final amendments and the distribution of these costs among affected facilities have a role in determining how the market will change. The final amendments will require all new kilns constructed on or after December 2, 2005, to install THC monitors. As with existing sources, the cost on a THC monitor is not significant compared to the costs assessed in the earlier regulations. However, the cost for ACI or for the wet scrubbers/RTO systems are significant. We estimate that 3 of the 20 new kilns will have to install ACI, 2 of 20 new kilns will be required to install a wet scrubber/RTO system to meet the limits for THC, and five kilns will install a wet scrubber to meet the new source mercury limits.

Because of the high cost of transportation compared to the value of Portland cement, the market for Portland cement is localized and characterized by imperfect competition. The possible outcomes of the final amendments are either a deferral in

bringing the new kiln into production or a price increase in the immediate region around the two new kilns that face control costs. For perfect competition, control costs at a new facility will be completely passed on in the long run to the purchaser of the good. With imperfect competition the outcome is harder to predict. Less than full cost pass through is a likely possibility.

The model new kilns used in this analysis have a clinker capacity of 650,000 tons/yr. The annual control cost would be up to $597,000 for kilns that apply ACI, $1.5 million for a kiln that applies a wet scrubber, and $3.9 million for a kiln that applies an scrubber/RTO, in 2002 dollars. Clinker is an intermediate good in the production of Portland cement and corresponds to a Portland cement capacity of 720,000 tons/yr. To compare the costs to the value of the Portland cement in 2004 of $85 for a national average mill value we use the Chemical Engineering Plant Cost Index for 2004 and 2002 to get a 2004 annual cost of $640,000 for kilns that require ACI, $1.7 million for kiln that apply wet scrubbers, and $4.4 million for those that apply an scrubber/RTO. The value of the Portland cement produced in a year at the $85 price would be $61 million. If the cost were to be fully passed on to the purchaser in a higher price the price would increase by 1.0 to 7.2 percent, to values of $86 to $91, respectively.

With the increasing demand for Portland cement and the high capacity utilization of existing plants and the nature of the regional markets, it is unlikely that the new kilns would be delayed. Because of the imperfect competition, it is likely in the regions around the two new kilns facing control, the price of the Portland cement would increase but by less than the 1.0 to 7.2 percent that would be required to fully cover the control costs.

VIII. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order (EO) 12866 (58 FR 51735, October 4, 1993), this action is a "significant regulatory action" because it raised novel legal and policy issues. Accordingly, EPA submitted this action to the Office of Management and Budget (OMB) for review under EO 12866 and any changes made in response to OMB recommendations have been documented in the docket for this action.

B. Paperwork Reduction Act

The information collection requirements in this final rule have been submitted for approval to the OMB under the *Paperwork Reduction Act*, 44 U.S.C. 3501 *et seq.* The information collection requirements are not enforceable until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies set forth in 40 CFR part 2, subpart B.

These requirements include records of CKD removal from the kiln system at all existing and new sources, and requirements for new kilns constructed after December 2, 2005, to install and test a continuous monitor to measure THC. We expect these additional requirements to affect 94 facilities over the first 3 years. The estimated annual average burden is outlined below.

Affected entity	Total hours	Labor costs	Total annual O&M costs	Total costs
Industry	4,159	$679,105	$161,672	$840,777
Implementing Agency	213	16,100	NA	16,100

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9. When this information collection request is approved by OMB, the Agency will publish a technical amendment to 40 CFR part 9 in the **Federal Register** to display the OMB control number for the approved information collection requirements contained in this final rule.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impact of today's proposed rule amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration's (SBA) regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of this final rule amendments on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. The small entities directly regulated by the final rule amendments are small businesses. We determined there are 6 or 7 small businesses in this industry out of a total of 44. Each small business operates a single plant with one or more kilns. The total annualized cost of the standards in the amendments for an existing kiln is

nominal. The revenue for the entire small business sector is estimated to be around $260 million (2003 dollars). New sources, will incur higher costs because new kilns must install a THC monitor, and approximately three of the 20 new kilns will have to install ACI, two will have to install wet scrubbers, and two will have to install a wet scrubber/RTO system for THC control. For new sources that must install controls, the cost of control is estimated to be one to seven percent of the expected revenue from a new kiln. We currently do not have any information on plans for small businesses to build new kilns.

Although the final rule amendments will not have a significant economic impact on a substantial number of small entities, EPA nonetheless has tried to reduce the impact of the final amendments on small entities. The emission standards are representative of the floor level of emissions control, which is the minimum level of control allowed under CAA. Further, the costs of required performance testing and monitoring for non-dioxin organic HAP emissions from new sources have been minimized by specifying emissions limits and monitoring parameters in terms a surrogate for organic HAP emissions, which surrogate (THC) is less costly to measure.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year, nor do the amendments significantly or uniquely impact small governments, because they contain no requirements that apply to such governments or impose obligations upon them. Thus, these final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. The final rule amendments will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132, because State and local governments do not own or operate any sources that would be subject to the proposed rule amendments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175, because tribal governments do not own or operate any sources subject to today's action. Thus, Executive Order 13175 does not apply to the proposed rule amendments.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the rule. The final rule amendments are not subject to Executive Order 13045 because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions That Significantly Affect Energy, Supply, Distribution, or Use

This rule is not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355 (May 22, 2001)) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. These rule requirements will have energy effects due to the energy requirements for the control devices required for new sources. We estimate the additional electrical demand to be 15 million kWhr per year and the

natural gas use to be 270 billion cubic feet by the end of the fifth year. We do not consider these energy impacts to be significant.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113, Section 12(d), 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities, unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

This final rule involves technical standards. EPA cites EPA Method 29 of 40 CFR part 60 for measurement of mercury emissions in stack gases for new cement kilns.

Consistent with the NTTAA, EPA conducted searches to identify voluntary consensus standards in addition to these EPA methods. The search and review results are in the docket for this rule.

One voluntary consensus standard was identified as an acceptable alternative to an EPA test method for the purposes of the final rule. The voluntary consensus standard ASTM D6784–02, "Standard Test Method for Elemental, Oxidized, Particle-Bound and Total Mercury Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method)," is an acceptable alternative to EPA Method 29 (portion for mercury only) as a method for measuring mercury.

The search for emissions measurement procedures identified two other voluntary consensus standards. EPA determined that these two standards identified for measuring emissions of the HAP or surrogates subject to emission standards in this rule were impractical alternatives to EPA test methods for the purposes of this rule. Therefore, EPA does not intend to adopt these standards for this purpose. The reasons for the determinations for the two methods are discussed below.

The voluntary consensus standard EN 13211:2001, "Air Quality—Stationary Source Emissions—Determination of the Concentration of Total Mercury," is not acceptable as an alternative to the mercury portion of EPA Method 29 primarily because it is not validated for use with impingers, as in EPA method, although the standard describes procedures for the use of impingers. This European standard is validated for the use of fritted bubblers only and requires the use of a side (split) stream arrangement for isokinetic sampling because of the low sampling rate of the bubblers (up to 3 liters per minute, maximum). Also, only two bubblers (or impingers) are required by EN 13211, whereas EPA method requires the use of six impingers. In addition, EN 13211 does not include many of the quality control procedures of EPA methods, especially for the use and calibration of temperature sensors and controllers, sampling train assembly and disassembly, and filter weighing.

The voluntary consensus standard CAN/CSA Z223.26–M1987, "Measurement of Total Mercury in Air Cold Vapour Atomic Absorption Spectrophotometeric Method," is not acceptable as an alternative to EPA Method 29 (for mercury). This standard is not acceptable because of the lack of detail in quality control. Specifically, CAN/CSA Z223.26 does not include specifications for the number of calibration samples to be analyzed, procedures to prevent carryover from one sample to the next, and procedures for subtraction of the instrument response to calibration blank as in EPA method. Also, CAN/CSA Z223.26 does not require that the calibration curve be forced through or close to zero (or a point no further than ±2 percent of the recorder full scale) as in EPA method. Also, CAN/CSA Z223.26 does not include a procedure to assure that two consecutive peak heights agree within 3 percent of their average value and that the peak maximum is greater than 10 percent of the recorder full scale, as in EPA methods. CAN/CSA Z223.26 does not include instructions for a blank and a standard to be run at least every five samples, and specifications for the peak height of the blank and the standard as in EPA method.

Section 63.1349 to subpart LLL of this rule lists the testing methods included in the regulation. Under § 63.7(f) and § 63.8(f) of Subpart A of the General Provisions, a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any required testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). This rule will be effective on December 20, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, and Reporting and recordkeeping requirements.

Dated: December 8, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[Amended]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart LLL—[Amended]

■ 2. § 63.1342 is revised to read as follows:

§ 63.1342 Standards: General.

Table 1 to this subpart provides cross references to the 40 CFR part 63, subpart A, general provisions, indicating the applicability of the general provisions requirements to subpart LLL.

■ 3. Section 63.1343 is revised to read as follows:

§ 63.1343 Standards for kilns and in-line kiln/raw mills.

(a) *General.* The provisions in this section apply to each kiln, each in-line kiln/raw mill, and any alkali bypass associated with that kiln or in-line kiln/raw mill. All gaseous, mercury and D/F emission limits are on a dry basis, corrected to 7 percent oxygen. All total hydrocarbon (THC) emission limits are measured as propane. The block averaging periods to demonstrate compliance are hourly for 20 ppmv total hydrocarbon (THC) limits and monthly for the 50 ppmv THC limit.

(b) *Existing kilns located at major sources.* No owner or operator of an existing kiln or an existing kiln/raw mill

located at a facility that is a major source subject to the provisions of this subpart shall cause to be discharged into the atmosphere from these affected sources, any gases which:

(1) Contain particulate matter (PM) in excess of 0.15 kg per Mg (0.30 lb per ton) of feed (dry basis) to the kiln. When there is an alkali bypass associated with a kiln or in-line kiln/raw mill, the combined particulate matter emissions from the kiln or in-line kiln/raw mill and the alkali bypass are subject to this emission limit.

(2) Exhibit opacity greater than 20 percent.

(3) Contain D/F in excess of:

(i) 0.20 ng per dscm (8.7×10^{-11} gr per dscf) (TEQ); or

(ii) 0.40 ng per dscm (1.7×10^{-10} gr per dscf) (TEQ) when the average of the performance test run average temperatures at the inlet to the particulate matter control device is 204 °C (400 °F) or less.

(c) *Reconstructed or new kilns located at major sources.* No owner or operator of a reconstructed or new kiln or reconstructed or new inline kiln/raw mill located at a facility which is a major source subject to the provisions of this subpart shall cause to be discharged into the atmosphere from these affected sources any gases which:

(1) Contain particulate matter in excess of 0.15 kg per Mg (0.30 lb per ton) of feed (dry basis) to the kiln. When there is an alkali bypass associated with a kiln or in-line kiln/raw mill, the combined particulate matter emissions from the kiln or in-line kiln/raw mill and the bypass stack are subject to this emission limit.

(2) Exhibit opacity greater than 20 percent.

(3) Contain D/F in excess of:

(i) 0.20 ng per dscm (8.7×10^{-11} gr per dscf) (TEQ); or

(ii) 0.40 ng per dscm (1.7×10^{-10} gr per dscf) (TEQ) when the average of the performance test run average temperatures at the inlet to the particulate matter control device is 204 °C (400 °F) or less.

(4) Contain total hydrocarbons (THC), from the main exhaust of the kiln, or main exhaust of the in-line kiln/raw mill, in excess of 20 ppmv if the source is a new or reconstructed source that commenced construction after December 2, 2005. As an alternative to meeting the 20 ppmv standard you may demonstrate a 98 percent reduction of THC emissions from the exit of the kiln to discharge to the atmosphere. If the source is a greenfield kiln that commenced construction on or prior to December 2, 2005, then the THC limit is 50 ppmv.

(5) Contain mercury from the main exhaust of the kiln, or main exhaust of the in-line kiln/raw mill, or the alkali bypass in excess of 41μg/dscm if the source is a new or reconstructed source that commenced construction after December 2, 2005. As an alternative to meeting the 41 μg/dscm standard you may route the emissions through a packed bed or spray tower wet scrubber with a liquid-to-gas (l/g) ratio of 30 gallons per 1000 actual cubic feet per minute (acfm) or more and meet a site-specific emissions limit based on the measured performance of the wet scrubber.

(d) *Existing kilns located at area sources.* No owner or operator of an existing kiln or an existing in-line kiln/raw mill located at a facility that is an area source subject to the provisions of this subpart shall cause to be discharged into the atmosphere from these affected sources any gases which:

(1) Contain D/F in excess of 0.20 ng per dscm (8.7×10^{-11} gr per dscf) (TEQ); or

(2) Contain D/F in excess of 0.40 ng per dscm (1.7×10^{-10} gr per dscf) (TEQ) when the average of the performance test run average temperatures at the inlet to the particulate matter control device is 204 °C (400 °F) or less.

(e) *New or reconstructed kilns located at area sources.* No owner or operator of a new or reconstructed kiln or new or reconstructed in-line kiln/raw mill located at a facility that is an area source subject to the provisions of this subpart shall cause to be discharged into the atmosphere from these affected sources any gases which:

(1) Contain D/F in excess of:

(i) 0.20 ng per dscm (8.7×10^{-11} gr per dscf) (TEQ; or

(ii) 0.40 ng per dscm (1.7×10^{-10} gr per dscf) (TEQ) when the average of the performance test run average temperatures at the inlet to the particulate matter control device is 204 °C (400 °F) or less.

(2) Contain total hydrocarbons (THC), from the main exhaust of the kiln, or main exhaust of the in-line kiln/raw mill, in excess of 20 ppmv if the source is a new or reconstructed source that commenced construction after December 2, 2005. As an alternative to meeting the 20 ppmv standard you may demonstrate a 98 percent reduction of THC emissions from the exit of the kiln to discharge to the atmosphere. If the source is a greenfield kiln that commenced construction on or prior to December 2, 2005, then the THC limit is 50 ppmv.

(3) Contain mercury from the main exhaust of the kiln, or main exhaust of the in-line kiln/raw mill, or the alkali bypass in excess of 41 μg/dscm if the source is a new or reconstructed source that commenced construction after December 2, 2005. As an alternative to meeting the 41 μg/dscm standard you may route the emissions through a packed bed or spray tower wet scrubber with a liquid-to-gas (l/g) ratio of 30 gallons per 1000 actual cubic feet per minute (acfm) or more and meet a site-specific emissions limit based on the measured performance of the wet scrubber.

■ 4. Section 63.1344 is amended as follows:

■ a. Revising paragraphs (c) through (e);

■ b. Adding paragraphs (f) through (i).

§ 63.1344 Operating limits for kilns and in-line kiln/raw mills.

* * * * *

(c) The owner or operator of an affected source subject to a mercury, THC or D/F emission limitation under § 63.1343 that employs carbon injection as an emission control technique must operate the carbon injection system in accordance with paragraphs (c)(1) and (c)(2) of this section.

(1) The three-hour rolling average activated carbon injection rate shall be equal to or greater than the activated carbon injection rate determined in accordance with § 63.1349(b)(3)(vi).

(2) The owner or operator shall either:

(i) Maintain the minimum activated carbon injection carrier gas flow rate, as a three-hour rolling average, based on the manufacturer's specifications. These specifications must be documented in the test plan developed in accordance with § 63.7(c), or

(ii) Maintain the minimum activated carbon injection carrier gas pressure drop, as a three-hour rolling average, based on the manufacturer's specifications. These specifications must be documented in the test plan developed in accordance with § 63.7(c).

(d) Except as provided in paragraph (e) of this section, the owner or operator of an affected source subject to a mercury, THC or D/F emission limitation under § 63.1343 that employs carbon injection as an emission control technique must specify and use the brand and type of activated carbon used during the performance test until a subsequent performance test is conducted, unless the site-specific performance test plan contains documentation of key parameters that affect adsorption and the owner or operator establishes limits based on those parameters, and the limits on these parameters are maintained.

(e) The owner or operator of an affected source subject to a D/F, THC, or mercury emission limitation under

§ 63.1343 that employs carbon injection as an emission control technique may substitute, at any time, a different brand or type of activated carbon provided that the replacement has equivalent or improved properties compared to the activated carbon specified in the site-specific performance test plan and used in the performance test. The owner or operator must maintain documentation that the substitute activated carbon will provide the same or better level of control as the original activated carbon.

(f) Existing kilns and in-line kilns/raw mills must implement good combustion practices (GCP) designed to minimize THC from fuel combustion. GCP include training all operators and supervisors to operate and maintain the kiln and calciner, and the pollution control systems in accordance with good engineering practices. The training shall include methods for minimizing excess emissions.

(g) No kiln and in-line kiln/raw mill may use as a raw material or fuel any fly ash where the mercury content of the fly ash has been increased through the use of activated carbon, or any other sorbent unless the facility can demonstrate that the use of that fly ash will not result in an increase in mercury emissions over baseline emissions (i.e. emissions not using the fly ash). The facility has the burden of proving there has been no emissions increase over baseline.

(h) All kilns and in-line kilns/raw mills must remove (i.e. not recycle to the kiln) from the kiln system sufficient cement kiln dust to maintain the desired product quality.

(i) New and reconstructed kilns and in-line kilns/raw mills must not exceed the average hourly CKD recycle rate measured during mercury performance testing. Any exceedance of this average hourly rate is considered a violation of the standard.

■ 5. Section 63.1346 is revised to read as follows:

§ 63.1346 Standards for new or reconstructed raw material dryers.

(a) New or reconstructed raw material dryers located at facilities that are major sources can not discharge to the atmosphere any gases which:

(1) Exhibit opacity greater than ten percent, or

(2) Contain THC in excess of 20 ppmv, on a dry basis as propane corrected to 7 percent oxygen if the source commenced construction after December 2, 2005. As an alternative to the 20 ppmv standard, you may demonstrate a 98 percent reduction in THC emissions from the exit of the raw materials dryer to discharge to the atmosphere. If the source is a greenfield dryer constructed on or prior to December 2, 2005, then the THC limit is 50 ppmv, on a dry basis corrected to 7 percent oxygen.

(b) New or reconstructed raw materials dryers located at a facility that is an area source cannot discharge to the atmosphere any gases which contain THC in excess of 20 ppmv, on a dry basis as propane corrected to 7 percent oxygen if the source commenced construction after December 2, 2005. As an alternative to the 20 ppmv standard, you may demonstrate a 98 percent reduction in THC emissions from the exit of the raw materials dryer to discharge to the atmosphere. If the source is a greenfield dryer constructed on or prior to December 2, 2005, then the THC limit is 50 ppmv, on a dry basis corrected to 7 percent oxygen.

■ 6. Section 63.1349 is amended as follows:

■ a. By revising paragraph (b)(4);

■ b. By adding paragraph (b)(5);

■ c. By removing paragraph (f).

§ 63.1349 Performance Testing Requirements.

* * * * *

(b) * * *

(4)(i) The owner or operator of an affected source subject to limitations on emissions of THC shall demonstrate initial compliance with the THC limit by operating a continuous emission monitor in accordance with Performance Specification 8A of appendix B to part 60 of this chapter. The duration of the performance test shall be three hours, and the average THC concentration (as calculated from the one-minute averages) during the three-hour performance test shall be calculated. The owner or operator of an in-line kiln/raw mill shall demonstrate initial compliance by conducting separate performance tests while the raw mill of the in-line kiln/raw mill is under normal operating conditions and while the raw mill of the in-line kiln/raw mill is not operating.

(ii) The owner or operator of an affected source subject to limitations on emissions of THC who elects to demonstrate compliance with the alternative THC emission limit of 98 percent weight reduction must demonstrate compliance by also operating a continuous emission monitor in accordance with Performance Specification 8A of appendix B to part 60 at the inlet to the THC control device of the kiln, inline kiln raw mill, or raw materials dryer in the same manner as prescribed in paragraph (i) above. Alternately, you may elect to demonstrate a 98 weight percent reduction in THC across the control device using the performance test requirements in 40 CFR part 63, subpart SS.

(5) The owner or operator of a kiln or in-line kiln/raw mill subject to the 41 μg/dscm mercury standard shall demonstrate compliance using EPA Method 29 of 40 CFR part 60. ASTM D6784–02, Standard Test Method for Elemental, Oxidized, Particle-Bound and Total Mercury Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method), is an acceptable alternative to EPA Method 29 (portion for mercury only). If the kiln has an in-line raw mill, you must demonstrate compliance with both raw mill off and raw mill on. You must record the hourly recycle rate of CKD during both test conditions and calculate an average hourly rate for the three test runs for each test condition.

* * * * *

■ 7. Section 63.1350 is amended as follows:

■ a. Revising paragraphs (g), (h) and (n); and

■ b. Adding paragraphs (o) and (p).

§ 63.1350 Monitoring requirements.

* * * * *

(g) The owner or operator of an affected source subject to an emissions limitation on D/F, THC or mercury emissions that employs carbon injection as an emission control technique shall comply with the monitoring requirements of paragraphs (f)(1) through (f)(6) and (g)(1) through (g)(6) of this section to demonstrate continuous compliance with the D/F, THC or mercury emissions standard.

(1) Install, operate, calibrate and maintain a continuous monitor to record the rate of activated carbon injection. The accuracy of the rate measurement device must be ±1 percent of the rate being measured.

(2) Verify the calibration of the device at least once every three months.

(3) The three-hour rolling average activated carbon injection rate shall be calculated as the average of 180 successive one-minute average activated carbon injection rates.

(4) Periods of time when one-minute averages are not available shall be ignored when calculating three-hour rolling averages. When one-minute averages become available, the first one-minute average is added to the previous 179 values to calculate the three-hour rolling average.

(5) When the operating status of the raw mill of the in-line kiln/raw mill is changed from off to on, or from on to off, the calculation of the three-hour

rolling average activated carbon injection rate must begin anew, without considering previous recordings.

(6) The owner or operator must install, operate, calibrate and maintain a continuous monitor to record the activated carbon injection system carrier gas parameter (either the carrier gas flow rate or the carrier gas pressure drop) established during the mercury, THC or D/F performance test in accordance with paragraphs (g)(6)(i) through (g)(6)(iii) of this section.

(i) The owner or operator shall install, calibrate, operate and maintain a device to continuously monitor and record the parameter value.

(ii) The owner or operator must calculate and record three-hour rolling averages of the parameter value.

(iii) Periods of time when one-minute averages are not available shall be ignored when calculating three-hour rolling averages. When one-minute averages become available, the first one-minute average shall be added to the previous 179 values to calculate the three-hour rolling average.

(h) The owner or operator of an affected source subject to a limitation on THC emissions under this subpart shall comply with the monitoring requirements of paragraphs (h)(1) through (h)(3) of this section to demonstrate continuous compliance with the THC emission standard:

(1) The owner or operator shall install, operate and maintain a THC continuous emission monitoring system in accordance with Performance Specification 8A, of appendix B to part 60 of this chapter and comply with all of the requirements for continuous monitoring systems found in the general provisions, subpart A of this part.

(2) The owner or operator is not required to calculate hourly rolling averages in accordance with section 4.9 of Performance Specification 8A if they are only complying with the 50 ppmv THC emissions limit.

(3) For facilities complying with the 50 ppmv THC emissions limit, any thirty-day block average THC concentration in any gas discharged from a greenfield raw material dryer, the main exhaust of a greenfield kiln, or the main exhaust of a greenfield in-line kiln/raw mill, exceeding 50 ppmvd, reported as propane, corrected to seven percent oxygen, is a violation of the standard.

(4) For new facilities complying with the 20 ppmv THC emissions limit, any hourly average THC concentration in any gas discharged from a raw material dryer, the main exhaust of a greenfield kiln, or the main exhaust of a kiln or in-line kiln/raw mill, exceeding 20 ppmvd, reported as propane, corrected to seven percent oxygen, is a violation of the standard.

* * * * *

(n) Any kiln or kiln/in-line raw mill using a control device (other then ACI) to comply with a mercury emissions limit or equipment standard will monitor the control device parameters as specified in 40 CFR part 63 subpart SS.

(o) For kilns and in-line kilns/raw mills complying with the requirements in Section 63.1344(g), each owner or operator must obtain a certification from the supplier for each shipment of fly ash received to demonstrate that the fly ash was not derived from a source in which the use of activated carbon, or any other sorbent, is used as a method of mercury emissions control. The certification shall include the name of the supplier and a signed statement from the supplier confirming that the fly ash was not derived from a source in which the use of activated carbon, or any other sorbent, is used as a method of emission control.

(p) If the facility opts to use a fly ash derived from a source in which the use of activated carbon, or any other sorbent, is used as a method of mercury emissions control and demonstrate that the use of this fly ash does not increase mercury emissions, they must obtain daily fly ash samples, composites monthly, and analyze the samples for mercury.

■ 8. Section 63.1351 is revised to read as follows:

§ 63.1351 Compliance dates.

(a) Except as noted in paragraph (c) below, the compliance date for an owner or operator of an existing affected source subject to the provisions of this subpart is June 14, 2002.

(b) Except as noted in paragraph (d) below, the compliance date for an owner or operator of an affected source subject to the provisions of this subpart that commences new construction or reconstruction after March 24, 1998, is June 14, 1999, or upon startup of operations, whichever is later.

(c) The compliance date for an existing source to meet the requirements of GCP for THC is December 20, 2007.

(d) The compliance date for a new source which commenced construction after December 2, 2005, and before December 20, 2006 to meet the THC emission limit of 20 ppmv/98 percent reduction or the mercury standard of 41 μg/dscm or a site-specific standard based on application of a wet scrubber will be December 21, 2009.

■ 9. Section 63.1355 is amended by adding paragraphs (d), (e) and (f) to read as follows:

§ 63.1355 Recordkeeping requirements.

* * * * *

(d) You must keep annual records of the amount of CKD which is removed from the kiln system and either disposed of as solid waste or otherwise recycled for a beneficial use outside of the kiln system.

(e) You must keep records of the amount of CKD recycled on an hourly basis.

(f) You must keep records of all fly ash supplier certifications as required by § 63.1350(o).

■ 10. Section 63.1356 is amended by revising paragraph (a) to read as follows:

§ 63.1356 Exemption from new source performance standards.

(a) Except as provided in paragraphs (a)(1) and (2) of this section, any affected source subject to the provisions of this subpart is exempt from any otherwise applicable new source performance standard contained in subpart F or subpart OOO of part 60 of this chapter.

(1) Kilns and in-line kiln/raw mills, as applicable, under 40 CFR 60.60(b), located at area sources are subject to PM and opacity limits and associated reporting and recordkeeping, under 40 CFR part 60, subpart F.

(2) Greenfield raw material dryers, as applicable under 40 CFR 60.60(b), located at area sources, are subject to opacity limits and associated reporting and recordkeeping under 40 CFR part 60, subpart F.

RIN 2060–AN32

National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters: Reconsideration of Emissions Averaging Provision and Technical Corrections

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; notice of final action on reconsideration.

SUMMARY: EPA is promulgating amendments to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Industrial, Commercial, and Institutional Boilers and Process Heaters. After promulgation of this final rule, the Administrator received petitions for reconsideration of certain provisions in the final rule. Subsequently, EPA published a notice of the reconsideration and requested public comment on proposed amendments to the NESHAP. After evaluating public comments, we are adopting each of the amendments that we proposed.

DATES: This final rule is effective on February 5, 2007. The incorporation by reference of certain publications listed in this final rule is approved by the Director of the Office of **Federal Register** as of February 5, 2007.

ADDRESSES: EPA has established a docket for this action under docket ID No. EPA–HQ–OAR–2002–0058. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air and Radiation Docket and Information Center, EPA/DC, EPA West Building, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. James Eddinger, Energy Strategies Group, Sector Policies and Programs Division (D243–01), Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5426, fax number: (919) 541–5450, e-mail address: *eddinger.jim@epamail.epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by the final rule:

Category	NAICS code	Examples of potentially regulated entities
Any industry using a boiler or process heater in the final rule ...	321	Manufacturers of lumber and wood products.
	322	Pulp and paper mills.
	325	Chemical manufacturers.
	324	Petroleum refiners and manufacturers of coal products.
	316, 326, 339	Manufacturers of rubber and miscellaneous plastic products.
	331	Steel works.
	332	Electroplating, plating, polishing, anodizing, and coloring.
	336	Manufacturers of motor vehicle parts and accessories.
	221	Electric, gas, and sanitary services.
	622	Health services.
	611	Educational Services.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this final rule. To determine whether your facility would be regulated by this final rule, you should carefully examine the applicability criteria in 40 CFR 63.7485 of this final rule. If you have any questions regarding the applicability of this final rule to a particular entity, contact the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

WorldWide Web (WWW). In addition to being available in the docket, an electronic copy of this final rule will be available on the WWW through the Technology Transfer Network Web site (TTN). EPA has posted a copy of the final rule on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by February 5, 2007. Under CAA section 307(d)(7)(B), only an objection to the final rule that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under CAA section 307(b)(2), the requirements established by today's final action may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Background Information Document. EPA proposed and provided notice of the reconsideration of the NESHAP for industrial, commercial, and institutional boilers and process heaters on October 31, 2005 (70 FR 62264) and received 17 comment letters on the proposal. A memorandum "National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters, Summary of Public Comments and Responses to GE Petition and Reconsideration of the Final Rule," containing EPA's responses to each public comment is available in Docket No. EPA–HQ–OAR–2002–0058.

Organization of this document: The information presented in this preamble is organized as follows:

I. Statutory Authority for the Final Rule
II. Background
III. What changes are included in this final rule?
A. American Society for Testing and Materials (ASTM) Test Methods
B. Utility Steam Generating Units
C. Fuel Analysis Requirement
D. Consolidated Testing
1. Compliance With Consolidated Testing
2. Monitoring of Common Stack
3. Emissions Averaging when Units in Different Subcategories are Ducted to Common Stack
4. Continuous Compliance With the Emissions Averaging Provision
5. Monthly Compliance Demonstrations and Calculations
E. Definitions
IV. Responses to Significant Comments
A. Scope of Emissions Averaging Provision
B. Compliance Testing and Monitoring
C. Definitions
D. Testing Methods
V. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Statutory Authority for the Final Rule

Section 112 of the Clean Air Act (CAA) requires us to list categories and subcategories of major sources and area sources of hazardous air pollutant (HAP) and to establish NESHAP for the listed source categories and subcategories. Industrial boilers, commercial and institutional boilers, and process heaters were listed on July 16, 1992 (57 FR 31576). Major sources of HAP are those that have the potential to emit greater than 10 tons per year (tpy) of any one HAP or 25 tpy of any combination of HAP.

II. Background

On September 13, 2004 (69 FR 55218), we promulgated the NESHAP for industrial, commercial, and institutional (ICI) boilers and process heaters (Boilers NESHAP) as subpart DDDDD of 40 CFR part 63 under section 112(d) of the CAA. The NESHAP contain technology-based emissions standards reflecting the maximum achievable control technology and a health-based compliance alternative for certain threshold pollutants. We proposed these standards for ICI boilers and process heaters on January 13, 2003 (68 FR 1660).

In the preamble for the January 2003 proposed rule, we discussed our consideration of a bubbling compliance alternative and requested comment on incorporating a bubbling compliance alternative (*i.e.*, emission averaging) into this final rule as part of EPA's general policy of encouraging the use of flexible compliance approaches where they can be properly monitored and enforced. (See 68 FR 1686.) Industry trade associations, owners/operators of boilers and process heaters, State regulatory agencies, local government agencies, and environmental groups submitted comments on the emissions averaging approach. We received a total of 40 public comment letters regarding the emissions averaging approach in the proposed rule during the comment period. We summarized major public comments on the proposed emissions averaging approach, along with our responses to those comments, in the preamble to the final rule (69 FR 55238) and in the memorandum "Response to Public Comments on Proposed Industrial, Commercial, and Institutional Boilers and Process Heaters NESHAP (Revised)" (RTC Memorandum) which was placed in the docket for the final rule.

In the September 2004 final rule, we adopted an emissions averaging provision for existing large solid fuel boilers. The procedures that affected sources must use to demonstrate compliance through emissions averaging were promulgated at 40 CFR 63.7522. (See 69 FR 55257.) For each existing large solid fuel boiler in the averaging group, the emissions are capped at the emission level being achieved on the effective date of the final rule (November 12, 2004). Under emissions averaging provision in the 2004 final rule, compliance must be demonstrated on a 12-month rolling average basis, determined at the end of every calendar month. If a facility uses this option, it must also develop and submit an implementation plan to the applicable regulatory authority for review and approval no later than 180 days before the date that the facility intends to demonstrate compliance.

Following promulgation of the emissions averaging provision in the final rule, the Administrator received a petition for reconsideration pursuant to section 307(d)(7)(B) of the CAA from General Electric (GE). Under this section, the Administrator is to initiate reconsideration proceedings if the petitioner can show that it was impracticable to raise an objection to a rule within the public comment period or that the grounds for the objection arose after the public comment period.

GE requested that EPA reconsider portions of the emissions averaging provision that it believes could not have been practicably addressed during the public comment period. In the alternative, GE requested clarification that the final rule already allows for consolidated testing of commonly vented boilers. By a letter dated April 27, 2005, we informed GE that we intended to grant their petition for reconsideration. On October 31, 2005, we published a notice of reconsideration and proposed amendments to the final rule (70 FR 62264).

In the notice of reconsideration of the emissions averaging provision, we proposed amendments to 40 CFR 63.7522 and solicited comment in the following areas: (1) Allowing testing of a common stack in situations where each of the units vented to the common stack are in the existing solid fuel subcategory; (2) treating a group of boilers that vent through a common emissions control system to a common stack as a single existing solid fuel boiler for the purpose of subpart DDDDD of 40 CFR part 63; (3) treating a group of boilers that vent through more than one common emissions control system as distinct units and requiring individual compliance testing according to the methods specified in Table 8 to subpart DDDDD; (4) demonstrating compliance with opacity limits using a single continuous opacity monitoring system (COMS) located in the common stack if each of the boilers venting to the common stack has an applicable opacity limit; (5) treating certain common stack situations as a single emission point for purposes of averaging emissions with other existing large solid fuel boilers located at the facility.

In addition, our October 31, 2005 notice of proposed rulemaking included several corrections to subpart DDDDD of 40 CFR part 63 that were not related to emissions averaging. Several clarifying amendments addressed: (1) The applicability of firetube boilers in the small unit subcategories and limited use subcategories; (2) the definitions of firetube and watertube boilers with respect to "hybrid boilers"; and (3) the equivalent methods allowed in Table 6 to subpart DDDDD. The proposed corrections include language that: (1) Excludes electric utility steam

generating units that are covered by 40 CFR part 60, subpart Da or 40 CFR part 60, subpart HHHH; (2) adds Equation 4A to subpart DDDDD for calculating a 12-month rolling average emission rate when using the emissions averaging option; (3) requires an oxygen monitor to be installed when a carbon monoxide monitor is required by the rule; and (4) updates American Society of Testing and Materials (ASTM) test methods in Table 6 to subpart DDDDD.

A comprehensive response to public comments is available in a document entitled "National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters, Summary of Public Comments and Responses to GE Petition and Reconsideration of the Final Rule," which can be found in the docket (Docket No. EPA–HQ–OAR–2002–0058).

III. What Changes Are Included in This Final Rule?

In this final action, we are making a limited number of corrections and amendments to 40 CFR 63.14 and sections 63.7491, 63.7510, 63.7522, 63.7525, 63.7540, 63.7541, 63.7575, and Table 6 of subpart DDDDD consistent with our October 2005 proposal. These changes improve and clarify the procedures for implementing the emissions averaging provision and for conducting compliance testing when boilers are vented to a common stack. Among other technical corrections, we also are clarifying several definitions to help affected sources classify "limited use" and "hybrid" boilers. We have modified some of regulatory language that we proposed based on public comments, but overall, we are adopting amendments to the emission averaging provision and other provision in subpart DDDDD that are in substantially the same form as what we proposed in October 2005.

A. American Society for Testing and Materials (ASTM) Test Methods

We are adopting the proposed revisions relating to ASTM test methods without change. As suggested by the ASTM, we are amending Table 6 to subpart DDDDD to reflect updated ASTM test methods. Similar changes are also being made to 40 CFR 60.14 (Incorporation by Reference) of the General Provisions. Additionally, we are publishing in Table 1 of this preamble a list of testing methods that EPA previously reviewed and approved for use as "alternative" methods that are considered "equivalent" for the purpose of Table 6 to subpart DDDDD.

TABLE 1.—LIST OF EQUIVALENT METHODS APPROVED AS OF FEBRUARY 15, 2005

Pollutant or Analyte	EPA-approved equivalent method
Arsenic	SW–846–7060.[a]
	SW–846–7060A.
Chlorine	ASTM D2361.
Hydrogen Chloride	SW–846–5050.
	SW–846–9056.
	SW–846–9076.
	SW–846–9250.
	ASTM E776–87.
Mercury	EPA Method 1631E.
	SW–846–1631.
	ASTM D6722–01.
	EPA 821–R–01–013.
Higher Heating Value	ASTM E711–87 (1996).
	ASTM D240.
Moisture content of Coal Fuel.	ASTM D2691–95.
Moisture Analysis	EPA 160.3 Mod.
Digestion Procedure	EPA–821–R–01–03.
	ASTM D586 (Dry Ash method).
Sample Preparation for TSM.	SW–846–3050B.
Sample Preparation and Digestion for TSM.	SW–846–3050.
	TAPPI T266.
Sample Preparation and Grinding.	ASTM E829–94.
Selenium	SW–846–7740.
Total Selected Metals	EPA 200.8.
	ASTM D6357–04.
	ASTM D4606–03.
	EPA 7060A.
	SW–846–6020A.
	SW–846–6020.

[a] *http://www.epa.gov/epaoswer/hazwaste/test/sw846.htm.*

This table is not meant to be exhaustive, because the list of equivalent methods is dynamic. This table is meant to serve as guidance for the methods that have been approved to date. We emphasize that equivalent methods may be used in lieu of the prescribed methods in Table 6 to subpart DDDDD at the discretion of the source owner or operator. Therefore, maintaining a list of "approved methods" in the final rule is not necessary. Similarly, approval of equivalent methods by EPA or the delegated implementation authority is not necessary.

B. Utility Steam Generating Units

We are adopting the regulatory language that we proposed to avoid overlapping coverage between subpart DDDDD of 40 CFR part 63 and other rules that apply to certain types of electric utility steam generating units. The types of boilers and process heaters that are not subject to subpart DDDDD are listed in 40 CFR 63.7491. Our intention was to exempt from subpart DDDDD any units that are already or will be subject to regulation for HAP under another standard. (See 69 FR 1663.) Because regulations relating to electric utility steam generating units were under development at the time of promulgation of subpart DDDDD, we were unable to reference a specific rule citation that applied to electric utility steam generating units. Instead, subpart DDDDD excluded electric utility steam generating units by using only the definition of electric utility steam generating units contained in section 112(a)(8) of the CAA.

On May 18, 2005, EPA promulgated the Clean Air Mercury Rule (70 FR 28606). In that rule, EPA established standards of performance for mercury (40 CFR part 60, subpart Da) from new electric utility steam generating units, as well as mercury emission guidelines for existing electric utility steam generating units (40 CFR part 60, subpart HHHH). After that rule was promulgated, it was brought to our attention that the scope of the exclusion in subpart DDDDD of 40 CFR part 63 for electric utility steam generating units was unclear. Confusion resulted because 40 CFR part 60, subparts Da and HHHH, employ different definitions to determine applicability. (See 70 FR at 28609.) Thus, to clarify applicability of subpart DDDDD, we are amending 40 CFR 63.7491(c) to exclude "an electric utility steam generating unit (including a unit covered by 40 CFR part 60, subpart Da) or a Mercury Budget unit covered by 40 CFR part 60, subpart HHHH."

C. Fuel Analysis Requirement

We received a comment raising the question of whether we intended for units which combust only a single fuel type to be required to conduct fuel analysis when demonstrating compliance through performance (stack) testing, as required by 40 CFR 63.7510(a). Our intent, as stated in the September 2004 preamble to the final rule (69 FR 55225), was that "Units burning only a single fuel type (not including startup fuels) do not need to determine, by fuel analysis, the fuel inlet operating limit when conducting performance tests." In this final action, we are adding similar language to 40 CFR 63.7510(a) to make this understanding explicit in the text of our regulations. This change was not included among the corrections we proposed in October 2005. However, since this revision is based on language in the September 2004 preamble that has not given rise to any objection, we are adopting this correction as part of this final rule.

D. Consolidated Testing and Emissions Averaging

The current language for the emissions averaging option in 40 CFR 63.7522 requires testing of each individual boiler in the averaging group. Our intent with regard to the emissions averaging option in the final rule was to provide an equivalent, more flexible, and less costly compliance alternative. Since testing emissions from a common stack for a group of boilers would be equivalent to the average emissions calculated from emissions tests on each individual boiler, we are amending subpart DDDDD of 40 CFR part 63 to allow testing of emissions at the common stack under specified situations described below.

Consolidated testing of the common stack must be conducted when each boiler is operated under representative testing conditions as specified in the National Stack Testing Guidance issued by EPA on September 30, 2005.

The amendments to 40 CFR 63.7522 adopted in this action are substantially the same as what we proposed in October 2005. However, based on public comments, we have modified some of the proposed language and added some conforming amendments to other provisions of subpart DDDDD of 40 CFR part 63 that relate to emissions averaging.

1. Compliance With Consolidating Testing

GE sought clarification on the consolidated testing procedures necessary to demonstrate compliance in two different common stack situations. In one situation, the exhaust from three existing large solid fuel boilers are combined and vented through a common emissions control system to a common stack. In the other situation, the exhaust from two existing large solid fuel boilers are each individually controlled prior to being vented to a common stack. In the revised regulatory provisions set forth below, we are amending this final rule to clarify how to demonstrate compliance under these two circumstances. The final amendments address these two circumstances in the same way that we proposed in October 2005.

In the first situation, a group of units that share a common control device before venting to a common stack is treated as a single source. In such situations, an operator can demonstrate compliance by testing at the common stack without using the emissions averaging equations in 40 CFR 63.7522 for each unit or submitting an implementation plan. We are also adding language in section 63.7522(k) of subpart DDDDD to clarify that the common stack situations described above may be treated as a separate single emission point for purpose of including these units in an emissions averaging group with other existing large solid fuel boilers located at the facility.

We are adopting a slightly different approach for averaging emissions from groups of affected units that vent to a common stack through more than one emissions control system. These distinct approaches are necessary to ensure that a source with more than one emissions control system demonstrates continuous compliance at each emissions control system. Where a group of boilers vents to a common stack through more than one emission control system, continuous compliance will be demonstrated according to the methods specified in Table 8 to subpart DDDDD.

2. Monitoring of Common Stack

In this final action, we are adding an amendment to section 63.7541 of subpart DDDDD to address the COMS requirements for facilities participating in the emissions averaging option. If each of the boilers venting to a common stack has an applicable opacity operating limit, a dry control system, and no units from other subcategories or nonaffected units vent to the common stack, then a single COMS may be located in the common stack instead of each duct to the common stack. Alternately, if any of the boilers venting to the common stack does not have an applicable opacity operating limit, but each of the existing solid fuel units is equipped with a dry control system and no nonaffected units vent to the common stack, a COMS monitor may be located at the common stack instead of each duct to the common stack. We amended 40 CFR 63.7541 to allow for a COMS monitor at the common stack in this situation.

We discussed this approach in the October 2005 proposal (70 FR at 62268), but did not include any regulatory language in that action. Commenters requested that we make explicit in our regulations that this practice is permissible when sources elect to demonstrate compliance using emissions averaging.

3. Emissions Averaging When Units in Different Subcategories Are Ducted to Common Stack

In response to the GE petition for reconsideration, we proposed amendments that would limit the emissions averaging provision to common stack scenarios that contained solely units in the existing large solid fuel subcategory. In this final action, we have decided to expand the emissions averaging provision to allow units in the existing large solid fuel subcategory to conduct performance tests at the end of a common stack configuration with affected units from other subcategories and nonaffected units under specific circumstances.

As a result of public comments submitted, we now recognize that affected units from several subcategories (*e.g.*, both gas and solid fuel fired units) and nonaffected units are sometimes ducted to a common stack. To address these situations, we are adopting a revised amendment to the emissions averaging provision in 40 CFR 63.7522 that allows consolidated testing of units in the existing large solid fuel subcategory as long as the commonly vented units from other subcategories and nonaffected units follow specific procedures during the consolidated compliance test.

The emissions averaging provision is only applicable to units in the existing large solid fuel subcategory. EPA did not find cause to promulgate emissions limitations for many of the subcategories of existing units. However, new units are subject to different emissions limitations than existing units. These differing emissions limitations make it difficult to allow consolidated testing of emissions from sources in different subcategories under an emissions averaging approach.

However, to eliminate this obstacle to consolidated testing when existing large solid fuel units may share a duct or stack with units in other subcategories or nonaffected units covered by another NESHAP category, we are requiring facilities to shut down, or vent to a different stack, affected boilers or process heaters in other subcategories or nonaffected units in other categories prior to performing a consolidated compliance test for the units in the large solid fuel subcategory. Testing of a common stack in these situations will measure the average emissions from the averaging group of existing large solid fuel units, just as if each boiler in the large solid fuel subcategory was tested individually and their emissions averaged. By requiring the affected units from other subcategories or nonaffected units to be shut off, or vented to a different stack, during testing, the consolidated testing for certain stack configurations allows the group of existing large solid fuel boilers to demonstrate initial compliance at a lower cost.

Allowing the testing of a common stack under these conditions also

satisfies the criteria discussed in the September 2004 preamble to the final rule (69 FR 55239) that EPA has generally imposed on the scope and nature of emissions averaging programs. These criteria include: (1) No averaging between different types of pollutants, (2) no averaging between sources that are not part of the same major source, (3) no averaging between sources within the same major source that are not subject to the same NESHAP, and (4) no averaging between existing sources and new sources. This final rule fully satisfies each of these criteria.

The provision promulgated in this action only allows averaging of emissions from existing units in the large solid fuel subcategory. Emissions from units that are shut down or vented elsewhere during compliance testing are not included in the average or co-mingled with the emissions that are the focus of the test.

4. Continuous Compliance With the Emissions Averaging Provision

As a result of this expansion to the emissions averaging provision, we had to establish continuous compliance procedures with this provision to address common stack scenarios with units from multiple subcategories or nonaffected units. In this final rule, we are also amending 40 CFR 63.7541 to establish continuous compliance procedures under the emissions averaging provision for common stack configurations with different subcategories or nonaffected units. These amendments require affected units to maintain 3-hour average parametric limits on all the control devices for existing large solid fuel boilers venting to a common stack. The parametric limits will ensure that the control devices continue to operate under the conditions established during the initial compliance test. These amendments establish continuous compliance requirements for common stack configurations that were not previously eligible to comply with the emissions averaging provision.

5. Monthly Compliance Demonstrations and Calculations

This final rule includes several additional amendments to subsections (d), (e), and (f) of section 63.7522 that were recommended in public comments. These amendments clarify that, under the emissions averaging provision, continuous compliance must be demonstrated at the end of every month (12 times per year). In addition, we have made several corrections to the formulas used in emissions averaging calculations. Additional details on these amendments are reflected in the Response-to-Comments document that is available in Docket No. EPA-HQ-OAR–2002–0058.

E. Definitions

In the October 2005 notice, we proposed to add or amend several definitions in subpart DDDDD of 40 CFR part 63 to clarify our intent and correct inadvertent omissions. In this final action, we are adopting modified versions of several definitions based on public comments. In addition, we are promulgating three additional definitions to provide additional clarity requested by commenters.

We have added a definition for "common stack" similar to the definition provided in 40 CFR part 72 at the request of some of the commenters.

We have also added a definition for "voluntary consensus standards" since this term is used to define "equivalent" as this term is used in Table 6 of subpart DDDDD. We are adopting the same definition of "equivalent" that we proposed, but we have added language to Table 6 of subpart DDDDD to clarify that equivalent methods may be used in lieu of the prescribed methods in Table 6 at the discretion of the source owner or operator.

The definitions for both "firetube boiler" and "watertube boiler" are amended to include criteria for classifying boilers designed with both firetubes and watertubes, commonly referred to as "hybrid boilers." Based on comments, we are adopting a modified definition of firetube boiler to include boilers that utilize a containment shell that encloses firetubes and allows the water to vaporize and steam to separate. We have also modified the definition of watertube boilers that we proposed to include boilers that incorporate a steam drum with tubes connected to the drum to separate steam from water.

We have amended the proposed definitions for both small gaseous and small liquid fuel subcategories to clarify that these subcategories include all firetube boilers, regardless of size, as well as other types of boilers with a rated capacity of 10 million MMBtu per hour heat input or less. We have amended the definitions to clarify our intent that firetube boilers greater than 10 MMBtu per hour heat input are still part of the small subcategory.

We have also added an amendment to the definitions for both the small and large gaseous fuel subcategories to allow for units in these two categories to periodically test using liquid fuel as long as the tests do not exceed a combined total of 48 hours during any calendar year. This allowance was adopted because of the need to test an emergency fuel in order to ensure that the unit could effectively operate using the emergency fuel during a period of gas curtailment. California regulations stipulate a 48-hour limit on this periodic testing on emergency fuels, and we have adopted their precedent.

We are also amending the definition of "fuel type" in response to a comment we received. Questions have been raised on whether we intended for units that may burn evidence seized in drug raids as a public service for a variety of enforcement agencies to test these materials as part of the compliance testing requirements. It is reportedly exceedingly difficult to arrange for a test of these materials given the security that surrounds them. Also, facilities have been approached about burning retired U.S. flags. Burning is the preferred mode of disposal of retired U.S. flags. Since we did not intend to include contraband materials, or U.S. flags, as a fuel when a facility is conducting performance tests or fuel analyses to demonstrate compliance, we are amending the definition of "fuel type" to include the statement "Contraband, prohibited goods, or retired U.S. flags, burned at the request of a government agency, are not considered a fuel type for the purpose of this subpart." We do not classify facilities designed and operated for energy recovery as commercial and industrial solid waste incinerators if they combust small amounts of others materials. (See 70 FR 55568, 55575; September 22, 2005.)

A revision to the definition of "fuel type" was not included among the corrections that we proposed. However, since this amendment addresses a *de minimis* situation that supports law enforcement efforts and respect for a national symbol, we are adopting this correction in this final action.

IV. Responses to Significant Comments

We received 17 public comment letters on the proposed rule and notice of reconsideration. Complete summaries of all the comments and EPA responses are found in the Response-to-Comments document (see **SUPPLEMENTARY INFORMATION** section). The most significant comments are summarized below.

A. Scope of Emissions Averaging Provision

Comment: Several commenters requested that EPA expand the common stack testing option to include common stack configurations with groups of boilers from different subcategories or units not subject to the boiler NESHAP. Two of these commenters added that in

many situations the layout of boilers and ductwork to common stacks make it impractical to perform emissions testing on each individual boiler venting to the common stack due to a lack of appropriate sampling location and duct configurations. One commenter (OAR–2002–0058–0722) added that in order to test each individual unit a source would have to build a temporary testing system of stacks and ductwork to demonstrate initial compliance, and this temporary system would still not be suitable for demonstrating continuous compliance. The commenter contended that without expanding the testing to groups of boilers from different source categories venting to a common stack, the NESHAP would require a source to reconfigure its ductwork and build new stacks.

One commenter approved of EPA's amendments to allow common stack performance testing under the circumstances provided in the proposed amendments.

Response: We agree in part with the commenters' recommendation and have modified the rule to allow performance testing to be conducted at the end of stacks that receive emissions from boilers from different subcategories and nonaffected units in other NESHAP categories, as long as the emissions from these other units are stopped or redirected as described further below. However, we do not consider it appropriate to allow averaging of emissions from units in other subcategories or nonaffected units or consolidated testing of co-mingled emissions from units in other subcategories or nonaffected units. EPA has generally imposed limits on emissions averaging programs, which includes no averaging between emission units that are not part of the same source category. Since these units are generally subject to different emissions limitations, averaging or co-mingling of emissions would not provide a reliable demonstration of compliance with the applicable emissions limitation for those sources in a particular category or subcategory.

Nevertheless, we do consider it appropriate under specified conditions described further below to allow testing at the end of the common stack for existing large solid fuel units at facilities with stack configurations that contain units from other subcategories (*e.g.*, gas-fired units) and nonaffected units. EPA has established a clear and enforceable method for demonstrating initial, annual, and continuous compliance when units of different subcategories and nonaffected units vent to a common stack. Further, extending the common stack testing option to these stack configurations will not cause adverse effects to human health or the environment. The total emissions out of the stack will not increase as a result of this extension and compliance with the emission limits of each unit feeding the common stack will be determined by parametric limits on the control device through which the units vent to the common stack.

Facilities that have common stack configurations consisting of units subject to the boiler NESHAP and units from other source categories also have the prerogative to petition for alternate testing and compliance plans on a site-specific basis.

B. Compliance Testing and Monitoring

Comment: Several commenters suggested an alternative methodology to meet the requirements of initial and annual compliance tests for units opting to use the emissions averaging provision. These commenters suggested that during the initial and subsequent annual compliance tests, all boilers venting to the common stack that are not subject to emission limits be turned off (*i.e.* gas-fired units or nonaffected units). These commenters suggested that shutting down units of different subcategories or nonaffected units would satisfy the requirements of the boiler NESHAP. One commenter added that these methods will still provide reliable test data to the regulatory authorities to demonstrate compliance. One commenter added that since many large solid fuel units share a stack with gas-fired units, the NESHAP, as proposed in the notice of reconsideration, would require individual performance testing on each large solid fuel boiler, which would greatly increase the costs of testing compliance and increase system downtime.

Response: We agree that turning off units from other subcategories (*e.g.*, gas-fired units) and nonaffected units during the testing period, satisfies the requirements of the boiler NESHAP emissions averaging provision. Allowing the testing of a common stack, when units from other subcategories and nonaffected units are turned off satisfies the criteria that EPA has generally imposed on the scope and nature of emissions averaging programs. These criteria include: (1) No averaging between different types of pollutants, (2) no averaging between sources that are not part of the same major source, (3) no averaging between sources within the same major source that are not subject to the same NESHAP, and (4) no averaging between existing sources and new sources. The provision promulgated in this action only allows averaging of emissions from existing units in the large solid fuel subcategory. Emissions from units that are shut down or vented elsewhere during compliance testing are not included in the average or co-mingled with the emissions that are the focus of the test.

Facilities that have common stack configurations, with units subject to the boiler NESHAP and nonaffected units, have the prerogative to petition for alternate testing and compliance plans on a site-specific basis. The type of testing discussed here is one example of an alternate testing and compliance plan that a facility would petition for on a site-specific basis. We have adjusted the rule language in 40 CFR 63.7522(h) to allow for shutting down units from other subcategories and nonaffected units to demonstrate compliance with the emissions averaging provision when units belonging to different subcategories of the boiler NESHAP and nonaffected units vent to the same stack as large solid fuel boilers.

Comment: Two commenters suggested that parametric limits be set on all control devices used on solid fuel fired units and that these parametric limits be used to demonstrate continuous compliance with the emissions averaging provision of the boiler NESHAP. These commenters added that parametric limits on the control devices for existing large solid-fuel boilers would ensure that these control devices operated under the conditions established during the initial compliance test and provide a defensible way to demonstrate continuous compliance with the emissions averaging provision of the boiler NESHAP. One commenter suggested that parametric compliance limits be set on any control device in the group of units sharing a common stack, regardless of whether the conditions are wet or dry in the stack.

Response: We agree that setting parametric limits on all control devices for existing large solid-fuel boilers venting to a common stack is an acceptable method for demonstrating continuous compliance with the emissions averaging provision of the boiler NESHAP. These parametric limits are a clear and enforceable method of demonstrating compliance. We have adjusted the rule language in 40 CFR 63.7541 to allow for a facility to demonstrate continuous compliance under the emissions averaging provision by using parametric limits on the control devices of existing large solid fuel units venting to a common stack.

Comment: One commenter requested that EPA allow for a COMS at a common stack even when a source does not make use of the emissions averaging provision and opts to do performance testing on individual boilers. The commenter added that this regulatory flexibility will reduce compliance costs and maintain adequate levels of emissions monitoring.

Two commenters requested that EPA clarify 40 CFR 63.7525(b) to allow a COMS to be located at the common stack, regardless of whether the group of boilers sharing a common stack consists of boilers of different subcategories. One commenter suggested that it did not believe EPA intended to require a COMS on individual units sharing a common stack. The commenter added that it is impractical, due to a lack of space or adequate location, to install individual COMS monitors in the duct work for groups of boilers that share a common stack. The commenter cites 40 CFR part 60, appendix B, Performance Specification (PS)–1, to reference that in many cases this requirement has been satisfied by placing a COMS on the common stack.

One commenter suggested that language be added to 40 CFR 63.7522(j)(3) to indicate that a COMS monitor is required at a common stack, even when each individual boiler unit has a separate opacity operating limit. The commenter is concerned that without additional language, 40 CFR 63.7522(j)(3) could be misinterpreted to require a COMS in each duct leading to the common stack. The commenter noted that although there is discussion of this intent in the preamble (70 FR 62268), the commenter suggested that there be language added to this effect in the actual rule text. The commenter also suggested that language be added to 40 CFR 63.7541(a)(2) to clarify that a single COMS monitor for a group of units that each vents through a unique control system and then to a common stack. The commenter suggested this language is necessary so that this group of units is treated similarly to a group of units venting through a common control device to a common stack with respect to the requirements of a COMS.

Response: We agree with these suggestions as long as all units feeding the common stack are in the existing large solid fuel subcategory. The emissions averaging provision was intended to be an option for affected facilities to allow for increased regulatory flexibility. We reiterate here that if a source chooses to do performance testing for HAP emissions at each individual unit, the source is still eligible to locate a COMS monitor on the common stack as long as all the units feeding the common stack are in the existing large solid fuel subcategory.

We disagree with the commenter's suggestion to allow for a COMS monitor to be located at the common stack when groups of boilers from different affected subcategories or nonaffected units are feeding the stack. We also disagree with allowing a single COMS unit to be placed on the common stack if the units feeding the common stack belong to other source categories.

C. Definitions

Comment: Several commenters requested that EPA modify the definitions of firetube and watertube boilers to account for hybrid boilers. The commenters suggested that EPA make the distinction between the two units based on the location of the containment or steam separation system in the unit in order to clarify the basic difference between fire tube and water tube units. Three commenters added that water tube units incorporate a steam drum, which provides for steam separation from water, whereas a fire tube unit uses a containment shell, inside which the water vaporizes and steam separates. One commenter suggested that a water tube boiler be defined as a boiler that has a water tube type of steam drum, with no additional heat exchange surface in the form of fire tubes running through the drum. The commenter suggested that a fire tube boiler be defined as any hybrid type of boiler where steam separation takes place in a vessel that also contains fire tubes that provide the major heat input to the water. The commenter added that this approach will simplify interpretation of this definition. Two commenters requested that EPA adopt the following addition to the definition of firetube boiler to account for hybrid boilers: "All owners or operators of hybrid boilers that have been registered/certified by the National Board of Boiler and Pressure Vessel Inspectors and/or the State as firetube boilers as indicated by "Form P–2" (Manufacturers Data Report For All Types of Boilers Except Watertube and Electric As Required by the Provisions of the American Society of Mechanical Engineers (ASME) Code Rules, Section I) shall be considered small units for the purpose of this subpart."

Response: We agree with the distinction between a firetube and watertube boiler using the criteria of whether a unit has a containment shell or a steam drum. We consider the ASME Code Rules and Forms to be an acceptable and established method for classifying vessel types. We have modified the proposed definitions of watertube and firetube boilers to allow a facility to classify its hybrid vessel by one of two methods: (1) Determining whether or not the unit has a steam drum or containment system, or (2) the indication of firetube boiler on the ASME P–2 form.

Comment: Two commenters requested that the definition for large gaseous fuel units be changed to allow for units to combust oil during periods of natural gas supply emergencies or natural gas curtailment. The commenters added that if the unit combusts oil for periodic testing under these circumstances, this unit should not be automatically categorized in the large oil fuel subcategory.

Response: We agree that it is necessary for gas-fired units that are designed for combusting oil during periods of natural gas curtailment to periodically tune the unit for proper oil firing and combustion to be prepared for such periods. Based on review of current regulations in California regarding equipment testing of non-gaseous fuel, periodic testing of oil is allowed for a combined total of 48 hours during any calendar year. This periodic testing for up to 48 hours, which is in addition to periods of combusting oil during natural gas curtailment, will not cause a boiler to be categorized in the oil fuel subcategories. We have amended the definitions to clarify that gas boilers that fire liquid fuel for the purposes of periodic testing are not included in the liquid fuel subcategories.

D. Testing Methods

Comment: Several commenters requested that EPA list some specific examples of equivalent methods in Table 6 to subpart DDDDD. The commenters specifically added that since the promulgation of the NESHAP, EPA has received and approved many site-specific requests for the use "equivalent" methods. The commenters requested that any approved methods be added to Table 6.

Another commenter disagreed with deleting test method ASTM D3684–01 from Table 6 to subpart DDDDD. The commenter added that this test method should be retained in Table 6, and the final revised table should indicate that this test method is applicable for determining both arsenic and selenium.

Two commenters requested that the latest revisions of following test methods be listed in Table 6 to subpart DDDDD: ASTM D3684 for coal mercury analysis, ASTM D3683 for coal total selected metals, and ASTM D4208 for coal chlorine content. These

commenters added that these methods have a long history as established standard methods. By adding these methods to Table 6, sources or testing companies would not have to petition for approval of these established methods. These commenters also added that many coal chlorine levels exceed the upper bound (1136 parts per million) on the concentration range for repeatability and reproducibility on ASTM D6721, and that ASTM D4208 is a more appropriate testing method on coals with high chlorine concentrations.

Two commenters recommended that EPA provide authority to the States for approving equivalent testing methods that have already been accepted by EPA on multiple similar site-specific requests. The commenters added that providing authority to the States is an efficient way to determine approved equivalent testing methods.

Response: With this action, we have clarified the definition of equivalent method. Equivalent methods are voluntary consensus standards (VCS) or EPA methods which are applicable to the fuel type or target analyte being measured. Although we disagree with adding a complete list of equivalent methods already approved to the final rule itself, we have provided a list of these previously approved methods in the preamble to the final rule. We have also added a definition of VCS to the final rule to help clarify what equivalent methods are. Equivalent methods may be used in lieu of the prescribed methods in Table 6 to subpart DDDDD at the discretion of the source owner or operator. Therefore, publishing a list of or adding to the list of approved methods is not necessary. Similarly, State or EPA approval of equivalent methods is not necessary.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is a "significant regulatory action" because it is likely to raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order. Accordingly, EPA submitted this action to the Office of Management and Budget (OMB) for review under Executive Order 12866 and any changes made in response to OMB recommendations have been documented in the docket for this action.

B. Paperwork Reduction Act

This final action imposes no new information collection requirements on the industry. Because there is no additional burden on the industry as a result of the final rule amendments, the information collection request has not been revised. OMB has previously approved the information collection requirements contained in the existing regulations under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0551 (EPA No. 2028.02). A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, Collection Strategies Division, U.S. Environmental Protection Agency (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impact of this final rule on small entities, a small entity is defined as: (1) A small business as defined by the Small Business Administration's regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, country, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and that is not dominant in its field.

After considering the economic impacts of this final rule on small entities, we certify that this action will not have a significant economic impact on a substantial number of small entities. EPA has determined that none of the small entities will experience a significant impact because the final rule imposes no additional regulatory requirements on owners or operators of affected sources.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private section, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost effective, for least-burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed, under section 203 of the UMRA, a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA's regulatory proposals with significant Federal intergovernmental mandates, and

informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that this final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. Although the original NESHAP had annualized costs estimated to range from $690 to $860 million (depending on the number of facilities eventually demonstrating eligibility for the health-based compliance alternatives), this final rule does not add new requirements that would increase this cost. Thus, this final rule is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that this final rule does not significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, this final rule is not subject to section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

This final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The requirements discussed in this action will not supersede State regulations that are more stringent. Thus, Executive Order 13132 does not apply to this final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 6, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications."

This final rule does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. No affected facilities are owned or operated by Indian tribal governments. Thus, Executive Order 13175 does not apply to this final rule.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

This final rule is not subject to the Executive Order because EPA does not have reason to feel that the environmental health or safety risks associated with the emissions addressed by this action presents a disproportionate risk to children. This demonstration is based on the fact that this action does not affect the emissions limits contained in this final rule.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This final rule is not a "significant energy actions" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that this action is not likely to have any adverse energy effect.

I. National Technology Transfer and Advancement Act

As noted in the final rule, section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113; 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impracticable. Voluntary consensus standards are technical standards (*e.g.*, material specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA requires EPA to provide Congress, through the OMB, with explanations when EPA decides not to use available and applicable voluntary consensus standards.

This action involves technical standards. During the development of this final rule, EPA searched for voluntary consensus standards that might be applicable. EPA adopted the following standards in this final rule: (1) ASTM D2013–04, "Standard Practice for Preparing Coal Samples for Analysis," (2) ASTM D2234–D2234M–03E01, "Standard Practice for Collection of a Gross Sample of Coal," (3) ASTM D6721–01, "Standard Test Method for Determination of Chlorine in Coal by Oxidative Hydroylsis Microcoulometry," (4) ASTM D3173–03, "Standard Test Method for Moisture in the Analysis Sample of Coal and Coke," (5) ASTM D4606–03, "Standard Test Method for Determination of Arsenic and Selenium in Coal by the Hydride Generation/Atomic Absorption Method," (6) ASTM D6357–04, "Standard Test Methods for Determination of Trace Elements in Coal, Coke, and Combustion Residues from Coal Utilization Processes by Inductively Coupled Plasma Atomic Emission Spectrometry, Inductively Coupled Plasma Mass Spectrometry, and Graphite Furnace Atomic Absorption Spectrometry," (7) ASTM D6722–01, "Standard Test Method for Total Mercury in Coal and Coal Combustion Residues by the Direct Combustion Analysis," and (8) ASTM D5865–04, "Standard Test Method for Gross Calorific Value of Coal and Coke."

Table 6 to subpart DDDDD of 40 CFR part 63 lists the fuel analysis methods included in this final rule. Under 40 CFR 63.7(f) in subpart A of the General Provisions, a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any required testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the

Congress and to the Comptroller General of the United States. EPA will submit a report containing this action and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). This final rule will be effective February 5, 2007.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: November 30, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter 1 of the code of Federal Regulations is amended to read as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 2. Section 63.14 is amended by adding paragraphs (b)(55) through (62) to read as follows:

§ 63.14 Incorporation by reference.

* * * * *

(b) * * *

(55) ASTM D2013–04, Standard Practice for Preparing Coal Samples for Analysis, IBR approved for Table 6 to subpart DDDDD of this part.

(56) ASTM D2234–D2234M–03€[1], Standard Practice for Collection of a Gross Sample of Coal, IBR approved for Table 6 to subpart DDDDD of this part.

(57) ASTM D6721–01, Standard Test Method for Determination of Chlorine in Coal by Oxidative Hydrolysis Microcoulometry, IBR approved for Table 6 to subpart DDDDD of this part.

(58) ASTM D3173–03, Standard Test Method for Moisture in the Analysis Sample of Coal and Coke, IBR approved for Table 6 to subpart DDDDD of this part.

(59) ASTM D4606–03, Standard Test Method for Determination of Arsenic and Selenium in Coal by the Hydride Generation/Atomic Absorption Method, IBR approved for Table 6 to subpart DDDDD of this part.

(60) ASTM D6357–04, Standard Test Methods for Determination of Trace Elements in Coal, Coke, and Combustion Residues from Coal Utilization Processes by Inductively Coupled Plasma Atomic Emission Spectrometry, Inductively Coupled Plasma Mass Spectrometry, and Graphite Furnace Atomic Absorption Spectrometry, IBR approved for Table 6 to subpart DDDDD of this part.

(61) ASTM D6722–01, Standard Test Method for Total Mercury in Coal and Coal Combustion Residues by the Direct Combustion Analysis, IBR approved for Table 6 to subpart DDDDD of this part.

(62) ASTM D5865–04, Standard Test Method for Gross Calorific Value of Coal and Coke, IBR approved for Table 6 to subpart DDDDD of this part.

* * * * *

Subpart DDDDD—[Amended]

■ 3. Section 63.7491 is amended by revising paragraph (c) to read as follows:

§ 63.7491 Are any boilers or process heaters not subject to this subpart?

* * * * *

(c) An electric utility steam generating unit (including a unit covered by 40 CFR part 60, subpart Da) or a Mercury (Hg) Budget unit covered by 40 CFR part 60, subpart HHHH.

* * * * *

■ 4. Section 63.7510 is amended by revising paragraph (a) to read as follows:

§ 63.7510 What are my initial compliance requirements and by what date must I conduct them?

(a) For affected sources that elect to demonstrate compliance with any of the emission limits of this subpart through performance testing, your initial compliance requirements include conducting performance tests according to § 63.7520 and Table 5 to this subpart, conducting a fuel analysis for each type of fuel burned in your boiler or process heater according to § 63.7521 and Table 6 to this subpart, establishing operating limits according to § 63.7530 and Table 7 to this subpart, and conducting CMS performance evaluations according to § 63.7525. For affected sources that burn a single type of fuel, you are exempted from the initial compliance requirements of conducting a fuel analysis for each type of fuel burned in your boiler or process heater according to § 63.7521 and Table 6 to this subpart.

* * * * *

■ 5. Section 63.7522 is amended as follows:

■ a. By revising paragraph (b),

■ b. By revising paragraph (c),

■ c. By revising paragraph (d),

■ d. By revising paragraph (e),

■ e. By revising paragraph (f), and

■ f. By adding paragraphs (h) through (k).

§ 63.7522 Can I use emission averaging to comply with this subpart?

* * * * *

(b) Separate stack requirements. For a group of two or more existing large solid fuel boilers that each vent to a separate stack, you may average particulate matter or TSM, HCl and mercury emissions to demonstrate compliance with the limits in Table 1 to this subpart if you satisfy the requirements in paragraphs (c), (d), (e), (f), and (g) of this section.

(c) For each existing large solid fuel boiler in the averaging group, the emission rate achieved during the initial compliance test for the HAP being averaged must not exceed the emission level that was being achieved on November 12, 2004 or the control technology employed during the initial compliance test must not be less effective for the HAP being averaged than the control technology employed on November 12, 2004.

(d) The emissions rate from the existing large solid fuel boilers participating in the emissions averaging option must be in compliance with the limits in Table 1 to this subpart at all times following the compliance date specified in § 63.7495.

(e) You must demonstrate initial compliance according to paragraph (e)(1) or (2) of this section.

(1) You must use Equation 1 of this section to demonstrate that the particulate matter or TSM, HCl, and mercury emissions from all existing large solid fuel boilers participating in the emissions averaging option do not exceed the emission limits in Table 1 to this subpart.

$$\text{Ave Weighted Emissions} = \sum_{i=1}^{n} (Er \times Hm) \div \sum_{i=1}^{n} Hm \qquad \text{(Eq. 1)}$$

Where:

Ave Weighted Emissions = Average weighted emissions for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Er = Emission rate (as calculated according to Table 5 to this subpart or by fuel analysis (as calculated by the applicable equation in § 63.7530(d))) for boiler, i, for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Hm = Maximum rated heat input capacity of boiler, i, in units of million Btu per hour.

n = Number of large solid fuel boilers participating in the emissions averaging option.

(2) If you are not capable of monitoring heat input, you may use Equation 2 of this section as an alternative to using Equation 1 of this section to demonstrate that the particulate matter or TSM, HCl, and mercury emissions from all existing large solid fuel boilers participating in the emissions averaging option do not exceed the emission limits in Table 1 to this subpart.

$$\text{Ave Weighted Emissions} = \sum_{i=1}^{n}(\text{Er} \times \text{Sm} \times \text{Cf}) \div \sum_{i=1}^{n}\text{Sm} \times \text{Cf} \qquad \text{(Eq. 2)}$$

Where:

Ave Weighted Emissions = Average weighted emission level for PM or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Er = Emission rate (as calculated according to Table 5 to this subpart or by fuel analysis (as calculated by the applicable equation in § 63.7530(d))) for boiler, i, for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Sm = Maximum steam generation by boiler, i, in units of pounds.

Cf = Conversion factor, calculated from the most recent compliance test, in units of million Btu of heat input per pounds of steam generated.

(f) You must demonstrate continuous compliance on a monthly basis determined at the end of every month (12 times per year) according to paragraphs (f)(1) through (3) of this section. The first monthly period begins on the compliance date specified in § 63.7495.

(1) For each calendar month, you must use Equation 3 of this section to calculate the monthly average weighted emission rate using the actual heat capacity for each existing large solid fuel boiler participating in the emissions averaging option.

$$\text{Ave Weighted Emissions} = \sum_{i=1}^{n}(\text{Er} \times \text{Hb}) \div \sum_{i=1}^{n}\text{Hb} \qquad \text{(Eq. 3)}$$

Where:

Ave Weighted Emissions = monthly average weighted emission level for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Er = Emission rate, (as calculated during the most recent compliance test, (as calculated according to Table 5 to this subpart) or fuel analysis (as calculated by the applicable equation in § 63.7530(d)) for boiler, i, for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Hb = The average heat input for each calendar month of boiler, i, in units of million Btu.

n = Number of large solid fuel boilers participating in the emissions averaging option.

(2) If you are not capable of monitoring heat input, you may use Equation 4 of this section as an alternative to using Equation 3 of this section to calculate the monthly weighted emission rate using the actual steam generation from the large solid fuel boilers participating in the emissions averaging option.

$$\text{Ave Weighted Emissions} = \sum_{i=1}^{n}(\text{Er} \times \text{Sa} \times \text{Cf}) \div \sum_{i=1}^{n}\text{Sa} \times \text{Cf} \qquad \text{(Eq. 4)}$$

Where:

Ave Weighted Emissions = monthly average weighted emission level for PM or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Er = Emission rate, (as calculated during the most recent compliance test (as calculated according to Table 5 to this subpart) or by fuel analysis (as calculated by the applicable equation in § 63.7530(d))) for boiler, i, for particulate matter or TSM, HCl, or mercury, in units of pounds per million Btu of heat input.

Sa = Actual steam generation for each calendar month by boiler, i, in units of pounds.

Cf = Conversion factor, as calculated during the most recent compliance test, in units of million Btu of heat input per pounds of steam generated.

(3) Until 12 monthly weighted average emission rates have been accumulated, calculate and report only the monthly average weighted emission rate determined under paragraph (f)(1) or (2) of this section. After 12 monthly weighted average emission rates have been accumulated, for each subsequent calendar month, use Equation 4A of this section to calculate the 12-month rolling average of the monthly weighted average emission rates for the current month and the previous 11 months.

$$E_{avg} = \frac{\sum_{i=1}^{n}ER_i}{12} \qquad \text{(Eq. 4A)}$$

Where:

Eavg = 12-month rolling average emission rate, (pounds per million Btu heat input)

ERi = Monthly weighted average, for month "i", (pounds per million Btu heat input)(as calculated by (f)(1) or (2))

* * * * *

(h) Common stack requirements. For a group of two or more existing large solid fuel boilers, each of which vents through a single common stack, you may average particulate matter or TSM, HCl and mercury to demonstrate compliance with the limits in Table 1 to this subpart if you satisfy the requirements in paragraph (i) or (j) of this section.

(i) For a group of two or more existing large solid fuel boilers, each of which vents through a common emissions control system to a common stack, that

does not receive emissions from units in other subcategories or categories, you may treat such averaging group as a single existing solid fuel boiler for purposes of this subpart and comply with the requirements of this subpart as if the group were a single boiler.

(j) For all other groups of boilers subject to paragraph (h) of this section, the owner or operator may elect to:

(1) Conduct performance tests according to procedures specified in § 63.7520 in the common stack (if affected units from other subcategories (*e.g.*, gas-fired units) or nonaffected units vent to the common stack, the units from other subcategories and nonaffected units must be shut down or vented to a different stack during the performance test); and

(2) Meet the applicable operating limit specified in § 63.7540 and Table 8 to this subpart for each emissions control system (except that, if each boiler venting to the common stack has an applicable opacity operating limit, then a single continuous opacity monitoring system may be located in the common stack instead of in each duct to the common stack).

(k) *Combination requirements.* The common stack of a group of two or more boilers subject to paragraph (h) of this section may be treated as a separate stack for purposes of paragraph (b) of this section and included in an emissions averaging group subject to paragraph (b) of this section.

■ 6. Section 63.7525 is amended by revising paragraphs (a) introductory text and (a)(1) to read as follows:

§ 63.7525 What are my monitoring, installation, operation, and maintenance requirements?

(a) If you have an applicable work practice standard for carbon monoxide, and your boiler or process heater is in any of the large subcategories and has a heat input capacity of 100 MMBtu per hour or greater, you must install, operate, and maintain a continuous emission monitoring system (CEMS) for carbon monoxide and oxygen according to the procedures in paragraphs (a)(1) through (6) of this section by the compliance date specified in § 63.7495. The carbon monoxide and oxygen shall be monitored at the same location at the outlet of the boiler or process heater.

(1) Each CEMS must be installed, operated, and maintained according to the applicable procedures under Performance Specification (PS) 3 or 4A of 40 CFR part 60, appendix B, and according to the site-specific monitoring plan developed according to § 63.7505(d).

* * * * *

■ 7. Section 63.7540 is amended by revising paragraph (a)(4) to read as follows:

§ 63.7540 How do I demonstrate continuous compliance with the emission limits and work practice standards?

(a) * * *

(4) If you demonstrate compliance with an applicable HCl emission limit through performance testing and you plan to burn a new type of fuel or a new mixture of fuels, you must recalculate the maximum chlorine input using Equation 5 of § 63.7530. If the results of recalculating the maximum chlorine input using Equation 5 of § 63.7530 are higher than the maximum chlorine input level established during the previous performance test, then you must conduct a new performance test within 60 days of burning the new fuel type or fuel mixture according to the procedures in § 63.7520 to demonstrate that the HCl emissions do not exceed the emission limit. You must also establish new operating limits based on this performance test according to the procedures in § 63.7530(c).

* * * * *

■ 8. Section 63.7541 is amended as follows:

■ a. By revising paragraph (a) introductory text,

■ b. By revising paragraph (a)(2),

■ c. By adding paragraph (a)(5), and

■ d. By revising paragraph (b).

§ 63.7541 How do I demonstrate continuous compliance under the emission averaging provision?

(a) Following the compliance date, the owner or operator must demonstrate compliance with this subpart on a continuous basis by meeting the requirements of paragraphs (a)(1) through (5) of this section.

* * * * *

(2) You must maintain the applicable opacity limit according to paragraphs (a)(2)(i) through (ii) of this section.

(i) For each existing solid fuel boiler participating in the emissions averaging option that is equipped with a dry control system and not vented to a common stack, maintain opacity at or below the applicable limit.

(ii) For each group of boilers participating in the emissions averaging option where each boiler in the group is an existing solid fuel boiler equipped with a dry control system and vented to a common stack that does not receive emissions from affected units from other subcategories or nonaffected units, maintain opacity at or below the applicable limit at the common stack;

* * * * *

(5) For each existing large solid fuel boiler participating in the emissions averaging option venting to a common stack configuration containing affected units from other subcategories and/or nonaffected units, maintain the appropriate operating limit for each unit as specified in Tables 2 through 4 to this subpart that applies.

(b) Any instance where the owner or operator fails to comply with the continuous monitoring requirements in paragraphs (a)(1) through (5) of this section, except during periods of startup, shutdown, and malfunction, is a deviation.

■ 9. Section 63.7575 is amended as follows:

■ a. By revising the definitions for "Firetube boiler," "Fuel type," "Large gaseous fuel subcategory," "Large liquid fuel subcategory," "Large solid fuel subcategory," "Small gaseous fuel subcategory," "Small liquid fuel subcategory," "Watertube boiler," and

■ b. By adding definitions for "Common Stack," "Equivalent," and "Voluntary Consensus Standard" in alphabetical order.

§ 63.7575 What definitions apply to this subpart?

* * * * *

Common Stack means the exhaust of emissions from two or more affected units through a single flue.

* * * * *

Equivalent means the following only as this term is used in Table 6 to subpart DDDDD:

(1) An equivalent sample collection procedure means a published voluntary consensus standard or practice (VCS) or EPA method that includes collection of a minimum of three composite fuel samples, with each composite consisting of a minimum of three increments collected at approximately equal intervals over the test period.

(2) An equivalent sample compositing procedure means a published VCS or EPA method to systematically mix and obtain a representative subsample (part) of the composite sample.

(3) An equivalent sample preparation procedure means a published VCS or EPA method that: Clearly states that the standard, practice or method is appropriate for the pollutant and the fuel matrix; or is cited as an appropriate sample preparation standard, practice or method for the pollutant in the chosen VCS or EPA determinative or analytical method.

(4) An equivalent procedure for determining heat content means a published VCS or EPA method to obtain gross calorific (or higher heating) value.

(5) An equivalent procedure for determining fuel moisture content means a published VCS or EPA method to obtain moisture content. If the sample analysis plan calls for determining metals (especially the mercury, selenium, or arsenic) using an aliquot of the dried sample, then the drying temperature must be modified to prevent vaporizing these metals. On the other hand, if metals analysis is done on an "as received" basis, a separate aliquot can be dried to determine moisture content and the metals concentration mathematically adjusted to a dry basis.

(6) An equivalent pollutant (mercury, TSM, or total chlorine) determinative or analytical procedure means a published VCS or EPA method that clearly states that the standard, practice, or method is appropriate for the pollutant and the fuel matrix and has a published detection limit equal or lower than the methods listed in Table 6 to subpart DDDDD for the same purpose.

* * * * *

Firetube boiler means a boiler that utilizes a containment shell that encloses firetubes (tubes in a boiler having water on the outside and carrying the hot gases of combustion inside), and allows the water to vaporize and steam to separate. Hybrid boilers that have been registered/certified by the National Board of Boiler and Pressure Vessel Inspectors and/or the State as firetube boilers as indicated by "Form P–2" (Manufacturers' Data Report for All Types of Boilers Except Watertube and Electric, As Required by the Provisions of the ASME Code Rules, Section I), are considered to be firetube boilers for the purpose of this subpart.

* * * * *

Fuel type means each category of fuels that share a common name or classification. Examples include, but are not limited to, bituminous coal, subbituminous coal, lignite, anthracite, biomass, construction/demolition material, salt water laden wood, creosote treated wood, tires, residual oil. Individual fuel types received from different suppliers are not considered new fuel types except for construction/demolition material. Contraband, prohibited goods, or retired U.S. flags, burned at the request of a government agency, are not considered a fuel type for the purpose of this subpart.

* * * * *

Large gaseous fuel subcategory includes any watertube boiler or process heater that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or for periodic testing of liquid fuel, has a rated capacity of greater than 10 MMBtu per hour heat input, and does not have a federally enforceable annual average capacity factor of equal to or less than 10 percent. Periodic testing of liquid fuel is not to exceed a combined total of 48 hours during any calendar year.

Large liquid fuel subcategory includes any watertube boiler or process heater that does not burn any solid fuel and burns any liquid fuel either alone or in combination with gaseous fuels, has a rated capacity of greater than 10 MMBtu per hour heat input, and does not have a federally enforceable annual average capacity factor of equal to or less than 10 percent. Large gaseous fuel boilers and process heaters that burn liquid fuel during periods of gas curtailment, gas supply emergencies or for periodic testing of liquid fuel not to exceed a combined total of 48 hours during any calendar year are not included in this definition.

Large solid fuel subcategory includes any watertube boiler or process heater that burns any amount of solid fuel either alone or in combination with liquid or gaseous fuels, has a rated capacity of greater than 10 MMBtu per hour heat input, and does not have a federally enforceable annual average capacity factor of equal to or less than 10 percent.

* * * * *

Small gaseous fuel subcategory includes any size of firetube boiler and any other boiler or process heater with a rated capacity of less than or equal to 10 MMBtu per hour heat input that burn gaseous fuels not combined with any solid fuels and burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or for periodic testing of liquid fuel. Periodic testing is not to exceed a combined total of 48 hours during any calendar year.

Small liquid fuel subcategory includes any size of firetube boiler and any other boiler or process with a rated capacity of less than or equal to 10 MMBtu per hour heat input that do not burn any solid fuel and burn any liquid fuel either alone or in combination with gaseous fuels. Small gaseous fuel boilers and process heaters that burn liquid fuel during periods of gas curtailment, gas supply emergencies or for periodic testing of liquid fuel not to exceed a combined total of 48 hours during any calendar year are not included in this definition.

* * * * *

Watertube boiler means a boiler that incorporates a steam drum with tubes connected to the drum to separate steam from water.

* * * * *

Voluntary Consensus Standards or VCS mean technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. EPA/OAQPS has by precedent only used VCS that are written in English. Examples of VCS bodies are: American Society of Testing and Materials (ASTM), American Society of Mechanical Engineers (ASME), International Standards Organization (ISO), Standards Australia (AS), British Standards (BS), Canadian Standards (CSA), European Standard (EN or CEN) and German Engineering Standards (VDI). The types of standards that are not considered VCS are standards developed by: the U.S. states, *e.g.*, California (CARB) and Texas (TCEQ); industry groups, such as American Petroleum Institute (API), Gas Processors Association (GPA), and Gas Research Institute (GRI); and other branches of the U.S. government, *e.g.* Department of Defense (DOD) and Department of Transportation (DOT). This does not preclude EPA from using standards developed by groups that are not VCS bodies within their rule. When this occurs, EPA has done searches and reviews for VCS equivalent to these non-EPA methods.

* * * * *

■ 10. Table 6 and text before table to subpart DDDDD are revised to read as follows:

As stated in § 63.7521, you must comply with the following requirements for fuel analysis testing for existing, new or reconstructed affected sources. However, equivalent methods may be used in lieu of the prescribed methods at the discretion of the source owner or operator:

TABLE 6.—TO SUBPART DDDDD OF PART 63—FUEL ANALYSIS REQUIREMENTS

To conduct a fuel analysis for the following pollutant * * *	You must * * *	Using * * *
1. Mercury * * *	a. Collect fuel samples * * *	Procedure in § 63.7521(c) or ASTM D2234–D2234M–03€[1] (for coal) (IBR, see § 63.14(b)) or ASTM D6323–98 (2003) (for biomass) (IBR, See § 63.14(b)) or equivalent.
	b. Composite fuel samples * * *	Procedure in § 63.7521(d) or equivalent.
	c. Prepare composited fuel samples * * *.	SW–846–3050B (for solid samples) or SW–846–3020A (for liquid samples) or ASTM D2013–04 (for coal) (IBR, see § 63.14(b)) or ASTM D5198–92 (2003) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	d. Determine heat content of the fuel type * * *.	ASTM D5865–04 (for coal) (IBR, see § 63.24(b)) or ASTM E711–87 (for biomass) (IBR, see § 63.14(b)) or equivalent.
	e. Determine moisture content of the fuel type * * *.	ASTM D3173–03 (IBR, see § 63.14(b)) or ASTM E871–82 (1998) (IBR, see § 63.14(b)) or equivalent.
	f. Measure mercury concentration in fuel sample * * *.	ASTM D6722–01 (for coal) (IBR, see § 6314(b)) or SW–846–7471A (for solid samples) or SW–846–7470A (for liquid samples or equivalent.
	g. Convert concentration into units of pounds of pollutant per MMBtu of heat content.	
2. Total Selected metals * * *	a. Collect fuel samples * * *	Procedure in § 63.7521(c) or ASTM D2234–D2234M–03€[1] (for coal) (IBR, see § 63.14(b)) or ASTM D6323–98 (2003) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	b. Composite fuel samples * * *	Procedure in § 63.7521(d) or equivalent.
	c. Prepare composited fuel samples * * *.	SW–846–3050B (for solid samples) or SW–846–3020A (for liquid samples) or ASTM D2013–04 (for coal) (IBR, see § 63.14(b)) or ASTM D5198–92 (2003) (for biomass (IBR, see § 63.14(b)) or equivalent.
	d. Determine heat content of the fuel type * * *.	ASTM D5865–04 (for coal) (IBR, see § 63.14(b)) or ASTM E711–87 (for biomass) (IBR, see § 63.14(b)) or equivalent.
	e. Determine moisture content of the fuel type * * *.	ASTM D3173–03 (IBR, see § 63.14(b)) or ASTM E871–82 (IBR, see § 63.14(b)) or equivalent.
	f. Measure total selected metals concentration in fuel sample * * *.	SW–846–6010B or ASTM D6357–04 (for arsenic, beryllium, cadmium, chromium, lead, manganese, and nickel for all solid fuels) and ASTM D4606–03 (for selenium in coal) (IBR, see § 63.14(b)) or ASTM E885–88 (1996) for biomass) (IBR, see § 63.14(b)) or equivalent.
	g. Convert concentrations into units of pounds of pollutant per MMBtu of heat content.	
3. Hydrogen Chloride * * *	a. Collect fuel samples * * *	Procedure in § 63.7521(c) or ASTM D2234–D2234M–03€[1] (for coal) (IBR, see § 63.14(b)) or ASTM D6323–98 (2003) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	b. Composite fuel samples * * *	Procedure in § 63.7521(d) or equivalent.
	c. Prepare composited fuel samples * * *.	SW–846–3050B (for solid samples) or SW–846–3020A (for liquid samples) or ASTM D2013–04 (for coal) (IBR, see § 63.14(b)) or ASTM D5198–92 (2003) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	d. Determine heat content of the fuel type * * *.	ASTM D5865–04 (for coal) (IBR, see § 63.14(b)) or ASTM E711–87 (1996) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	e. Determine moisture content of the fuel type * * *.	ASTM D3173–03 (IBR, see § 63.14(b)) or ASTM E871–82 (1998) or equivalent.
	f. Measure chlorine concentration in fuel sample * * *.	SW–846–9250 or ASTM D6721–01 (for coal) or ASTM E776–87 (1996) (for biomass) (IBR, see § 63.14(b)) or equivalent.
	g. Convert concentrations into units of pounds of pollutant per MMBtu of heat content..	

[FR Doc. E6–20637 Filed 12–5–06; 8:45 am]
BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 70

[FDMS Docket No. EPA–R03–OAR–2006–0933; FRL–8252–3]

State Operating Permit Programs; Delaware; Amendments to the Definition of a "Major Source"

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: EPA is taking direct final action to amend the State of Delaware's operating permit program to correct the definition of "major source." Delaware's revision was submitted in response to the Clean Air Act (CAA) Amendments of 1990 that required States to submit to EPA program revisions in accordance with the Federal Title V regulations. The EPA granted final approval of Delaware's operating permit program on November 19, 2001. Delaware amended its operating permit program to address the Federal EPA amendment to the Federal Title V regulation, which went into effect on November 27, 2001, and this action approves this amendment. Any parties interested in commenting on this action granting approval of Delaware's amendment to the Title V operating permit program should do so at this time.

DATES: This rule is effective on February 5, 2007 without further notice, unless EPA receives adverse written comment by January 5, 2007. If EPA receives such comments, it will publish a timely withdrawal of the direct final rule in the **Federal Register** and inform the public that the rule will not take effect.

ADDRESSES: Submit your comments, identified by Docket ID Number EPA–R03–OAR–2006–0933 by one of the following methods:

A. *http://www.regulations.gov.* Follow the on-line instructions for submitting comments.

B. E-mail: *campbell.dave@epa.gov.*

C. Mail: EPA–R03–OAR–2006–0933, David Campbell, Chief, Permits and Technical Assessment Branch, Mailcode 3AP11, U.S. Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, Pennsylvania 19103.

D. Hand Delivery: At the previously-listed EPA Region III address. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

Instructions: Direct your comments to Docket ID No. EPA–R03–OAR–2006–0933. EPA's policy is that all comments received will be included in the public docket without change, and may be made available online at *http://www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or e-mail. The *www.regulations.gov* Web site is an "anonymous access" system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through *www.regulations.gov*, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses.

Docket: All documents in the electronic docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, i.e., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in *http://www.regulations.gov* or in hard copy during normal business hours at the Air Protection Division, U.S. Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, Pennsylvania 19103. Copies of the State submittal are available at the Delaware Department of Natural Resources & Environmental Control, 89 Kings Highway, P.O. Box 1401, Dover, Delaware 19903.

FOR FURTHER INFORMATION CONTACT: Rosemarie Nino, (215) 814–3377, or by e-mail at *nino.rose@epa.gov.*

SUPPLEMENTARY INFORMATION: On May 18, 2004, the State of Delaware submitted an amendment to its State operating permit program. This amendment is the subject of this document and this section provides additional information on the amendment by addressing the following questions:

What Is the State Operating Permit Program?
What Are the State Operating Permit Program Requirements?
What Is Being Addressed in This Document?
What Is Not Being Addressed in This Document?
What Changes to Delaware's Operating Permit Program Is EPA Approving?
What Action Is Being Taken by EPA?

What Is the State Operating Permit Program?

The Clean Air Act Amendments of 1990 required all States to develop operating permit programs that meet certain Federal criteria. When implementing the operating permit programs, the States require certain sources of air pollution to obtain permits that contain all of their applicable requirements under the Clean Air Act (CAA). The focus of the operating permit program is to improve enforcement by issuing each source a permit that consolidates all of its applicable CAA requirements into a Federally-enforceable document. By consolidating all of the applicable requirements for a given air pollution source into an operating permit, the source, the public, and the State environmental agency can more easily understand what CAA requirements apply and how compliance with those requirements is determined.

Sources required to obtain an operating permit under this program include "major" sources of air pollution and certain other sources specified in the CAA or in EPA's implementing regulations. For example, all sources regulated under the acid rain program, regardless of size, must obtain operating permits. Examples of "major" sources include those that have the potential to emit 100 tons per year or more of volatile organic compounds, carbon monoxide, lead, sulfur dioxide, nitrogen oxides, or particulate matter (PM_{10} and $PM_{2.5}$); those that emit 10 tons per year of any single hazardous air pollutant (HAP) specifically listed under the CAA; or those that emit 25 tons per year or more of a combination of HAPs. In areas that are not meeting the national ambient air quality standards (NAAQS) for ozone, carbon monoxide, or particulate matter, major sources are defined by the gravity of the nonattainment classification.

Administration, 7500 Standish Pl., Rockville, MD 20855, 301–827–6967, e-mail: *david.newkirk@fda.hhs.gov.*

SUPPLEMENTARY INFORMATION: Bertek Pharmaceuticals, Inc., 12720 Dairy Ashford, Sugar Land, TX 77478, has informed FDA that it has changed its name to Mylan Bertek Pharmaceuticals, Inc. Accordingly, the agency is amending the regulations in 21 CFR 510.600 to reflect the change.

This rule does not meet the definition of "rule" in 5 U.S.C. 804(3)(A) because it is a rule of "particular applicability." Therefore, it is not subject to the congressional review requirements in 5 U.S.C. 801–808.

List of Subjects in 21 CFR Part 510

Administrative practice and procedure, Animal drugs, Labeling, Reporting and recordkeeping requirements.

■ Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs and redelegated to the Center for Veterinary Medicine, 21 CFR part 510 is amended as follows:

PART 510—NEW ANIMAL DRUGS

■ 1. The authority citation for 21 CFR part 510 continues to read as follows:

Authority: 21 U.S.C. 321, 331, 351, 352, 353, 360b, 371, 379e.

■ 2. In § 510.600 in the table in paragraph (c)(1) remove the entry for "Bertek Pharmaceuticals, Inc." and alphabetically add a new entry for "Mylan Bertek Pharmaceuticals, Inc."; and in the table in paragraph (c)(2) revise the entry for "062794" to read as follows:

§ 510.600 Names, addresses, and drug labeler codes of sponsors of approved applications.

* * * * *

(c) * * *

(1) * * *

Firm name and address	Drug labeler code
* * * * *	
Mylan Bertek Pharmaceuticals, Inc., 12720 Dairy Ashford, Sugar Land, TX 77478.	062794
* * * * *	

(2) * * *

National Emission Standards for Hazardous Air Pollutants: Site Remediation

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action amends the national emission standards for hazardous air pollutants (NESHAP) for site remediation activities. This final rule revises specific provisions in the rule to resolve issues and questions subsequent to promulgation; correct technical omissions; and correct typographical, cross-reference, and grammatical errors.

DATES: This final rule is effective on November 29, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0021. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air & Radiation Docket, Docket ID No. EPA–HQ–OAR–2002–0021, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to visit the Public Ready Room to view documents. Consult EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site *http://www.epa.gov/epahome/dockets.htm* for current information on docket status, locations, and telephone numbers.

FOR FURTHER INFORMATION CONTACT: Mr. Greg Nizich, Chemicals and Coatings Group, Sector Policies and Programs Division (E143–01), U.S. EPA, Research Triangle Park, NC 27711, telephone number: (919) 541–3078, facsimile number: (919) 541–0246, electronic mail (e-mail) address: *nizich.greg@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The regulated categories and entities affected by the NESHAP include:

Category	NAICS[1]	Examples of regulated entities
Industry	325211 325192 325188 32411 49311 49319 48611 42269 42271.	Site remediation activities at businesses at which materials containing organic HAP currently are or have been in the past stored, processed, treated, or otherwise managed at the facility. These facilities include: organic liquid storage terminals, petroleum refineries, chemical manufacturing facilities, and other manufacturing facilities with co-located site remediation activities.
Federal Government		Federal agency facilities that conduct site remediation activities to clean up materials contaminated with organic HAP.

Category	NAICS [1]	Examples of regulated entities
State/ Local/ Tribal Government	.....	Tribal governments that conduct site remediation activities to clean up materials contaminated with organic HAP.

[1] North American Industry Classification System (NAICS) code. Representative industrial codes at which site remediation activities have been or are currently conducted at some but not all facilities under a given code. The list is not necessarily comprehensive as to the types of facilities at which a site remediation cleanup may potentially be required either now or in the future.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. This table lists the types of entities that we are now aware could potentially be regulated by this action.

A comprehensive list of NAICS codes cannot be compiled for businesses or facilities potentially regulated by the rule due to the nature of activities regulated by the source category. The industrial code alone for a given facility does not determine whether the facility is or is not potentially subject to this final rule. This final rule may be applicable to any type of business or facility at which a site remediation is conducted to clean up media contaminated with organic hazardous air pollutant (HAP) and other hazardous material. Thus, for many businesses and facilities subject to the rule, the regulated sources (*i.e.*, the site remediation activities) are not the predominant activity, process, operation, or service conducted at the facility. In these cases, the industrial code indicates a primary product produced or service provided at the facility rather than the presence of a site remediation at the facility. For example, NAICS code classifications where site remediation activities are currently being performed at some but not all facilities include, but are not limited to, petroleum refineries (NAICS code 32411), industrial organic chemical manufacturing (NAICS code 3251xx), and plastic materials and synthetics manufacturing (NAICS code 3252xx).

However, we are also aware of site remediation activities potentially subject to the rule being performed at facilities listed under NAICS codes for refuse systems, waste management, business services, miscellaneous services, and nonclassifiable.

To determine whether your facility is regulated by the action, you should carefully examine the applicability criteria in the 40 CFR part 63, subpart GGGGG-National Emissions Standards for Hazardous Air Pollutants: Site Remediation. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of this final action will also be available on the Worldwide Web through the Technology Transfer Network (TTN). Following signature, a copy of this final rule will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg/*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by January 29, 2007. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Organization of This Document. The information presented in this preamble is organized as follows:

I. Background
II. Final Amendments to Rule
  A. Applicability Determination for Remediation Activities at Certain Oil and Natural Gas Production Facilities
  B. 1 Megagram (Mg) Site Remediation Applicability Exemption
  C. Short-Term Site Remediation Exemption (30-day)
  D. Point of Determination of Remediation Material VOHAP Concentration
  E. Requirements for Equipment Leaks
  F. Other Rule Corrections
III. Statutory and Executive Order Reviews
  A. Executive Order 12866: Regulatory Planning and Review
  B. Paperwork Reduction Act
  C. Regulatory Flexibility Act
  D. Unfunded Mandates Reform Act
  E. Executive Order 13132: Federalism
  F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
  G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
  H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
  I. National Technology Transfer Advancement Act
  J. Congressional Review Act

I. Background

On October 8, 2003 (68 FR 58172), we issued a NESHAP for site remediation activities (40 CFR part 63, subpart GGGGG). This NESHAP implements section 112(d) of the CAA by requiring owners and operators of facilities that are major sources of HAP emissions and where a site remediation is conducted, that meets the definitions and conditions specified in this rule, to comply with emission standards and work practices for control of HAP reflecting application of the maximum achievable control technology.

After promulgation of subpart 40 CFR part 63, GGGGG, we received questions about our intent and interpretation of specific provisions in the rule. To clarify these issues, we decided that technical amendments to the rule are appropriate. We proposed on May 1, 2006, (71 FR 25531) amendments to subpart GGGGG to clarify certain provisions of the rule and to correct unintentional technical omissions and terminology, typographical, printing, and grammatical errors that we have identified since promulgation of the original rule. A 60-day period, which ended on June 30, 2006, was provided to accept public comments on the proposed amendments to subpart GGGGG. We received comments on the proposed amendments from 12 commenters.

A petition for reconsideration for 40 CFR part, subpart GGGGG was filed by the Sierra Club on December 8, 2003. The amendments to subpart GGGGG promulgated by this action do not address any issues cited in the Sierra Club's petition. We are still reviewing the items for reconsideration and will address them in a future notice.

II. Final Amendments to Rule

We are amending 40 CFR part 63, subpart GGGGG to clarify our intent for applying and implementing specific rule requirements and to correct unintentional technical omissions and editorial errors. This action promulgates our proposed regulatory language for the amendments to subpart GGGGG except

for those provisions, as noted below, for which modifications were made to the regulatory language for the final amendments in response to specific public comments. Our original projections for the subpart GGGGG compliance costs, environmental benefits, burden on industry, or the number of affected facilities are not changed by these final amendments.

This final rule promulgated by this action reflects our full consideration of all the comments we received on the amendment proposal. Our responses to all of the substantive public comments on the proposal are presented in a comment summary and response document available in Docket ID No. EPA–HQ–OAR–2002–0021 and at *http://www.epa.gov/ttn/atw/siterm/sitermpg.html.*

A. Applicability Determination for Remediation Activities at Certain Oil and Natural Gas Production Facilities

The major source determination requirements used for determining the applicability of 40 CFR part 63, subpart GGGGG are amended for certain facilities involved with oil and natural gas production to be consistent with special directives for these facilities in CAA section 112(n)(4)(A). As discussed in the preamble for the proposed amendments (71 FR 25536), in the Oil and Natural Gas Production NESHAP (40 CFR part 63, subpart HH) we address the provisions of CAA section 112(n)(4)(A) by limiting the emission points that are aggregated for the major source status determination of a production field facility to only the glycol dehydration units and storage vessels with flash emission potential, as defined in the rule (see 40 CFR 63.761). Consistent with our approach used for subpart HH, we are amending subpart GGGGG to specify that for a major source status determination of a production field facility, only the HAP emissions from the glycol dehydration units and storage vessels with the potential for flash emissions, as defined in subpart HH, are to be aggregated with the HAP emissions from the site remediation activities at the facility.

Several commenters on the proposed amendments stated that in compliance with the CAA section 112(n)(4) statutory directives, EPA should provide a similar applicability provision in 40 CFR part 63, subpart GGGGG for natural gas transmission and storage facilities consistent with the major source definition in the Natural Gas Transmission and Storage Facilities NESHAP (40 CFR part 63, subpart HHH). We agree that such a provision is appropriate, and are amending subpart GGGGG to specify that for natural gas transmission and storage facilities, HAP emissions are to be aggregated according to the definition of major source in § 63.1271 for a major source determination.

B. 1 Megagram (Mg) Site Remediation Applicability Exemption

The final amendments clarify the 40 CFR part 63, subpart GGGGG language with respect to how the 1 Mg applicability exemption is to be applied at a facility. Under this applicability exemption, site remediation activities conducted at your facility are not subject to the requirements of subpart GGGGG (except for certain recordkeeping requirements) if you determine that the total quantity of the HAP that is contained in the remediation material excavated, extracted, pumped, or otherwise removed during all of the site remediations conducted at your facility is less than 1 Mg annually. This final rule language for the exemption provisions does not change how the 1 Mg limit is applied nor change the documentation requirements for the exemption, but adds clarifying language stating that the 1 Mg limit applies on a facility-wide, annual basis and that there is no restriction to the number of site remediations that can be conducted under the exemption. Also, in response to public comments on the proposed regulatory language, the term "annual" was substituted for "calendar year", and language was added to the final rule stating that a Title V permit does not have to be reopened or revised solely to include the recordkeeping requirement required for the 1 Mg exemption. However, the recordkeeping requirement must be included in the facility's Title V permit the next time the permit is renewed, reopened, or revised for another reason.

C. Short-Term Site Remediation Exemption (30-Day)

Subpart GGGGG of 40 CFR part 63 is amended to clarify the rule language with respect to our intent for application of the 30-day site remediation exemption, including those situations when the remediation material is transferred off-site. Under this exemption, site remediations at your facility with affected sources subject to regulation under subpart GGGGG that can be completed within 30 days are exempted from having to meet the air emission control requirements specified in this final rule. The final rule language explicitly defines the beginning and end of the 30-day period for the purpose of qualifying for the exemption.

The first day of the 30-day exemption period is defined as the day on which you initiate any action that removes, destroys, degrades, transforms, immobilizes, or otherwise manages the remediation materials. Certain activities that you perform to prepare for the actual cleanup of the contaminated media are not counted as part of the 30-day period. The period of time (*i.e.,* number days) that you are required to perform the following activities are not counted as part of the 30-day interval that cannot be exceeded in order to qualify for the exemption provided that these activities are completed before the actual site cleanup begins: Activities to characterize the type and extent of the contamination by collecting and analyzing samples; activities to obtain permits from Federal, State, or local authorities to conduct the site remediation; activities to schedule workers and necessary equipment; and activities to arrange for contractor or third party assistance in performing the site remediation.

The last day of the 30-day exemption period is defined as the day on which all of the remediation materials generated by the cleanup have been treated or disposed of in a manner such that the organic HAP in the material no longer have a reasonable potential for volatilizing and being released to the atmosphere (*e.g.,* placed in a landfill). The exemption does not apply to a site remediation where the only activities completed during the 30-day period are excavating, pumping, or otherwise removing the remediation material from the contaminated area, and then storing this material on-site (*e.g.,* in waste piles, tanks, or containers) to be treated or disposed at some later date after the end of the 30-day period. In this case, the processes and equipment used for site remediation need to meet the applicable air emission control requirement in 40 CFR part 63, subpart GGGGG (unless the site remediation qualifies for another exemption allowed under the rule).

It was our intent that this exemption be used for those short-term site remediations for which all of the remediation materials generated by the cleanup are treated or disposed within the 30-day period to meet the requirement that the organic HAP constituents in the materials no longer have a reasonable potential for volatilizing and subsequent release to the atmosphere. However, we recognize that in some situations where the remediation materials are shipped off-site for treatment or disposal, unexpected special circumstances

beyond the direct control of the facility owner or operator may not allow the final treatment or disposal of the remediation material sent to the off-site location to be completed within the 30-day period required to qualify for the exemption. To address these situations, this final rule includes a provision allowing you to qualify for the exemption provided that all of the remediation material generated by your cleanup is transferred off-site within the 30-day exemption period according to the existing requirements specified in section 63.7936 of subpart GGGGG for remediation material transferred to another party or shipped to another facility. The requirements in section 63.7936 apply to the off-site transfer of remediation materials that have an average total average volatile organic HAP (VOHAP) concentration equal to or greater than 10 parts per million by weight (ppmw), and provide the owner or operator of the affected facility from which the remediation material is transferred with several compliance options. This final rule adds the requirement that you must include in the applicable shipping documentation used to transfer the remediation material off-site, in addition to any notifications and certifications required under section 63.7936, a statement that the shipped material was generated by a site remediation activity subject to the conditions specified for the 30-day exemption. The statement must include the date on which you initiated the site remediation activity generating the shipped remediation materials and the date 30 calendar days following your initiation date.

D. Point of Determination of Remediation Material VOHAP Concentration

Subpart GGGGG of 40 CFR part 63 applies the air emission control requirements for remediation material management units (*i.e.*, tanks, surface impoundments, containers, oil/water separators, organic/water separators and transfer systems) to those units that manage remediation material with an average VOHAP concentration equal to or greater than 500 ppmw. The final rule revises the applicable regulatory language in subpart GGGGG referring to the point at which the facility owner or operator determines the average VOHAP concentration of a remediation material. The final rule implements our original intended VOHAP determination procedure by reinstating the regulatory language and terminology we originally proposed for rule, and removing the term "point-of-extraction" from the rule.

Under the amended 40 CFR part 63, subpart GGGGG, you are required to determine the average total VOHAP concentration of the remediation material at a point prior to or within a remediation material management unit. Thus, once the VOHAP concentration for a remediation material has been determined to be less than 500 ppmw, all remediation material management units downstream from the point of determination that manage this material are no longer required to meet the air emission control requirements in subpart GGGGG unless a remediation process is used that concentrates all, or part of, the remediation material being managed in the unit such that the VOHAP concentration of the material increases to 500 ppmw or more. The amended regulatory language also clarifies that any free product returned to a manufacturing process is no longer subject to the air emission control requirements in subpart GGGGG.

E. Requirements for Equipment Leaks

The final rule adds a compliance option to 40 CFR part 63, subpart GGGGG, air emission control requirements for those affected equipment leak sources already using air pollution controls or work practices to comply with another subpart under 40 CFR part 61 or 40 CFR part 63. Under this option, the affected source is in compliance with subpart GGGGG if the HAP emissions from the affected equipment leak source are controlled in compliance with the applicable standards specified in the other subpart in part 61 or 63 that the affected source is subject. This final rule extends the same compliance option that subpart GGGGG already allows for process vents and remediation material management units to equipment leak sources.

If you choose to comply with this option, you must comply with all of the applicable emissions limitations and work practice standards under the other subpart (*e.g.*, you implement leak detection and control measures to reduce HAP emissions as specified by the applicable subpart). This provision does not apply to any exemption of the affected source from the emissions limitations and work practice standards allowed by the other applicable subpart.

F. Other Rule Corrections

For purposes of implementing the requirements of subpart GGGGG, Table 1 in the rule lists the specific organic chemical compounds, isomers, and mixtures that are HAP. The final rule updates this table to be consistent with EPA's current HAP list. The final rule removes from Table 1 the listings for 1,1-dimethyl hydrazine and methyl ethyl ketone. Both of these organic chemical compounds have been delisted as HAP.

Provisions in 40 CFR part 63, subpart GGGGG related to startup, shutdown, and malfunction plan requirements have been revised, as appropriate, to be consistent with the amendments to the General Provisions under subpart A to 40 CFR part 63 that we promulgated on April 20, 2006 (71 FR 20446).

The final rule includes changes to the cross-reference citations in §§ 63.7938(b)(2), 63.7938(d)(2), 63.7938(d)(3), 63.7941(h), 63.7950(c), 63.7884(b)(2), and Table 3 of the rule to cite the correct provision in 40 CFR part 63, subpart GGGGG that we had intended to be referenced. Also, the final amendments correct terminology, typographical, and grammatical errors in specific provisions of subpart GGGGG that have been identified since the rule was originally promulgated. The final rule replaces the rule language with the correct cross-reference citation, term, or wording, but do not change any of the technical or administrative requirements of the rule.

III. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

This action is not a "significant regulatory action" under the terms of Executive Order 12866 (58 FR 51735, October 4, 1993) and is therefore not subject to review under the Executive Order.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The final rule results in no changes to the information collection requirements of the existing rule. OMB has previously approved the information collection requirements contained in 40 CFR part 63, subpart GGGGG, under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0534, EPA ICR number 2062.02. A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby; Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW.; Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop,

acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR part 63 are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For the purposes of assessing the impacts of the final rule on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of the final rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. The small entities that may be directly regulated by the rule include small businesses and small governmental jurisdictions. We have determined that there is little or no impact on any affected small entities because the final rule amends existing regulations to clarify specific provisions and to correct technical omissions and editorial errors.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, the final rule is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments, because they contain no requirements that apply to such governments or impose obligations upon them.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. The final rule does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The final rule does not add any new requirements to the current rule, they only clarify our intent and correct errors. Thus, Executive Order 13132 does not apply to the final amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175. This action does not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

EPA interprets Executive Order 13045 as applying only to those regulatory

actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to the Executive Order because they are based on control technology and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This action is not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy because it only clarifies our intent and corrects errors in the existing rule. Further, we have concluded that the final rule is not likely to have any adverse energy effects.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law No. 104–113, 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities, unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by one or more VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

This action does not involve any new technical standards or the incorporation by reference of existing technical standards. Therefore, the consideration of VCS is not relevant to this action.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final amendments and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). These final amendments are effective on November 29, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: November 22, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63, of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart GGGGG—[Amended]

■ 2. Section 63.7881 is amended by revising paragraphs (a)(3) and (c) to read as follows:

§ 63.7881 Am I subject to this subpart?

(a) * * *

(3) Your facility is a major source of HAP as defined in § 63.2, except as specified in paragraph (a)(3)(i) or (ii) of this section. A major source emits or has the potential to emit any single HAP at the rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year.

(i) For production field facilities, as defined in § 63.761, only the HAP emissions from the glycol dehydration units and storage vessels with the potential for flash emissions (both as defined in § 63.761) shall be aggregated with the HAP emissions from the site remediation activities at the facility for a major source determination.

(ii) For natural gas transmission and storage facilities, HAP emissions shall be aggregated in accordance with the definition of major source in § 63.1271 for a major source determination.

* * * * *

(c) Your site remediation activities are not subject to the requirements of this subpart, except for the recordkeeping requirements in this paragraph, provided that you meet the requirements specified in paragraphs (c)(1) through (c)(3) of this section.

(1) You determine that the total quantity of the HAP listed in Table 1 to this subpart that is contained in the remediation material excavated, extracted, pumped, or otherwise removed during all of the site remediations conducted at your facility is less than 1 megagram (Mg) annually. This exemption applies the 1 Mg limit on a facility-wide, annual basis, and there is no restriction to the number of site remediations that can be conducted during this period.

(2) You must prepare and maintain at your facility written documentation to support your determination that the total HAP quantity in your remediation materials for the year is less than 1 Mg. The documentation must include a description of your methodology and data used for determining the total HAP content of the remediation material.

(3) Your Title V permit does not have to be reopened or revised solely to include the recordkeeping requirement specified in paragraph (c)(2) of this section. However, the requirement must be included in your permit the next time the permit is renewed, reopened, or revised for another reason.

* * * * *

■ 3. Section 63.7884 is revised to read as follows:

§ 63.7884 What are the general standards I must meet for each site remediation with affected sources?

(a) For each site remediation with an affected source designated under § 63.7882, you must meet the standards specified in §§ 63.7885 through 63.7955, as applicable to your affected source, unless your site remediation meets the requirements for an exemption under paragraph (b) of this section.

(b) A site remediation that is completed within 30 consecutive calendar days according to the conditions in paragraphs (b)(1) through (3) of this section is not subject to the standards under paragraph (a) of this section. This exemption cannot be used for a site remediation involving the staged or intermittent cleanup of remediation material whereby the remediation activities at the site are started, stopped, and then re-started in a series of intervals, with durations less than 30-days per interval, when the time period from the beginning of the first interval to the end of the last interval exceeds 30 days.

(1) The 30 consecutive calendar day period for a site remediation that qualifies for this exemption is determined according to actions taken by you as defined in paragraphs (b)(1)(i) through (iii) of this section.

(i) The first day of the 30-day period is defined as the day on which you initiate any action that removes, destroys, degrades, transforms, immobilizes, or otherwise manages the

remediation materials. The following activities, when completed before beginning this initial action, are not counted as part of the 30-day period: Activities to characterize the type and extent of the contamination by collecting and analyzing samples; activities to obtain permits from Federal, State, or local authorities to conduct the site remediation; activities to schedule workers and necessary equipment; and activities to arrange for contractor or third party assistance in performing the site remediation.

(ii) The last day of the 30-day period is defined as the day on which treatment or disposal of all of the remediation materials generated by the cleanup is completed such that the organic constituents in these materials no longer have a reasonable potential for volatilizing and being released to the atmosphere.

(iii) If treatment or disposal of the remediation materials is conducted at an off-site facility where the final treatment or disposal of the material cannot, or may not, be completed within the 30-day exemption period, then the shipment of all of the remediation material generated from your cleanup that is transferred to another party, or shipped to another facility, within the 30-day period, must be performed according to the applicable requirements specified in § 63.7936.

(2) For the purpose of complying with paragraph (b)(1) of this section, if you ship or otherwise transfer the remediation material off-site you must include in the applicable shipping documentation, in addition to any notifications and certifications required under § 63.7936, a statement that the shipped material was generated by a site remediation activity subject to the conditions of this exemption. The statement must include the date on which you initiated the site remediation activity generating the shipped remediation materials, as specified in paragraph (b)(1)(i) of this section, and the date 30 calendar days following your initiation date.

(3) You must prepare and maintain at your facility written documentation describing the exempted site remediation, and listing the initiation and completion dates for the site remediation.

■ 4. Section 63.7886 is amended by revising paragraph (b)(2) to read as follows:

§ 63.7886 What are the general standards I must meet for my affected remediation material management units?

* * * * *

(b) * * *

(2) You determine that the average total VOHAP concentration, as defined in § 63.7957, of the remediation material managed in the remediation material management unit material is less than 500 ppmw. You must follow the requirements in § 63.7943 to demonstrate that the VOHAP concentration of the remediation material is less than 500 ppmw. Once the VOHAP concentration for a remediation material has been determined to be less than 500 ppmw, all remediation material management units downstream from the point of determination managing this material meet the requirements of this paragraph unless a remediation process is used that concentrates all, or part of, the remediation material being managed in the unit such that the VOHAP concentration of the material could increase. Any free product returned to the manufacturing process (*e.g.*, recovered oil returned to a storage tank at a refinery) is no longer subject to this subpart.

* * * * *

■ 5. Section 63.7887 is revised to read as follows:

§ 63.7887 What are the general standards I must meet for my affected equipment leak sources?

(a) You must control HAP emissions from equipment leaks from each equipment component that is part of the affected source by implementing leak detection and control measures according to the standards specified in §§ 63.7920 through 63.7922 unless you elect to meet the requirements in paragraph (b) of this section.

(b) If the affected equipment leak source is also subject to another subpart in 40 CFR part 61 or 40 CFR part 63, you may control emissions of the HAP listed in Table 1 to this subpart from the affected equipment leak source in compliance with the standards specified in the other applicable subpart. This means you are complying with all applicable emissions limitations and work practice standards under the other subpart (*e.g.*, you implement leak detection and control measures to reduce HAP emissions as specified by the applicable subpart). This provision does not apply to any exemption of the affected source from the emissions limitations and work practice standards allowed by the other applicable subpart.

■ 6. Section 63.7890 is amended by revising paragraph (b)(2) to read as follows:

§ 63.7890 What emissions limitations and work practice standards must I meet for process vents?

* * * * *

(b) * * *

(2) Reduce from all affected process vents the emissions of total organic compounds (TOC) (minus methane and ethane) to a level below 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy); or

* * * * *

■ 7. Section 63.7893 is amended by revising paragraph (b) introductory text to read as follows:

§ 63.7893 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for process vents?

* * * * *

(b) You must maintain emission levels from all of your affected process vents to meet the facilitywide emission limits in § 63.7890(b) that apply to you, as specified in paragraphs (b)(1) through (4) of this section.

* * * * *

■ 8. Section 63.7896 is amended by revising paragraph (b)(2) to read as follows:

§ 63.7896 How do I demonstrate initial compliance with the emissions limitations and work practice standards for tanks?

* * * * *

(b) * * *

(2) You have determined, according to the procedures in § 63.7944, and recorded the maximum HAP vapor pressure of the remediation material placed in each affected tank subject to § 63.7886(b)(1)(i) that does not use Tank Level 2 controls.

* * * * *

■ 9. Section 63.7898 is amended by revising paragraph (e)(2) to read as follows:

§ 63.7898 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for tanks?

* * * * *

(e) * * *

(2) Visually inspecting the external floating roof according to the requirements in § 63.1063(d)(1) and inspecting the seals according to the requirements in § 63.1063(d)(2) and (3).

* * * * *

■ 10. Section 63.7913 is amended by revising paragraph (c) introductory text to read as follows:

§ 63.7913 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for separators?

* * * * *

(c) You must demonstrate continuous compliance for each separator using a fixed roof vented through a closed vent system to a control device according to § 63.7910(b)(2) by meeting the requirements in paragraphs (c)(1) through (6) of this section.

* * * * *

■ 11. Section 63.7915 is amended by revising paragraph (c)(2) to read as follows:

§ 63.7915 What emissions limitations and work practice standards must I meet for transfer systems?

* * * * *

(c) * * *

(2) A transfer system that consists of continuous hard piping. All joints or seams between the pipe sections must be permanently or semi-permanently sealed (*e.g.*, a welded joint between two sections of metal pipe or a bolted and gasketed flange).

* * * * *

■ 12. Section 63.7917 is amended by revising paragraph (c) to read as follows:

§ 63.7917 What are my inspection and monitoring requirements for transfer systems?

* * * * *

(c) If you operate a transfer system consisting of hard piping according to § 63.7915(c)(2), you must annually inspect the unburied portion of pipeline and all joints for leaks and other defects. In the event that a defect is detected, you must repair the leak or defect according to the requirements of paragraph (e) of this section.

* * * * *

■ 13. Section 63.7918 is amended by revising paragraphs (d) and (e) introductory text to read as follows:

§ 63.7918 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for transfer systems?

* * * * *

(d) You must demonstrate continuous compliance for each transfer system that consists of hard piping according to § 63.7915(c)(2) by meeting the requirements in paragraphs (d)(1) through (4) of this section.

(1) Operating and maintaining the pipeline to ensure that all joints or seams between the pipe sections remain permanently or semi-permanently sealed (*e.g.*, a welded joint between two sections of metal pipe or a bolted and gasketed flange).

(2) Inspecting the pipeline for defects at least annually according to the requirements in § 63.7917(c).

(3) Repairing defects according to the requirements in § 63.7917(e).

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in § 63.7952.

(e) You must demonstrate continuous compliance for each transfer system that is enclosed and vented to a control device according to § 63.7915(c)(3) by meeting the requirements in paragraphs (e)(1) through (5) of this section.

* * * * *

■ 14. Section 63.7927 is amended by revising paragraph (b)(3) to read as follows:

§ 63.7927 What are my inspection and monitoring requirements for closed vent systems and control devices?

* * * * *

(b) * * *

(3) Use a CPMS to measure and record the hourly average temperature of the adsorption bed after regeneration (and within 15 minutes after completing any cooling cycle).

* * * * *

■ 15. Section 63.7928 is amended by revising paragraphs (b)(6) and (7) and (c) introductory text to read as follows:

§ 63.7928 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for closed vent systems and control devices?

* * * * *

(b) * * *

(6) If the closed vent system is equipped with a flow indicator, recording the information in § 63.693(c)(2)(i).

(7) If the closed vent system is equipped with a seal or locking device, visually inspecting the seal or closure mechanism at least monthly according to the requirements in § 63.693(c)(2)(ii), and recording the results of each inspection.

(c) You must demonstrate continuous compliance of each control device subject to the emissions limits in § 63.7925(d) with the applicable emissions limit in § 63.7925(d) by meeting the requirements in paragraph (c)(1) or (2) of this section.

* * * * *

■ 16. Section 63.7935 is amended by revising paragraphs (c) and (f) to read as follows:

§ 63.7935 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

* * * * *

(f) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). We will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

* * * * *

■ 17. Section 63.7937 is amended by revising paragraphs (c)(2) and (c)(4)(ii) to read as follows:

§ 63.7937 How do I demonstrate initial compliance with the general standards?

* * * * *

(c) * * *

(2) If the remediation material managed in the affected remediation material management unit has an average total VOHAP concentration less than 500 ppmw according to § 63.7886(b)(2), you have submitted as part of your notification of compliance status, specified in § 63.7950, a signed statement that you have determined, according to the procedures in § 63.7943, and recorded the average VOHAP concentration of the remediation material placed in the affected remediation material management unit.

* * * * *

(4) * * *

(ii) You will monitor the biological treatment process conducted in each unit according to the requirements in § 63.684(e)(4).

* * * * *

■ 18. Section 63.7938 is amended by revising paragraphs (b)(2) and (c)(4)(ii) to read as follows:

63.7938 How do I demonstrate continuous compliance with the general standards?

* * * * *

(b) * * *

(2) If the remediation material treated or managed by the process vented through the affected process vents has an average total VOHAP less than 10 ppmw according to § 63.7885(c)(1), you must demonstrate continuous compliance by performing a new determination and preparing new documentation as required in § 63.7885(c)(2) to show that the total VOHAP concentration of the remediation material remains less than 10 ppmw.

(c) * * *

(4) * * *

(ii) Monitoring the biological treatment process conducted in each

unit according to the requirements in § 63.7886(4)(i).

* * * * *

■ 19. Section 63.7940 is amended by revising paragraph (c) to read as follows:

§ 63.7940 By what date must I conduct performance tests or other initial compliance demonstrations?

* * * * *

(c) For new sources, you must conduct initial performance tests and other initial compliance demonstrations according to the provisions in § 63.7(a)(2).

■ 20. Section 63.7941 is amended as follows:

■ a. By revising paragraph (c);

■ b. By revising paragraph (g); and

■ c. By removing and reserving paragraph (h):

§ 63.7941 How do I conduct a performance test, design evaluation, or other type of initial compliance demonstration?

* * * * *

(c) If you use a carbon adsorption system, condenser, vapor incinerator, boiler, or process heater to meet an emission limit in this subpart, you may choose to perform a design evaluation to demonstrate initial compliance instead of a performance test. You must perform a design evaluation according to the general requirements in § 63.693(b)(8) and the specific requirements in § 63.693(d)(2)(ii) for a carbon adsorption system (including establishing carbon replacement schedules and associated requirements), § 63.693(e)(2)(ii) for a condenser, § 63.693(f)(2)(ii) for a vapor incinerator, or § 63.693(g)(2)(i)(B) for a boiler or process heater.

* * * * *

(g) If you are required to conduct a visual inspection of an affected source, you must conduct the inspection according to the procedures in § 63.906(a)(1) for Tank Level 1 controls, § 63.1063(d) for Tank Level 2 controls, § 63.926(a) for Container Level 1 controls, § 63.946(a) for a surface impoundment equipped with a floating membrane cover, § 63.946(b) for a surface impoundment equipped with a cover and vented to a control device, § 63.1047(a) for a separator with a fixed roof, § 63.1047(c) for a separator equipped with a fixed roof and vented to a control device, § 63.695(c)(1)(i) or (c)(2)(i) for a closed vent system, and § 63.964(a) for individual drain systems.

* * * * *

(h) [Reserved]

* * * * *

■ 21. Section 63.7943 is amended as follows:

■ a. By revising paragraph (a);

■ b. By revising paragraph (b) introductory text;

■ c. By revising paragraphs (b)(1) introductory text and (b)(3); and

■ d. By revising paragraph (c) introductory text.

§ 63.7943 How do I determine the average VOHAP concentration of my remediation material?

(a) General requirements. You must determine the average total VOHAP concentration of a remediation material using either direct measurement as specified in paragraph (b) of this section or by knowledge as specified in paragraph (c) of this section. These methods may be used to determine the average VOHAP concentration of any material listed in (a)(1) through (3) of this section.

(1) A single remediation material stream; or

(2) Two or more remediation material streams that are combined prior to, or within, a remediation material management unit or treatment process; or

(3) Remediation material that is combined with one or more non-remediation material streams prior to, or within, a remediation material management unit or treatment process.

(b) Direct measurement. To determine the average total VOHAP concentration of a remediation material using direct measurement, you must use the procedures in paragraphs (b)(1) through (3) of this section.

(1) Sampling. Samples of each material stream must be collected from the container, pipeline, or other device used to deliver each material stream prior to entering the remediation material management unit or treatment process in a manner such that volatilization of organics contained in the sample is minimized and an adequately representative sample is collected and maintained for analysis by the selected method.

* * * * *

(3) Calculations. The average total VOHAP concentration ($\bar{C}$) on a mass-weighted basis must be calculated by using the results for all samples analyzed according to paragraph (b)(2) of this section and Equation 1 of this section as follows:

$$\bar{C} = \frac{1}{Q_T} \times \sum_{i=1}^{n} (Q_i \times C_i) \qquad \text{(Eq. 1)}$$

Where:

$\bar{C}$ = Average VOHAP concentration of the material on a mass-weighted basis, ppmw.

i = Individual sample "i" of the material.

n = Total number of samples of the material collected (at least 4 per stream) for the averaging period (not to exceed 1 year).

Q_i = Mass quantity of material stream represented by C_i, kilograms per hour (kg/hr).

Q_T = Total mass quantity of all material during the averaging period, kg/hr.

C_i = Measured VOHAP concentration of sample "i" as determined according to the requirements of paragraph (b)(2) of this section, ppmw.

(c) Knowledge of the material. To determine the average total VOHAP concentration of a remediation material using knowledge, you must use the procedures in paragraphs (c)(1) through (3) of this section.

* * * * *

■ 22. Section 63.7950 is amended by revising paragraph (c) to read as follows:

§ 63.7950 What notifications must I submit and when?

* * * * *

(c) As specified in § 63.9(b)(3), if you start up your new or reconstructed affected source on or after the effective date, you must submit an Initial Notification no later than 120 calendar days after initial startup.

* * * * *

■ 23. Section 63.7956 is amended by revising paragraph (c) introductory text to read as follows:

§ 63.7956 Who implements and enforces this subpart?

* * * * *

(c) The authorities that cannot be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section.

* * * * *

■ 24. Section 63.7957 is amended by removing the definition of "Point-of-extraction" and revising the definitions of "deviation" and "transfer system" to read as follows:

§ 63.7957 What definitions apply to this subpart?

* * * * *

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emissions limitation (including any operating limit), or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emissions limitation, (including any operating limit), or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

* * * * *

Transfer system means a stationary system for which the predominant function is to convey liquids or solid materials from one point to another point within a waste management operation or recovery operation. For the purpose of this subpart, the conveyance of material using a container (as defined for this subpart) or a self-propelled vehicle (*e.g.*, a front-end loader) is not a transfer system. Examples of a transfer system include but are not limited to a pipeline, an individual drain system, a gravity-operated conveyor (such as a chute), and a mechanically-powered conveyor (such as a belt or screw conveyor).

* * * * *

■ 25. Table 1 to Subpart GGGGG of Part 63 is revised to read as follows:

TABLE 1 TO SUBPART GGGGG OF PART 63.—LIST OF HAZARDOUS AIR POLLUTANTS

CAS No.[a]	Compound name	$F_{m\,305}$
75070	Acetaldehyde	1.000
75058	Acetonitrile	0.989
98862	Acetophenone	0.314
98862	Acetophenone	0.314
107028	Acrolein	1.000
107131	Acrylonitrile	0.999
107051	Allyl chloride	1.000
71432	Benzene (includes benzene in gasoline)	1.000
98077	Benzotrichloride (isomers and mixture)	0.958
100447	Benzyl chloride	1.000

Final Extension of the Deferred Effective Date for 8-Hour Ozone National Ambient Air Quality Standards for Early Action Compact Areas

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The EPA is finalizing the extension of the deferred effective date of air quality designations for 14 areas of the country that have entered into Early Action Compacts. Early Action Compact areas have agreed to reduce ground-level ozone pollution earlier than the Clean Air Act (CAA) requires. On April 30, 2004, EPA published an action designating all areas of the country for the 8-hour ozone National Ambient Air Quality Standards (NAAQS). In the designation rule, EPA deferred the effective date of the nonattainment designation for 14 areas that had entered into Early Action Compacts until September 30, 2005. On August 29, 2005, EPA deferred the nonattainment designation for these areas a second time until December 31, 2006. The EPA is now extending the deferred effective date of the nonattainment designation for 13 Early Action Compact areas until April 15, 2008, and for the Denver Early Action Compact area until July 1, 2007.

EFFECTIVE DATE: This final rule is effective on December 29, 2006.

ADDRESSES: The EPA has established a docket for this action under Docket ID no. EPA–HQ–OAR–2003–0090. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *i.e.*, Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Docket, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave., Northwest, Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Office of Air and Radiation Docket is (202) 566–1742. In addition, we have placed a copy of the rule and a variety of materials relevant to Early Action Compact areas on EPA's Web site at *http://www.epa.gov/ttn/naaqs/ozone/eac/*.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to visit the Public Reading Room to view documents. Consult EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* for current information on docket status, locations and telephone numbers.

FOR FURTHER INFORMATION CONTACT: Ms. Barbara Driscoll, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Mail Code C539–04, Research Triangle Park, NC 27711, phone number (919) 541–1051 or by e-mail at: *driscoll.barbara@epa.gov* or Mr. David Cole, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Mail Code C304–05, Research Triangle Park, NC 27711, phone number (919) 541–5565 or by e-mail at: *cole.david@epa.gov*.

SUPPLEMENTARY INFORMATION:

I. General Information

Does This Action Apply to Me?

This action applies only to the 14 areas that entered into Early Action compacts and for which the effective date of the nonattainment designation was deferred. A list of these areas is included in Table 1.

The information presented in this preamble is organized as follows:

Outline

I. General Information
Does this Action Apply to Me?

NESHAP: National Emission Standards for Hazardous Air Pollutants: Standards for Hazardous Waste Combustors (Amendment)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The EPA is amending the effective date of the standard for particulate matter for new cement kilns that burn hazardous waste. EPA promulgated this standard as part of the national emission standards for hazardous air pollutants (NESHAP) for hazardous waste combustors that were issued on October 12, 2005, under section 112 of the Clean Air Act. EPA agreed to reconsider the standard and proposed to change it on March 23, 2006 (71 FR 14665). This amendment suspends the obligation of new cement kilns to comply with the particulate matter standard until EPA takes final action on this proposal. This amendment does not affect other standards applicable to new or existing hazardous waste burning cement kilns.

DATES: The final rule is effective on October 25, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2004–0022. All documents in the docket are listed on *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information the disclosure of which is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in *http://www.regulations.gov* or in hard copy at the HQ EPA Docket Center, Docket ID No. EPA–HQ–OAR–2004–0022, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC 20004 (See note below). This Docket Facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The HQ EPA Docket Center telephone number is (202) 566–1742. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744. A reasonable fee may be charged for copying docket materials.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to visit the Public Reading Room to view documents. Consult EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* for current information on docket status, locations and telephone numbers.

FOR FURTHER INFORMATION CONTACT: For more information on this rulemaking, contact Frank Behan at (703) 308–8476, or *behan.frank@epa.gov*, Office of Solid Waste (MC: 5302P), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave., NW., Washington, DC. 20460.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The regulated categories and entities affected by the NESHAP include:

Category	NAICS code	SIC code	Examples of regulated entities
Industry	327310	3241	Cement manufacturing, clinker production.
Federal government	.....	.....	Not affected.
State/local/tribal government	.....	.....	Not affected.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be impacted by this action. This table lists examples of the types of entities EPA is now aware could potentially be regulated by this action. Other types of entities not listed could also be affected. To determine whether your facility, company, business, organization, etc., is affected by this action, you should examine the applicability criteria in 40 CFR 63.1200. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (www). In addition to being available in the docket, an electronic copy of today's final rule will also be available on the www at *http://www.epa.gov/hwcmact.*

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of today's amendment to the NESHAP for hazardous waste combustors is available only on the filing of a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit within 60 days of today's publication of this final rule. Under section 307(b)(2) of the CAA, the requirements that are subject to today's notice may not be challenged later in civil or criminal proceedings brought by the EPA to enforce these requirements.

Organization of This Document. The information presented in this preamble is organized as follows:

I. National Technology Transfer and Advancement Act
J. Congressional Review

I. Summary of Final Rule

EPA is issuing a final rule to amend the effective date of the standard for particulate matter for new cement kilns that burn hazardous waste. The effect of this action is to suspend the obligation of new cement kilns to comply with the particulate matter standard that was issued on October 12, 2005 (70 FR 59402), under section 112 of the CAA, and set forth in § 63.1220(b)(7)(i). EPA is codifying this amendment by amending §§ 63.1206(a)(1)(ii)(B) and 63.1220(b)(7)(i).

Under this amended rule, cement kilns that were constructed or reconstructed after April 20, 2004, are temporarily relieved of the obligation to comply with the replacement particulate matter standard of 0.0023 gr/dscf, corrected to 7 percent oxygen, under § 63.1220(b)(7)(i).[1] However, such sources instead must comply with a particulate matter standard of 0.15 kg/Mg dry feed, which was the standard applicable to new cement kilns prior to the promulgation of the replacement standard (*i.e.*, the standard set forth in § 63.1220(b)(7)(i) as promulgated in the October, 2005 rule). This action does not affect any other standards applicable to new (or existing) cement kilns. It also does not affect the standards for other hazardous waste combustor source categories.

This amendment of the effective date shall take effect immediately upon publication in the **Federal Register**, and will remain in effect until EPA takes final action on the proposal to revise the particulate matter standard under § 63.1220(b)(7)(i). After EPA takes final action on the particulate matter standard, a cement kiln constructed or reconstructed after April 20, 2004, will be subject to the particulate matter standard set forth in § 63.1220(b)(7)(i).

II. Background

The final maximum achievable control technology (MACT) standards for hazardous waste combustors, implementing section 112(d) of the Clean Air Act, were published on October 12, 2005 (70 FR 59402). They are codified at 40 CFR part 63, subpart EEE. These standards include limits for particulate matter, which is a surrogate for certain hazardous air pollutant (HAP) metals. The particulate matter standard for new hazardous waste burning cement kilns is 0.0023 gr/dscf.[2]

Following promulgation of the hazardous waste combustor final rule, the Administrator received petitions for reconsideration of this standard pursuant to section 307(d)(7)(B) of the CAA from Ash Grove Cement Company (AGCC) and the Cement Kiln Recycling Coalition (CKRC).[3] Under this section of the CAA, the Administrator shall initiate reconsideration proceedings if the petitioner can show that it was impracticable to raise an objection to a rule within the public comment period or that the grounds for the objection arose after the public comment period.

Petitioners AGCC and CKRC requested that EPA reconsider the particulate matter standard for new cement kilns. They stated that the final standard of 0.0023 gr/dscf was not properly noticed and was derived using unrepresentative test data from the Ash Grove Cement Chanute (AGCC Chanute) plant, resulting in an unachievable standard. To support their position, the petitioners provided additional performance data from the AGCC Chanute plant, the cement kiln whose performance was the basis for the standard. On March 23, 2006, we published a proposed rule granting reconsideration of the particulate matter standard for new cement kilns and proposed a revised standard. See 71 FR 14665. In the proposal we agreed that there was legitimate confusion regarding whether we would base the new source standard on emissions data from the Ash Grove Cement Chanute plant, and that also, there was no practical opportunity for commenters to address this issue during the public comment period. We also stated that "it appears that the promulgated new source standard for particulate matter for cement kilns is overly stringent in that it does not fully reflect the variability of the best performing source over time (the "emission control that is achieved in practice," using the language of section 112(d)(3))". 71 FR at 14668. Therefore, we proposed a revised particulate matter standard for new cement kilns of 0.0069 gr/dscf. Eleven public comment letters were submitted in response to the proposal, including a request to extend the comment period by two weeks that was granted in a subsequent notice on April 13, 2006 (71 FR 19155).

Pursuant to section 307(d)(7)(B) of the CAA, EPA also issued an administrative stay of the 0.0023 gr/dscf standard on March 23, 2006 (71 FR 14655). The administrative stay was in effect for three months, the maximum allowable under this section of the CAA, from March 23, 2006 to June 23, 2006. The administrative stay was based on our initial determination that the petitions for reconsideration (for the particulate matter standard for new cement kilns) appear to have merit and that there is a potential environmental detriment associated with requiring immediate compliance with the current standard of 0.0023 gr/dscf (71 FR at 14655).

III. Basis for Amended Effective Date

Although we proposed to revise the particulate matter standard for new cement kilns to 0.0069 gr/dscf from 0.0023 gr/dscf in response to the petitions for reconsideration, the

[1] In this notice all concentration-based standards with units of gr/dscf are corrected to 7% oxygen.

[2] The particulate matter standard is used as a surrogate to control five HAP metals including antimony, cobalt, manganese, nickel, and selenium. In addition, the particulate matter standard is a surrogate control for all non-mercury HAP metals in the raw materials and auxiliary fuels. 69 FR at 21221.

[3] AGCC's petition for reconsideration is docket item EPA–HQ–OAR–2004–0022–0516 and the petition of CKRC is docket item EPA–HQ–OAR–2004–0022–0520.

October 12, 2005 final rule provides that the promulgated particulate matter standard of 0.0023 gr/dscf takes effect upon publication. Without today's amendment of this provision, all cement kilns that were constructed or reconstructed after April 20, 2004, would have been required to comply immediately with the 0.0023 gr/dscf emission standard. While there are no cement kilns operating that were constructed or reconstructed after April 20, 2004 (and thus already complying with the 0.0023 gr/dscf standard) currently, there are a number of cement plants that are in various stages of constructing new, lower emitting and more energy-efficient kilns to replace older cement kilns. Comments submitted by these cement companies affirm that the promulgated particulate matter standard of 0.0023 gr/dscf, if left in effect during the reconsideration proceedings, could adversely affect the construction of these new kilns. As discussed in Section IV below, we have found that such delays, if they were to occur, would result in adverse environmental and energy impacts (*e.g.*, increased emissions of particulate matter and increased consumption of fossil fuels such as coal). Therefore, we conclude it is appropriate to amend the effective date of the particulate matter standard for new cement kilns until we conclude the reconsideration proceedings.

We are mindful that there would be no need to amend the effective date of the new source particulate matter standard for cement kilns if it seemed likely that we would affirm the promulgated standard of 0.0023 gr/dscf at the conclusion of the reconsideration process. Based on a preliminary, non-cursory evaluation of public comments submitted in response to the proposed rule to revise the particulate matter standard, we continue to believe that a MACT floor level of 0.0023 gr/dscf is not representative of the performance of any single best performing cement kiln source in our emissions data base, properly taking normal operating variability into account. Therefore, while not a final determination, our preliminary review of public comments provided during the reconsideration proceedings has not persuaded us that a revision of the particulate matter standard for new cement kilns is unnecessary. We will, of course, consider objectively all information submitted during the reconsideration process and make a final determination in the near future as to the need to revise this standard.

Our preliminary view is that an emissions standard of 0.0023 gr/dscf for particulate matter is not an appropriate standard for new cement kilns either as a MACT floor or as a beyond-the-floor standard.[4] First, a level of 0.0023 gr/dscf does not appear to be an achievable MACT floor level based on available particulate matter emissions data from the AGCC Chanute plant, the cement kiln on whose performance that standard was based. Available performance data for AGCC Chanute include emissions data from 2001–2002 (the basis of the promulgated MACT floor of 0.0023 gr/dscf) and additional emissions data from 2003–2005 submitted by petitioner AGCC during reconsideration proceedings (the basis for identifying another cement plant as the single best performing source in the reconsideration proposed rule that led EPA to propose a MACT floor of 0.0069 gr/dscf). As discussed below, it is our view that these emissions data show that the AGCC Chanute source does not routinely achieve a standard of 0.0023 gr/dscf. In fact, our review of the AGCC Chanute data led us to identify another cement plant as the single best performing source in the March 23, 2006 reconsideration proposed rule.

One commenter to the March 23, 2006 proposed rule stated that the emissions data of AGCC Chanute from 2003–2005 reflect unnecessary bag leakage and ineffective maintenance, and, therefore, the test data submitted during reconsideration proceedings for AGCC Chanute should not be accepted as representative of routine performance. The commenter also states that a standard of 0.0023 gr/dscf would be readily achievable by AGCC Chanute (and other cement kilns) through, among other things, an effective preventative maintenance program that includes the use of bag leak detection systems to identify and correct bag leaks when they first occur.[5] However, the commenter provides no evidence that an ineffective preventative maintenance program is responsible for the variability seen in the additional emissions data from 2003–2005 as compared to the 2001–2002 data. Without a basis to exclude the data, we tentatively believe these additional data must not be excluded from the MACT floor analysis because they reflect the normal variability of the source over time. As discussed in the reconsideration proposed rule, if these data are considered, then AGCC Chanute's performance clearly shows that an emission level of 0.0023 gr/dscf is not an appropriate MACT floor for new cement kilns because it does not fully reflect the source's emission variability (71 FR at 14669). We also tentatively reject the commenter's argument that AGCC Chanute could routinely achieve a MACT floor of 0.0023 gr/dscf if its baghouse (fabric filter) were better maintained by monitoring emissions with a bag leak detection system. The argument suggests that AGCC Chanute could have maintained the performance achieved in 2001–2002 through improved monitoring and a better preventative maintenance program. We disagree that the commenter's argument is even relevant when identifying a MACT floor because whether AGCC Chanute could operate better (achieve lower emissions over time) with different equipment, such as a bag leak detection system, is a beyond-the-floor issue. As the commenter acknowledges, AGCC Chanute is not equipped with a bag leak detection system. For purposes of a MACT floor, we must identify the single best performing source and identify an emission level that reflects "the emission control that is achieved in practice by the best controlled source." Section 112(d)(3). Therefore, a MACT floor of 0.0023 gr/dscf for particulate matter would not be justifiable based on theoretical performance of a differently-equipped AGCC Chanute plant.

Second, a level of 0.0023 gr/dscf does not appear to be an achievable MACT floor level based on available particulate matter emissions data from any other cement kiln source in our emissions data base. As presented in the support document to the reconsideration proposed rule, we are not in possession of any emissions data from a cement kiln achieving this level, accounting for normal performance variability.[6]

Finally, an emissions standard of 0.0023 gr/dscf for particulate matter is not likely an appropriate beyond-the-floor standard for new cement kilns. In

[4] See the notice of proposed rulemaking for a discussion of how we selected representative data for each source so that the single best performing source could be identified and how we calculated the MACT floor levels for particulate matter. 69 FR at 21223–233 (April 20, 2004). The proposed rule also describes how emissions variability was accounted for, including the use of a "universal variability factor" that was used only for the particulate matter standard to address long-term variability in particulate matter emissions of sources using fabric filters. See also 70 FR at 59436–450. In developing MACT standards, we must also consider beyond-the-floor control options that are more stringent than the floor level taking into consideration not only emission performance but also the cost of achieving the emission reductions, any health and environmental impacts, and energy requirements. CAA section 112(d)(2).

[5] See docket item EPA–HQ–OAR–2004–0022–0542.01, page 2.

[6] USEPA, "Draft Technical Support Document for HWC MACT Standards, Reconsideration of the New Source Particulate Matter Standards for Cement Kilns," March 2006, Table 4.

the reconsideration proposal, we evaluated a beyond-the-floor standard of 0.0035 gr/dscf and proposed that such a standard would not be justified.[7] This analysis was based on improved baghouse performance that evaluates improved bag material and a lower gas to cloth ratio. We also reached that conclusion in the final rule whereby we rejected adopting a beyond-the-floor standard of 0.0012 gr/dscf.[8] While we are not able to quantify the costs here (because the MACT floor level has yet to be determined), the previous analyses indicate that a beyond-the-floor standard of 0.0023 gr/dscf is not likely to be warranted. We will, of course, make a final determination as to the appropriateness of a beyond-the-floor standard for new cement kilns during the reconsideration process in the near future.

IV. Good Cause Findings

Section 553(b) of the Administrative Procedure Act (APA) (which applies to this action pursuant to the final sentence of CAA section 307(d)(1)) provides that, when any agency for good cause finds that notice and public procedure are impracticable, unnecessary, or contrary to the public interest, the agency may issue a rule without providing notice and an opportunity for public comment. Similarly, under section 553(d) of the APA, an agency may find that there is good cause to make the rule effective upon publication in the **Federal Register**.

We have determined that there is good cause for making today's amendment final without prior proposal and opportunity for public comment for several reasons. First, this amendment removes potential impediments to significant environmental and energy savings by allowing continued construction of new cement kilns that burn hazardous waste. As noted in the petitions for reconsideration of AGCC and CKRC, at least three companies are in various stages of constructing new, lower emitting and more energy-efficient kilns to replace older cement kilns.[9] Declarations made by representatives of these companies are that the companies could choose not to burn hazardous waste at these kilns and instead comply with the more lenient standards for particulate matter applicable to non-waste burning kilns, should the current particulate matter standard of 0.0023 gr/dscf be included in a permit.[10] Using the AGCC's Foreman plant as an example, we estimate that emissions of particulate matter would increase by approximately 77 tons per year at the Foreman plant should AGCC decide to abandon plans to burn hazardous waste at the new preheater/precalciner kiln.[11] Continental Cement Company and Keystone Cement Company also are planning to construct new cement kilns. If all three companies abandoned plans to build the new lower-emitting cement kilns, then particulate matter emissions would potentially increase by over 200 tons per year.

There also may be environmental detriment if the amendment is not issued because the companies building new cement kilns could experience construction and permitting delays. This detriment would result because the existing higher-emitting and less efficient cement kilns would (assuming delay) continue to operate for a longer period of time (i.e., operation of the new cement kilns replacing the older kilns would be postponed). We estimate that emissions of particulate matter would increase by approximately 60 tons at the Foreman plant should AGCC experience a 1-year delay in initiating operation of their new preheater/precalciner kiln.[12] Delays at Continental Cement Company and Keystone Cement Company would result in annual increases in particulate matter emissions of 27 tons and 30 tons, respectively. Thus, if all three companies experienced a one-year delay in building the new lower-emitting cement kilns, then particulate matter emissions would increase by approximately 117 tons.

We also find that amending the rule's effective date yields substantial energy savings. A typical wet process cement kiln requires approximately 5–6 million Btu of energy to make one ton of clinker product, while the more thermally-efficient preheater/precalciner kilns require 3 million Btu of energy. One wet process cement kiln annually producing 500,000 tons of clinker would consume approximately 105,000 tons of coal (assumes that all energy is derived from coal). However, a more thermally-efficient preheater/precalciner kiln would require 57,000 tons of coal per year, which equates to an annual energy savings of nearly 50,000 tons of coal per kiln as compared to a wet process kiln. Thus, a delay in the start-up of the new kilns or outright abandonment of its construction would result in the increased use of several hundred thousand tons of coal per year.

It is also important to note that while this amendment temporarily relieves newly constructed or reconstructed cement kilns of the obligation to comply with the replacement standard of 0.0023 gr/dscf, there are no cement kilns currently in operation that are subject to the replacement standard. That is, there are no new cement kilns that are currently complying with the replacement standard of 0.0023 gr/dscf for particulate matter, and thus no kilns that will actually emit particulate matter at higher levels. Thus, although the less stringent particulate matter standard that was applicable to new cement kilns prior to the promulgation of the replacement standards will be in effect as a result of today's amendment, this will not lead to an actual increase in particulate matter emissions.

We also note that the issue of the rule's effective date has essentially already been subject to robust public comment through the grant of reconsideration and proposal to amend the rule. Thus, this is not a situation where the public is presented with a final rule without having opportunity to address the issues involved in the action.

Finally, we note that we expect this amendment to be in effect for only a short time. We estimate that the amendment will remain in effect for less than 1-year while the rulemaking to revise the particulate matter standard for new cement kilns is concluded. We intend to take final action on

[7] USEPA, "Draft Technical Support Document for HWC MACT Standards, Reconsideration of the New Source Particulate Matter Standards for Cement Kilns," March 2006, Section 4.1.2.

[8] USEPA, "Technical Support Document for HWC MACT Standards, Volume III: Selection of MACT Standards," September 2005, Section 11.3.4.

[9] For example, AGCC is replacing its three older wet process cement kilns at its Foreman, Arkansas plant with a new preheater/precalciner kiln. See docket item EPA-HQ-OAR–2004–0022–0523, page 3. Information related to plans of Continental Cement Company and Keystone Cement Company to build new cement kilns can be found in docket item EPA–HQ–OAR–2004–0022–0521, Appendices F and G, respectively.

[10] Declarations made by representatives of AGCC, Continental Cement Company, and Keystone Cement Company are available in the docket. See docket item EPA-HQ-OAR–2004–0022–0521, Appendices F, G, and H.

[11] For purposes of this estimate, it was assumed that the new preheater/precalciner kiln would be designed to 0.0034 gr/dscf, which is the design level for the standard that we proposed for new hazardous waste burning cement kilns on March 23, 2006 (71 FR 14665). The particulate matter standard for new cement kilns that do not burn hazardous waste is 0.15 kg/Mg dry feed, which equates to approximately 0.04 gr/dscf, corrected to 7% oxygen, for a preheater/precalciner kiln. Section 63.1343(b)(1).

[12] We estimate emissions of particulate matter from Ash Grove Cement's three wet process kilns at 85 tons per year. See USEPA, "Technical Support Document for HWC MACT Replacement Standards, Volume V: Emissions Estimates and Engineering Costs," September 2005, Appendix C. For purposes of this estimation, we assumed that the new preheater/precalciner kiln would be designed to 0.0034 gr/dscf, which is the design level for the standard that we proposed for new hazardous waste burning cement kilns on March 23, 2006.

reconsideration of the particulate matter standard for new cement kilns as expeditiously as possible. When that work is completed, the kilns currently under construction will be responsible for meeting the standard in the revised rule prior to commencing operation. We do not anticipate that any of those new kilns will ever operate subject to the previous replacement standard.

Given the possibility of environmental detriment, the lack of environmental prejudice, the previous opportunity for public comment on the issues involved, and the likely short duration of this amendment, we find that there is good cause to amend the rule's effective date under 5 U.S.C. 553(b)(B) without prior notice or opportunity to comment. We also find, for the same reasons, that good cause exists under APA section 553(d)(3) to make this amendment effective upon publication in the **Federal Register** rather than 30 days later.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

This action is not a "significant regulatory action" under the terms of Executive Order (EO) 12866 (58 FR 51735, October 4, 1993) and is therefore not subject to review under the EO. Consequently, this action was not submitted to the Office of Management and Budget for review under EO 12866.

B. Paperwork Reduction Act

The information collection requirements in the final rule (70 FR 59402, October 12, 2005) were submitted to and approved by OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and assigned OMB control number 2050–0171. An Information Collection Request (ICR) document was prepared by EPA (ICR No. 1773.08) and a copy may be obtained from Susan Auby by mail at Office of Environmental Information Collection Strategies Division (ME–2822T), 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded from the Internet at *http://www.epa.gov/icr.*

Today's action does not impose an information collection burden under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* Because there is no additional burden on the industry as a result of the final rule amendments, the ICR has not been revised.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's final rule on small entities, small entity is defined as: (1) A small business that is primarily engaged in cement manufacturing as defined by NAIC code 327310 with less than 750 employees (for the entire corporation); (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in the field.

After considering the economic impacts of today's final rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. This final rule will not impose any new, more stringent requirements on new source, small cement manufacturing entities.

D. Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Pub. L. 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or to the private sector in any one year. Furthermore, section 202 does not apply to rules for which EPA invokes an exemption under section 553(b)(1)(B) of the Administrative Procedure Act, as is being done in this action. Thus, today's action is not subject to sections 202 and 205 of the UMRA. EPA has also determined that the final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments. Thus, the final rule amendments are not

subject to the requirements of section 203 of the UMRA no new enforceable duty on any State, local or tribal governments or the private sector.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

This final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. Thus, Executive Order 13132 does not apply to this rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." This final rule does not have tribal implications, as specified in Executive Order 13175. This action contains no requirements that are more stringent than in the October 2005 final rule. Thus, Executive Order 13175 does not apply to this rule.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

"Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under E.O. 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

Today's final rule is not subject to E.O. 13045 because it does not meet either of these criteria. The rule simply amends the effective date of a standard while EPA takes final action on the proposed rule (71 FR 14665 (March 23, 2006)).

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This rule is not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355 (May 22, 2001)) because it is not an economically significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule (69 FR 21198), Section 12(d) of the National Technology Transfer and Advancement Act of 1995 ("NTTAA"), Pub. L. 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards. This action does not involve technical standards. Therefore, EPA did not consider the use of any voluntary consensus standards.

J. Congressional Review

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. Section 808 allows the issuing agency to make a rule effective sooner than otherwise provided by the CRA if the agency makes a good cause finding that notice and public procedure is impracticable, unnecessary or contrary to the public interest. This determination must be supported by a brief statement. 5 U.S.C. 808(2). As discussed in Section IV above, EPA has made such a good cause finding, including the reasons therefore, and established an effective date of October 25, 2006. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subject in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: October 19, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 63—NATIONAL EMISSIONS STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

■ 2. Section 63.1206 is amended by revising paragraph (a)(1)(ii)(B)(*1*) and adding new paragraph (a)(1)(ii)(B)(*3*) to read as follows:

§ 63.1206 When and how must you comply with the standards and operating requirements?

(a) * * *

(1) * * *

(ii) * * *

(B) * * * (*1*) If you commenced construction or reconstruction of your hazardous waste combustor after April 20, 2004, you must comply with the new source emission standards under §§ 63.1219, 63.1220, and 63.1221 and the other requirements of this subpart by the later of October 12, 2005 or the date the source starts operations, except as provided by paragraphs (a)(1)(ii)(B)(*2*) and (a)(1)(ii)(B)(*3*) of this section. The costs of retrofitting and replacement of equipment that is installed specifically to comply with this subpart, between April 20, 2004, and a source's compliance date, are not considered to be reconstruction costs.

* * * * *

(3) *Temporary particulate matter standard under § 63.1220 for new*

cement kilns. You are not required to comply with the particulate matter standard specified under § 63.1220(b)(7)(i) until EPA takes final action with regard to the particulate matter standard pursuant to reconsideration proceedings. If you start up a new or reconstructed hazardous waste burning cement kiln as defined by this subpart, you must not emit particulate matter in excess of 0.15 kg/Mg dry feed, as determined according to the requirements under § 63.1204(b)(7)(i) through (iii).

* * * * *

■ 3. Section 63.1220 is amended by revising paragraph (b)(7)(i) to read as follows:

§ 63.1220 What are the replacement standards for hazardous waste burning cement kilns?

* * * * *

(b) * * *

(7) * * *

(i) Except as provided by § 63.1206(a)(1)(ii)(B)(*3*) and paragraph (b)(7)(iii) of this section, particulate matter emissions in excess of 0.0023 gr/dscf corrected to 7 percent oxygen.

* * * * *

[Docket No. OST–2005–22602]

RIN 2105–AD46

Debarment and Suspension (Nonprocurement) Requirements

AGENCY: Office of the Secretary (OST), DOT.

ACTION: Final rule.

SUMMARY: This rule amends the Department of Transportation's regulations implementing the governmentwide nonprocurement debarment and suspension requirements. Specifically, this rule adopts the optional lower tier coverage prohibiting excluded persons from participating in subcontracts at tiers lower than the first tier below a covered nonprocurement transaction.

DATES: *Effective Date:* This final rule is in effect November 24, 2006.

FOR FURTHER INFORMATION CONTACT: Ellen Shields, Office of the Senior Procurement Executive, Office of Administration (M–61), (202) 366–4268, 400 Seventh Street, SW., Washington, DC 20590–0001. Office hours are from 7:45 a.m. to 4:15 p.m. e.t., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Electronic Access

You may retrieve previously filed comments online through the Document Management System (DMS) at *http://dmses.dot.gov.* The DMS is available 24 hours each day, 365 days each year. Electronic retrieval help and guidelines are available under the help section of the Web site. An electronic copy of this document may be downloaded by using a computer, modem and suitable communications software from the Government Printing Office's Electronic Bulletin Board Service at (202) 512–1661. Internet users may also reach the Office of the Federal Register's home page at *http://www.nara.gov/fedreg* and the Government Printing Office's Web page at: *http://www.access.gpo.gov/nara.*

Background

On November 26, 2003, the Department of Transportation (DOT), along with twenty-nine other agencies, published its final rule implementing changes to the governmentwide debarment and suspension common rule (68 FR 66533). These regulations were intended to resolve unnecessary technical differences between the procurement and nonprocurement systems, revise the existing governmentwide debarment and suspension regulations in a plain language style and format, and make other improvements consistent with the purpose of the debarment and suspension system. One of the changes made to the regulations included limiting the mandatory down-tier application of an exclusion to only the first procurement level. Under the previous governmentwide regulations, all executive agencies applied suspensions and debarments to all procurement levels. However, in the revised governmentwide regulations, each agency was given the option of applying an exclusion to levels below the first procurement level. This final rule adopts the optional lower tier coverage to make the debarment and suspension regulations applicable to levels below the first procurement level. Many of the DOT programs involve billions of dollars in grants that are obligated to construction projects by States, localities and other recipients. For instance, on August 10, 2005, the President signed into law the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU), Public Law 109–59. This Act authorizes funding for highways, highway safety, and public transportation totaling $244.1 billion over five years (2005–2009) and is the largest surface transportation investment in our Nation's history. Of this $244.1 billion, a substantial portion of these funds will be used by States and other grantees to procure construction contracts. These construction contracts could involve multiple subcontracts that would be vulnerable to misconduct and poor performance if suspended or debarred contractors are allowed to participate in these transactions.

Discussion of Comments

On October 5, 2005, the Office of the Secretary (OST) in the DOT published a notice of proposed rulemaking (NRPM) and requested comment on whether the DOT should adopt the lower tier coverage. In response to the NPRM, OST received two comments. These comments were submitted by the American Road and Transportation Builders Association (ARTBA) and the Wisconsin Department of Transportation (WisDOT).

ARTBA commented that the transportation construction industry has a well-deserved reputation of being comprised of highly ethical firms. However, despite this reputation, some firms betray the integrity of the whole. In these situations, ARTBA acknowledged that suspension or debarment may be appropriate. Additionally, ARTBA commented on the importance of maintaining the contractor's due process rights. ARTBA stated that the basis of due process is that everyone is deemed innocent until proven guilty and that due process is not served if contractors are suspended or debarred before being afforded an opportunity to be heard. ARTBA noted that debarment and suspension cannot be taken lightly because of the interruption in the firm's ability to work and, as such, the DOT needs to ensure that the debarment and suspension process is fair.

The DOT agrees with ARTBA that the transportation construction industry does indeed have a well-deserved reputation of being comprised of highly ethical firms. However, as ARTBA acknowledges, there are some firms within the industry that betray this reputation. The participation of these irresponsible firms and individuals in the transportation program could result in millions of dollars being wasted due to fraud. These are funds that could be used on construct more transportation projects. Also, the DOT agrees with

ENVIRONMENTAL PROTECTION AGENCY

[EPA–HQ–OAR–2003–0178; FRL–8227–5]

RIN 2060–AM72

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates amendments to the national emission standards for hazardous air pollutants for miscellaneous coating manufacturing. The amendments clarify that coating manufacturing means the production of coatings using operations such as mixing and blending, not reaction or separation processes used in chemical manufacturing. The amendments extend the compliance date for certain coating manufacturing equipment that is also part of a chemical manufacturing process unit. The amendments also clarify that operations by end users that modify a purchased coating prior to application at the purchasing facility are exempt. These changes clarify applicability of the rule and minimize the compliance burden.

EFFECTIVE DATE: October 4, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2003–0178. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air and Radiation Docket, Docket ID No. EPA–HQ–OAR–2003–0178, EPA/DC, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

Note: The EPA Docket Center suffered damage due to flooding during the last week of June 2006. The Docket Center is continuing to operate. However, during the cleanup, there will be temporary changes to Docket Center telephone numbers, addresses, and hours of operation for people who wish to visit the Public Reading Room to view documents. Consult EPA's **Federal Register** notice at 71 FR 38147 (July 5, 2006) or the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* for current information on docket status, locations, and telephone numbers.

FOR FURTHER INFORMATION CONTACT: Mr. Randy McDonald, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), U.S. EPA, Research Triangle Park, NC 27711; telephone number: (919) 541–5402; fax number: (919) 541–0246; e-mail address: *mcdonald.randy@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The regulated category and entities affected by this action include:

Category	NAICS Code*	Examples of regulated entities
Industry ..	3255, 3259	Manufacturers of paints, coatings, adhesives, or inks.

*North American Industry Classification System

This table is not intended to be exhaustive, but rather provides a guide for readers likely to be interested in the revisions to the rule affected by this action. To determine whether your facility, company, business, organization, etc., is regulated by this action, you should carefully examine all of the applicability criteria in 40 CFR 63.7985 of subpart HHHHH (national emission standards for hazardous air pollutants (NESHAP) for miscellaneous coating manufacturing), as well as in today's amendment to the definitions section. If you have questions regarding the applicability of the amendments to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13 of subpart A (General Provisions).

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of the final action will also be available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of the final action will be posted on the TTN policy and guidance page for newly proposed or promulgated rules at *www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final amendments is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by December 4, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the final amendments that was raised with reasonable specificity during the period for public comment may be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final amendments may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Organization of this Document. The information presented in this preamble is organized as follows:

I. Background
II. Response to Comments
  A. Compliance Date
  B. Affiliated Operations
III. Statutory and Executive Order Reviews
  A. Executive Order 12866: Regulatory Planning and Review
  B. Paperwork Reduction Act
  C. Regulatory Flexibility Act
  D. Unfunded Mandates Reform Act
  E. Executive Order 13132: Federalism
  F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

On December 11, 2003, we promulgated NESHAP for miscellaneous coating manufacturing as subpart HHHHH of 40 CFR part 63 (68 FR 69164). Subpart HHHHH applies to the facilitywide collection of equipment used to manufacture coatings. On May 17, 2006 (71 FR 28639), we proposed amendments to the: (1) Definition of the term "coating," (2) compliance date for shared equipment that is part of a process unit group (PUG) developed under the miscellaneous organic chemical manufacturing NESHAP (MON) (40 CFR part 63, subpart FFFF), and (3) exemptions for operations by end users that are related to the application of a pre-manufactured coating.

All equipment that is used to manufacture coatings is subject to 40 CFR part 63, subpart HHHHH. Because the definition of coating at 40 CFR 63.8105 in subpart HHHHH does not specify that coatings are produced only by blending, mixing, diluting, and related formulation operations without chemical synthesis or separation, some products of synthetic organic chemical manufacturing could be considered coatings. This overly broad definition of "coating" expands the applicability of 40 CFR part 63, subpart HHHHH to equipment intended to by covered by 40 CFR part 63, subpart FFFF. The proposed amendments to the definition of coating clarify that products of reaction and separation, such as polymers, resins, and synthetic organic chemicals are not coatings and are not covered by the final rule. In addition, the proposed amendments to the definition of coating clarify that 40 CFR part 63, subpart HHHHH also does not apply to the production of formulation components by chemical synthesis or separation activity if those components are not stored prior to formulation. We proposed these revisions so that the applicability of the final rule accurately and appropriately reflects the coating manufacturing industry and the basis for the maximum achievable control technology (MACT) floor.

The recent extension of the compliance date for 40 CFR part 63, subpart FFFF (see 71 FR 10439, March 1, 2006) raises a timing issue with respect to 40 CFR part 63, subpart FFFF and 40 CFR part 63, subpart HHHHH overlap. The extension for the compliance date for 40 CFR part 63, subpart FFFF results in the compliance date for 40 CFR part 63, subpart HHHHH occurring before the MON compliance date, thus creating a problem for plants with equipment subject to both subparts FFFF and HHHHH of 40 CFR part 63 who opt to develop a PUG. Because we have extended the compliance date for 40 CFR part 63, subpart FFFF, a source that primarily manufactures organic chemicals, but also produces a coating product in the same equipment, would not be able to comply with subparts FFFF and HHHHH of 40 CFR part 63 as EPA intended during the period between the compliance date for 40 CFR part 63, subpart HHHHH (December 11, 2006) and 40 CFR part 63, subpart FFFF (May 10, 2008). Due to the significant amendments to 40 CFR part 63, subpart FFFF, it is unlikely that sources will be able to comply with the revised 40 CFR part 63, subpart FFFF by the compliance date for 40 CFR part 63, subpart HHHHH. Alternatively, if the source was planning to comply with subpart HHHHH by referencing 40 CFR 63.2535(l)(3)(i), it is also unlikely the source would have enough time to design and install interim controls for the coating operations so as to comply with 40 CFR part 63, subpart HHHHH between December 11, 2006 and May 10, 2008. Thus, relying on the presumption that equipment should be regulated according to the standard that effectively applies for a majority of products produced, we proposed amending the final rule to reference 40 CFR part 63, subpart FFFF requirements for a PUG which produces primarily 40 CFR part 63, subpart FFFF products. The proposed amendments also clarify that if the source so chooses, equipment that is part of a PUG in which a MON product is the primary product must comply with the MON by the MON compliance date, not 40 CFR part 63, subpart HHHHH by the subpart HHHHH compliance date.

In section IV.A of the preamble to the final rule, we stated "the final rule does not apply to activities conducted by end users of coating products in preparation for application" (68 FR 69164, December 11, 2003). Although the final rule exempts "affiliated operations" at sources that are subject to surface coating rules, it does not specifically exempt operations at sources that are not subject to another subpart of 40 CFR part 63. Therefore, we proposed adding an exemption in 40 CFR 63.7985(d)(5) for operations by end users who modify a purchased coating prior to application at the same facility. This exemption applies only if the purchased product is already a coating that an end user could apply as purchased, and the modified coating must be applied at the same facility where the modification is conducted.

Two trade associations and three coatings manufacturing companies provided comments on the proposed amendments to the rule. In general, the commenters supported the proposed changes. One commenter also requested changes to the compliance date and the exemption for affiliated operations at sources that are subject to surface coating MACT rules. After consideration of the comments, we are promulgating the amendments as proposed.

II. Response to Comments

A. Compliance Date

Comment: One commenter supported the amendment to clarify the definition of "coating" but also expressed concern that this change could have unanticipated impacts that would make it difficult to achieve compliance by December 11, 2006. According to the commenter, the change is a major modification of the rule because it could affect applicability determinations for some facilities. For example, the commenter suggested the possibility that some facilities currently thinking they are subject to the MON may realize that they have to comply with the Miscellaneous Coating Manufacturing NESHAP. To ensure that facilities have time to review the amendments and make appropriate changes to their compliance plans, the commenter requested that the compliance date for all existing sources under 40 CFR part 63, subpart HHHHH be extended to May 10, 2008.

Response: As noted in the preamble to the proposed amendments, concerns with the definition of "coating" in the final rule were that it was too expansive. It included all materials that are intended to be applied to a substrate, regardless of the production process. The amended definition narrows the scope of the definition, which may reduce the number of operations that are subject to the MON. Any operations that are excluded from the amended Miscellaneous Coating Manufacturing NESHAP will be subject to the MON. Facilities with such operations will have until May 10, 2008, to comply with the Miscellaneous Organic Chemical Manufacturing NESHAP. We are unaware of any materials that are coatings under the amended definition

that would not have been coatings under the definition in the final rule. Thus, we have determined that there is no need to extend the compliance date for existing sources that are subject to the Miscellaneous Coating Manufacturing NESHAP, except for operations that are part of a PUG under the MON as discussed in section I of this preamble.

B. Affiliated Operations

Comment: One commenter supports our position, as stated in the preamble to the proposed amendments, that 40 CFR part 63, subpart HHHHH does not apply to activities conducted by end users of coating products in preparation for application. According to the commenter, these activities cannot be regulated under 40 CFR part 63, subpart HHHHH because they are not coating manufacturing operations and were not part of the MACT analysis for 40 CFR part 63, subpart HHHHH. For the rule to be consistent with this position, the commenter believes 40 CFR 63.7985(d)(2) should exempt "affiliated operations" at all surface coating facilities, not just those at sources that are subject to the surface coating rules in subparts GG, KK, JJJJ, MMMM, and SSSS of 40 CFR part 63. The commenter suggested listing each surface coating category in 40 CFR 63.7985(d)(2).

Response: We decided not to adopt the changes suggested by the commenter. Listing all surface coating categories in 40 CFR 63.7985(d)(2) is unnecessary and impractical. There are three categories of end users to consider: Sources that are subject to 40 CFR part 63 surface coating rules that do not include "affiliated operations" in the affected source, sources that are subject to 40 CFR part 63 surface coating rules that do include "affiliated operations" in the affected source, and sources that are not subject to a 40 CFR part 63 surface coating rule. Operations at end user facilities in two categories are exempted by existing provisions in the rule, and operations at end user facilities in the third category are exempted by the proposed amendments.

First, as the commenter noted, explicit exemptions for affiliated operations, as defined in 40 CFR 63.7985(d)(2), apply to affiliated operations that are located at affected sources under subparts GG, KK, JJJJ, MMMM, and SSSS of 40 CFR part 63. All of these rules lack requirements for affiliated operations, but affiliated operations were considered during development of the rules. Therefore, an exemption was needed in the Miscellaneous Coating Manufacturing NESHAP to avoid a conflict between the decisions made in the development of the five surface coating rules and the applicability of 40 CFR part 63, subpart HHHHH.

Facilities in the second group of end users are also subject to surface coating rules, but the affiliated operations at these facilities are part of the affected sources under the applicable surface coating rule. These affiliated operations are exempt from 40 CFR part 63, subpart HHHHH by 40 CFR 63.7985(a)(4), which specifies that operations are miscellaneous coating manufacturing operations and subject to 40 CFR part 63, subpart HHHHH only if they are not part of an affected source under another subpart of 40 CFR part 63. Therefore, exempting these source categories by listing them in 40 CFR 63.7985(d)(2) would be redundant.

The third group of end users includes all facilities that are not part of a source category that is subject to a surface coating NESHAP. Listing all of these surface coating categories in 40 CFR 63.7985(d)(2) would be impractical because there is no way of knowing all possible categories. Therefore, the proposed exemption in new paragraph (d)(5) of 40 CFR 63.7985 provides a general exemption for all facilities in this group. This new provision exempts operations that modify a purchased coating prior to application at the purchasing facility. Therefore, we have decided to promulgate this proposed amendment without changes.

III. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

This action is not a "significant regulatory action" under the terms of Executive Order 12866 (58 FR 51735, October 4, 1993) and is therefore not subject to review under the Executive Order.

B. Paperwork Reduction Act

The final rule amendments impose no new information collection requirements on the industry. The final rule amendments clarify applicability of the final rule and extend the compliance date for owners and operators of certain coating manufacturing equipment. These changes have the potential to result in minor reductions in the information collection burden. Therefore, the Information Collection Request (ICR) has not been revised.

The Office of Management and Budget (OMB) has previously approved the information collection requirements contained in the existing regulations (40 CFR part 63, subpart HHHHH) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0535 (EPA ICR number 2115.01). A copy of the OMB approved ICR may be obtained from Susan Auby, by mail at the Office of Environmental Information, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. Include the ICR or OMB number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule amendments.

For purposes of assessing the impacts of the final rule amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administrations' regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; or (3) a small organization that is any not-for-profit enterprise that is independently owned and operated and is not dominant in its field.

For sources subject to the final rule amendments, the relevant NAICS and associated employee sizes are listed below:

NAICS 32551—Paint and Coatings Manufacturing—500 employees or fewer.
NAICS 32552—Adhesives and Sealants Manufacturing—500 employees or fewer.
NAICS 32591—Printing Ink Manufacturing—500 employees or fewer.

After considering the economic impacts of the final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the proposed rule on small entities." 5 U.S.C. 603 and 604. Thus, an agency may conclude that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule. The final rule amendments clarify applicability of the final rule and extend the compliance date for owners and operators of certain coating manufacturing equipment. These changes have the potential to result in minor burden reductions for small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act (UMRA) of 1995, Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. Therefore, the final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA. In addition, the final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments because they contain no requirements that apply to such governments or impose obligations upon them. Therefore, the final rule amendments are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State or local governments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175. The final rule amendments clarify applicability of the rule and extend the compliance date for owners and operators of certain coating manufacturing equipment. Therefore, the final rule amendments will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. Thus, Executive Order 13175 does not apply to the final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule amendments are not subject to the Executive Order because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule amendments do not constitute a "significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because they are not likely to have a significant adverse effect on the supply, distribution, or use of energy. The final rule amendments clarify applicability of the rule and extend the compliance date for owners and operators of certain coating manufacturing equipment. Further, we have concluded that the final rule amendments are not likely to have any adverse energy effects.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, section 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

During the rulemaking, the EPA conducted searches to identify VCS in addition to EPA test methods referenced by the final rule. The search and review results have been documented and placed in the docket for the NESHAP (Docket ID No. EPA–HQ–OAR–2003–0178). The final rule amendments do not require the use of any additional technical standards beyond those cited in the final rule. Therefore, EPA is not considering the use of any additional VCS for the final rule amendments.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule amendments are effective on October 4, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: September 28, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart HHHHH—[Amended]

■ 2. Section 63.7985 is amended by revising paragraph (d) introductory text and adding paragraph (d)(5) to read as follows:

§ 63.7985 Am I subject to the requirements of this subpart?

* * * * *

(d) The requirements for miscellaneous coating manufacturing sources in this subpart do not apply to operations described in paragraphs (d)(1) through (5) of this section.

* * * * *

(5) Modifying a purchased coating in preparation for application at the purchasing facility.

■ 3. Section 63.7995 is amended by adding introductory text to read as follows:

§ 63.7995 When do I have to comply with this subpart?

Except as specified in § 63.8090, you must comply with this subpart according to the requirements of this section.

* * * * *

■ 4. Section 63.8090 is amended by adding paragraph (c) to read as follows:

§ 63.8090 What compliance options do I have if part of my plant is subject to both this subpart and another subpart?

* * * * *

(c) *Compliance with 40 CFR part 63, subpart FFFF.*

After the compliance dates specified in § 63.7995, an affected source under this subpart HHHHH that includes equipment that is also part of an affected source under 40 CFR part 63, subpart FFFF is deemed in compliance with this subpart HHHHH if all of the conditions specified in paragraphs (c)(1) through (5) of this section are met.

(1) Equipment used for both miscellaneous coating manufacturing operations and as part of a miscellaneous organic chemical manufacturing process unit (MCPU), as defined in § 63.2435, must be part of a process unit group developed in accordance with the provisions in § 63.2535(l).

(2) For the purposes of complying with § 63.2535(l), a miscellaneous coating manufacturing "process unit" consists of all coating manufacturing equipment that is also part of an MCPU in the process unit group. All miscellaneous coating manufacturing operations that are not part of a process unit group must comply with the requirements of this subpart HHHHH.

(3) The primary product for a process unit group that includes miscellaneous coating manufacturing equipment must be organic chemicals as described in § 63.2435(b)(1).

(4) The process unit group must be in compliance with the requirements in 40 CFR part 63, subpart FFFF as specified in § 63.2535(l)(3)(i) no later than the applicable compliance dates specified in § 63.2445.

(5) You must include in the notification of compliance status report required in § 63.8070(d) the records as specified in § 63.2535(l)(1) through (3).

5. Section 63.8105 is amended by revising the definition of the term "coating" in paragraph (g) to read as follows:

§ 63.8105 What definitions apply to this subpart?

* * * * *

(g) * * *

Coating means a material such as paint, ink, or adhesive that is intended to be applied to a substrate and consists of a mixture of resins, pigments, solvents, and/or other additives, where the material is produced by a manufacturing operation where materials are blended, mixed, diluted, or otherwise formulated. Coating does not include materials made in processes where a formulation component is synthesized by chemical reaction or separation activity and then transferred to another vessel where it is formulated to produce a material used as a coating,

where the synthesized or separated component is not stored prior to formulation. Typically, coatings include products described by the following North American Industry Classification System (NAICS) codes, code 325510, Paint and Coating Manufacturing, code 325520, Adhesive and Sealant Manufacturing, and code 325910, Ink Manufacturing.

RIN 2060–AN29

Protection of Stratospheric Ozone: Allocation of Essential Use Allowances for Calendar Year 2006

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: With this action, EPA is allocating essential use allowances for import and production of class I stratospheric ozone depleting substances (ODSs) for calendar year 2006. Essential use allowances enable a person to obtain controlled class I ODSs as part of an exemption from the regulatory ban on the production and import of these chemicals that became effective as of January 1, 1996. EPA allocates essential use allowances for exempted production or import of a specific quantity of class I ODSs solely for the designated essential purpose. The allocations in this action total 1,002.40 metric tons (MT) of chlorofluorocarbons (CFCs) for use in metered dose inhalers for 2006.

DATES: *Effective Date:* This final rule is effective October 4, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA-HQ-OAR-2006–0158. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. This Docket facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Kirsten Cappel of the Office of Air and Radiation, Stratospheric Protection Division by regular mail at the Environmental Protection Agency, 1200 Pennsylvania Avenue NW., (6205J) Washington DC 20460; telephone number: 202–343–9556; fax number: 202–343–2338; e-mail address: *cappel.kirsten@epa.gov.*

I. Basis for Allocating Essential Use Allowances

A. What are essential use allowances?

Essential use allowances are allowances to produce or import certain ozone-depleting substances (ODSs) in the U.S. for purposes that have been deemed "essential" by the U.S. Government and by the Parties to the Montreal Protocol on Substances that Deplete the Ozone Layer (Montreal Protocol).

The Montreal Protocol is an international agreement aimed at reducing and eliminating the production and consumption [1] of ODSs. The elimination of production and consumption of class I ODSs is accomplished through adherence to phaseout schedules for specific class I ODSs,[2] which include chlorofluorocarbons (CFCs), halons, carbon tetrachloride, and methyl chloroform. As of January 1, 1996, production and import of most class I ODSs were phased out in developed countries, including the United States.

However, the Montreal Protocol and the Clean Air Act provide exemptions that allow for the continued import and/or production of class I ODSs for specific uses. Under the Montreal Protocol, exemptions may be granted for uses that are determined by the Parties to be "essential." Decision IV/25, taken by the Parties to the Protocol in 1992, established criteria for determining whether a specific use should be approved as essential, and set forth the international process for making determinations of essentiality. The criteria for an essential use, as set forth in paragraph 1 of Decision IV/25, are the following:

"(a) That a use of a controlled substance should qualify as 'essential' only if:

(i) It is necessary for the health, safety or is critical for the functioning of society (encompassing cultural and intellectual aspects); and

(ii) There are no available technically and economically feasible alternatives or substitutes that are acceptable from the standpoint of environment and health;

(b) That production and consumption, if any, of a controlled substance for essential uses should be permitted only if:

(i) All economically feasible steps have been taken to minimize the essential use and any associated emission of the controlled substance; and

(ii) The controlled substance is not available in sufficient quantity and quality

[1] "Consumption" is defined as the amount of a substance produced in the United States, plus the amount imported into the United States, minus the amount exported to Parties to the Montreal Protocol (see section 601(6) of the Clean Air Act).

[2] Class I ozone depleting substances are listed at 40 CFR part 82 subpart A, appendix A.

Corrections

Federal Register

Vol. 71, No. 183

Thursday, September 21, 2006

This section of the FEDERAL REGISTER contains editorial corrections of previously published Presidential, Rule, Proposed Rule, and Notice documents. These corrections are prepared by the Office of the Federal Register. Agency prepared corrections are issued as signed documents and appear in the appropriate document categories elsewhere in the issue.

[EPA–HQ–OAR–2003–0138; FRL–8202–4]

RIN 2060–AM77

National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendments; notice of final action on reconsideration.

SUMMARY: EPA is promulgating amendments to the national emission standards for hazardous air pollutants for organic liquids distribution (non-gasoline) (OLD NESHAP), which EPA promulgated on February 3, 2004. After promulgation of the final OLD NESHAP, the Administrator received petitions for administrative reconsideration of the promulgated rule, and several petitions for judicial review of the final rule were filed in the United States Court of Appeals for the District of Columbia Circuit. On November 14, 2005, pursuant to a settlement agreement between some of the parties to the litigation, EPA published a notice of proposed amendments to address some of the concerns raised in the petitions and requested comments on the proposed amendments. In this action, EPA is promulgating those amendments, adding additional vapor balancing options, and making technical corrections to the final rule.

DATES: The final rule amendments are effective on July 28, 2006. The incorporation by reference of certain publications listed in the final rule is approved by the Director of the Federal Register as of July 28, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2003–0138. All documents in the docket are listed either on the *www.regulations.gov* Web site or in the legacy docket, A–98–13. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA/DC, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

At this time, the EPA/DC's Public Reading Room is closed until further notice due to flooding. Fax numbers for Docket offices in the EPA/DC are temporarily unavailable. EPA visitors are required to show photographic identification and sign the EPA visitor log. After processing through the X-ray and magnetometer machines, visitors will be given an EPA/DC badge that must be visible at all times.

Informational updates will be provided via the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* as they are available.

FOR FURTHER INFORMATION CONTACT: Ms. Brenda Shine, U.S. EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), Research Triangle Park, NC 27711; telephone number: (919) 541–3608; fax number: (919) 541–0246; e-mail address: *shine.brenda@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS* code	Examples of regulated entities
Industry	325211 325192 325188 32411 49311 49319 48611 42269 42271	Operations at major sources that transfer organic liquids into or out of the plant site, including: Liquid storage terminals, crude oil pipeline stations, petroleum refineries, chemical manufacturing facilities, and other manufacturing facilities with collocated OLD operations.
Federal Government		Federal agency facilities that operate any of the types of entities listed under the "industry" category in this table.

*North American Industry Classification System/Considered to be the primary industrial codes for the plant sites with OLD operations.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in 40 CFR part 63, subpart EEEE. If you have any questions regarding the applicability of this action to a particular entity, consult the individual described in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule is also available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of the final rule will be posted on the TTN policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule amendments to the OLD NESHAP is available by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by September 26, 2006. Only those objections that were raised with reasonably specificity during the period for public comment may be raised during judicial review. Under section 307(b)(2) of the CAA, the requirements that are the subject of the final rule amendments may not be challenged later in civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "[o]nly an objection to a rule or procedure which was raised with reasonable specificity

during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Organization of this document: The information presented in this preamble is organized as follows:

I. What Is the Statutory Authority for the Final Rule?
II. Background
III. What Revisions Were Made as a Result of Comments Received on the Proposed Amendments?
IV. What Are the Responses to Significant Comments?
A. Compliance Date Extension for All Storage Tanks
B. Vapor Balancing
C. Recordkeeping and Reporting for Emissions Sources That Do Not Require Control
D. Technical Corrections
V. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. What Is the Statutory Authority for the Final Rule?

Section 112 of the CAA requires EPA to list categories and subcategories of major sources and area sources of hazardous air pollutants (HAP) and to establish NESHAP for the listed source categories and subcategories. OLD was listed on July 16, 1992 (57 FR 31576). Major sources of HAP are those that have the potential to emit at least 10 tons per year (tpy) of any one HAP or 25 tpy of any combination of HAP.

II. Background

On February 3, 2004 (69 FR 5063), EPA promulgated the OLD NESHAP (40 CFR part 63, subpart EEEE) pursuant to section 112 of the CAA. In response to several petitions for administrative reconsideration of the OLD NESHAP and several petitions for judicial review filed with the United States Court of Appeals for the District of Columbia Circuit and pursuant to a settlement agreement between some of the parties to the litigation, EPA proposed amendments (November 14, 2005, 70 FR 69210) to subpart EEEE. EPA received comments from four entities. The final notice presents EPA's responses to those comments and promulgates amendments to subpart EEEE in response to the petitions and public comments.

As noted in the November 14, 2005, **Federal Register** notice, EPA will be taking separate action to address an administrative petition for reconsideration and a petition for judicial review concerning wastewater sources that were not addressed in the settlement agreement that gave rise to the November 14, 2005, proposal.

III. What Revisions Were Made as a Result of Comments Received on the Proposed Amendments?

Based on consideration of the comments received on the proposed amendments, EPA is revising the OLD rule provisions addressing vapor balancing for transfer racks by providing an additional, equivalent control option that allows routing of displaced HAP vapors to a storage tank with a common header. In addition, EPA is adding an option to allow vapor balancing back to the transport vehicle for storage tanks when they are being filled with organic liquids. EPA is withdrawing the proposed amendment that would have allowed vapor balancing transfer rack emissions to a process unit because this option is already available through other language. EPA is making additional changes, which are either technical corrections or clarifications.

IV. What Are the Responses to Significant Comments?

EPA received four public comment letters on the proposed amendments. Most of the comments from three of the commenters were supportive of the proposed amendments, and EPA thanks the commenters for that support. The following summarizes the comments that sought changes to the proposed amendments and EPA's response to those comments.

A. Compliance Date Extension for All Storage Tanks

Comment: One commenter noted that 40 CFR 63.2342(b)(2) allows owners and operators of storage tanks with floating roofs up to 10 years or after the next degassing and cleaning activities to comply with the regulations for such storage tanks. The commenter requested that this compliance provision be extended to all storage tanks, because, in their opinion, the emissions produced by emptying and degassing a tank in order to perform the required alterations would exceed the cumulative reduction in emissions occurring in the years following alteration of the tank.

Response: EPA notes that this comment does not pertain to the proposed amendments to subpart EEEE in the November 14, 2005, **Federal Register** notice. Nevertheless, EPA is responding to this request because it is important to clarify this issue. This provision (40 CFR 63.2342(b)(2)) is only applicable to storage tanks with floating roofs and is not applicable to other types of storage tanks (i.e., fixed roof storage tanks). The compliance date provisions for floating roof tanks are consistent with similar rules such as the Hazardous Organic NESHAP (HON). The rationale for allowing extended compliance time for floating roof tanks (up to 10 years) that must upgrade fittings to comply with this rule was that the incremental reductions associated with upgrading controls generally would not exceed the emissions generated as a result of emptying and degassing. However, this is not the case for fixed roof tanks that are essentially uncontrolled. Further, the commenter did not provide substantive information regarding emission potentials and offsetting cleaning and degassing emission potentials for fixed roof tanks. Thus, the technical basis for the compliance date provision is only applicable to storage tanks with floating roofs and not to storage tanks with fixed roofs. Therefore, EPA is not changing this provision as requested by the commenter.

B. Vapor Balancing

Comment: Two commenters requested that 40 CFR 63.2346(b)(3)(i) and (ii) be revised to allow organic HAP vapors

displaced during loading to be vented to another storage tank connected by common header in addition to the tank from which the organic HAP vapor originated or to a process unit, as currently allowed. The commenters stated that this would afford the same flexibility afforded in the HON and the Miscellaneous Organic NESHAP.

Response: EPA agrees that the alternative proposed by the commenters is both appropriate and applicable to the OLD source category. The option provides owners and operators flexibility in meeting the requirements of 40 CFR part 63, subpart EEEE, without sacrificing the level of emission reductions being achieved. Further, making this change would provide consistency between similar emission sources being controlled under similar rules. Therefore, EPA has revised the rule to incorporate this option for vapor balancing for transfer racks.

In addition, other rules (e.g., see 40 CFR 63.119(g) of the HON) allow an owner or operator to route emissions from the filing of storage tanks back to the transport vehicle from which the organic liquid originates. EPA has determined that, like vapor balancing through a common header, the inclusion of this vapor balancing option for storage tanks when they are being filled provides both consistency between the OLD rule and other similar subparts and flexibility to owners and operators without sacrificing emission reduction. Further, because some of the transport vehicles to which vapors are returned are refilled offsite, EPA has included requirements for such offsite facilities. Therefore, EPA has added this provision, along with the necessary requirements for initial and continuous compliance and for keeping records.

Finally, EPA is withdrawing the proposed amendment that would have allowed vapor balancing transfer rack emissions back to a process unit. In the final rule, transfer racks may be routed back to a process (see 40 CFR 63.2346(b)(2)). As part of the proposed amendments (see 40 CFR 63.2346(b)(3)(i) and 40 CFR 63.2346(b)(3)(ii)), vapor balancing these emissions back to a process unit was proposed. Upon further consideration, both options essentially describe one single practice, and therefore, EPA recognizes that it is not necessary for the final rule to contain both options; that 40 CFR 63.2346(b)(2) of the final rule is sufficient. Therefore, EPA is withdrawing the proposed vapor balancing of transfer racks back to a process unit. No changes have been made concerning the use of vapor balancing transfer rack emissions back to the storage tank from which the liquid originated.

We also would like to address the provisions of 40 CFR 63.2378(d), which allow emissions bypasses of fuel gas systems or the process for up to 240 hours per year. These provisions allow bypassing that is necessary for valid safety or operational reasons but are only applicable if emissions are routinely physically vented to fuel gas systems or the process. This means that the owner or operator can not use the language of 40 CFR 63.2378(d) to exempt a transfer rack that is used for less than 240 hours per year from control requirements.

C. Recordkeeping and Reporting for Emissions Sources That Do Not Require Control

Comment: One commenter requested that the recordkeeping requirements proposed in 40 CFR 63.2343(a) for tanks under 5,000 gallons capacity and for transfer racks that only unload organic liquids be eliminated in their entirety. The commenter stated that such recordkeeping and reporting requirements for these sources impose unnecessary administrative requirements on facilities. The commenter fails to see the benefit in keeping records for tanks that physically cannot change in size or for unloading racks that only unload certain materials.

Response: Addressing storage tanks first, EPA points out that owners and operators of facilities subject to 40 CFR part 63, subpart EEEE will have to make a determination as to which storage tanks are storing organic liquids subject to subpart EEEE and which are not. If a storage tank is storing an organic liquid subject to subpart EEEE, the tank is subject to subpart EEEE. For storage tanks subject to subpart EEEE, the owner or operator would then identify the capacity of each tank in order to identify those that are less than 5,000 gallons in capacity and which do not require control. Proposed 40 CFR 63.2343(a) only applies to those tanks that are storing an organic liquid subject to subpart EEEE and with capacities of less than 5,000 gallons. This applicability is stated clearly in proposed 40 CFR 63.2343(a) (emphasis added):

> (a) For each storage tank *subject to this subpart having a capacity of less than 18.9 cubic meters (5,000 gallons)* and for each transfer rack subject to this subpart that only unloads organic liquids (i.e., no organic liquids are loaded at any of the transfer racks), you must keep documentation that verifies that each storage tank and transfer rack identified in paragraph (a) of this section is not required to be controlled.

Proposed 40 CFR 63.2343(a) requires only that the owner or operator keep a record of the size determination; that is, by virtue of having a capacity of less than 5,000 gallons, the storage tank is not required to be controlled. The proposed paragraph does not apply to: (1) Storage tanks storing a liquid that is not an organic liquid and (2) storage tanks storing an organic liquid that is not subject to 40 CFR part 63, subpart EEEE.

As correctly pointed out by the commenter, storage tanks do not change in size. Therefore, there would be no further effort required on the part of the owner or operator to document that the storage tank is not subject to control; that is, the original determination is sufficient.

Proposed 40 CFR 63.2343(a) also required that the documentation by kept up-to-date:

> The documentation must be kept up-to-date (i.e., all such emission sources at a facility are identified in the documentation regardless of when the documentation was last compiled) and must be in a form suitable and readily available for expeditious inspection and review according to § 63.10(b)(1), including records stored in electronic form in a separate location.

EPA points out that in explaining what is meant by "up-to-date," the phrase "all such emission sources at a facility" is used. Within the context of the entire paragraph, this phrase unambiguously refers back to those storage tanks for which the documentation under 40 CFR 63.2343(a)(1) is being requested; that is, storage tanks subject to 40 CFR part 63, subpart EEEE, which are storage tanks storing organic liquids subject to subpart EEEE. EPA does not believe it necessary to revise the regulatory text to further clarify the phrase "all such emission sources at a facility." This phrase does not apply to either storage tanks storing liquids that are not organic liquids or to storage tanks storing organic liquids that are not subject to subpart EEEE. To better identify the type of documentation that is acceptable, EPA has revised 40 CFR 63.2343(a) to allow the use of piping and instrumentation diagrams (P&ID) to identify tanks (and transfer racks) subject to 40 CFR 63.2343(a).

EPA reemphasizes that proposed 40 CFR 63.2343(a) only applies to storage tanks storing an organic liquid subject to 40 CFR part 63, subpart EEEE. If a facility has storage tanks of less than 5,000 gallon capacity, but those storage tanks do not store organic liquids (as defined in subpart EEEE), then there are no recordkeeping requirements for those tanks under 40 CFR 63.2343(a)(1) or

under any other part of subpart EEEE. Furthermore, there are no recordkeeping requirements under subpart EEEE for storage tanks of any size that either do not store and organic liquid or for storage tanks storing organic liquids that are not subject to subpart EEEE.

EPA further points out that 40 CFR 63.10(b)(3) of subpart A (the General Provisions) does not impose any recordkeeping requirements under the OLD maximum achievable control technology (MACT) for storage tanks that are not storing organic liquids and, therefore, not part of the OLD source category. The determination of applicability of 40 CFR 63.10(b)(3) applies to stationary sources that are part of the source category, but that are not subject to the relevant standard, in this case 40 CFR part 63, subpart EEEE, based on either the source's potential to emit or a specific exclusion in the subpart. In the case of the commenter, their OLD operation is located at a major source of HAP and there are no exclusions in subpart EEEE applicable to it; therefore, their OLD operation is an affected source subject to subpart EEEE. Once this determination is made, there is no applicability of 40 CFR 63.10(b)(3) to the OLD affected source.

For other storage tanks located at their plant site that do not store organic liquids and, therefore, are not part of the OLD affected source, 40 CFR 63.10(b)(3) imposes no recordkeeping requirements, for the purposes of the OLD rule, on those storage tanks or the source to which they belong.

EPA clarified this in the preamble to the March 23, 2001, proposed amendments to the General Provisions at 66 FR 16330. We state

> The current General Provisions include a requirement at 63.10(b)(3) for a source both to determine applicability and to keep a record of their determination if the source determines that it is not an affected source for a relevant standard. [A]n unintended interpretation of the General Provisions could be to require owners and operators of any source, including facilities not in the source category being regulated, to perform applicability determinations each time any NESHAP are promulgated. It was not our intent that the General Provisions require owners and operators to make a determination that they are not subject to every NESHAP that is issued.

For transfer racks, a situation similar to storage tanks exists. Only transfer racks loading or unloading organic liquids that are subject to 40 CFR part 63, subpart EEEE are affected; loading racks that load or unload only non-organic liquids (or organic liquids not subject to subpart EEEE) are not affected. For those racks that only unload organic liquids subject to subpart EEEE, owners and operators must make the initial determination that the rack only unloads such organic liquids, and then must keep a record of that determination. As long as such racks do not begin to load organic liquids subject to subpart EEEE, no further effort, beyond keeping the record readily available and up-to-date, is required on the part of the owner or operator to document that the transfer rack only unloads organic liquids subject to subpart EEEE.

Finally, EPA believes that maintaining these basic determinations in the form of a record, both for storage tanks with capacities of less than 5,000 gallons and for transfer racks that only unload organic liquids, will facilitate the time and effort an inspector would expend during an inspection of a facility and the time and effort the source would expend recreating these determinations each time they were asked.

For these reasons, EPA has not revised the proposed rule language associated with these storage tanks and transfer racks, except for the allowance of P&ID to identify such storage tanks and transfer racks.

Comment: One commenter requested that the recordkeeping and reporting requirements proposed in 40 CFR 63.2343 for storage tanks with capacities equal to or greater than 5,000 gallons that do not require control be eliminated. The commenter stated that such requirements impose an administrative burden with no environmental benefit. The commenter suggested that the more appropriate way to address these tanks is to require the owner or operator of such tanks to notify the State permitting authority at the point in time when such tanks trigger control requirements under Table 2 of 40 CFR part 63, subpart EEEE. The commenter recommended that EPA apply the same approach used in the Engine Testing MACT (40 CFR 63.9290). In the Engine Testing MACT, a source that is exclusively used for testing internal combustion engines of less than 25 horsepower is required only to submit an initial notification, meeting the requirements in the General Provisions. The initial notification for these sources also must state that the source has no additional requirements, including a brief explanation of the basis of the exclusion. No other reporting, recordkeeping, or notification requirements, including submission of startup, shutdown, and malfunction plans and compliance demonstrations, apply to sources that do not have to comply with emission limitations. According to the commenter, EPA should apply this same approach to sources that are not subject to controls under subpart EEEE.

Response: As noted in the previous response, the requirements in proposed 40 CFR 63.2343(b) only apply to storage tanks storing organic liquids subject to 40 CFR part 63, subpart EEEE. Further, an owner or operator would have to make an initial determination as to whether these larger storage tanks contain organic liquids with vapor pressures that trigger the control requirements. As long as the liquid in the tank did not change, no further action is required on the part of the owner or operator, beyond keeping the record readily available and up-to-date. If the owner or operator changes the liquids stored in such tanks, however, the owner or operator is required to make a determination as to whether or not the vapor pressure of the new liquid being stored is sufficient to require control and maintain a record of that determination, even if control is still not required.

EPA continues to believe that keeping a record of such information is important to allow an inspector to determine compliance with the OLD rule. Therefore, EPA has not revised this requirement in the final rule.

D. Technical Corrections and Clarifying Changes

EPA is making the following technical corrections and clarifications to the final rule:

1. The cross-reference to 40 CFR 63.2382(b) found in 40 CFR 63.2370(c) is incorrect. The correct cross-reference is 40 CFR 63.2382(d).

2. Item 1.b in Table 5 to 40 CFR part 63, subpart EEEE references the emission limit of "at least 95 weight percent." This limit is applicable to storage tanks only. The applicable limit for transfer racks (both low throughput and high throughput racks) is "at least 98 weight percent." EPA has revised the final rule to reflect accordingly.

3. In table 12 to 40 CFR part 63, subpart EEEE, 40 CFR 63.6(h)(1) through (7) are indicated as being not applicable to subpart EEEE, while 40 CFR 63.6(h)(8) and CFR 63.6(h)(9) are indicated as being applicable. 40 CFR 63.6(h) applies to opacity and visible emission standards. Upon closer examination of this apparent inconsistency, EPA has determined that all of 40 CFR 63.6(h) is not applicable, except to the extent that Method 22 observations are required as part of a flare compliance assessment. Therefore, EPA has revised the applicability of 40 CFR 63.6(h) to read as follows:

"No; except only as it applies to flares for which Method 22 observations are required as part of a flare compliance assessment."

4. We are deleting methyl ethyl ketone (MEK) from Table 1 because MEK has been delisted by the Agency as a HAP.

5. We are correcting the cross-reference in 40 CFR 63.2346(a) for storage tanks meeting the tank capacity and liquid vapor pressure criteria for control in Table 2, item 6. The final rule referenced compliance with paragraph (a)(1) when it should have referenced compliance with either paragraphs (a)(1) or (a)(2).

6. We are revising the phrasing in 40 CFR 63.2354(a)(3) to clarify that performance evaluations for continuous monitoring systems (CMS) are only currently required for continuous emission monitoring systems. The requirements of 40 CFR 63.8 only apply if there are promulgated performance specifications for CMS, including continuous parameter monitoring systems. Currently, there are no performance specifications for the continuous parameter monitoring systems that are identified in 40 CFR part 63, subpart SS, which this subpart references. However, performance specifications for parameter monitoring systems are expected to be proposed in the future. When developing these performance specifications, the Agency will consider their application to OLD and other similar rules. For consistency, we have also clarified the applicability of CMS provisions contained in the General Provisions, 40 CFR 63.8(c)(6)–(8), (d), and (f).

7. We have added a new paragraph, 40 CFR 63.2396(e)(2), to clarify the relationship between the recordkeeping and reporting requirements of this subpart and the recordkeeping and reporting requirements for equipment leak components associated with unloading racks under other subparts. The new paragraph clarifies that such equipment leak components must be in compliance with this subpart EEEE. However, if the recordkeeping and reporting requirements of the other 40 CFR part 63 subpart are equivalent to those required by this subpart EEEE, the owner or operator may elect to continue to comply with the recordkeeping and reporting requirements under which they are currently being controlled and be considered in compliance with this subpart EEEE. This new paragraph parallels the similar relationship in the final rule provided for monitoring, recordkeeping, and reporting for control devices.

8. We have revised the definition of "annual average true vapor pressure" to clarify that the vapor pressure is to be based on organic HAP that are listed in Table 1 to this subpart EEEE.

9. We have corrected an incorrect cross-reference in the second column of Item 8 in Table 3 of this subpart EEEE. The incorrect cross-reference, 40 CFR 63.2366(c), does not exist. The correct cross-reference is 40 CFR 63.2366(b).

10. We corrected the last column of item 1.b in Table 5 and the third column of items 1 and 2 of Table 6 of this subpart EEEE by adding the phrase "for nonflare combustion devices" to the option of 20 parts per million by volume exhaust concentration. This phrase was inadvertently omitted and makes these items consistent with item 1.a.i.(5)(A)(ii) in Table 5 of this subpart EEEE.

11. We are making the description in item 2 in Table 11 of this subpart EEEE consistent with the General Provisions' language that requires an immediate notification when an exceedance of an applicable emission standard occurs during a startup, shutdown, or malfunction episode. The language in the rule as promulgated did not reference the exceedance of an applicable emission standard for determining when an immediate notification was required.

12. We are correcting in Table 12 of this subpart EEEE how 40 CFR 63.9(j) applies to this subpart EEEE. The types of changes that 40 CFR 63.9(j) requires to be reported are covered in subpart EEEE in 40 CFR 63.2386(c) and (d). In these paragraphs, these changes would be submitted with the next compliance report. Thus, the requirement to submit these changes within 15 days after the change is not applicable to this subpart EEEE. The change in Table 12 reflects this.

13. We are revising § 63.2350(c) to be consistent with 40 CFR 63.6(e)(3), which requires the development of a startup, shutdown, and malfunction plan. The revised language, therefore, drops the phrase "and implement." An owner or operator is still required, under 40 CFR 63.6(e)(1), to minimize emissions during a period of startup, shutdown, or malfunction; thus there is no change in the stringency of the final rule.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, OMB has notified EPA that it considers this a "significant regulatory action" within the meaning of the Executive Order. EPA has submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The final rule required owners and operators to list sources not subject to control in the first and subsequent compliance reports and to keep appropriate documentation. The final rule applied these requirements across-the-board for all emission sources not requiring control and, in general, was not specific as to what recordkeeping is required. Under the final rule amendments, we clarify how these provisions would apply to those emission sources for which control would never be required and to those emission sources for which control could be required, but is not currently required. In addition, we identify the specific circumstances under which listing in subsequent compliance reports would be required for sources for which control is not required rather than requiring all previously identified sources to be re-listed. Further, we narrow the applicability of certain sections of the General Provisions for sources for which control is not required because the proposed amendments make such application of those sections in the General Provisions unnecessary. Thus, in sum, the final rule amendments are

not adding new information collection burden. However, OMB has previously approved the information collection requirements contained in the existing regulations at 40 CFR part 63, subpart EEEE under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0539, EPA Information Collection Request (ICR) number 1963.02. A copy of the OMB approved ICR may be obtained from Susan Auby, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule amendments.

For purposes of assessing the impacts of the final rule amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration's regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of the final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the proposed rule on small entities." 5 U.S.C. 603 and 604. Thus, an agency may conclude that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule.

The final rule amendments will not impose any new requirements on small entities, and will reduce some of the burden established under the promulgated rule. The final rule amendments will relieve regulatory burden by, for example, exempting all emission sources in the affected source not requiring control under the OLD NESHAP from notification, recordkeeping, and reporting requirements, except as otherwise specified for all affected small entities; excluding from the affected source storage tanks, transfer racks, transport vehicles, containers, and equipment leak components when used in special operations and to conduct maintenance activities; and allowing owners or operators of existing sources to request a compliance extension of up to 1 year if the additional time is necessary for the installation of controls. We have therefore concluded that today's final rule will relieve regulatory burden for all affected small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. Thus, the final rule amendments are not subject to the requirements of section 202 and 205 of the UMRA. In addition, the final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments because they contain no requirements that apply to such governments or impose obligations upon them. Therefore, the final rule amendments are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. They will not have new substantial direct effects on the States, on the relationship between the national government and

the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. They correct typographical errors, clarify provisions, or eliminate unnecessary recordkeeping and reporting requirements for emission sources for which there are no control requirements. These changes do not modify existing or create new responsibilities among EPA Regional Offices, States, or local enforcement agencies. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to the final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule amendments are not subject to Executive Order 13045 because it is based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy, Supply, Distribution, or Use

The final rule amendments are not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because they are not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that this rule is not likely to have any adverse energy effects.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

The final rule amendments involve a technical standard. EPA has decided to use ASTM D6420–99 (reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, as an alternative to Method 18. This method allows the use of ASTM D6420–99 (Reapproved 2004) as an alternative to Method 18 to determine compliance with the organic HAP or total organic compounds emission limit under certain circumstances.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule will be effective on July 28, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: July 18, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Section 63.14 is amended by revising paragraph (b)(28) to read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(b) * * *

(28) ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, IBR approved for §§ 63.2354(b)(3)(i), 63.2354(b)(3)(ii), 63.2354(b)(3)(ii)(A), and 63.2354(b)(3)(ii)(B).

* * * * *

Subpart EEEE—[Amended]

■ 3. Section 63.2338 is amended by:

■ a. Revising paragraphs (b)(3) and (b)(4);

■ b. Adding a new paragraph (b)(5);

■ c. Revising paragraph (c)(1);

■ d. Removing paragraph (c)(2) and redesignating paragraphs (c)(3) and (c)(4) as (c)(2) and (c)(3), respectively; and

■ e. Revising newly designated paragraphs (c)(2) and (c)(3) to read as follows:

§ 63.2338 What parts of my plant does this subpart cover?

* * * * *

(b) * * *

(3) All equipment leak components in organic liquids service that are associated with:

(i) Storage tanks storing organic liquids;

(ii) Transfer racks loading or unloading organic liquids;

(iii) Pipelines that transfer organic liquids directly between two storage tanks that are subject to this subpart;

(iv) Pipelines that transfer organic liquids directly between a storage tank subject to this subpart and a transfer rack subject to this subpart; and

(v) Pipelines that transfer organic liquids directly between two transfer racks that are subject to this subpart.

(4) All transport vehicles while they are loading or unloading organic liquids at transfer racks subject to this subpart.

(5) All containers while they are loading or unloading organic liquids at transfer racks subject to this subpart.

(c) * * *

(1) Storage tanks, transfer racks, transport vehicles, containers, and equipment leak components that are part of an affected source under another 40 CFR part 63 national emission standards for hazardous air pollutants (NESHAP).

(2) Non-permanent storage tanks, transfer racks, transport vehicles, containers, and equipment leak components when used in special situation distribution loading and unloading operations (such as maintenance or upset liquids management).

(3) Storage tanks, transfer racks, transport vehicles, containers, and equipment leak components when used to conduct maintenance activities, such as stormwater management, liquid removal from tanks for inspections and maintenance, or changeovers to a different liquid stored in a storage tank.

* * * * *

■ 4. Section 63.2342 is amended by:

■ a. Revising paragraph (a) introductory text;

■ b. Adding paragraph (a)(3);

■ c. Revising paragraph (b)(1);

■ d. Adding paragraph (b)(3); and

■ e. Revising paragraph (d) to read as follows:

§ 63.2342 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source, you must comply with this subpart according to the schedule identified in paragraph (a)(1), (a)(2), or (a)(3) of this section, as applicable.

* * * * *

(3) If, after startup of a new affected source, the total actual annual facility-level organic liquid loading volume at that source exceeds the criteria for control in Table 2 to this subpart, items 9 and 10, the owner or operator must comply with the transfer rack requirements specified in § 63.2346(b) immediately; that is, be in compliance the first day of the period following the end of the 3-year period triggering the control criteria.

(b)(1) If you have an existing affected source, you must comply with the emission limitations, operating limits, and work practice standards for existing affected sources no later than February 5, 2007, except as provided in paragraphs (b)(2) and (3) of this section.

* * * * *

(3)(i) If an addition or change other than reconstruction as defined in § 63.2 is made to an existing affected facility that causes the total actual annual facility-level organic liquid loading volume to exceed the criteria for control in Table 2 to this subpart, items 7 and 8, the owner or operator must comply with the transfer rack requirements specified in § 63.2346(b) immediately; that is, be in compliance the first day of the period following the end of the 3-year period triggering the control criteria.

(ii) If the owner or operator believes that compliance with the transfer rack emission limits cannot be achieved immediately, as specified in paragraph (b)(3)(i) of this section, the owner or operator may submit a request for a compliance extension, as specified in paragraphs (b)(3)(ii)(A) through (I) of this section. Subject to paragraph (b)(3)(ii)(B) of this section, until an extension of compliance has been granted by the Administrator (or a State with an approved permit program) under this paragraph (b)(3)(ii), the owner or operator of the transfer rack subject to the requirements of this section shall comply with all applicable requirements of this subpart. Advice on requesting an extension of compliance may be obtained from the Administrator (or the State with an approved permit program).

(A) *Submittal.* The owner or operator shall submit a request for a compliance extension to the Administrator (or a State, when the State has an approved 40 CFR part 70 permit program and the source is required to obtain a 40 CFR part 70 permit under that program, or a State, when the State has been delegated the authority to implement and enforce the emission standard for that source) seeking an extension allowing the source up to 1 additional year to comply with the transfer rack standard, if such additional period is necessary for the installation of controls. The owner or operator of the affected source who has requested an extension of compliance under this paragraph (b)(3)(ii)(A) and who is otherwise required to obtain a title V permit shall apply for such permit, or apply to have the source's title V permit revised to incorporate the conditions of the extension of compliance. The conditions of an extension of compliance granted under this paragraph (b)(3)(ii)(A) will be incorporated into the affected source's title V permit according to the provisions of 40 CFR part 70 or Federal title V regulations in this chapter (42 U.S.C. 7661), whichever are applicable.

(B) *When to submit.* (*1*) Any request submitted under paragraph (b)(3)(ii)(A) of this section must be submitted in writing to the appropriate authority no later than 120 days prior to the affected source's compliance date (as specified in paragraph (b)(3)(i) of this section), except as provided for in paragraph (b)(3)(ii)(B)(*2*) of this section. Nonfrivolous requests submitted under this paragraph (b)(3)(ii)(B)(*1*) will stay the applicability of the rule as to the emission points in question until such time as the request is granted or denied. A denial will be effective as of the date of denial.

(*2*) An owner or operator may submit a compliance extension request after the date specified in paragraph (b)(3)(ii)(B)(*1*) of this section provided the need for the compliance extension arose after that date, and before the otherwise applicable compliance date and the need arose due to circumstances beyond reasonable control of the owner or operator. This request must include, in addition to the information required in paragraph (b)(3)(ii)(C) of this section, a statement of the reasons additional time is needed and the date when the owner or operator first learned of the problems. Nonfrivolous requests submitted under this paragraph (b)(3)(ii)(B)(*2*) will stay the applicability of the rule as to the emission points in question until such time as the request is granted or denied. A denial will be effective as of the original compliance date.

(C) *Information required.* The request for a compliance extension under paragraph (b)(3)(ii)(A) of this section shall include the following information:

(*1*) The name and address of the owner or operator and the address of the existing source if it differs from the address of the owner or operator;

(*2*) The name, address, and telephone number of a contact person for further information;

(*3*) An identification of the organic liquid distribution operation and of the

specific equipment for which additional compliance time is required;

(*4*) A description of the controls to be installed to comply with the standard;

(*5*) Justification for the length of time being requested; and

(*6*) A compliance schedule, including the date by which each step toward compliance will be reached. At a minimum, the list of dates shall include:

(*i*) The date by which on-site construction, installation of emission control equipment, or a process change is planned to be initiated;

(*ii*) The date by which on-site construction, installation of emission control equipment, or a process change is to be completed; and

(*iii*) The date by which final compliance is to be achieved.

(D) *Approval of request for extension of compliance.* Based on the information provided in any request made under paragraph (b)(3)(ii)(C) of this section, or other information, the Administrator (or the State with an approved permit program) may grant an extension of compliance with the transfer rack emission standard, as specified in paragraph (b)(3)(ii) of this section. The extension will be in writing and will—

(*1*) Identify each affected source covered by the extension;

(*2*) Specify the termination date of the extension;

(*3*) Specify the dates by which steps toward compliance are to be taken, if appropriate;

(*4*) Specify other applicable requirements to which the compliance extension applies (e.g., performance tests);

(*5*) Specify the contents of the progress reports to be submitted and the dates by which such reports are to be submitted, if required pursuant to paragraph (b)(3)(ii)(E) of this section.

(*6*) Under paragraph (b)(3)(ii) of this section, specify any additional conditions that the Administrator (or the State) deems necessary to assure installation of the necessary controls and protection of the health of persons during the extension period.

(E) *Progress reports.* The owner or operator of an existing source that has been granted an extension of compliance under paragraph (b)(3)(ii)(D) of this section may be required to submit to the Administrator (or the State with an approved permit program) progress reports indicating whether the steps toward compliance outlined in the compliance schedule have been reached.

(F) *Notification of approval or intention to deny.*

(*1*) The Administrator (or the State with an approved permit program) will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (b)(3)(ii) of this section. The Administrator (or the State) will notify the owner or operator in writing of the status of his/her application; that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted. The 30-day approval or denial period will begin after the owner or operator has been notified in writing that his/her application is complete. Failure by the Administrator to act within 30 calendar days to approve or disapprove a request submitted under paragraph (b)(3)(ii) of this section does not constitute automatic approval of the request.

(*2*) When notifying the owner or operator that his/her application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after he/she is notified of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(*3*) Before denying any request for an extension of compliance, the Administrator (or the State with an approved permit program) will notify the owner or operator in writing of the Administrator's (or the State's) intention to issue the denial, together with:

(*i*) Notice of the information and findings on which the intended denial is based; and

(*ii*) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after he/she is notified of the intended denial, additional information or arguments to the Administrator (or the State) before further action on the request.

(*4*) The Administrator's final determination to deny any request for an extension will be in writing and will set forth the specific grounds on which the denial is based. The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(G) *Termination of extension of compliance.* The Administrator (or the State with an approved permit program) may terminate an extension of compliance at an earlier date than specified if any specification under paragraph (b)(3)(ii)(D)(*3*) or paragraph (b)(3)(ii)(D)(*4*) of this section is not met. Upon a determination to terminate, the Administrator will notify, in writing, the owner or operator of the Administrator's determination to terminate, together with:

(*1*) Notice of the reason for termination; and

(*2*) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after he/she is notified of the determination to terminate, additional information or arguments to the Administrator before further action on the termination.

(*3*) A final determination to terminate an extension of compliance will be in writing and will set forth the specific grounds on which the termination is based. The final determination will be made within 30 calendar days after presentation of additional information or arguments, or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(H) The granting of an extension under this section shall not abrogate the Administrator's authority under section 114 of the CAA.

(I) *Limitation on use of compliance extension.* The owner or operator may request an extension of compliance under the provisions specified in paragraph (b)(3)(ii) of this section only once for each facility.

* * * * *

(d) You must meet the notification requirements in §§ 63.2343 and 63.2382(a), as applicable, according to the schedules in § 63.2382(a) and (b)(1) through (3) and in subpart A of this part. Some of these notifications must be submitted before the compliance dates for the emission limitations, operating limits, and work practice standards in this subpart.

■ 5. Section 63.2343 is added to subpart EEEE to read as follows:

§ 63.2343 What are my requirements for emission sources not requiring control?

This section establishes the notification, recordkeeping, and reporting requirements for emission sources identified in § 63.2338 that do not require control under this subpart (i.e., under paragraphs (a) through (e) of § 63.2346). Such emission sources are not subject to any other notification, recordkeeping, or reporting sections in this subpart, including § 63.2350(c), except as indicated in paragraphs (a) through (d) of this section.

(a) For each storage tank subject to this subpart having a capacity of less

than 18.9 cubic meters (5,000 gallons) and for each transfer rack subject to this subpart that only unloads organic liquids (i.e., no organic liquids are loaded at any of the transfer racks), you must keep documentation that verifies that each storage tank and transfer rack identified in paragraph (a) of this section is not required to be controlled. The documentation must be kept up-to-date (i.e., all such emission sources at a facility are identified in the documentation regardless of when the documentation was last compiled) and must be in a form suitable and readily available for expeditious inspection and review according to § 63.10(b)(1), including records stored in electronic form in a separate location. The documentation may consist of identification of the tanks and transfer racks identified in paragraph (a) of this section on a plant site plan or process and instrumentation diagram (P&ID).

(b) For each storage tank subject to this subpart having a capacity of 18.9 cubic meters (5,000 gallons) or more that is not subject to control based on the criteria specified in Table 2 to this subpart, items 1 through 6, you must comply with the requirements specified in paragraphs (b)(1) through (3) of this section.

(1)(i) You must submit the information in § 63.2386(c)(1), (2), (3), and (10)(i) in either the Notification of Compliance Status, according to the schedule specified in Table 12 to this subpart, or in your first Compliance report, according to the schedule specified in § 63.2386(b), whichever occurs first.

(ii)(A) If you submit your first Compliance report before your Notification of Compliance Status, the Notification of Compliance Status must contain the information specified in § 63.2386(d)(3) and (4) if any of the changes identified in paragraph (d) of this section have occurred since the filing of the first Compliance report. If none of the changes identified in paragraph (d) of this section have occurred since the filing of the first Compliance report, you do not need to report the information specified in § 63.2386(c)(10)(i) when you submit your Notification of Compliance Status.

(B) If you submit your Notification of Compliance Status before your first Compliance report, your first Compliance report must contain the information specified in § 63.2386(d)(3) and (4) if any of the changes specified in paragraph (d) of this section have occurred since the filing of the Notification of Compliance Status.

(iii) If you are already submitting a Notification of Compliance Status or a first Compliance report under § 63.2386(c), you do not need to submit a separate Notification of Compliance Status or first Compliance report for each storage tank that meets the conditions identified in paragraph (b) of this section (i.e., a single Notification of Compliance Status or first Compliance report should be submitted).

(2)(i) You must submit a subsequent Compliance report according to the schedule in § 63.2386(b) whenever any of the events in paragraph (d) of this section occur, as applicable.

(ii) Your subsequent Compliance reports must contain the information in § 63.2386(c)(1), (2), (3) and, as applicable, in § 63.2386(d)(3) and (4). If you are already submitting a subsequent Compliance report under § 63.2386(d), you do not need to submit a separate subsequent Compliance report for each storage tank that meets the conditions identified in paragraph (b) of this section (i.e., a single subsequent Compliance report should be submitted).

(3) For each storage tank that meets the conditions identified in paragraph (b) of this section, you must keep documentation, including a record of the annual average true vapor pressure of the total Table 1 organic HAP in the stored organic liquid, that verifies the storage tank is not required to be controlled under this subpart. The documentation must be kept up-to-date and must be in a form suitable and readily available for expeditious inspection and review according to § 63.10(b)(1), including records stored in electronic form in a separate location.

(c) For each transfer rack subject to this subpart that loads organic liquids but is not subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, you must comply with the requirements specified in paragraphs (c)(1) through (3) of this section.

(1)(i) You must submit the information in § 63.2386(c)(1), (2), (3), and (10)(i) in either the Notification of Compliance Status, according to the schedule specified in Table 12 to this subpart, or a first Compliance report, according to the schedule specified in § 63.2386(b), whichever occurs first.

(ii)(A) If you submit your first Compliance report before your Notification of Compliance Status, the Notification of Compliance Status must contain the information specified in § 63.2386(d)(3) and (4) if any of the changes identified in paragraph (d) of this section have occurred since the filing of the first Compliance report. If none of the changes identified in paragraph (d) of this section have occurred since the filing of the first Compliance report, you do not need to report the information specified in § 63.2386(c)(10)(i) when you submit your Notification of Compliance Status.

(B) If you submit your Notification of Compliance Status before your first Compliance report, your first Compliance report must contain the information specified in § 63.2386(d)(3) and (4) if any of the changes specified in paragraph (d) of this section have occurred since the filing of the Notification of Compliance Status.

(iii) If you are already submitting a Notification of Compliance Status or a first Compliance report under § 63.2386(c), you do not need to submit a separate Notification of Compliance Status or first Compliance report for each transfer rack that meets the conditions identified in paragraph (b) of this section (i.e., a single Notification of Compliance Status or first Compliance report should be submitted).

(2)(i) You must submit a subsequent Compliance report according to the schedule in § 63.2386(b) whenever any of the events in paragraph (d) of this section occur, as applicable.

(ii) Your subsequent Compliance reports must contain the information in § 63.2386(c)(1), (2), (3) and, as applicable, in § 63.2386(d)(3) and (4). If you are already submitting a subsequent Compliance report under § 63.2386(d), you do not need to submit a separate subsequent Compliance report for each transfer rack that meets the conditions identified in paragraph (c) of this section (i.e., a single subsequent Compliance report should be submitted).

(3) For each transfer rack that meets the conditions identified in paragraph (c) of this section, you must keep documentation, including the records specified in § 63.2390(d), that verifies the transfer rack is not required to be controlled under this subpart. The documentation must be kept up-to-date and must be in a form suitable and readily available for expeditious inspection and review according to § 63.10(b)(1), including records stored in electronic form in a separate location.

(d) If one or more of the events identified in paragraphs (d)(1) through (4) of this section occur since the filing of the Notification of Compliance Status or the last Compliance report, you must submit a subsequent Compliance report as specified in paragraphs (b)(3) and (c)(3) of this section.

(1) Any storage tank or transfer rack became subject to control under this subpart EEEE; or

(2) Any storage tank equal to or greater than 18.9 cubic meters (5,000

gallons) became part of the affected source but is not subject to any of the emission limitations, operating limits, or work practice standards of this subpart; or

(3) Any transfer rack (except those racks at which only unloading of organic liquids occurs) became part of the affected source; or

(4) Any of the information required in § 63.2386(c)(1), § 63.2386(c)(2), or § 63.2386(c)(3) has changed.

■ 6. Section 63.2346 is amended by:
■ a. Revising paragraph (a) introductory text;
■ b. Revising paragraph (a)(2);
■ c. Adding a new paragraph (a)(4);
■ d. Revising paragraph (b) introductory text;
■ e. Revising paragraph (b)(2);
■ f. Revising paragraph (b)(3);
■ g. Revising paragraph (d) introductory text;
■ h. Revising paragraph (e); and
■ i. Removing and reserving paragraph (h) to read as follows:

§ 63.2346 What emission limitations, operating limits, and work practice standards must I meet?

(a) *Storage tanks.* For each storage tank storing organic liquids that meets the tank capacity and liquid vapor pressure criteria for control in Table 2 to this subpart, items 1 through 5, you must comply with paragraph (a)(1), (a)(2), (a)(3), or (a)(4) of this section. For each storage tank storing organic liquids that meets the tank capacity and liquid vapor pressure criteria for control in Table 2 to this subpart, item 6, you must comply with paragraph (a)(1), (a)(2), or (a)(4) of this section.

* * * * *

(2) Route emissions to fuel gas systems or back into a process as specified in 40 CFR part 63, subpart SS.

* * * * *

(4) Use a vapor balancing system that complies with the requirements specified in paragraphs (a)(4)(i) through (vii) of this section and with the recordkeeping requirements specified in § 63.2390(e).

(i) The vapor balancing system must be designed and operated to route organic HAP vapors displaced from loading of the storage tank to the transport vehicle from which the storage tank is filled.

(ii) Transport vehicles must have a current certification in accordance with the United States Department of Transportation (U.S. DOT) pressure test requirements of 49 CFR part 180 for cargo tanks and 49 CFR 173.31 for tank cars.

(iii) Organic liquids must only be unloaded from cargo tanks or tank cars when vapor collection systems are connected to the storage tank's vapor collection system.

(iv) No pressure relief device on the storage tank, or on the cargo tank or tank car, shall open during loading or as a result of diurnal temperature changes (breathing losses).

(v) Pressure relief devices must be set to no less than 2.5 pounds per square inch guage (psig) at all times to prevent breathing losses. Pressure relief devices may be set at values less than 2.5 psig if the owner or operator provides rationale in the notification of compliance status report explaining why the alternative value is sufficient to prevent breathing losses at all times. The owner or operator shall comply with paragraphs (a)(4)(iv)(A) through (C) of this section for each pressure relief valve.

(A) The pressure relief valve shall be monitored quarterly using the method described in § 63.180(b).

(B) An instrument reading of 500 parts per million by volume (ppmv) or greater defines a leak.

(C) When a leak is detected, it shall be repaired as soon as practicable, but no later than 5 days after it is detected, and the owner or operator shall comply with the recordkeeping requirements of § 63.181(d)(1) through (4).

(vi) Cargo tanks and tank cars that deliver organic liquids to a storage tank must be reloaded or cleaned at a facility that utilizes the control techniques specified in paragraph (a)(4)(vi)(A) or (a)(4)(vi)(B) of this section.

(A) The cargo tank or tank car must be connected to a closed-vent system with a control device that reduces inlet emissions of total organic HAP by 95 percent by weight or greater or to an exhaust concentration less than or equal to 20 ppmv, on a dry basis corrected to 3 percent oxygen for combustion devices using supplemental combustion air.

(B) A vapor balancing system designed and operated to collect organic HAP vapor displaced from the cargo tank or tank car during reloading must be used to route the collected vapor to the storage tank from which the liquid being transferred originated or to another storage tank connected to a common header.

(vii) The owner or operator of the facility where the cargo tank or tank car is reloaded or cleaned must comply with paragraphs (a)(4)(vii)(A) through (D) of this section.

(A) Submit to the owner or operator of the storage tank and to the Administrator a written certification that the reloading or cleaning facility will meet the requirements of paragraph (a)(4)(vii)(A) through (C) of this section. The certifying entity may revoke the written certification by sending a written statement to the owner or operator of the storage tank giving at least 90 days notice that the certifying entity is rescinding acceptance of responsibility for compliance with the requirements of this paragraph (a)(4)(vii) of this section.

(B) If complying with paragraph (a)(4)(vi)(A) of this section, comply with the requirements for a closed vent system and control device as specified in this subpart EEEE. The notification requirements in § 63.2382 and the reporting requirements in § 63.2386 do not apply to the owner or operator of the offsite cleaning or reloading facility.

(C) If complying with paragraph (a)(4)(vi)(B) of this section, keep the records specified in § 63.2390(e)(3) or equivalent recordkeeping approved by the Administrator.

(D) After the compliance dates specified in § 63.2342, at an offsite reloading or cleaning facility subject to § 63.2346(a)(4), compliance with the monitoring, recordkeeping, and reporting provisions of any other subpart of this part 63 that has monitoring, recordkeeping, and reporting provisions constitutes compliance with the monitoring, recordkeeping and reporting provisions of § 63.2346(a)(4)(vii)(B) or § 63.2346(a)(4)(vii)(C). You must identify in your notification of compliance status report required by § 63.2382(d) the subpart of this part 63 with which the owner or operator of the offsite reloading or cleaning facility complies.

(b) *Transfer racks.* For each transfer rack that is part of the collection of transfer racks that meets the total actual annual facility-level organic liquid loading volume criterion for control in Table 2 to this subpart, items 7 through 10, you must comply with paragraph (b)(1), (b)(2), or (b)(3) of this section for each arm in the transfer rack loading an organic liquid whose organic HAP content meets the organic HAP criterion for control in Table 2 to this subpart, items 7 through 10. For existing affected sources, you must comply with paragraph (b)(1), (b)(2), or (b)(3)(i) of this section during the loading of organic liquids into transport vehicles. For new affected sources, you must comply with paragraph (b)(1), (b)(2), or (b)(3)(i) and (ii) of this section during the loading of organic liquids into transport vehicles and containers. If the total actual annual facility-level organic liquid loading volume at any affected source is equal to or greater than the loading volume criteria for control in

Table 2 to this subpart, but at a later date is less than the loading volume criteria for control, compliance with paragraph (b)(1), (b)(2), or (b)(3) of this section is no longer required. For new sources and reconstructed sources, as defined in § 63.2338(d) and (e), if at a later date, the total actual annual facility-level organic liquid loading volume again becomes equal to or greater than the loading volume criteria for control in Table 2 to this subpart, the owner or operator must comply with paragraph (b)(1), (b)(2), or (b)(3)(i) and (ii) of this section immediately, as specified in § 63.2342(a)(3). For existing sources, as defined in § 63.2338(f), if at a later date, the total actual annual facility-level organic liquid loading volume again becomes equal to or greater than the loading volume criteria for control in Table 2 to this subpart, the owner or operator must comply with paragraph (b)(1), (b)(2), or (b)(3)(i) of this section immediately, as specified in § 63.2342(b)(3)(i), unless an alternative compliance schedule has been approved under § 63.2342(b)(3)(ii) and subject to the use limitation specified in § 63.2342(b)(3)(ii)(I).

* * * * *

(2) Route emissions to fuel gas systems or back into a process as specified in 40 CFR part 63, subpart SS.

(3)(i) Use a vapor balancing system that routes organic HAP vapors displaced from the loading of organic liquids into transport vehicles to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header.

(ii) Use a vapor balancing system that routes the organic HAP vapors displaced from the loading of organic liquids into containers directly (e.g., no intervening tank or containment area such as a room) to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header.

* * * * *

(d) *Transport vehicles.* For each transport vehicle equipped with vapor collection equipment that is loaded at a transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, you must comply with paragraph (d)(1) of this section. For each transport vehicle without vapor collection equipment that is loaded at a transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, you must comply with paragraph (d)(2) of this section.

* * * * *

(e) *Operating limits.* For each high throughput transfer rack, you must meet each operating limit in Table 3 to this subpart for each control device used to comply with the provisions of this subpart whenever emissions from the loading of organic liquids are routed to the control device. For each storage tank and low throughput transfer rack, you must comply with the requirements for monitored parameters as specified in subpart SS of this part for storage vessels and, during the loading of organic liquids, for low throughput transfer racks, respectively. Alternatively, you may comply with the operating limits in Table 3 to this subpart.

* * * * *

■ 7. Section 63.2350 is amended by revising paragraph (c) to read as follows:

§ 63.2350 What are my general requirements for complying with this subpart?

* * * * *

(c) Except for emission sources not required to be controlled as specified in § 63.2343, you must develop a written startup, shutdown, and malfunction (SSM) plan according to the provisions in § 63.6(e)(3).

■ 8. Section 63.2354 is amended by revising paragraphs (a)(3) and (b)(3) to read as follows:

§ 63.2354 What performance tests, design evaluations, and performance evaluations must I conduct?

(a)(1) * * *

(3) For each performance evaluation of a continuous emission monitoring system (CEMS) you conduct, you must follow the requirements in § 63.8(e).

(b)(1) * * *

(3)(i) In addition to EPA Method 25 or 25A of 40 CFR part 60, appendix A, to determine compliance with the organic HAP or TOC emission limit, you may use EPA Method 18 of 40 CFR part 60, appendix A, as specified in paragraph (b)(3)(i) of this section. As an alternative to EPA Method 18, you may use ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see § 63.14), under the conditions specified in paragraph (b)(3)(ii) of this section.

(A) If you use EPA Method 18 to measure compliance with the percentage efficiency limit, you must first determine which organic HAP are present in the inlet gas stream (i.e., uncontrolled emissions) using knowledge of the organic liquids or the screening procedure described in EPA Method 18. In conducting the performance test, you must analyze samples collected as specified in EPA Method 18, simultaneously at the inlet and outlet of the control device. Quantify the emissions for the same organic HAP identified as present in the inlet gas stream for both the inlet and outlet gas streams of the control device.

(B) If you use EPA Method 18 of 40 CFR part 60, appendix A, to measure compliance with the emission concentration limit, you must first determine which organic HAP are present in the inlet gas stream using knowledge of the organic liquids or the screening procedure described in EPA Method 18. In conducting the performance test, analyze samples collected as specified in EPA Method 18 at the outlet of the control device. Quantify the control device outlet emission concentration for the same organic HAP identified as present in the inlet or uncontrolled gas stream.

(ii) You may use ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see § 63.14), as an alternative to EPA Method 18 if the target concentration is between 150 parts per billion by volume and 100 ppmv and either of the conditions specified in paragraph (b)(2)(ii)(A) or (B) of this section exists. For target compounds not listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004) and not amenable to detection by mass spectrometry, you may not use ASTM D6420–99 (Reapproved 2004).

(A) The target compounds are those listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see § 63.14),; or

(B) For target compounds not listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see § 63.14), but potentially detected by mass spectrometry, the additional system continuing calibration check after each run, as detailed in ASTM D6420–99 (Reapproved 2004), Section 10.5.3, must be followed, met, documented, and submitted with the data report, even if there is no moisture

condenser used or the compound is not considered water-soluble.

* * * * *

■ 9. Section 63.2362 is amended by revising paragraph (b)(1) to read as follows:

§ 63.2362 When must I conduct subsequent performance tests?

* * * * *

(b)(1) For each transport vehicle that you own that is equipped with vapor collection equipment and that is loaded with organic liquids at a transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, you must perform the vapor tightness testing required in Table 5 to this subpart, item 2, on that transport vehicle at least once per year.

* * * * *

■ 10. Section 63.2370 is amended by revising paragraph (c) to read as follows:

§ 63.2370 How do I demonstrate initial compliance with the emission limitations, operating limits, and work practice standards?

* * * * *

(c) You must submit the results of the initial compliance determination in the Notification of Compliance Status according to the requirements in § 63.2382(d).

■ 11. Section 63.2382 is amended by revising paragraphs (d)(2)(iv), (v), (vi), (vii), and (viii) to read as follows:

§ 63.2382 What notifications must I submit and when and what information should be submitted?

* * * * *

(d) * * *

(2) * * *

(iv) Descriptions of worst-case operating and/or testing conditions for the control device(s).

(v) Identification of emission sources subject to overlapping requirements described in § 63.2396 and the authority under which you will comply.

(vi) The applicable information specified in § 63.1039(a)(1) through (3) for all pumps and valves subject to the work practice standards for equipment leak components in Table 4 to this subpart, item 4.

(vii) If you are complying with the vapor balancing work practice standard for transfer racks according to Table 4 to this subpart, item 3.a, include a statement to that effect and a statement that the pressure vent settings on the affected storage tanks are greater than or equal to 2.5 psig.

(viii) The information specified in § 63.2386(c)(10)(i), unless the information has already been submitted with the first Compliance report. If the information specified in § 63.2386(c)(10)(i) has already been submitted with the first Compliance report, the information specified in § 63.2386(d)(3) and (4), as applicable, shall be submitted instead.

■ 12. Section 63.2386 is amended by:

■ a. Revising paragraph (b)(3);

■ b. Revising paragraph (c)(4);

■ c. Revising paragraphs (c)(9) and (c)(10);

■ d. Revising paragraph (d) introductory text;

■ e. Removing paragraph (d)(3); and

■ f. Adding new paragraphs (d)(3) and (d)(4) to read as follows:

§ 63.2386 What reports must I submit and when and what information is to be submitted in each?

* * * * *

(b) * * *

(3) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent Compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) and (2) of this section.

(c) * * *

(4) Any changes to the information listed in § 63.2382(d)(2) that have occurred since the submittal of the Notification of Compliance Status.

* * * * *

(9) A listing of all transport vehicles into which organic liquids were loaded at transfer racks that are subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, during the previous 6 months for which vapor tightness documentation as required in § 63.2390(c) was not on file at the facility.

(10)(i) A listing of all transfer racks (except those racks at which only unloading of organic liquids occurs) and of tanks greater than or equal to 18.9 cubic meters (5,000 gallons) that are part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart.

(ii) If the information specified in paragraph (c)(10)(i) of this section has already been submitted with the Notification of Compliance Status, the information specified in paragraphs (d)(3) and (4) of this section, as applicable, shall be submitted instead.

(d) *Subsequent Compliance reports.* Subsequent Compliance reports must contain the information in paragraphs (c)(1) through (9) of this section and, where applicable, the information in paragraphs (d)(1) through (4) of this section.

* * * * *

(3)(i) A listing of any storage tank that became subject to controls based on the criteria for control specified in Table 2 to this subpart, items 1 through 6, since the filing of the last Compliance report.

(ii) A listing of any transfer rack that became subject to controls based on the criteria for control specified in Table 2 to this subpart, items 7 through 10, since the filing of the last Compliance report.

(4)(i) A listing of tanks greater than or equal to 18.9 cubic meters (5,000 gallons) that became part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart, since the last Compliance report.

(ii) A listing of all transfer racks (except those racks at which only the unloading of organic liquids occurs) that became part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart, since the last Compliance report.

* * * * *

■ 13. Section 63.2390 is amended by:

■ a. Revising paragraphs (a) and (b);

■ b. Revising paragraph (c) introductory text;

■ c. Redesignating paragraph (c)(3) as paragraph (d);

■ d. Adding a new paragraph (c)(3);

■ e. Revising newly designated paragraph (d); and

■ f. Adding a new paragraph (e) to read as follows:

§ 63.2390 What records must I keep?

(a) For each emission source identified in § 63.2338 that does not require control under this subpart, you must keep all records identified in § 63.2343.

(b) For each emission source identified in § 63.2338 that does require control under this subpart:

(1) You must keep all records identified in subpart SS of this part and in Table 12 to this subpart that are applicable, including records related to notifications and reports, SSM, performance tests, CMS, and performance evaluation plans; and

(2) You must keep the records required to show continuous compliance, as required in subpart SS of this part and in Tables 8 through 10 to this subpart, with each emission limitation, operating limit, and work practice standard that applies to you.

(c) For each transport vehicle into which organic liquids are loaded at a transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, you must keep the applicable records in paragraphs (c)(1) and (2) of this section or alternatively the verification records in paragraph (c)(3) of this section.

* * * * *

(3) In lieu of keeping the records specified in paragraph (c)(1) or (2) of this section, as applicable, the owner or operator shall record that the verification of U.S. DOT tank certification or Method 27 of appendix A to 40 CFR part 60 testing, required in Table 5 to this subpart, item 2, has been performed. Various methods for the record of verification can be used, such as: A check-off on a log sheet, a list of U.S. DOT serial numbers or Method 27 data, or a position description for gate security showing that the security guard will not allow any trucks on site that do not have the appropriate documentation.

(d) You must keep records of the total actual annual facility-level organic liquid loading volume as defined in § 63.2406 through transfer racks to document the applicability, or lack thereof, of the emission limitations in Table 2 to this subpart, items 7 through 10.

(e) An owner or operator who elects to comply with § 63.2346(a)(4) shall keep the records specified in paragraphs (e)(1) through (3) of this section.

(1) A record of the U.S. DOT certification required by § 63.2346(a)(4)(ii).

(2) A record of the pressure relief vent setting specified in § 63.2348(a)(4)(v).

(3) If complying with § 63.2348(a)(4)(vi)(B), keep the records specified in paragraphs (e)(3)(i) and (ii) of this section.

(i) A record of the equipment to be used and the procedures to be followed when reloading the cargo tank or tank car and displacing vapors to the storage tank from which the liquid originates.

(ii) A record of each time the vapor balancing system is used to comply with § 63.2348(a)(4)(vi)(B).

■ 14. Section 63.2394 is amended by revising paragraph (a) to read as follows:

§ 63.2394 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious inspection and review according to § 63.10(b)(1), including records stored in electronic form at a separate location.

* * * * *

■ 15. Section 63.2396 is amended by revising paragraphs (a), (b), and (e) to read as follows:

§ 63.2396 What compliance options do I have if part of my plant is subject to both this subpart and another subpart?

(a) *Compliance with other regulations for storage tanks.*

(1) After the compliance dates specified in § 63.2342, you are in compliance with the provisions of this subpart for any storage tank that is assigned to the OLD affected source and that is both controlled with a floating roof and is in compliance with the provisions of either 40 CFR part 60, subpart Kb, or 40 CFR part 61, subpart Y, except that records shall be kept for 5 years rather than 2 years for storage tanks that are assigned to the OLD affected source.

(2) After the compliance dates specified in § 63.2342, you are in compliance with the provisions of this subpart for any storage tank with a fixed roof that is assigned to the OLD affected source and that is both controlled with a closed vent system and control device and is in compliance with either 40 CFR part 60, subpart Kb, or 40 CFR part 61, subpart Y, except that you must comply with the monitoring, recordkeeping, and reporting requirements in this subpart.

(3) As an alternative to paragraphs (a)(1) and (2) of this section, if a storage tank assigned to the OLD affected source is subject to control under 40 CFR part 60, subpart Kb, or 40 CFR part 61, subpart Y, you may elect to comply only with the requirements of this subpart for storage tanks meeting the applicability criteria for control in Table 2 to this subpart.

(b) *Compliance with other regulations for transfer racks.* After the compliance dates specified in § 63.2342, if you have a transfer rack that is subject to 40 CFR part 61, subpart BB, and that transfer rack is in OLD operation, you must meet all of the requirements of this subpart for that transfer rack when the transfer rack is in OLD operation during the loading of organic liquids.

* * * * *

(e) *Overlap with other regulations for monitoring, recordkeeping, and reporting.*

(1) *Control devices.* After the compliance dates specified in § 63.2342, if any control device subject to this subpart is also subject to monitoring, recordkeeping, and reporting requirements of another 40 CFR part 63 subpart, the owner or operator must be in compliance with the monitoring, recordkeeping, and reporting requirements of this subpart EEEE. If complying with the monitoring, recordkeeping, and reporting requirements of the other subpart satisfies the monitoring, recordkeeping, and reporting requirements of this subpart, the owner or operator may elect to continue to comply with the monitoring, recordkeeping, and reporting requirements of the other subpart. In such instances, the owner or operator will be deemed to be in compliance with the monitoring, recordkeeping, and reporting requirements of this subpart. The owner or operator must identify the other subpart being complied with in the Notification of Compliance Status required by § 63.2382(b).

(2) *Equipment leak components.* After the compliance dates specified in § 63.2342, if you are applying the applicable recordkeeping and reporting requirements of another 40 CFR part 63 subpart to the valves, pumps, and sampling connection systems associated with a transfer rack subject to this subpart that only unloads organic liquids directly to or via pipeline to a non-tank process unit component or to a storage tank subject to the other 40 CFR part 63 subpart, the owner or operator must be in compliance with the recordkeeping and reporting requirements of this subpart EEEE. If complying with the recordkeeping and reporting requirements of the other subpart satisfies the recordkeeping and reporting requirements of this subpart, the owner or operator may elect to continue to comply with the recordkeeping and reporting requirements of the other subpart. In such instances, the owner or operator will be deemed to be in compliance with the recordkeeping and reporting requirements of this subpart. The owner or operator must identify the other subpart being complied with in the Notification of Compliance Status required by § 63.2382(b).

■ 16. Section 63.2402 is amended by revising paragraphs (b)(2), (b)(3), and (b)(4) to read as follows:

§ 63.2402 Who implements and enforces this subpart?

* * * * *

(b) * * *

(2) Approval of major changes to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major changes to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

■ 17. Section 63.2406 is amended by:

■ a. Revising the introductory text;

■ b. Revising the definitions of "Annual average true vapor pressure," "Shutdown," "Startup," paragraph (3) in the definition of "Storage tank," "Transfer rack," "Vapor balancing system," and "Vapor collection system;" and

■ c. Adding in alphabetical order definitions for "Bottoms receiver," "High throughput transfer rack," "Low throughput transfer rack," "Surge control vessel," and "Total actual annual facility-level organic liquid loading volume" to read as follows:

§ 63.2406 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in § 63.2, 40 CFR part 63, subparts H, PP, SS, TT, UU, and WW, and in this section. If the same term is defined in another subpart and in this section, it will have the meaning given in this section for purposes of this subpart. Notwithstanding the introductory language in § 63.921, the terms "container" and "safety device" shall have the meaning found in this subpart and not in § 63.921.

* * * * *

Annual average true vapor pressure means the equilibrium partial pressure exerted by the total Table 1 organic HAP in the stored or transferred organic liquid. For the purpose of determining if a liquid meets the definition of an organic liquid, the vapor pressure is determined using standard conditions of 77 degrees F and 29.92 inches of mercury. For the purpose of determining whether an organic liquid meets the applicability criteria in Table 2, items 1 through 6, to this subpart, use the actual annual average temperature as defined in this subpart. The vapor pressure value in either of these cases is determined:

(1) In accordance with methods described in American Petroleum Institute Publication 2517, Evaporative Loss from External Floating-Roof Tanks (incorporated by reference, see § 63.14);

(2) Using standard reference texts;

(3) By the American Society for Testing and Materials Method D2879–83, 96 (incorporated by reference, see § 63.14); or

(4) Using any other method that the EPA approves.

* * * * *

Bottoms receiver means a tank that collects distillation bottoms before the stream is sent for storage or for further processing downstream.

* * * * *

High throughput transfer rack means those transfer racks that transfer into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) a total of 11.8 million liters per year or greater of organic liquids.

* * * * *

Low throughput transfer rack means those transfer racks that transfer into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) less than 11.8 million liters per year of organic liquids.

* * * * *

Shutdown means the cessation of operation of an OLD affected source, or portion thereof (other than as part of normal operation of a batch-type operation), including equipment required or used to comply with this subpart, or the emptying and degassing of a storage tank. Shutdown as defined here includes, but is not limited to, events that result from periodic maintenance, replacement of equipment, or repair.

Startup means the setting in operation of an OLD affected source, or portion thereof (other than as part of normal operation of a batch-type operation), for any purpose. Startup also includes the placing in operation of any individual piece of equipment required or used to comply with this subpart including, but not limited to, control devices and monitors.

Storage tank * * *

(3) Bottoms receivers;

* * * * *

Surge control vessel means feed drums, recycle drums, and intermediate vessels. Surge control vessels are used within chemical manufacturing processes when in-process storage, mixing, or management of flow rates or volumes is needed to assist in production of a product.

* * * * *

Total actual annual facility-level organic liquid loading volume means the total facility-level actual volume of organic liquid loaded for transport within or out of the facility through transfer racks that are part of the affected source into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) based on a 3-year rolling average, calculated annually.

(1) For existing affected sources, each 3-year rolling average is based on actual facility-level loading volume during each calendar year (January 1 through December 31) in the 3-year period. For calendar year 2004 only (the first year of the initial 3-year rolling average), if an owner or operator of an affected source does not have actual loading volume data for the time period from January 1, 2004, through February 2, 2004 (the time period prior to the effective date of the OLD NESHAP), the owner or operator shall compute a facility-level loading volume for this time period as follows: At the end of the 2004 calendar year, the owner or operator shall calculate a daily average facility-level loading volume (based on the actual loading volume for February 3, 2004, through December 31, 2004) and use that daily average to estimate the facility-level loading volume for the period of time from January 1, 2004, through February 2, 2004. The owner or operator shall then sum the estimated facility-level loading volume from January 1, 2004, through February 2, 2004, and the actual facility-level loading volume from February 3, 2004, through December 31, 2004, to calculate the annual facility-level loading volume for calendar year 2004.

(2)(i) For new affected sources, the 3-year rolling average is calculated as an average of three 12-month periods. An owner or operator must select as the beginning calculation date with which to start the calculations as either the initial startup date of the new affected source or the first day of the calendar month following the month in which startup occurs. Once selected, the date with which the calculations begin cannot be changed.

(ii) The initial 3-year rolling average is based on the projected maximum facility-level annual loading volume for each of the 3 years following the selected beginning calculation date. The second 3-year rolling average is based on actual facility-level loading volume for the first year of operation plus a new projected maximum facility-level annual loading volume for second and third years following the selected beginning calculation date. The third 3-year rolling average is based on actual facility-level loading volume for the first 2 years of operation plus a new projected maximum annual facility-level loading volume for the third year following the beginning calculation date. Subsequent 3-year rolling averages are based on actual facility-level loading volume for each year in the 3-year rolling average.

* * * * *

Transfer rack means a single system used to load organic liquids into, or unload organic liquids out of, transport vehicles or containers. It includes all loading and unloading arms, pumps, meters, shutoff valves, relief valves, and other piping and equipment necessary for the transfer operation. Transfer equipment and operations that are physically separate (i.e., do not share

common piping, valves, and other equipment) are considered to be separate transfer racks.

* * * * *

Vapor balancing system means: (1) A piping system that collects organic HAP vapors displaced from transport vehicles or containers during loading and routes the collected vapors to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header. For containers, the piping system must route the displaced vapors directly to the appropriate storage tank or to another storage tank connected to a common header in order to qualify as a vapor balancing system; or (2) a piping system that collects organic HAP vapors displaced from the loading of a storage tank and routes the collected vapors to the transport vehicle from which the storage tank is filled.

Vapor collection system means any equipment located at the source (i.e., at the OLD operation) that is not open to the atmosphere; that is composed of piping, connections, and, if necessary, flow-inducing devices; and that is used for:

(1) Containing and conveying vapors displaced during the loading of transport vehicles to a control device;

(2) Containing and directly conveying vapors displaced during the loading of containers; or

(3) Vapor balancing. This does not include any of the vapor collection equipment that is installed on the transport vehicle.

■ 18. Table 1 to subpart EEEE of part 63 is amended by removing the entry for methyl ethyl ketone (2-Butanone) (MEK).

■ 19. Table 2 to subpart EEEE of part 63 is amended by revising entries 1, 6, 7, 8, 9, and 10 to read as follows:

TABLE 2 TO SUBPART EEEE OF PART 63.—EMISSION LIMITS

* * * * * * *

If you own or operate . . .	And if . . .	Then you must . . .
1. A storage tank at an existing affected source with a capacity ≥18.9 cubic meters (5,000 gallons) and <189.3 cubic meters (50,000 gallons).	a. The stored organic liquid is not crude oil and if the annual average true vapor pressure of the total Table 1 organic HAP in the stored organic liquid is ≥27.6 kilopascals (4.0 psia) and <76.6 kilopascals (11.1 psia).	i. Reduce emissions of total organic HAP (or, upon approval, TOC) by at least 95 weight-percent or, as an option, to an exhaust concentration less than or equal to 20 ppmv, on a dry basis corrected to 3 percent oxygen for combustion devices using supplemental combustion air, by venting emissions through a closed vent system to any combination of control devices meeting the applicable requirements of 40 CFR part 63, subpart SS; OR ii. Comply with the work practice standards specified in Table 4 to this subpart, items 1.a, 1.b, or 1.c for tanks storing liquids described in that table.
	b. The stored organic liquid is crude oil	i. See the requirement in item 1.a.i or 1.a.ii of this table.
* *	* * *	* *
6. A storage tank at an existing, reconstructed, or new affected source meeting the capacity criteria specified in Table 2 of this subpart, items 1 through 5.	a. The stored organic liquid is not crude oil and if the annual average true vapor pressure of the total Table 1 organic HAP in the stored organic liquid is ≥76.6 kilopascals (11.1 psia).	i. Reduce emissions of total organic HAP (or, upon approval, TOC) by at least 95 weight-percent or, as an option, to an exhaust concentration less than or equal to 20 ppmv, on a dry basis corrected to 3 percent oxygen for combustion devices using supplemental combustion air, by venting emissions through a closed vent system to any combination of control devices meeting the applicable requirements of 40 CFR part 63, subpart SS; OR ii. Comply with the work practice standards specified in Table 4 to this subpart, item 2.a, for tanks storing the liquids described in that table.
7. A transfer rack at an existing facility where the total actual annual facility-level organic liquid loading volume through transfer racks is equal to or greater than 800,000 gallons and less than 10 million gallons.	a. The total Table 1 organic HAP content of the organic liquid being loaded through one or more of the transfer rack's arms is at least 98 percent by weight and is being loaded into a transport vehicle.	i. For all such loading arms at the rack, reduce emissions of total organic HAP (or, upon approval, TOC) from the loading of organic liquids either by venting the emissions that occur during loading through a closed vent system to any combination of control devices meeting the applicable requirements of 40 CFR part 63, subpart SS, achieving at least 98 weight-percent HAP reduction, OR, as an option, to an exhaust concentration less than or equal to 20 ppmv, on a dry basis corrected to 3 percent oxygen for combustion devices using supplemental combustion air; OR ii. During the loading of organic liquids, comply with the work practice standards specified in item 3 of Table 4 to this subpart.

TABLE 2 TO SUBPART EEEE OF PART 63.—EMISSION LIMITS—Continued

If you own or operate . . .	And if . . .	Then you must . . .
8. A transfer rack at an existing facility where the total actual annual facility-level organic liquid loading volume through transfer racks is ≥10 million gallons..	a. One or more of the transfer rack's arms is loading an organic liquid into a transport vehicle.	i. See the requirements in items 7.a.i and 7.a.ii of this table.
9. A transfer rack at a new facility where the total actual annual facility-level organic liquid loading volume through transfer racks is less than 800,000 gallons.	a. The total Table 1 organic HAP content of the organic liquid being loaded through one or more of the transfer rack's arms is at least 25 percent by weight and is being loaded into a transport vehicle.	i. See the requirements in items 7.a.i and 7.a.ii of this table.
	b. One or more of the transfer rack's arms is filling a container with a capacity equal to or greater than 55 gallons.	i. For all such loading arms at the rack during the loading of organic liquids, comply with the provisions of §§63.924 through 63.927 of 40 CFR part 63, Subpart PP—National Emission Standards for Containers, Container Level 3 controls; OR ii. During the loading of organic liquids, comply with the work practice standards specified in item 3.a of Table 4 to this subpart.
10. A transfer rack at a new facility where the total actual annual facility-level organic liquid loading volume through transfer racks is equal to or greater than 800,000 gallons.	a. One or more of the transfer rack's arms is loading an organic liquid into a transport vehicle.	i. See the requirements in items 7.a.i and 7.a.ii of this table.
	b. One or more of the transfer rack's arms is filling a container with a capacity equal to or greater than 55 gallons.	i. For all such loading arms at the rack during the loading of organic liquids, comply with the provisions of §§63.924 through 63.927 of 40 CFR part 63, Subpart PP—National Emission Standards for Containers, Container Level 3 controls; OR ii. During the loading of organic liquids, comply with the work practice standards specified in item 3.a of Table 4 to this subpart.

■ 20. Table 3 to subpart EEEE of part 63 is amended by revising entries 3, 5, 6, and 8 to read as follows:

TABLE 3 TO SUBPART EEEE OF PART 63.—OPERATING LIMITS—HIGH THROUGHPUT TRANSFER RACKS

For each existing, each reconstructed, and each new affected source using . . .	You must . . .
3. An absorber to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds in the absorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR b. Maintain the daily average scrubbing liquid temperature less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND Maintain the difference between the specific gravities of the saturated and fresh scrubbing fluids greater than or equal to the difference established during the design evaluation or performance test that demonstrated compliance with the emission limit.
5. An adsorption system with adsorbent regeneration to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds in the adsorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR b. Maintain the total regeneration stream mass flow during the adsorption bed regeneration cycle greater than or equal to the reference stream mass flow established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND

TABLE 3 TO SUBPART EEEE OF PART 63.—OPERATING LIMITS—HIGH THROUGHPUT TRANSFER RACKS—Continued

For each existing, each reconstructed, and each new affected source using . . .	You must . . .
6. An adsorption system without adsorbent regeneration to comply with an emission limit in Table 2 to this subpart.	Before the adsorption cycle commences, achieve and maintain the temperature of the adsorption bed after regeneration less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND Achieve a pressure reduction during each adsorption bed regeneration cycle greater than or equal to the pressure reduction established during the design evaluation or performance test that demonstrated compliance with the emission limit. a. Maintain the daily average concentration level of organic compounds in the adsorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR b. Replace the existing adsorbent in each segment of the bed with an adsorbent that meets the replacement specifications established during the design evaluation or performance test before the age of the adsorbent exceeds the maximum allowable age established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND Maintain the temperature of the adsorption bed less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit.
* * * * * * *	
8. Another type of control device to comply with an emission limit in Table 2 to this subpart.	Submit a monitoring plan as specified in §§ 63.995(c) and 63.2366(b), and monitor the control device in accordance with that plan.

■ 21. Table 4 to subpart EEEE to part 63 is revised to read as follows:

TABLE 4 TO SUBPART EEEE OF PART 63.—WORK PRACTICE STANDARDS

[As stated in § 63.2346, you may elect to comply with one of the work practice standards for existing, reconstructed, or new affected sources in the following table. If you elect to do so, . . .]

For each . . .	You must . . .
1. Storage tank at an existing, reconstructed, or new affected source meeting any set of tank capacity and organic HAP vapor pressure criteria specified in Table 2 to this subpart, items 1 through 5.	a. Comply with the requirements of 40 CFR part 63, subpart WW (control level 2), if you elect to meet 40 CFR part 63, subpart WW (control level 2) requirements as an alternative to the emission limit in Table 2 to this subpart, items 1 through 5; OR b. Comply with the requirements of § 63.984 for routing emissions to a fuel gas system or back to a process; OR c. Comply with the requirements of § 63.2346(a)(4) for vapor balancing emissions to the transport vehicle from which the storage tank is filled.
2. Storage tank at an existing, reconstructed, or new affected source meeting any set of tank capacity and organic HAP vapor pressure criteria specified in Table 2 to this subpart, item 6.	a. Comply with the requirements of § 63.984 for routing emissions to a fuel gas system or back to a process; OR b. Comply with the requirements of § 63.2346(a)(4) for vapor balancing emissions to the transport vehicle from which the storage tank is filled.
3. Transfer rack subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	a. If the option of a vapor balancing system is selected, install and, during the loading of organic liquids, operate a system that meets the requirements in Table 7 to this subpart, item 3.b.i and item 3.b.ii, as applicable; OR b. Comply with the requirements of § 63.984 during the loading of organic liquids, for routing emissions to a fuel gas system or back to a process.
4. Pump, valve, and sampling connection that operates in organic liquids service at least 300 hours per year at an existing, reconstructed, or new affected source.	Comply with the requirements for pumps, valves, and sampling connections in 40 CFR part 63, subpart TT (control level 1), subpart UU (control level 2), or subpart H.
5. Transport vehicles equipped with vapor collection equipment that are loaded at transfer racks that are subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10.	Follow the steps in 40 CFR 60.502(e) to ensure that organic liquids are loaded only into vapor-tight transport vehicles, and comply with the provisions in 40 CFR 60.502(f), (g), (h), and (i), except substitute the term transport vehicle at each occurrence of tank truck or gasoline tank truck in those paragraphs.

TABLE 4 TO SUBPART EEEE OF PART 63.—WORK PRACTICE STANDARDS—Continued

[As stated in § 63.2346, you may elect to comply with one of the work practice standards for existing, reconstructed, or new affected sources in the following table. If you elect to do so, . . .]

For each . . .	You must . . .
6. Transport vehicles equipped without vapor collection equipment that are loaded at transfer racks that are subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10.	Ensure that organic liquids are loaded only into transport vehicles that have a current certification in accordance with the U.S. DOT pressure test requirements in 49 CFR 180 (cargo tanks) or 49 CFR 173.31 (tank cars).

■ 22. Table 5 to subpart EEEE of part 63 is revised to read as follows:

TABLE 5 TO SUBPART EEEE OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS AND DESIGN EVALUATIONS

[As stated in §§ 63.2354(a) and 63.2362, you must comply with the requirements for performance tests and design evaluations for existing, reconstructed, or new affected sources as follows:]

For . . .	You must conduct . . .	According to . . .	Using . . .	To determine . . .	According to the following requirements . . .
1. Each existing, each reconstructed, and each new affected source using a nonflare control device to comply with an emission limit in Table 2 to this subpart, items 1 through 10.	a. A performance test to determine the organic HAP (or, upon approval, TOC) control efficiency of each nonflare control device, OR the exhaust concentration of each combustion device; OR	i. § 63.985(b)(1)(ii), § 63.988(b), § 63.990(b), or § 63.995(b).	(1) EPA Method 1 or 1A in appendix A of 40 CFR part 60, as appropriate.	(A) Sampling port locations and the required number of traverse points.	(i) Sampling sites must be located at the inlet and outlet of each control device if complying with the control efficiency requirement or at the outlet of the control device if complying with the exhaust concentration requirement; AND (ii) The outlet sampling site must be located at each control device prior to any releases to the atmosphere.
			(2) EPA Method 2, 2A, 2C, 2D, 2F, or 2G in appendix A of 40 CFR part 60, as appropriate.	(A) Stack gas velocity and volumetric flow rate.	See the requirements in items 1.a.i.(1)(A)(i) and (ii) of this table.
			(3) EPA Method 3 or 3B in appendix A of 40 CFR part 60, as appropriate.	(A) Concentration of CO_2 and O_2 and dry molecular weight of the stack gas.	See the requirements in items 1.a.i.(1)(A)(i) and (ii) of this table.
			(4) EPA Method 4 in appendix A of 40 CFR part 60.	(A) Moisture content of the stack gas.	See the requirements in items 1.a.i.(1)(A)(i) and (ii) of this table.

TABLE 5 TO SUBPART EEEE OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS AND DESIGN EVALUATIONS—Continued

[As stated in §§ 63.2354(a) and 63.2362, you must comply with the requirements for performance tests and design evaluations for existing, reconstructed, or new affected sources as follows:]

For . . .	You must conduct . . .	According to . . .	Using . . .	To determine . . .	According to the following requirements . . .
			(5) EPA Method 18, 25, or 25A in appendix A of 40 CFR part 60, as appropriate, or EPA Method 316 in appendix A of 40 CFR part 63 for measuring formaldehyde.	(A) Total organic HAP (or, upon approval, TOC), or formaldehyde emissions.	(i) The organic HAP used for the calibration gas for EPA Method 25A must be the single organic HAP representing the largest percent by volume of emissions; AND (ii) During the performance test, you must establish the operating parameter limits within which total organic HAP (or, upon approval, TOC) emissions are reduced by the required weight-percent or, as an option for nonflare combustion devices, to 20 ppmv exhaust concentration.
		b. A design evaluation (for nonflare control devices) to determine the organic HAP (or, upon approval, TOC) control efficiency of each nonflare control device, or the exhaust concentration of each combustion control device..	§ 63.985(b)(1)(i).	.....	During a design evaluation, you must establish the operating parameter limits within which total organic HAP, (or, upon approval, TOC) emissions are reduced by at least 95 weight-percent for storage tanks or 98 weight-percent for transfer racks, or, as an option for nonflare combustion devices, to 20 ppmv exhaust concentration.
2. Each transport vehicle that you own that is equipped with vapor collection equipment and is loaded with organic liquids at a transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	A performance test to determine the vapor tightness of the tank and then repair as needed until it passes the test..	.....	EPA Method 27 in appendix A of 40 CFR part 60.	Vapor tightness	The pressure change in the tank must be no more than 250 pascals (1 inch of water) in 5 minutes after it is pressurized to 4,500 pascals (18 inches of water).

■ 23. The text of the table in Table 6 to subpart EEEE of part 63 is revised to read as follows:

TABLE 6 TO SUBPART EEEE OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITS

* * * * * * *

For each . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
1. Storage tank at an existing, reconstructed, or new affected source meeting either set of tank capacity and liquid organic HAP vapor pressure criteria specified in Table 2 to this subpart, items 1 through 6.	Reduce total organic HAP (or, upon approval, TOC) emissions by at least 95 weight-percent, or as an option for combustion devices to an exhaust concentration of ≤20 ppmv.	Total organic HAP (or, upon approval, TOC) emissions, based on the results of the performance testing or design evaluation specified in Table 5 to this subpart, item 1.a or 1.b, respectively, are reduced by at least 95 weight-percent or as an option for nonflare combustion devices to an exhaust concentration ≤20 ppmv.
2. Transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	Reduce total organic HAP (or, upon approval, TOC) emissions from the loading of organic liquids by at least 98 weight-percent, or as an option for nonflare combustion devices to an exhaust concentration of ≤20 ppmv.	Total organic HAP (or, upon approval, TOC) emissions from the loading of organic liquids, based on the results of the performance testing or design evaluation specified in Table 5 to this subpart, item 1.a or 1.b, respectively, are reduced by at least 98 weight-percent or as an option for nonflare combustion devices to an exhaust concentration of ≤20 ppmv.

■ 24. Table 7 to subpart EEEE of part 63 is revised to read as follows:

TABLE 7 TO SUBPART EEEE OF PART 63.—INITIAL COMPLIANCE WITH WORK PRACTICE STANDARDS

For each . . .	If you . . .	You have demonstrated initial compliance if . . .
1. Storage tank at an existing affected source meeting either set of tank capacity and liquid organic HAP vapor pressure criteria specified in Table 2 to this subpart, items 1 or 2.	a. Install a floating roof or equivalent control that meets the requirements in Table 4 to this subpart, item 1.a.	i. After emptying and degassing, you visually inspect each internal floating roof before the refilling of the storage tank and perofrm seal gap inspections of the primary and secondary rim seals of each external floating roof within 90 days after the refilling of the storage tank.
	b. Route emissions to a fuel gas system or back to a process.	i. You meet the requirements in §63.984(b) and submit the statement of connection required by §63.984(c).
	c. Install and, during the filling of the storage tank with organic liquids, operate a vapor balancing system.	i. You meet the requirements in §3.2346(a)(4).
2. Storage tank at a reconstructed or new affected source meeting any set of tank capacity and liquid organic HAP vapor pressure criteria specified in Table 2 to this subpart, items 3 through 5.	a. Install a floating roof or equivalent control that meets the requirements in Table 4 to this subpart, item 1.a.	i. You visually inspect each internal floating roof before the initial filling of the storage tank, and perform seal gap inspections of the priamry and secondary rim seals of each external floating roof within 90 days after the initial filling of the storage tank.
	b. Route emissions to a fuel gas system or back to a process.	i. See item 1.b.i of this table.
	c. Install and, during the filling of the storage tank with organic liquids, operate a vapor balancing system.	i. See item 1.c.i of this table.
3. Transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	a. Load organic liquids only into transport vehicles having current vapor tightness certification as described in Table 4 to this subpart, item 5 and item 6.	i. You comply with the provisions specified in Table 4 to this subpart, item 5 or item 6, as applicable.

TABLE 7 TO SUBPART EEEE OF PART 63.—INITIAL COMPLIANCE WITH WORK PRACTICE STANDARDS—Continued

For each . . .	If you . . .	You have demonstrated initial compliance if . . .
	b. Install and, during the loading of organic liquids, operate a vapor balancing system.	i. You design and operate the vapor balancing system to route organic HAP vapors displaced from loading of organic liquids into transport vehicles to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header. ii. You design and operate the vapor balancing system to route organic HAP vapors displaced from loading of organic liquids into containers directly (e.g., no intervening tank or containment area such as a room) to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header.
	c. Route emissions to a fuel gas system or back to a process.	i. See item 1.b.i of this table.
4. Equipment leak component, as defined in § 63.2406, that operates in organic liquids service ≥300 hours per year at an existing, reconstructed, or new affected source.	a. Carry out a leak detection and repair program or equivalent control according to one of the subparts listed in Table 4 to this subpart, item 4.a.	i. You specify which one of the control programs listed in Table 4 to this subpart you have selected, OR ii. Provide written specifications for your equivalent control approach.

■ 25. Table 8 to subpart EEEE of part 63 is revised to read as follows:

TABLE 8 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITS

[As stated in §§ 63.2378(a) and (b) and 63.2390(b), you must show continuous compliance with the emission limits for existing, reconstructed, or new affected sources according to the following table:]

For each . . .	For the following emission limit . . .	You must demonstrate continuous compliance by . . .
1. Storage tank at an existing, reconstructed, or new affected source meeting any set of tank capacity and liquid organic HAP vapor pressure criteria specified in Table 2 to this subpart, items 1 through 6.	a. Reduce total organic HAP (or, upon approval, TOC) emissions from the closed vent system and control device by 95 weight-percent or greater, or as an option to 20 ppmv or less of total organic HAP (or, upon approval, TOC) in the exhaust of combustion devices.	i. Performing CMS monitoring and collecting data according to §§ 63.2366, 63.2374, and 63.2378; AND ii. Maintaining the operating limits established during the design evaluation or performance test that demonstrated compliance with the emission limit.
2. Transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	a. Reduce total organic HAP (or, upon approval, TOC) emissions during the loading of organic liquids from the closed vent system and control device by 98 weight-percent or greater, or as an option to 20 ppmv or less of total organic HAP (or, upon approval, TOC) in the exhaust of combustion devices.	i. Performing CMS monitoring and collecting data according to §§ 63.2366, 63.2374, and 63.2378 during the loading of organic liquids; AND ii. Maintaining the operating limits established during the design evaluation or performance test that demonstrated compliance with the emission limit during the loading of organic liquids.

■ 26. Table 9 to subpart EEEE of part 63 is amended by revising entries 2, 3, 4, 5, 6, and 7 to read as follows:

TABLE 9 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH OPERATING LIMITS—HIGH THROUGHPUT TRANSFER RACKS

* * * * * * *

For each existing, reconstructed, and each new affected source using . . .	For the following operating limit . . .	You must demonstrate continuous compliance by . . .
* *	* * *	* *
2. A catalytic oxidizer to comply with an emission limit in Table 2 to this subpart.	a. Replace the existing catalyst bed before the age of the bed exceeds the maximum allowable age established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND	i. Replacing the existing catalyst bed before the age of the bed exceeds the maximum allowable age established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
	b. Maintain the daily average temperature at the inlet of the catalyst bed greater than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND	i. Continuously monitoring and recording the temperature at the inlet of the catalyst bed at least every 15 minutes and maintaining the daily average temperature at the inlet of the catalyst bed greater than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
	c. Maintain the daily average temperature difference across the catalyst bed greater than or equal to the minimum temperature difference established during the design evaluation or performance test that demonstrated compliance with the emission limit.	i. Continuously monitoring and recording the temperature at the outlet of the catalyst bed every 15 minutes and maintaining the daily average temperature difference across the catalyst bed greater than or equal to the minimum temperature difference established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
3. An absorber to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds in the absorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR	i. Continuously monitoring the organic concentration in the absorber exhaust and maintaining the daily average concentration less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
	b. Maintain the daily average scrubbing liquid temperature less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND Maintain the difference between the specific gravities of the saturated and fresh scrubbing fluids greater than or equal to the difference established during the design evaluation or performance test that demonstrated compliance with the emission limit.	i. Continuously monitoring the scrubbing liquid temperature and maintaining the daily average temperature less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Maintaining the difference between the specific gravities greater than or equal to the difference established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND iii. Keeping the applicable records required in § 63.998.
4. A condenser to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds at the exit of the condenser less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR	i. Continuously monitoring the organic concentration at the condenser exit and maintaining the daily average concentration less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.

TABLE 9 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH OPERATING LIMITS—HIGH THROUGHPUT TRANSFER RACKS—Continued

* * * * * * *

For each existing, reconstructed, and each new affected source using . . .	For the following operating limit . . .	You must demonstrate continuous compliance by . . .
	b. Maintain the daily average condenser exit temperature less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit.	i. Continuously monitoring and recording the temperature at the exit of the condenser at least every 15 minutes and maintaining the daily average temperature less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
5. An adsorption system with adsorbent regeneration to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds in the adsorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR	i. Continuously monitoring the daily average organic concentration in the adsorber exhaust and maintaining the concentration less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
	b. Maintain the total regeneration stream mass flow during the adsorption bed regeneration cycle greater than or equal to the reference stream mass flow established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND	i. Maintaining the total regeneration stream mass flow during the adsorption bed regeneration cycle greater than or equal to the reference stream mass flow established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND
	Before the adsorption cycle commences, achieve and maintain the temperature of the adsorption bed after regeneration less than or equal to the reference temperature established during the design evaluation or performance test; AND	ii. Maintaining the temperature of the adsorption bed after regeneration less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND
	Achieve greater than or equal to the pressure reduction during the adsorption bed regeneration cycle established during the design evaluation or performance test that demonstrated compliance with the emission limit.	iii. Achieving greater than or equal to the pressure reduction during the regeneration cycle established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND iv. Keeping the applicable records required in § 63.998.
6. An adsorption system without adsorbent regeneration to comply with an emission limit in Table 2 to this subpart.	a. Maintain the daily average concentration level of organic compounds in the adsorber exhaust less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; OR	i. Continuously monitoring the organic concentration in the adsorber exhaust and maintaining the concentration less than or equal to the reference concentration established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND ii. Keeping the applicable records required in § 63.998.
	b. Replace the existing adsorbent in each segment of the bed before the age of the adsorbent exceeds the maximum allowable age established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND.	i. Replacing the existing adsorbent in each segment of the bed with an adsorbent that meets the replacement specifications established during the design evaluation or performance test before the age of the adsorbent exceeds the maximum allowable age established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND
	Maintain the temperature of the adsorption bed less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit.	ii. Maintaining the temperature of the adsorption bed less than or equal to the reference temperature established during the design evaluation or performance test that demonstrated compliance with the emission limit; AND iii. Keeping the applicable records required in § 63.998.

TABLE 9 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH OPERATING LIMITS—HIGH THROUGHPUT TRANSFER RACKS—Continued

For each existing, reconstructed, and each new affected source using . . .	For the following operating limit . . .	You must demonstrate continuous compliance by . . .
7. A flare to comply with an emission limit in Table 2 to this subpart.	a. Maintain a pilot flame in the flare at all times that vapors may be vented to the flare (§ 63.11(b)(5)); AND	i. Continuously operating a device that detects the presence of the pilot flame; AND ii. Keeping the applicable records required in § 63.998.
	b. Maintain a flare flame at all times that vapors are being vented to the flare (§ 63.11(b)(5)); AND	i. Maintaining a flare flame at all times that vapors are being vented to the flare; AND ii. Keeping the applicable records required in § 63.998.
	c. Operate the flare with no visible emissions, except for up to 5 minutes in any 2 consecutive hours (§ 63.11(b)(4)); AND EITHER	i. Operating the flare with no visible emissions exceeding the amount allowed; AND ii. Keeping the applicable records required in § 63.998.
	d.1. Operate the flare with an exit velocity that is within the applicable limits in § 63.11(b)(7) and (8) and with a net heating value of the gas being combusted greater than the applicable minimum value in § 63.11(b)(6)(ii); OR	i. Operating the flare within the applicable exit velocity limits; AND ii. Operating the flare with the gas heating value greater than the applicable minimum value; AND iii. Keeping the applicable records required in § 63.998.
	d.2. Adhere to the requirements in § 63.11(b)(6)(i).	i. Operating the flare within the applicable limits in 63.11(b)(6)(i); AND ii. Keeping the applicable records required in § 63.998.

■ 27. Table 10 to subpart EEEE of part 63 is amended by revising entries 1, 2, 4, 5, and 6 to read as follows:

TABLE 10 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH WORK PRACTICE STANDARDS

For each . . .	For the following standard . . .	You must demonstrate continuous compliance by . . .
1. Internal floating roof (IFR) storage tank at an existing, reconstructed, or new affected source meeting any set of tank capacity, and vapor pressure criteria specified in Table 2 to this subpart, items 1 through 5.	a. Install a floating roof designed and operated according to the applicable specifications in § 63.1063(a) and (b).	i. Visually inspecting the floating roof deck, deck fittings, and rim seals of each IFR once per year (§ 63.1063(d)(2)); AND ii. Visually inspecting the floating roof deck, deck fittings, and rim seals of each IFR either each time the storage tank is completely emptied and degassed or every 10 years, whichever occurs first (§ 63.1063(c)(1), (d)(1), and (e)); AND iii. Keeping the tank records required in § 63.1065.
2. External floating roof (EFR) storage tank at an existing, reconstructed, or new affected source meeting any set of tank capacity and vapor pressure criteria specified in Table 2 to this subpart, items 1 through 5.	a. Install a floating roof designed and operated according to the applicable specifications in § 63.1063(a) and (b).	i. Visually inspecting the floating roof deck, deck fittings, and rim seals of each EFR either each time the storage tank is completely emptied and degassed or every 10 years, whichever occurs first (§ 63.1063(c)(2), (d), and (e)); AND ii. Performing seal gap measurements on the secondary seal of each EFR at least once every year, and on the primary seal of each EFR at least every 5 years (§ 63.1063(c)(2), (d), and (e)); AND iii. Keeping the tank records required in § 63.1065.
4. Transfer rack that is subject to control based on the criteria specified in Table 2 to this subpart, items 7 through 10, at an existing, reconstructed, or new affected source.	a. Ensure that organic liquids are loaded into transport vehicles in accordance with the requirements in Table 4 to this subpart, items 5 or 6, as applicable.	i. Ensuring that organic liquids are loaded into transport vehicles in accordance with the requirements in Table 4 to this subpart, items 5 or 6, as applicable.

TABLE 10 TO SUBPART EEEE OF PART 63.—CONTINUOUS COMPLIANCE WITH WORK PRACTICE STANDARDS—Continued

* * * * * * *

For each . . .	For the following standard . . .	You must demonstrate continuous compliance by . . .
	b. Install and, during the loading of organic liquids, operate a vapor balancing system.	i. Monitoring each potential source of vapor leakage in the system quarterly during the loading of a transport vehicle or the filling of a container using the methods and procedures described in the rule requirements selected for the work practice standard for equipment leak components as specified in Table 4 to this subpart, item 4. An instrument reading of 500 ppmv defines a leak. Repair of leaks is performed according to the repair requirements specified in your selected equipment leak standards.
	c. Route emissions to a fuel gas system or back to a process.	i. Continuing to meet the requirements specified in § 63.984(b).
5. Equipment leak component, as defined in § 63.2406, that operates in organic liquids service at least 300 hours per year.	a. Comply with the requirements of 40 CFR part 63, subpart TT, UU, or H.	i. Carrying out a leak detection and repair program in accordance with the subpart selected from the list in item 5.a of this table.
6. Storage tank at an existing, reconstructed, or new affected source meeting any of the tank capacity and vapor pressure criteria specified in Table 2 to this subpart, items 1 through 6.	a. Route emissions to a fuel gas system or back to the process.	i. Continuing to meet the requirements specified in § 63.984(b).
	b. Install and, during the filling of the storage tank with organic liquids, operate a vapor balancing system.	i. Monitoring each potential source of vapor leakage in the system quarterly during the loading of a transport vehicle or the filling of a container using the methods and procedures described in the rule requirements selected for the work practice standard for equipment leak components as specified in Table 4 to this subpart, item 4. An instrument reading of 500 ppmv defines a leak. Repair of leaks is performed according to the repair requirements specified in your selected equipment leak standards.

■ 28. Table 11 to subpart EEEE of part 63 is revised to read as follows:

TABLE 11 TO SUBPART EEEE OF PART 63.—REQUIREMENTS FOR REPORTS

[As stated in § 63.2386(a) and (b), you must submit compliance reports and SSM reports according to the following table:]

You must submit a(n) . . .	The report must contain . . .	You must submit the report . . .
1. Compliance report or Periodic Report	a. The information specified in § 63.2386(c), (d), (e). If you had a SSM during the reporting period and you took actions consistent with your SSM plan, the report must also include the information in § 63.10(d)(5)(i); AND	Semiannually, and it must be postmarked by January 31 or July 31, in accordance with § 63.2386(b).
	b. The information required by 40 CFR part 63, subpart TT, UU, or H, as applicable, for pumps, valves, and sampling connections; AND	See the submission requirement in item 1.a of this table.
	c. The information required by § 63.999(c); AND	See the submission requirement in item 1.a of this table.
	d. The information specified in § 63.1066(b) including: Notification of inspection, inspection results, requests for alternate devices, and requests for extensions, as applicable.	See the submission requirement in item 1.a. of this table.
2. Immediate SSM report if you had a SSM that resulted in an applicable emission standard in the relevant standard being exceeded, and you took an action that was not consistent with your SSM plan.	a. The information required in § 63.10(d)(5)(ii)	i. By letter within 7 working days after the end of the event unless you have made alternative arrangements with the permitting authority (§ 63.10(d)(5)(ii)).

■ 29. Table 12 to subpart EEEE of part 63 is amended by:
■ (a) Revising entries § 63.6(e)(3), § 63.7(g), § 63.8(c)(6)–(8), § 63.8(d), § 63.8(e), § 63.8(f)(1)–(5), § 63.9(h)(1)–(6), § 63.9(j), and § 63.10(e)(3)(iv)–(v);
■ (b) By removing entries § 63.6(h)(1), § 63.6(h)(2)(i), § 63.6(h)(2)(ii), § 63.6(h)(2)(iii), § 63.6(h)(3), § 63.6(h)(4), § 63.6(h)(5)(i), (iii)–(v), § 63.6(h)(5)(ii), § 63.6(h)(6), § 63.6(h)(7)(i), § 63.6(h)(7)(ii), § 63.6(h)(7)(iii), § 63.6(h)(7)(iv), § 63.6(h)(7)(v), § 63.6(h)(8), and § 63.6(h)(9); and
■ (c) By adding entry § 63.6(h) to read as follows:

TABLE 12 TO SUBPART EEEE OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART EEEE

* * * * * * *

Citation	Subject	Brief description	Applies to subpart EEEE
*	*	*	*
§ 63.6(e)(3)	SSM Plan	Requirement for SSM plan; content of SSM plan; actions during SSM.	Yes; however, (1) the 2-day reporting requirement in paragraph § 63.6(e)(3)(iv) does not apply and (2) § 63.6(e)(3) does not apply to emissions sources not requiring control.
*	*	*	*
§ 63.6(h)	Opacity/Visible Emission Standards.	Requirements for compliance with opacity and visible emission standards.	No; except as it applies to flares for which Method 22 observations are required as part of a flare compliance assessment.
*	*	*	*
§ 63.7(g)	Performance Test Data Analysis.	Must include raw data in performance test report; must submit performance test data 60 days after end of test with the Notification of Compliance Status; keep data for 5 years.	Yes; however, performance test data is to be submitted with the Notification of Compliance Status according to the schedule specified in § 63.9(h)(1)–(6) below.
*	*	*	*
§ 63.8(c)(6)–(8)	CMS Requirements	Zero and high level calibration check requirements. Out-of-control periods.	Yes, but only applies for CEMS. 40 CFR part 63, subpart SS provides requirements for CPMS.
§ 63.8(d)	CMS Quality Control	Requirements for CMS quality control, including calibration, etc.; must keep quality control plan on record for 5 years; keep old versions for 5 years after revisions.	Yes, but only applies for CEMS. 40 CFR part 63, subpart SS provides requirements for CPMS.
§ 63.8(e)	CMS Performance Evaluation.	Notification, performance evaluation test plan, reports.	Yes, but only applies for CEMS.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method.	Procedures for Administrator to approve alternative monitoring.	Yes, but 40 CFR part 63, subpart SS also provides procedures for approval of CPMS.
*	*	*	*
§ 63.9(h)(1)–(6)	Notification of Compliance Status.	Contents due 60 days after end of performance test or other compliance demonstration, except for opacity/visible emissions, which are due 30 days after; when to submit to Federal vs. State authority.	Yes; however, (1) there are no opacity standards and (2) all initial Notification of Compliance Status, including all performance test data, are to be submitted at the same time, either within 240 days after the compliance date or within 60 days after the last performance test demonstrating compliance has been completed, whichever occurs first.
*	*	*	*
§ 63.9(j)	Change in Previous Information.	Must submit within 15 days after the change	No. These changes will be reported in the first and subsequent compliance reports.
*	*	*	*
§ 63.10(e)(3)(iv)–(v)	Excess Emissions Reports.	Requirement to revert to quarterly submission if there is an excess emissions or parameter monitoring exceedance (now defined as deviations); provision to request semiannual reporting after compliance for 1 year; submit report by 30th day following end of quarter or calendar half; if there has not been an exceedance or excess emissions (now defined as deviations), report contents in a statement that there have been no deviations; must submit report containing all of the information in §§ 63.8(c)(7)–(8) and 63.10(c)(5)–(13).	Yes.

Part II

Environmental Protection Agency

40 CFR Part 63
National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2005–0155; FRL–8200–2]

RIN 2060–AK18

National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: EPA is promulgating revised standards to limit emissions of perchloroethylene (PCE) from existing and new dry cleaning facilities. On September 22, 1993, EPA promulgated technology-based emission standards to control emissions of PCE from dry cleaning facilities. EPA has reviewed these standards and is promulgating revisions to take into account new developments in production practices, processes, and control technologies. In addition, EPA has evaluated the remaining risk to public health and the environment following implementation of the technology-based rule and is promulgating more stringent standards for major sources in order to protect public health with an ample margin of safety. The final standards are expected to provide further reductions of PCE beyond the 1993 national emission standards for hazardous air pollutants (NESHAP), based on application of equipment and work practice standards and, in certain situations, disallowing the use of PCE at dry cleaning facilities. In addition, EPA is taking this opportunity to make some technical corrections to the 1993 Dry Cleaning NESHAP.

DATES: *Effective Date:* This final rule is effective July 27, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2005–0155. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available (*e.g.*, Confidential Business Information (CBI) or other information whose disclosure is restricted by statute). Certain other material, such as copyrighted material, will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the EPA Docket Center, Docket ID No. EPA–HQ–OAR–2005–0155, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

At this time, the EPA/DC's Public Reading Room is closed until further notice due to flooding. Fax numbers for Docket offices in the EPA/DC are temporarily unavailable. EPA visitors are required to show photographic identification and sign the EPA visitor log. After processing through the X-ray and magnetometer machines, visitors will be given an EPA/DC badge that must be visible at all times.

Informational updates will be provided via the EPA Web site at *http://www.epa.gov/epahome/dockets.htm* as they are available.

FOR FURTHER INFORMATION CONTACT: For questions about the final rule amendments, contact Mr. Warren Johnson, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Natural Resources and Commerce Group (E143–03), Research Triangle Park, NC 27711; telephone number (919) 541–5124; fax number (919) 541–3470; e-mail address: *johnson.warren@epa.gov*. For questions on the residual risk analysis, contact Mr. Neal Fann, EPA, Office of Air Quality Planning and Standards, Health and Environmental Impacts Division, Air Benefits Cost Group (C439–02), Research Triangle Park, NC 27711; telephone number (919) 541–0839; fax number (919) 541–0209; e-mail address: *fann.neal@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by the final rule are industrial and commercial PCE dry cleaners. The final rule affects the following categories of sources:

Category	NAICS [1] code	Examples of potentially regulated entities
Coin-operated Laundries and Dry Cleaners	812310	Dry-to-dry machines Transfer machines.
Dry Cleaning and Laundry Services (except coin-operated)	812320	Dry-to-dry machines Transfer machines.
Industrial Launderers	812332	Dry-to-dry machines Transfer machines.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by the final rule. To determine whether your facility is regulated by the final rule, you should examine the applicability criteria in 40 CFR 63.320 of subpart M (1993 Dry Cleaning NESHAP). If you have any questions regarding the applicability of the final rule to a particular entity, contact the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Docket. The docket number for the National PCE Air Emission Standards for Dry Cleaning Facilities (40 CFR part 63, subpart M) is Docket ID No. EPA–HQ–OAR–2005–0155.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule is also available on the WWW. Following the Administrator's signature, a copy of the final rule will be posted on EPA's Technology Transfer Network (TTN) policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by September 25, 2006. Under CAA section 307(d)(7)(B), only an objection to the final rule that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under CAA section 307(b)(2), the requirements established by this final action may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for EPA to convene a proceeding for reconsideration, "if the person raising the objection can demonstrate to the EPA that it was impracticable to raise such an objection [within the period for public comment] or if the grounds for such objection arose after the period for

public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to the EPA should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Director of the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Statutory Authority for Regulating Hazardous Air Pollutants?
B. What Are PCE Dry Cleaning Facilities?
C. What Are the Health Effects of PCE?
D. What Does the 1993 NESHAP Require?
II. Summary of the Proposed Rule
A. What Were the Proposed Requirements for Major Sources?
B. What Were the Proposed Requirements for Area Sources?
C. What Were the Proposed Requirements for Transfer Machines at Major and Area Sources?
III. Summary of the Final Rule
A. What Are the Requirements for Major Sources?
B. What Are the Requirements for Area Sources?
C. What Are the Requirements for Transfer Machines at Existing Major and Area Sources?
D. What Are the Requirements for Co-residential Sources?
IV. Responses to Significant Comments
A. Statutory Authority
B. Methods Used for the Risk Assessment
C. Compliance Dates
D. Control Requirements for Major Sources
E. Area Sources
F. Co-Residential Sources
G. Technical Corrections to the 1993 Dry Cleaning NESHAP
V. Impacts
A. Major Sources

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Statutory Authority for Regulating Hazardous Air Pollutants?

Section 112 of the CAA requires us to regulate hazardous air pollutants (HAP) emitted by categories of stationary sources. For "major" sources of HAP, the CAA directs us to first establish technology-based standards reflecting maximum achievable control technology ("MACT"), and to second establish residual risk standards if such standards are required in order to provide an ample margin of safety to protect public health or prevent an adverse environmental effect. For non-major "area" sources of HAP, the CAA allows us to establish standards reflecting generally available control technology ("GACT"), in lieu of MACT and residual risk standards. The HAP we must regulate are listed at CAA section 112(b). The types of technology-based standards we must promulgate differ based on whether the regulated sources are "major" sources or "area" sources. Under CAA section 112(a)(1), major sources are those that emit or have the potential to emit 10 tons per year or more of any HAP or 25 tons per year or more of any combination of HAP, including fugitive emissions. Section 112(a)(2) of the CAA provides that area sources are all other non-major stationary sources of HAP. For major sources, our initial technology-based standards must reflect maximum achievable control technology (MACT) as set forth in CAA sections 112(d)(2)–(3). For area sources, we may set less stringent standards based on generally available control technology (GACT) under CAA section 112(d)(5). For both MACT and GACT, CAA section 112(h) allows us to establish design, equipment, work practice, or operational standards where we determine it is not feasible to prescribe or enforce an emission standard.

Section 112(f)(2) of the CAA requires us to determine for each category of major sources regulated under CAA section 112(d) whether the MACT standard protects public health with an ample margin of safety, eight years after we promulgate MACT for that source category. Section 112(f)(5) of the CAA provides that we are not required to conduct this review for categories of area sources regulated by GACT standards. If the MACT standards for HAP classified as a known, probable, or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than 1-in-1 million, we must promulgate "residual risk" standards under CAA section 112(f) for the source category (or subcategory) as necessary to protect public health with an ample margin of safety. We must also adopt more stringent standards if required to prevent an "adverse environmental effect" as defined in CAA section 112(a)(7), after considering costs, energy, safety, and other relevant factors.

We are also required by CAA section 112(d)(6) to periodically review all standards we promulgate under CAA section 112 and to revise them as necessary, taking into account developments in practices, processes and control technologies. The first such review must occur eight years after we promulgate MACT and GACT standards, and can be combined with the residual risk review performed under CAA section 112(f)(2). The section CAA 112(d)(6) review is thereafter to be repeated no less frequently than every eight years.

B. What Are PCE Dry Cleaning Facilities?

Most dry cleaners use PCE in a dry cleaning machine to clean all types of garments, including clothes, gloves, leather garments, blankets, and absorbent materials. There are approximately 34,000 dry cleaning facilities in the United States, approximately 28,000 of which use PCE. Of the 28,000 PCE-using dry cleaners, 12 of the facilities are major sources and the remainder are area sources. As defined in the 1993 Dry Cleaning NESHAP, major source PCE dry cleaners are those that purchase more than 2,100 gallons (gal) of PCE per year (1,800 gal per year if the facility uses transfer machines). In the 1993 Dry Cleaning NESHAP, area sources were defined as either large or small, with large area sources defined as facilities that use between 140 to 2,100 gal of PCE per year (or 140 to 1,800 gal per year if the facility uses transfer machines) and small area sources defined as those facilities using less than 140 gal per year. Some area sources are located in the same buildings where people live. In the 1993 Dry Cleaning NESHAP we did not specifically discuss these sources, but in this notice we refer to them as co-residential dry cleaners. A co-residential dry cleaning facility is located in a building in which people reside. Co-residential facilities are located primarily in urban areas.

In general, PCE dry cleaning facilities can be classified into three types: Commercial, industrial, and leather. Commercial facilities typically clean household items such as suits, dresses, coats, pants, comforters, curtains, and formal wear. Industrial dry cleaners clean heavily-stained articles such as work gloves, uniforms, mechanics' overalls, mops, and shop rags. Leather cleaners mostly clean household leather products like jackets and other leather clothing. The 12 major sources include seven industrial facilities and five commercial facilities. The commercial facilities are each the central plant for a chain of retail storefronts. We do not expect any new PCE dry cleaning facilities constructed in the future to be major sources. Based on the emission rates of current PCE dry cleaning machines and the typical business models used in the industrial and commercial dry cleaning sectors, it is unlikely that any new sources that are constructed will emit PCE at major source levels, or that any existing area sources will become major sources due to business growth.

PCE dry cleaning machines can be classified into two types: Transfer and dry-to-dry. Similar to residential washing machines and dryers, transfer machines have a unit for washing/extracting and another unit for drying. Following the wash cycle, PCE containing articles are manually transferred from the washer/extractor to the dryer. The transfer of wet fabrics is the predominant source of PCE emissions in these systems. Dry-to-dry machines wash, extract, and dry the articles in the same drum in a single machine, so the articles enter and exit the machine dry. Because the transfer step is eliminated, dry-to-dry machines have much lower emissions than transfer machines.

New transfer machines are effectively prohibited at major and area sources due to the 1993 Dry Cleaning NESHAP requirement that new dry cleaning systems eliminate any emissions of PCE while transferring articles from the washer to the dryer. Therefore, transfer machines are no longer sold. Existing transfer machines are becoming an increasingly smaller segment of the dry cleaning population as these machines reach the end of their useful lives and are replaced by dry-to-dry machines. There are approximately 200 transfer machines currently being used, all at area sources.

The primary sources of PCE emissions from dry-to-dry machines are the drying cycle and fugitive emissions from the dry cleaning equipment (including equipment used to recycle PCE and dispose of PCE containing waste). Machines are designed to be either vented or non-vented during the drying cycle. Approximately 200 dry cleaners (1 percent) use vented machines, and the remaining facilities use the lower-polluting, non-vented machines. (For both major and area sources, the 1993 Dry Cleaning NESHAP prohibits new dry cleaning machines that vent to the atmosphere while the dry cleaning drum is rotating.) In vented machines, the majority of emissions from the drying cycle are vented outside the building. In non-vented machines, dryer emissions are released when the door is opened to remove garments. Currently, the largest sources of emissions from dry cleaning are from equipment leaks, which come from leaking valves and seals, and the loading and unloading of garments.

C. What Are the Health Effects of PCE?

The main effects of PCE in humans are neurological, liver, and kidney damage following acute (short-term) and chronic (long-term) inhalation exposure. The results of epidemiological studies evaluating the relative risk of cancer associated with PCE exposure have been mixed; some studies reported an increased incidence of a variety of tumors, while other studies did not report any carcinogenic effects. Animal studies have reported an increased incidence of liver cancer in mice, via inhalation and gavage (experimentally placing the chemical in the stomach), and kidney and mononuclear cell leukemia in rats.

Although PCE has not yet been reassessed under the Agency's recently revised Guidelines for Cancer Risk assessment, it was considered in one review by the EPA's Science Advisory Board to be intermediate between a "probable" and "possible" human carcinogen (Group B/C) when assessed under the previous 1986 Guidelines. Since that time, the U.S. Department of Health and Human Services has concluded that PCE is "reasonably anticipated to be a human carcinogen," and the International Agency for Research on Cancer has concluded that PCE is "probably carcinogenic to humans."

Effects other than cancer associated with long-term inhalation of PCE in worker or animal studies include neurotoxicity, liver and kidney damage, and, at higher levels, developmental effects. To characterize noncancer hazard in lieu of the completed Integrated Risk Information System (IRIS) assessment, which is being revised, we used the Agency for Toxic Substances and Disease Registry's (ATSDR) Minimum Risk Level (MRL). This value is based on a study of neurological effects in workers in dry cleaning shops, and is derived in a manner similar to EPA's method for derivation of reference concentrations, including scientific and public review.

The Agency's IRIS chemical assessment for PCE is currently being revised. A final IRIS determination on PCE is not expected until 2008. Because EPA has not yet issued a final IRIS document for PCE, to estimate cancer risk, we used the California EPA (CalEPA) unit risk estimate (URE) as well as a URE value developed by the EPA's Office of Prevention, Pesticides and Toxics (OPPTS) in 1998. The final IRIS reassessment may result in a URE that is different than these two values. Among the available Acute Reference Levels (ARL), the one-hour California Reference Exposure Level (REL) was considered the most appropriate to use in the assessment because it may be used to characterize acute risk for exposure an exposure duration of one hour. In contrast, the ATSDR acute MRL is appropriate to characterize acute risk for up to 14 days of exposure.

See the risk characterization memorandum in the public docket for additional information regarding the health effects of PCE.

D. What Does the 1993 NESHAP Require?

The 1993 NESHAP prescribes a combination of equipment, work practices, and operational requirements. The requirements for process controls are summarized in table 1 of this preamble. The 1993 Dry Cleaning NESHAP defines major and area sources based on the annual PCE purchases for all machines at a facility. The consumption criterion (which affects the amount of PCE purchased) varies depending on whether the facility has dry-to-dry machines only, transfer machines only, or a combination of both. The affected source is each individual dry cleaning system. Consequently, under the 1993 Dry Cleaning NESHAP, a single dry cleaning facility could be comprised of multiple affected sources, if it has multiple dry cleaning systems onsite. As a result, some of a facility's systems could be subject to "new" source requirements under the NESHAP, and some could be "existing" sources, depending upon when they were placed into service.

TABLE 1.—SUMMARY OF THE 1993 DRY CLEANING NESHAP PROCESS CONTROLS

Sources	Annual PCE purchased	New[1] (installed after 12/9/91)	Existing[2]
Major Sources	Dry-to-dry only > 2,100 gal/yr Transfer only >1,800 gal/yr Dry-to-dry and Transfer > 1,800 gal/yr	Closed-loop, dry-to-dry machines with a refrigerated condenser, and carbon adsorber operated immediately before or as the door is opened.	Dry-to-dry machines: Must have refrigerated condenser.[3] Transfer machines: Must be enclosed in a room exhausting to a dedicated carbon adsorber.
Large Area Sources	Dry-to-dry only 140 to 2,100 gal/yr .. Transfer only 200 to 1,800 gal/yr Dry-to-dry and Transfer 140 to 1,800 gal/yr	Closed-loop, dry-to-dry machines with a refrigerated condenser..	Dry-to-dry machines: Must have a refrigerated condenser[3] Transfer machines: No controls required.
Small Area Sources	Dry-to-dry ONLY < 140 gal/yr Transfer ONLY < 200 gal/yr Dry-to-dry AND Transfer < 140 gal/yr	Same as large area sources	No controls required.

[1] No new transfer machines are allowed after 9/23/93.
[2] Compliance date = 9/23/96.
[3] Alternatively, carbon adsorber is allowed only if installed before 9/22/93.

In addition, all sources must comply with certain operating requirements, including recording PCE purchases, storing PCE and PCE-containing waste in non-leaking containers, and inspecting for perceptible leaks. Owners or operators are required to operate and maintain the control equipment according to procedures specified in the 1993 Dry Cleaning NESHAP and to use pollution prevention procedures, such as good operation and maintenance, for both dry cleaning machines and auxiliary equipment (such as filter, muck cookers, stills, and solvent tanks) to prevent liquid and vapor leaks of PCE from these sources.

II. Summary of the Proposed Rule

A. What Were the Proposed Requirements for Major Sources?

Under the proposal, the requirements for all new and existing major sources were the same. The proposed requirements included the implementation of an enhanced leak detection and repair (LDAR) program and the use of dry-to-dry machines that do not vent to the atmosphere (closed-loop) during any phase of the dry cleaning cycle. A refrigerated condenser and a secondary carbon adsorber were proposed for all machines.

Under the proposed enhanced LDAR program, the facility owner or operator would be required to use a PCE gas analyzer (photoionization detector, flame ionization detector, or infrared analyzer) and perform leak checks according to EPA Method 21 on a monthly basis. The facility owner or operator would also continue the weekly perceptible leak check according to the requirements of the 1993 Dry Cleaning NESHAP.

B. What Were the Proposed Requirements for Area Sources?

For existing area sources (large and small), the proposed requirements included implementation of an enhanced LDAR program and a prohibition on the use of existing transfer machines. For new area sources (large and small), the proposed requirements included implementation of an enhanced LDAR program and use of a non-vented dry-to-dry machine with a refrigerated condenser and secondary carbon adsorber.

The enhanced LDAR program for area sources would require facilities to use a halogenated leak detector (instead of a more costly gas analyzer proposed for major sources) to perform leak checks on a monthly basis. The facility would also continue to inspect for perceptible leaks biweekly for small area sources and weekly for large area sources according to the requirements of the 1993 Dry Cleaning NESHAP.

For co-residential area sources, we proposed two options. The first option would effectively prohibit new PCE sources from locating in residential buildings by requiring that owners or operators eliminate PCE emissions from the dry cleaning process. Existing co-residential sources, under this proposed option, would be subject to the same requirements proposed for all other existing area sources (*i.e.*, enhanced LDAR and elimination of transfer machines). Instead of a prohibition on new co-residential sources, the second option would require that existing and new co-residential sources comply with standards based on those required by New York State Department of Environmental Conservation (NYSDEC) in their Title 6 New York Conservation Rules and Regulations (NYCRR) Part 232 rules, which include using machines equipped with refrigerated condensers and carbon adsorbers, enclosed in a vapor barrier to help prevent exposures to PCE emissions.

C. What Were the Proposed Requirements for Transfer Machines at Major and Area Sources?

The proposed rule included a prohibition on the use of all existing transfer machines 90 days after publication of the final rule by requiring owners or operators to eliminate any PCE emissions from clothing transfer between the washer and dryer. The installation of new transfer machines was prohibited by the 1993 Dry Cleaning NESHAP.

III. Summary of the Final Rule

A. What are the Requirements for Major Sources?

Under the final rule revisions, the requirements for all new and existing major sources are the same. In addition to the previous 1993 NESHAP requirements, the final revisions require the implementation of an enhanced LDAR program. Under the enhanced LDAR program, the facility owner or operator must use a PCE gas analyzer (photoionization detector, flame ionization detector, or infrared analyzer) and perform leak checks according to EPA Method 21 on a monthly basis. The facility owner or operator is also required to continue the weekly perceptible leak check according to the

requirements of the 1993 Dry Cleaning NESHAP.

B. What Are the Requirements for Area Sources?

For existing area sources (large and small), in addition to the previous 1993 NESHAP requirements, the final rule revisions require implementation of an enhanced LDAR program and prohibit the use of existing transfer machines. This requirement and prohibition apply to all types of existing area sources, including co-residential sources (for the remaining time in which the latter are permitted to use PCE at all).

For new area sources (large and small), the final rule revisions add to the previous 1993 NESHAP by requiring implementation of an enhanced LDAR program and use of a non-vented dry-to-dry machine with a refrigerated condenser and secondary carbon adsorber. These added requirements do not apply to new co-residential sources since these sources are prohibited from using PCE, as discussed later in this notice. The enhanced LDAR program for new and existing area sources requires facilities to use a halogenated leak detector (instead of a more costly gas analyzer for major sources) to perform leak checks on a monthly basis. The facility is also required to continue to inspect for perceptible leaks biweekly for small area sources and weekly for large area sources according to the requirements of the 1993 Dry Cleaning NESHAP.

C. What Are the Requirements for Transfer Machines at Existing Major and Area Sources?

The final rule prohibits the use of all existing transfer machines two years from the effective date of the final rule by requiring owners or operators to eliminate any PCE emissions from clothing transfer between the washer and dryer. The installation of new transfer machines was prohibited by the 1993 Dry Cleaning NESHAP. We estimate that about 200 transfer machines remain in use within the population of 28,000 PCE dry cleaning sources. Most of these machines are near the end of their useful economic lives. The typical useful life of a dry cleaning machine is 10 to 15 years. By the end of 2008, the newest transfer machines in the industry will be 15 years old.

D. What Are the Requirements for Co-residential Sources?

For co-residential area sources, the final rule effectively prohibits new PCE machines in residential buildings by requiring that owners or operators eliminate PCE emissions from dry cleaning systems that are installed after December 21, 2005. This requirement applies to any newly installed dry cleaning system that is located in a building with a residence, regardless of whether the dry cleaning system is a newly fabricated system or one that is relocated from another facility. In addition, the final rule revisions include a "sunset date" for the use of PCE at currently operating co-residential sources: All existing PCE machines in co-residential facilities are prohibited after December 21, 2020. This sunset date allows owners of existing co-residential sources to operate their machines for their maximum estimated useful life, 15 years, assuming they were first installed no later than the date of the proposed rule. We have concluded that it is reasonable to establish the sunset date at that point to allow such owners to recoup the cost of their investment in their current machines. We also decided not to allow for a later sunset date since on the date of our proposal owners were first placed on notice that we were considering a sunset provision for co-residential sources. This sunset period, during which existing machines will be required to comply with the same revised requirements that apply to other existing area sources, will provide adequate time for source owners and operators to switch to non-PCE equipment or move their PCE equipment to a non-residential location. In the interim before the sunset date, existing co-residential sources are subject to the same requirements that apply to all other existing area sources under the final rule revisions (*i.e.*, enhanced LDAR and elimination of transfer machines).

IV. Responses to Significant Comments

A. Statutory Authority

Comment: Two commenters questioned whether we have the legal authority to impose risk-based standards on area sources that are regulated under GACT. The commenters quoted sections of the Congressional Record (appropriate sections were attached to the comments) concerning this point and provided analysis to demonstrate a legislative intent to exempt area sources, specifically, dry cleaners from residual risk standards.

Response: While we do not concede that the commenter's interpretation of our authority under section 112(f) to impose risk based standards on area sources regulated under GACT is correct, we note that since we are not relying upon CAA section 112(f) as the authority for any of the requirements promulgated in this action for area sources, the commenters' arguments are moot for purposes of this final rulemaking.

Under CAA section 112(d)(6), we are required to conduct a review and, if appropriate, revise the dry cleaning standard as necessary to reflect advances in practices, processes, and control technologies. At proposal, we evaluated the emission reductions that could be achieved under CAA section 112(d)(6). After assessing advances in control technologies and considering the public comments, we have determined that, given the current knowledge of the health effects of PCE, additional requirements we proposed under the combined authorities of CAA sections 112(f)(2) and (d)(6) for area sources are equally supportable under CAA section 112(d)(6) alone. In light of public comments we received regarding possible risks posed by area sources, and EPA's pending IRIS review of PCE, we have determined that we are able to address the risks posed by area sources by revising our standards under the authority of section 112(d)(6). The standards for all area sources in this final rule are promulgated under the authority of CAA section 112(d)(6), and fulfill the Agency's statutory requirements under this authority for these sources.

The Agency's Office of Research and Development is currently re-evaluating the available information on human health effects of PCE as part of a hazard and dose-response assessment for the Agency's IRIS, which may result in revised metrics which are different enough from those used in our current assessment to warrant a re-assessment of risks from these sources. The project schedule for completion of the IRIS assessment is available at *http://cfpub.epa.gov/iristrac/index.cfm*. Also, additional information is needed to accurately estimate chronic and short-term exposures and risks to individuals located next to area sources other than co-residential (*e.g.*, sources co-located with schools and day care centers). While we received some information on measured PCE concentrations at such area sources in public comments, much of these data were collected based on complaints and may not be representative of PCE exposures from sources in compliance with the relevant regulations. EPA is aware of other data collected to support a peer-reviewed article; however, these data represent a very limited number of samples and sampling locations. As the results of the Agency's final PCE health assessment and additional scientifically peer

reviewed data become available, we may choose to further assess PCE risks and may re-evaluate our decision for area sources.

B. Methods Used for the Risk Assessment

Comment: A commenter requested that EPA account for any uncertainty in the ATSDR MRL and the OPPTS provisional Reference Concentration (RfC) by providing a greater margin of (public) safety when selecting a dose-response value for PCE. Two commenters requested EPA to use the New York State Department of Health (NYSDOH) non-cancer reference value. Many commenters questioned the use of the CalEPA and OPPTS URE in the absence of the revised IRIS re-assessment number. Several hundred commenters, using a form letter, questioned the carcinogenicity of PCE and referenced a Nordic study.

Response: The ATSDR MRL and the OPPTS provisional RfC, both based on 1992 occupational studies indicating effects at essentially identical exposure levels, are within a factor of two of each other, which, given the precision of the underlying data, is not a large difference. Additionally, a recent document by the World Health Organization (World Health Organization. 2006. Concise International Chemical Assessment Document 68.TETRACHLOROETHENE Wissenchaftliche Verlagsgesellschaft mbH, Stuttgart, Germany, available on-line at *http://www.who.int/ipcs/publications/cicad/cicad68.pdf*) included the derivation of a noncancer value termed a "tolerable concentration" which falls intermediate between the OPPTS provisional RfC and the ATSDR MRL. With regard to addressing uncertainty in the underlying database, both the ATSDR and OPPTS values (and the WHO value) were derived using similar approaches which rely on the inclusion of uncertainty factors to account for recognized uncertainties in the extrapolations from the experimental data conditions to an estimate appropriate to the assumed human scenario. The method employed by NYSDOH to derive their criterion differs from that employed by ATSDR, which is consistent with EPA methodology.

As the Agency has not yet completed its own cancer assessment for PCE, we have evaluated PCE cancer risk based on consideration of both the CalEPA and OPPTS cancer dose-response assessments, as well as more recently available data. Data are available from the Japanese Industrial Safety Association (1993) for rodent cancer bioassays by inhalation, which were not considered in either the CalEPA or OPPTS assessments. These data were considered in a recent WHO document, which presented a range of inhalation cancer unit risk estimates derived using the various available data sets and default methods for extrapolation to humans. The highest unit risk estimate derived from these data was quite similar to the CalEPA estimate, while the lowest was about an order of magnitude lower, similar to the OPPTS URE. While the Nordic study did not find an association between PCE exposures of the study population and cancer risk, this study needs to be thoroughly evaluated in the context of all epidemiological studies to determine whether or not it will change the weight of evidence evaluation. The EPA IRIS reassessment will include consideration of this study as well. Since the last EPA assessment of PCE carcinogenicity, the United States Department of Health and Human Services has concluded that PCE is "reasonably anticipated to be a human carcinogen" and the International Agency for Research on Cancer has concluded that PCE is "probably carcinogenic to humans."

C. Compliance Dates

1. Two Years for Existing Sources

Comment: Most of the comments received on compliance dates for the regulation were in favor of extending the date to more than 90 days. Some commenters asked for a one year extension, while others asked that the date be extended to three years. The commenters cited references in the CAA that stated that CAA section 112(i)(3)(A) governs the compliance times for CAA section 112, including residual risk standards, and that compliance is required as expeditiously as possible, but in no event later than three years from the effective date of the standard. The commenters added that CAA section 112(f)(4) merely states that EPA may not set a compliance date earlier than 90 days. The commenters believe that the CAA section 112(f)(4)(b) provision for waivers of up to two years would apply only in cases where the rule established a compliance date of more than 90 days but less than two years.

Another commenter, a State representative, recommended that the compliance deadline for area sources that need to purchase new machines should be extended to one year, because State agencies need time to conduct outreach. States do not have lists of area source dry cleaners and will need to collect this information during facility inspections.

Response: As we have recently explained in another rulemaking, the National Emission Standards for Hazardous Air Pollutants for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry; Proposed Rule, published on June 14, 2006 (71 FR 34422), we have since revisited our prior view regarding which CAA provisions govern compliance dates for residual risk rules. We hereby incorporate that discussion by reference. In response to the commenters, we are adopting different compliance deadlines for the existing source requirements than we proposed. We interpret CAA section 112(i) as providing the comprehensive framework for compliance deadlines for all rules adopted under CAA section 112, even where the provisions of CAA section 112(f)(4) may appear to conflict with those of CAA section 112(i).

As explained in the proposed residual risk rule for the HON source category, for new sources, CAA section 112(i)(1) requires that after the effective date of any standard under subsections (d), (f) or (h), no new source may be constructed or reconstructed except in compliance with the standard, as determined by EPA or the applicable permitting authority under title V of the CAA. A new source, under CAA section 112(a)(4), is any stationary source that commences construction or reconstruction after EPA proposes regulations applicable to the source category under CAA section 112. Sections 112(e)(10) and (f)(3) of the CAA provide that CAA section 112(d)(6) and residual risk standards, respectively, become effective immediately upon promulgation. This means generally that a new source that is constructed after a proposed rule is issued must comply with the final standard, when promulgated, immediately upon the rule's effective date or upon startup, which ever occurs later.

Sections 112(i)(7) and 112(i)(2)(A)–(B) of the CAA provide some exceptions to this general rule. The former provision essentially ensures that new sources that are built in compliance with MACT but before a residual risk rule is proposed will not be forced to undergo modifications to comply with a residual risk rule unreasonably early. The second set of provisions essentially treats new sources as if they are existing sources, where a final standard is more stringent than its proposed version and a source constructs after proposal but before final promulgation: Such sources have three years to comply with the final standard,

provided they comply with the standard as proposed in the meantime.

For existing sources, CAA section 112(i)(3) allows EPA to set compliance deadlines of up to three years for "any emission standard, limitation or regulation promulgated under this section." This up-to-3-year compliance period matches the 3-year period provided under CAA section 112(i)(2), which potentially applies to any standard issued under CAA sections 112(d), (f) or (h). There is also an exception to the 3-year deadline for existing sources: CAA section 112(i)(3)(B) allows EPA or a State title V permitting authority to issue a permit granting an existing source an additional year to comply with standards under subsection (d), if it is necessary for the installation of controls. We believe that this reference to only subsection (d) was accidental on Congress's part and presents a conflict with the rest of the statutory scheme Congress enacted in 1990 to govern compliance deadlines under CAA section 112.

In addition to adding section 112(i) in the 1990 CAA Amendments, the amended CAA section 112 included provisions in section 112(f) left over from the previous version of CAA section 112 that in several ways differ from those in CAA section 112(i). First, CAA section 112(f)(4) includes a requirement that new sources comply immediately with CAA section 112(f) final rules, which is redundant with CAA section 112(i). This provision also fails to account for the allowable exceptions to the immediate compliance requirement in CAA section 112(i) and fails to refer to the new title V implementation mechanism added in the 1990 CAA Amendments. In light of the overall statutory scheme regarding compliance deadlines for new sources reflected in CAA section 112(i), we believe that where those provisions conflict with the provisions of CAA section 112(f)(4), the most reasonable approach is to view CAA section 112(i) as controlling.

In addition, for existing sources, CAA section 112(f)(4)(A) imposes a 90-day compliance deadline following promulgation of residual risk rules. Section 112(f)(4)(B) of the CAA then states that EPA, without reference to a title V permitting authority, may grant a waiver for up to two years if such period is necessary for the installation of controls. Both of these provisions conflict with CAA section 112(i). The 90-day deadline conflicts with the up-to-3-year deadline available for existing sources under "any" rule adopted under CAA section 112 and has the result of imposing a shorter deadline on existing sources than may apply for new sources under CAA section 112(i)(2). The CAA section 112(f)(4)(B) waiver provision also fails to rely upon the new title V implementation mechanism, even though, of course, residual risk rules are required to be reflected in title V permits to the same extent as MACT rules to which CAA section 112(i)(3) clearly applies.

Notwithstanding CAA section 112(i)(3)(B)'s limited reference to standards adopted under subsection (d), we interpret CAA section 112(i)(3) as applying to "any" standards promulgated under CAA section 112, including those under CAA section 112(f), since CAA section 112(i)(3)(A) uses the term "any" without limitation. Moreover, it is clear that Congress intended the CAA section 112(i) provisions applicable to new sources to govern compliance under CAA section 112(f) standards, notwithstanding the language of CAA section 112(f)(4), based on their explicit reference to such standards. Reading CAA section 112(i)(3)(B) as reaching only subsection (d) standards, conversely, with CAA section 112(f)(4)(B) governing subsection (f) standards, would leave unanswered the question of which provision applies to subsection (h) standards, which may also require the installation of controls. A narrow reading of the scope of CAA section 112(i)(3) would also ignore the fact that in many cases, including this rule, the enabling authority will be both CAA sections 112(f)(2) and 112(d)(6). We conclude that the only reasonable way to avoid a conflict in the provisions addressing compliance deadlines for existing sources in these situations is to read the more specific and comprehensive set of provisions in CAA section 112(i) as govern both the CAA section 112(d) and CAA section 112(f) aspects of the regulation.

In our proposed rule, we asked for comments on the issue of whether a 90-day compliance deadline was sufficient for our proposed elimination of transfer machines. In response to this, and in response to our proposed deadlines for other requirements for existing sources, we received significant comments on this compliance deadline issue generally. Therefore, we believe that our approach promulgated in this action is a logical outgrowth of our proposed rule. In anticipation of an objection claiming that our resolution of the conflict between CAA sections 112(i) and 112(f)(4) was not adequately noticed in our proposal, we note that the same 2-year compliance deadline we are adopting for existing sources in the final rule is also fully supported under an alternative interpretation that CAA section 112(f)(4)(A)–(B) controls. This is because CAA section 112(f)(4) would allow us to grant a 2-year extension of the compliance deadline for existing sources, on top of the 90-day compliance deadline otherwise required. Since we find that the 2-year total compliance deadline is necessary for the installation of controls at existing dry cleaners that would have to replace transfer machines with equipment compliant with new source standards (as further discussed below), and as the total 2-year compliance deadline falls within the 2-year plus 90-day period that would be allowed under CAA section 112(f)(4)(A)–(B), the final rule deadline is within the permissible range of CAA section 112(f)(4), if it applies. In addition, since we explicitly asked for comment on the 90-day deadline proposed under CAA section 112(f)(4) for eliminating transfer machines and received substantial comments on this issue and on the compliance deadline issue in general, our final decision, to the extent it must rely on the authority of CAA section 112(f)(4), is also a logical outgrowth of our proposal.

We agree with the commenters that existing sources will need more than 90 days to fully implement the requirements of the rule. Existing area sources will require up to two years to comply with the revised standards. Approximately 200 facilities will need to replace their transfer machines with dry-to-dry machines. These facilities generally are small proprietorships that will need a sufficient amount of time to save the money to purchase new machines. Also, due to the large number of area sources in the U.S., time is needed for outreach to inform these facilities about the rule changes. Moreover, there could be a supply shortage if 28,000 area sources were required to obtain a leak detection instruments within 90 days of promulgation. Similarly, major sources will need additional time to obtain leak detection equipment and fully implement enhanced LDAR requirements.

2. Clarification of New Source Requirements

Comment: One commenter requested clarification on whether the proposed revisions for new sources apply to those constructed after the proposal date of the original NESHAP or of the date of the current proposal.

Response: The revised requirements for new sources apply only to new dry cleaning machines that are constructed or reconstructed after December 21,

2005. Under the general provisions, a new source is any affected source that commences construction or reconstruction after the date that a relevant emission standard is proposed in the **Federal Register**. Therefore, new dry cleaning machines build after the proposal date of the original rule but before December 21, 2005, are subject to the new source requirements of the original rule, and to any additional requirements of the revised rule that would apply to existing sources. New machines built after December 21, 2005, are subject to the requirements of the rule as revised upon the effective date of the final rule or upon their startup, whichever occurs later.

D. Control Requirements for Major Sources

Comment: Most comments received about the requirements for major sources supported EPA's proposed requirements of non-venting machines with refrigerated condenser, secondary carbon adsorber, and an enhanced LDAR program. Most major sources were estimated to incur an annual cost savings by implementing these requirements. We received a few comments that asked us to require more stringent requirements. These commenters asked us to require all major sources to upgrade their machines with a PCE analyzer and lockout and another asked to ban new PCE machines at major sources, require PCE sensor and lockout equipment for existing machines, and adopt an equipment standard that prohibits the use of PCE machines more than 15 years old. One commenter, a major source stated that they would face substantial negative economic impacts if required to replace their existing equipment with closed-loop systems with refrigerated condensers and carbon adsorbers as proposed.

Response: Since proposal, 3 major source facilities, including the proposal MIR facility, have been removed from our risk analysis, which has affected our risk estimates for existing major sources. The MIR facility ceased operation due to a change in ownership to a company that does not use PCE in the cleaning process. One additional facility ceased operation, and another was determined to have been an area source prior to the compliance date for the original NESHAP, and is therefore not subject to major source requirements. The resulting cancer risks at baseline for the remaining facilities range between 50 and 400 in-1-million.

In assessing the appropriate level of control to address these risks, we revisited the proposal level of control, which included enhanced LDAR, along with the requirements to use dry-to-dry machines that do not vent to the atmosphere (closed loop) during any phase of the dry cleaning cycle, and to have refrigerated condensers and secondary carbon adsorbers to control the PCE emissions during the final stage of the dry cleaning cycle immediately before and as the drum door is opened. Enhanced LDAR alone, which will require owners and operators to use a PCE gas analyzer and perform leak checks according to EPA Method 21 on a monthly basis (as well as continue weekly perceptible leak checks), is expected to reduce MIR from existing major sources to between 20 and 200 in-a-million. We have determined that this range of MIR levels is acceptable within the meaning of the Benzene NESHAP decision framework. In arriving at this determination we considered the MIR levels and other factors in making our determination of acceptability, as directed by the 1989 Benzene NESHAP. Nearly all of the population living within 10 km of each remaining major source facility is estimated to be exposed at risk levels of less than 1-in-1 million at this level of control. Considering the very small number of individuals that are estimated to be exposed at risk levels greater than 100-in-1 million cancer risk coupled with the exposure and dose response assessment methodology that was conservatively health protective, it is likely that no actual persons are exposed to PCE emissions from major sources causing cancer risk levels above 100-in-1 million. Among the exposed population of 9 million individuals, a maximum of 2 people are estimated to be exposed at risk levels of more than 100-in-1 million. In addition, no significant non-cancer health effects are predicted. The maximum HQ would be reduced from 0.3 to 0.06, and no adverse ecological impacts are predicted from exposure to emissions at this level of control. We expect that PCE usage will continue to drop as has been the trend over the past 10 years. This trend has been caused by the greater use of alternative solvents, older machines at the end of their useful lives being replaced with newer, lower emitting dry-to-dry machines with refrigerated condensers and secondary carbon adsorbers, and State and industry programs that improve machine efficiency and reduce PCE consumption. All of these factors will cause risks to continue to decrease in the future in the absence of further Federal regulatory requirements. Therefore, we have determined that the risks associated with enhanced LDAR at existing major sources are acceptable after considering MIR, the population exposed at different risk levels, and the projected decline in PCE usage. While not relevant in the analysis of acceptable level of risks, the costs for this option include a capital cost of approximately $30,000, and an annual cost savings of approximately $250,000.

In the second step of the residual risk process, we determined whether a standard more stringent than enhanced LDAR is warranted to protect public health with an ample margin of safety. We considered the estimate of health risk and other health information along with additional factors relating to the appropriate level of control, including costs and economic impacts of controls, technological feasibility, uncertainties, and other relevant factors, consistent with the approach of the 1989 Benzene NESHAP. The requirements to use closed loop dry-to-dry machines and for machines to be controlled with refrigerated condensers and carbon adsorbers as proposed would further reduce MIR to between 10 and 100 in-a-million. However, the additional costs and associated impacts from application of these controls at existing major sources do not warrant the level of incremental risk reductions this option would achieve, especially when considering the distribution of costs, emissions and risk reductions among the affected facilities. For example, of the seven existing facilities with major sources that would be impacted by this additional level of control, the bulk of the costs are incurred by one facility, and would result in minimal risk reductions from the facility. This facility would incur costs of approximately $2 million to replace equipment which could not be retrofitted to meet this level of control. Annual costs for this facility would be approximately $200,000. The risk range associated with this facility upon implementation of enhanced LDAR is estimated to be between 5 and 50 in-1 million. The risk range with the additional level of controls of closed loop dry-to-dry machines and refrigerated condenser and carbon adsorber would be between 2 and 20-in-1 million. While two of the remaining six facilities would achieve somewhat higher risk reductions that would be realized from the example facility, the remaining four are expected to only achieve minimal risk reductions, as represented by the range of incremental emissions reductions from the added layer of control (between 0 and 4 tons per year). The capital costs to achieve these emissions and risk

reductions would be $2.3 million, with annual costs of $53,000. Consequently, we have determined that the risks associated with enhanced LDAR at existing major sources represent an ample margin of safety after considering costs, remaining risks and population cancer risk.

As proposed, new major sources would be required to perform enhanced LDAR in addition to the 1993 NESHAP requirement of closed-loop, dry-to-dry systems with refrigerated condensers and carbon adsorbers. As explained in the proposal, we do not expect that any new major sources will be built, or that any existing area sources will increase PCE usage to major source levels. However, if this situation occurs, the additional LDAR requirements will continue to reduce emissions from equipment leaks. The risks posed by major sources do not warrant further control given the costs and the relatively low levels of emission and risk reduction that would be achieved by these additional controls. The available data indicated that closed-loop systems with refrigerated condensers and carbon adsorbers, as well as PCE analyzer and lockout costs were unreasonably high considering the range of impacts across facilities. Consequently, we determined that requiring these additional controls was not a reasonable or economically feasible option for all major sources. The costs to eliminate PCE usage at major sources would require a capital cost to the industry of approximately $8.2 million. This estimate was based on the total costs of replacing all PCE machines with machines using hydrocarbon solvent, the most common and lowest cost alternative in large-scale operations.

1. Risks From Major Sources

Comment: One commenter stated that the risk assessment is biased and does not represent all sources. Data regarding the performance of pollution control equipment used at each facility is critical. The commenter stated that the control technology at their facility is unlike that at any other facility. They believe the risk assessment for the group of major sources is invalid because it depended heavily on the risk of one outlier facility, ALAC, which recently closed. Therefore, they contend ALAC greatly increased the MIR for all major sources.

Response: We disagree with the commenter that the risk assessment is biased and is driven by the results of the assessment for a single facility. While we did use this facility's MIR at the time of proposal, we assessed risks using data from major source facilities that we concluded were representative of all major sources. Our final regulatory decision is based on a revised MIR for major sources, which ranges between 50-in-1 million and 400-in-1 million, after excluding data from sources that have ceased operation, such as the ALAC facility. This revised MIR supports our decision for major source under both sections 112(f) and 112(d)(6) of the CAA.

For the risk assessment, major sources were subdivided into three cleaning specializations-commercial, industrial and leather. EPA collected site-specific information from 10 of the 15 facilities (9 surveys and 1 site visit) to develop a cross-section of the three specializations within the source category. Facilities within each specialization tend to be homogenous with respect to factors that affect the emissions, pollutant dispersion, and population size in the modeling radius, allowing EPA to extrapolate risks from the facilities it modeled to those it did not.

The information EPA collected included:

- Source locations and emission points,
- Building dimensions,
- PCE consumption,
- Annual disposal of PCE in sludge or residual waste (still bottoms),
- Annual facility operating hours, and
- Locations of sensitive receptors, including neighboring houses.

Based on these survey and site-visit data, we estimated annual and hourly emissions by performing a mass balance calculation on PCE concentrations. Using this mass balance data, we then estimated annual average emission rates. Finally, we estimated maximum one-hour emissions by dividing the total emissions level by the total number of operational hours at that facility and then accounting for hourly variation in these emissions.

Comment: One commenter stated that EPA should have informed the public that two major sources recently ceased operations.

Response: The largest major source ceased operations in June 2005. One other source ceased dry cleaning operations and another source was determined to have been an area source. By the time we learned of the closures, the proposed rule package was at the later stages of senior-level Agency review. Since proposal, we re-evaluated the risk assessment without these sources. The baseline estimate for MIR eliminating the sources that ceased operation ranges between 50 in-one-million to 400 in-one-million. The MIR at the level of control promulgated in this final rule is between 20 in-one-million and about 200 in-one-million.

2. Site Specific Risk Assessment

Comment: Two commenters supported the concept of incorporating a site-specific risk assessment (SSRA) for both major and area sources. The commenters believe that substantial flexibility is needed to improve the cost-effectiveness of the rules and to avoid potentially adverse impacts on specific sources. They believe that EPA has published adequate guidance on conducting an SSRA. The commenters believe that the SSRA should be used both to demonstrate equivalence to specific emission reduction requirements and to determine applicability to the residual risk requirements. The commenters believe that the CAA allows EPA to focus the applicability of the residual risk requirements only on those sources whose remaining risks after application of MACT do not provide an ample margin of safety (citing Senate Report language to support their case).

Response: We have decided not to adopt an SSRA option for major or area sources as part of this action. As a result of the revised risk analysis for major source given the elimination of 3 sources from the analysis, including the MIR facility, baseline risks from major sources are much lower than estimated for proposal, and the associated risk reduction measures are less stringent than originally proposed. Major sources are required to perform enhanced LDAR, which is expected to reduce MIR from between 50 and 400 in a million, to between 20 and 200 in a million, which the Agency has determined meets ample margin of safety considering cost, population cancer risk at different control levels and other factors. Furthermore, an annual cost savings of about $250,000 is estimated for major sources from implementing enhanced LDAR. Similarly, an annual cost savings of about $2.7 million is estimated for area sources from implementing enhanced LDAR programs and eliminating existing transfer machines. We believe these requirements will be cost-effective. Therefore, we have determined that an option for major or area sources to perform an SSRA is not necessary.

For co-residential sources, we are promulgating a ban on new sources and a sunset date for existing sources. An option for co-residential sources to perform an SSRA to determine low risk and avoid these requirements is not feasible as part of this action. There is no established protocol for self assessment for co-residential sources

which would account for exposures inside of co-located apartments. Traditional methods of dispersion modeling of emissions would not accurately assess risks in this exposure scenario, as no modeling methodology exists that could determine dispersion patterns throughout buildings. Also, there may be practical difficulties for these small businesses to pay for, perform or obtain monitored samples of PCE concentrations in private residences, to be used as part of an SSRA in the absence of a modeling methodology. Therefore, an option for an SSRA is not included in this action.

3. PCE Analyzer and Lockout

Comment: Six commenters recommended that EPA require major sources to install a PCE sensor and lockout to further reduce health risk. Among the six commenters, two commenters suggested that if EPA receives additional information they should revisit the cost-effectiveness analysis. Another commenter stated that 40 tons per year of PCE removed by this control option at cost of $17,000 per ton would be worthwhile. One commenter stated that the sensor and lockout will help to reduce the PCE emissions from operator error, which is, along with poorly maintained older machines, the cause of the majority of emissions.

One commenter, a vendor of dry cleaning machines, advised EPA to be cautious regarding the use PCE analyzers inside the drum because of their high sensitivity to humidity, heat, and vibration which necessitates frequent recalibration. Another commenter, a major source, noted that a lockout system would increase cycle times significantly thereby increasing operating costs.

Response: Based on the revised risk assessment for major sources post proposal and the resulting cancer and non-cancer risk estimates, we have determined that the requirement for enhanced LDAR in addition to the existing requirements in the 1993 NESHAP are sufficient to protect public health with an ample margin of safety. We considered a variety of other factors in making our determination, as directed by the 1989 Benzene NESHAP (described above). Consequently, we believe that the additional costs of further controls are not warranted.

We agree with the commenter about the effect of operator error on emissions. Because our estimated emission reductions are based on subjective estimates by industry experts of typical performance over time, variations in operations have been taken into account in the emissions estimate. We also agree with the comment about the potential for unreliable readings from improperly calibrated PCE analyzers. While PCE analyzers are sometimes employed as PCE sensors, PCE analyzers are typically more advanced than sensors, as the analyzers typically employ technologies such as single-beam infrared photometers, and tend to be more sensitive instruments than those used as sensors. We did not take into account any additional costs associated with performing periodic calibration tests. As a result, the cost of the technology may be more than what we estimated. Due to the interlock, a high reading from a PCE analyzer can unnecessarily prevent the completion of a load. In a high-throughput operation, such increases in cycle time can impose a considerable decrease in production.

4. Economic Analysis

Comment: One major source commenter stated that financial impacts for his facility are much higher than what EPA estimated. The commenter contends that the Economic Impact Analysis is based on underestimated costs and revenue that is more than double the company's actual revenue. The commenter also contends that his company's machines cannot be retrofitted with a refrigerated condenser and would need to be replaced, that the cost to replace the machines has been estimated by EPA to be $1.9 million, that substantial lost revenue while machines are under construction was not considered, and that estimated financing and permitting costs were also not considered. This commenter strenuously disagreed with the conclusion of the Economic Impact Analysis that no negative impact would be incurred by major sources, and contends that EPA used incorrect revenue estimates. According to this commenter, the requirements of the proposed rule, if implemented within 90 days of promulgation, would result in the closure of this facility and the loss of 120 jobs in economically desolate Detroit, Michigan.

Response: Our economic analysis of the impacts associated with the proposed level of control for major sources from implementing the rule is based on comparing the estimated annualized compliance costs to the estimated revenues for the parent firm. The estimate for the rule is annualized compliance costs of 0.4 percent of the firm's sales (or cost per sales hereafter). This estimate is contingent on the accuracy of the compliance costs and the revenue estimate for the firm. Our revenue estimate is from 2002 fiscal year data collected for the firm. We collected this data for 2002 to be consistent with the year for which the costs are estimated. This is consistent with how EPA has estimated economic impacts in a variety of recent rulemakings for residual risk and other standards. Thus, the comment that the revenue estimate is incorrect is not accurate. If we were to recalculate the compliance costs for this facility assuming that all of their machines would need to be replaced, then the cost per sales will be 1.65 percent given the annualized costs of about $240,000 for the rule.

We have also adopted a 2-year compliance schedule in the final rule. This compliance schedule should provide adequate time for this facility fully implement requirements for enhanced LDAR.

We have not concluded that there is no negative economic impact on major sources resulting from the final rule. Rather, we have stated that there is not a significant economic impact to a substantial number of small entities (or SISNOSE). The commenter's facility is not a small business according to the SBA definition. While estimated cost savings are expected for a number of firms that are major dry cleaning sources, some firms are likely to experience some negative economic impacts. The Agency does not believe that such impacts are likely to be unreasonable for the affected major source-owning firms, however. This statement is based on our impact estimates that most of the affected major source-owning firms have annualized compliance cost to sales of less than 1 percent. These estimates can be found in the economic impact analysis for this final rule.

5. Performance-Based Standard for Existing Major Sources

Comment: One commenter supported incorporating a performance-based standard for major sources in the final rule. They believe a performance-based standard provides an incentive for sources to convert to safer alternatives for some or all of the articles handled by a source. Other commenters supported the alternative compliance option (facility-wide PCE usage or other metrics) for existing major sources to provide the maximum compliance flexibility possible.

Response: We appreciate the supportive comments regarding this concept, however a performance-based option has not been incorporated in the rule in part because we did not receive any indication from any of the major sources to which this option would have applied that they would have

found it useful. None of the major sources responded with comments supporting the need for a performance-based option, which suggests to us that their preferred compliance option would be to meet the required standards. Therefore, it is not necessary for us to further pursue a performance-based option for this specific industry.

E. Area Sources

Most comments received about the requirements for typical area sources supported EPA's proposed requirements of banning transfer machines, requiring existing facilities to implement an enhanced LDAR program, and requiring new sources to install a closed-loop dry-to-dry machine with refrigerated condenser and carbon adsorber. A few commenters opposed the ban on transfer machines based on the cost of the machine replacement. We received a few comments requesting more stringent requirements. These commenters asked EPA to require all typical area sources to upgrade their machines with a secondary carbon adsorber.

Based on our review of the advances in technology since the 1993 rule, we have determined that adopting the rule revisions for area sources as proposed satisfies the requirements of CAA section 112(d)(6). The preponderance of comments supported the proposed rule, and we received very few negative comments. Existing sources were estimated to incur a cost savings because both replacement of transfer machines and enhanced LDAR will reduce annual PCE consumption. The reduction in annual PCE consumption at the 200 businesses that would replace transfer machines is more than sufficient to offset the annualized cost of the new equipment. In particular, we believe most of the transfer machines are at the end of their useful life and it would be economically beneficial for the facilities to replace the transfer machines with dry-to-dry machines. Thus, we believe the economic impacts to the affected businesses and facilities are negligible. Finally, these costs and risk estimates do not consider the impacts of future trends of declining PCE usage. Therefore, consistent with our analysis at proposal, we are not requiring a secondary carbon adsorber on existing area sources because the emission and risk reduction would be relatively minor and the costs would impose unnecessary adverse economic impacts on a number of small businesses.

1. LDAR Program

Comment: One commenter believes the proposed LDAR requirements are not necessary, explaining that most States now require the PCE dry cleaners to inspect their equipment on a regular basis and State inspectors make periodic inspections.

Response: EPA disagrees. Most States do not have requirements beyond the 1993 NESHAP and do not inspect dry cleaners more than once every few years. Sensory methods are ineffective in identifying leaks early. Substantial PCE emissions occur between the point when failure begins and the leak can be detected by sensory methods. An instrument will enable earlier detection.

Comment: One commenter, a vendor of dry cleaning equipment, disagreed with the EPA's conclusion that leaks are the largest source of emissions. Leak inspections are a waste of time because serious leaks are repaired immediately without need for an inspection. More significant sources of emissions are:

1. Unloading incompletely-dried garments.
2. Routine maintenance.
3. Cleaning distillation units.
4. Receipt of new PCE.

Response: Our analysis has shown that the filling of PCE tanks is not a significant source of emissions. We agree that the first three sources named can be significant if dry cleaning systems are not operated properly. Under the General Provisions of 40 CFR 63, all regulated sources have a general duty to operate systems and control devices according to good air pollution control practices for minimizing emissions. This requirement includes following manufacturer's specifications for operation and maintenance of the system. We have concluded that it is not necessary at this time to specify in the rule additional operating and maintenance procedures. Leaks, however, are an important source of emissions, and controlling them is an integral part of an effective pollution prevention program. Leaks can be detected and controlled at a reasonable cost using an enhanced LDAR program. In a study by the South Coast Air Quality Management District, over half of the dry cleaning machines tested had leaky gaskets, which are replaceable parts that can cause significant PCE emissions. The enhanced LDAR program requirement is expected to result in earlier leak detection from these types of emission points, and is the best method to determine when gaskets need replacing and when they do not.

2. Banning PCE

Comment: Two commenters, a state agency and a manufacturer of PCE alternative solvent dry cleaning machines, stated that EPA failed to adequately assess the feasibility of alternative solvents because the negative impacts of alternative solvent technologies were not sufficiently considered. Any action that would result in the ban of PCE at some or all facilities requires the use of an alternative solvent.

Response: We concur with the commenter that each of the alternative solvents that are currently available have certain trade-offs or limitations relative to PCE. Depending on the system, these limitations may involve cost, cleaning ability, ease of use, applicability to certain fabrics, safety, or others. No single alternative offers all of the business advantages of PCE. Given these factors and the current degree of use of alternative solvents in the industry, we did not consider it appropriate to mandate the use of alternative solvents as part of the CAA section 112(d)(6) review, except in the context of co-residential area source settings as discussed below. For area sources, the 1993 NESHAP was based on the use of GACT. In our review of this standard under CAA section 112(d)(6), we considered PCE emission controls that are in widespread use by the industry. We concluded that, based on the current information before the agency, we are not prepared to require a ban of PCE at typical area sources (*i.e.*, area sources other than co-residential) under CAA section 112(d)(6). However, we interpret CAA section 112(d)(6) as allowing us to consider a broad range of factors in determining what changes to standards are "necessary," after taking into account developments in practices, processes, and control technologies. This interpretation is consistent with those regarding other provisions of the CAA that direct us to find the "best balance" of emissions control, costs of control, safety, and other factors. Such factors may include whether sources' emissions present different degrees of risk. Due to the potential for high risks posed by co-residential area source dry cleaners, and in light of the availability of non-PCE dry cleaning technologies in the market, we determined that it is necessary under CAA section 112(d)(6) to treat this component of the area source sector differently than we are treating other area sources dry cleaners, whose emissions present significantly smaller risks.

3. Transfer Machines and Vented Machines

Comment: One industry association opposed the ban on transfer machines because such a ban would result in a significant economic impact to these

economically marginal businesses. To require the replacement of transfer machines in 90 days would result in the closure of each of these small plants.

Response: The economic impact analysis shows that there is an economic impact on owners of transfer machines from a ban on their operation, but not a significant one. The results of the analysis show impacts of compliance costs of just under two percent of sales. Given that these transfer machines are all at least 13 years old due to the ban on new transfer machines applied under the dry cleaning NESHAP, these machines are very likely close to or beyond their expected equipment life of 15 years. Thus, owners of these machines are likely to consider replacing them in the near future in any event without any additional regulatory driver.

Comment: Two dry cleaners owning transfer machines stated that transfer machines should not be prohibited because such a requirement would force them to close because they cannot afford a new machine. One of these commenters stated he used the same amount of PCE as dry cleaners using third generation machines. The other commenter requested that EPA phase out transfer machines over 10 to 15 years and that EPA examine each dry cleaner operating a transfer machine individually.

Response: EPA's cost and economic impact analyses for this rule shows that firms owning transfer machines will have to pay $35,600 to purchase a new dry cleaning machine with secondary controls (refrigerated condenser and carbon adsorber). The annualized compliance costs are estimated at just over one percent of the sales for an average dry cleaning firm. We believe these impacts are not significant overall, but we recognize that individual firms, especially small firms, may experience greater impacts than the average. To provide an adequate opportunity to raise capital and in response to comments, we are promulgating a compliance period of two years, rather than the 90 days that would have been allowed under the proposal.

Comment: Two State representatives, a vendor of dry cleaning equipment, and an environmental group recommended that EPA prohibit the use of vented machines because their emissions are considerably greater than closed-loop machines. One commenter added that, if a carbon adsorber for a vented machine does not get frequent maintenance, its emissions increase considerably. The two State representatives said that their states have already banned vented machines without encountering appreciable resistance from the dry cleaning industry. One commenter noted that according to EPA's cost estimates, dry cleaners replacing a vented machine with a fourth generation machine would reduce their net cost because of reduced usage of PCE. This commenter added that vented machines are at the end of their useful life.

Response: The final rule will not prohibit the use of vented machines. We have reviewed developments in processes and control technology and determined that an LDAR program will be required on a monthly basis with a leak detection instrument. These requirements satisfy the requirements of CAA section 112(d)(6). We did not find any control technologies that could be retrofitted at a reasonable cost on these machines. We concluded that forced replacement of these machines at typical area sources is not warranted given the costs and the relatively low levels of emission and risk reduction that would be achieved.

4. Co-Commercial Sources

Comment: One commenter, a State representative, strongly disagreed with the statement in the proposed rule indicating that the existing NESHAP level of control would result in an acceptable level of risk for area sources for co-commercial sources. The commenter presented a summary of results from complaint-based sampling of facilities in strip malls that demonstrate where PCE concentrations ranged from 8 to 50,400 micrograms per cubic meter (ug/m^3), including a day care facility with a mean concentration of 2,100 ug/m^3. Also, PCE concentrations during the first hour of operation are roughly four times the average because vapor accumulates in the drum of the machine overnight.

Response: While these measured concentration results are high (relative to what we would expect from the type of dry cleaning equipment likely to be in use at co-commercial sources), the fact that they were measured as the result of complaints may indicate that the reason behind the elevated levels may be lack of compliance with the 1993 NESHAP. This being the case, we cannot confidently conclude that these data as represent exposure levels that reflect compliance with the NESHAP. Therefore, we are choosing to not use them to evaluate the success or failure of the NESHAP level of control. In the future, studies of PCE exposures should be conducted to include a representative sampling of facilities and indicate the actual level of control being utilized and achieved by each facility in question.

Comment: Several commenters recommended additional controls should be required at co-commercial sources. A State representative recommended the following requirements for co-commercial sources:

1. Secondary carbon,
2. Vapor barriers,
3. Weekly leak inspections,
4. Annual third party inspections, and
5. Operator certification by an approved training program.

Without these measures, the revised NESHAP cannot achieve reductions in PCE levels comparable to those achieved by NYCRR Part 232.

Response: Additional information is needed to accurately estimate exposures and risks to individuals located next to co-commercial sources (including, for example, sources co-located with schools and day care centers). Without valid information that co-commercial sources pose greater risks than typical area sources, we are not prepared to determine that the cost of additional controls for co-commercial sources is justified under CAA section 112(d)(6).

In their remarks, some commenters quoted relatively high exposure concentrations that are attributed to co-commercial sources. However, only one study was referenced with the comments. This study has not been peer reviewed and has not had the opportunity for public comment. The study was completed on one co-commercial facility and without documentation of the study, we cannot analyze the methods of data collection, the type of facilities sampled, the dry cleaning systems used, or the conditions under which the data were collected. Accordingly, we do not know if these reported measurements are valid or, if so, whether these exposures are representative of all co-commercial facilities or only particular configurations. In absence of these data, we have no technical basis for requiring additional control on these facilities. Until more research is available on PCE exposures at co-commercial sources, we have determined to subject co-commercial sources to the same control requirements as typical area sources that are not collocated in the same buildings with residences.

5. Economic Impacts

Comment: Two trade associations stated that EPA has significantly underestimated median revenue of dry cleaners. According to the 2002 Economic Census, 87 percent of all dry cleaning establishments had less revenue than the median revenue used by EPA. Further, one third of all dry cleaners are so small that they have no

payment to report and are not reflected in census data.

Response: EPA's economic analysis of the impacts to affected dry cleaners is based on comparing the estimated annualized compliance costs to the estimated revenues for the parent firm. This estimate is contingent on the accuracy of the compliance costs and the revenue estimate for the firm. The Agency chose to use the industry revenue average for 1997 instead of the data from the 2002 Census because it was readily available to the model EPA chose to employ for generating the economic impact results at the time of the analysis. The value used by EPA from the Census reflects the average revenue per firm and applying this value is consistent with revenue estimates used in economic impact analyses that accompanied recent agency rulemakings. This approach is consistent with how EPA has estimated economic impacts in a variety of recent rulemakings for residual risk and other standards. A review of average revenue for firms in the dry cleaning industry from the 2002 Economic Census showed that this average revenue was 10 percent higher than the value from the 1997 Economic Census. Hence, our economic impact estimates will be lower using average revenues per firm from the 2002 Census as compared to the revenues used in the current economic impact analysis.

The commenter's point about the lack of revenue data from many dry cleaners that do not report payroll is a useful point. Having such a lack of data means some caution in applying Census revenue data for these firms is appropriate. However, collecting revenue data from these firms or estimating their revenues by some other means is highly problematic and impossible to incorporate in the current economic impact analysis. The commenter's assertions of the "over saturation of the industry with too many plants" and that many "plants" are having difficulty paying bills are ones for which no data is provided. The Agency's current estimate of the number of dry cleaning facilities is about 34,000. This estimate is extremely close to the estimate of 33,863 provided by the Agency in its "Dry Cleaning Sector Notebook Project" report published in September 1995, which was before full implementation of the dry cleaning NESHAP took place. In addition, low profit margins are typical for dry cleaning operations; the "Dry Cleaning Sector Notebooks Project" published by the Agency over 10 years ago mentions that "Commercial dry cleaning is not a high profit business, and many dry cleaners are barely able to stay in business." The fact that the number of facilities in this industry are about the same over a ten year periods leads to skepticism as to whether the industry was oversaturated at the current time and whether firms in the industry are having more difficulty staying in business now than in the past.

F. Co-Residential Sources

Comment: We received several hundred comments on the two proposed options for co-residential sources. Comments from the industry and one mass-mailing campaign supported the technology-based option for co-residential sources similar to the technology requirements of New York's Part 232 regulations. Comments from States, environmental groups, and another mass-mailing campaign supported the ban of PCE at co-residential facilities with either an immediate ban or a phase-out over time. These commenters wanted dry cleaners to switch to alternative dry cleaning solvents. Some commenters supported the eventual phase-out of PCE and the interim imposition of technology requirements like New York's Part 232 regulations for all existing co-residential machines.

Response: Current technology controls to reduce PCE emissions from co-residential dry cleaning units—such as those embodied in the NY Part 232 requirements—have been generally effective in reducing exposures. Nevertheless, empirical evidence indicates that in certain cases PCE exposures may remain relatively high. We believe that further reductions are warranted to reduce potential exposure levels, but at the same time we believe that more stringent requirements should in part be based on considerations of cost, technical feasibility, and the availability of alternative technologies. Therefore, we are requiring existing sources to discontinue the use of PCE machines no later than December 21, 2020. In addition, our consideration of the relevant factors leads us to prohibit additional PCE-using machines from being installed.

We recognize that the industry has made great strides in technology that reduces PCE emissions since the 1993 NESHAP was established. If the development of future technologies produces one that is demonstrated to adequately reduce PCE emissions and related exposures to residents of apartments co-located in buildings with dry cleaners, we would consider revisiting the necessity of the ban and phase-out of PCE in co-residential settings. Such a review could, for example, occur in the next round of our review of the developments in control technologies, processes and practices under section 112(d)(6) for this NESHAP.

Some commenters suggest an immediate elimination of PCE in co-residential settings and others suggested phasing out PCE use over the natural life of the equipment. An immediate ban would impose significant adverse impacts on owners and operators of existing sources, as would a ban falling within the three-year compliance window we have traditionally allowed for existing sources. For these small businesses, which have substantial investments in their current equipment, we have concluded that it is appropriate to allow them sufficient time to recover the investment over the useful life of the equipment and raise the needed capital to fund alternative solvent systems.

The economic life of a PCE dry cleaning system is typically 15 years. One State commenter suggested that to set a phase-out of existing sources based on the purchase date of each machine would be impracticable and a burden for States to implement. This commenter suggested picking a single date by which all current systems would need to be converted. Considering these factors, the final rule establishes a date 15 years from the date of the proposed rule, after which time all existing PCE systems at co-residential sources are prohibited. We selected this date since it corresponds to the date when we first publicly proposed the potential requirements for PCE dry cleaners in co-residential settings. This amount of time is necessary in order to phase out PCE use in co-residential settings without causing unacceptable adverse economic impacts, which would be the result if we imposed a 3-year compliance deadline.

In addition, although it is unlikely that any additional co-residential PCE-using sources came on-line between the date of publication of the proposed rule and the date the Administrator signed the final rule (July 13, 2006), in this rulemaking we are treating such sources that commenced construction between December 21, 2005, and July 13, 2006 (if any exist), slightly differently than the way we are treating either existing sources discussed above or other new sources (which are required to comply with the PCE ban immediately upon startup or the effective date of the final rule, whichever is later). This is because the requirements we have adopted in the final rule for new co-residential sources are more stringent than one of the two options we proposed. Under CAA section 112(i)(2)(A)–(B), these

uniquely situated new sources will also be required to eliminate PCE use, but not until three years after the effective date of the final rule. In the interim, they are required to comply with the second option we proposed for new co-residential sources and use refrigerated condensers and secondary carbon adsorbers, with equipment housed inside a vapor barrier with general ventilation to the outside air, as required by NYSDEC title 6 NYCRR Part 232 rules. These facilities will also have to conduct weekly leak inspections using a leak detection device such as a halogenated hydrocarbon detector. To require these sources, which may have installed equipment compliant with New York controls in reliance on our co-proposal of that option, to dismantle their PCE equipment immediately could impose severe economic hardship for these sources, contrary to the efforts we have taken in the rest of the rulemaking to avoid causing significant adverse impacts on small businesses.

We anticipate that most existing systems will be relocated to nonresidential buildings or converted to alternative solvents prior to this date, given the range of ages of current co-residential sources. In the meantime, existing co-residential sources must also meet the additional control requirements in the final rule revisions for other area sources (i.e., eliminate transfer machines and use enhanced LDAR). We have decided not to impose additional control requirements on existing co-residential sources pending the phase-out of PCE use, such as the NYCRR Part 232 controls contained in our second proposed option addressing co-residential sources. While the NYCRR Part 232 controls are currently the most stringent technological controls required in the U.S., there is uncertainty about the precise effect of the NYCRR Part 232 controls on risk. Industry commenters claim that the high risks are not representative, and that dry cleaning systems using this technology do not pose high risks. Others point out that high risks measured in New York buildings have been assessed as being caused by poor control equipment design, malfunctions of control equipment, poor ventilation designs, operator error, and other unregulated activities. We do not consider it necessary or appropriate to impose the costs of the NYCRR Part 232 controls in the interim before PCE use at co-residential sources is eliminated entirely. Moreover, our economic analysis indicates that imposing the New York requirements on existing sources elsewhere in the country, pending the PCE phase out, would cause a significant adverse economic impact on small businesses.

The health risks from co-residential sources that we are concerned about are from chronic exposures, not acute. Thus, while short-term exposures from some sources will not be immediately reduced, this is not expected to result in adverse health effects. Further, although the full benefit of the ban (complete removal of sources and their associated risks from residential buildings) would not be realized until year 15, we expect that most sources would not wait until the 15th year to retire their equipment since many of these sources are nearing the end of their useful lives. Thus, over the next 15 years, the final rule will systematically reduce exposures and risks from current levels as old equipment is retired and existing co-residential shops are either relocated or converted to alternative solvents, ultimately resulting in the elimination of these chronic health risks.

About 80 percent of the co-residential sources already have installed controls similar to NYCRR Part 232 controls. Imposing additional capital costs on the approximately 250 remaining co-residential sources is not reasonable given the significant costs of the controls and the fact that even they would be prohibited upon machine replacement or the arrival of the sunset date. For many of these shops, the remaining useful life of the machine would not allow full amortization of the capital investment before the system would have to be replaced. In addition, it is not clear how much additional risk protection would be achieved by the controls and what would be the significance of the emissions reduction, which would be realized only over the remaining useful life of each machine. For shops with PCE equipment that would be replaced within a few years, the health benefits would be limited and the capital costs would not be well spent. Therefore, temporarily imposing this control technology is not necessary under section 112(d)(6).

1. Risk Assessment Data

Comment: Industry commenters claimed that the New York City data that EPA used to assess co-residential exposures were biased and these measured exposures are not representative of typical exposure. The sources of bias noted by the commenter were that: Residences sampled were selected based on complaints; sampled facilities may not have been in full compliance with NYCRR Part 232 rules; some samples taken soon after compliance with Part 232 and PCE would not have had time to dissipate to routine levels characteristic of the controls installed.

Response: The NYC study, as described in McDermott (2005), states that "indoor air perc levels in most apartments in dry cleaner buildings sampled were below, or only slightly above, the NYSDOH residential air guideline of 100 $\mu g/m^3$. Higher levels were found in dry cleaner buildings located in low-income, minority neighborhoods and in buildings elsewhere that had been the subject of a residential complaint. Since successful completion of the NYC Perc Project required that as many apartments as possible with elevated PCE levels be identified, the strategy for identifying buildings for inclusion was modified so that buildings located in minority or low-income ZIP code areas and those that had been the subject of complaint were prioritized." The article goes on to state on that the sample "obtained is not truly a random sample of all dry cleaners in the study area. However, socioeconomic characteristics of the census block groups where sampled buildings are located reflect socioeconomic characteristics of their larger ZIP Code area, are equivalent to census block groups where buildings that were not sampled are located, and are correlated with sampled household self-reported socioeconomic characteristics. Thus, conclusions drawn with respect to sampled building neighborhood characteristics and indoor air PCE level are likely to be applicable to other residential buildings matching NYC Perc Project building inclusion criteria (*e.g.*, dry cleaner using PCE on-site; not other sources of VOC)."

While the study authors believe that their results are likely generalizable to co-residential dry cleaners that meet similar criteria with respect to complaints and socioeconomic characteristics, the results cannot be generalized to all co-residential dry cleaners in NYC or across the country. We are not currently able to estimate the extent to which this study provides estimates that are biased. Nevertheless, these empirical results provide a representation of exposure levels that exist in New York City (where the vast majority of co-residential dry cleaners are located) and adequately serve as one basis for this rulemaking.

Our risk assessment has focused on the exposures associated with dry cleaning facilities that are in compliance with the New York Part 232 requirements. We examined the McDermott data, NYSDOH data, and public comments. To identify the compliant facilities, EPA ensured that

the date by which the sample was taken was after the date in which the facility began operating a fourth generation dry cleaning machine and had installed a vapor barrier. While the sampling dates are well documented, the compliance records for certain dry cleaning facilities are somewhat ambiguous; this is due to some limitations in the compliance records provided by NYSDOH. These records are comprised of initial notification letters that facilities have submitted to the NYSDEC as well as third-party inspection reports. EPA used a combination of these data to assess whether a particular facility was in or out of compliance with NYCRR Part 232. The result of this evaluation was a finding that 25 of the 65 sampled apartments were in the 9 buildings with potentially noncompliant dry cleaning systems, while 40 of the apartments were in the 14 buildings with compliant dry cleaning systems, and these were the values used to assess the risks associated with well-controlled dry cleaners. Nevertheless, we were unable to definitively determine the compliance status of one dry cleaner that was associated with high exposure level, as noted in the risk characterization memorandum in the docket. We believe that despite the uncertainty about this particular dry cleaner, our decision for the requirements for co-residential dry cleaners is warranted because it does not hinge on the compliance status of this particular facility.

2. Part 232 Technology Requirements

Comment: Some commenters opposed the use of Title 6 NYCRR Part 232 Technology Requirements for the final rule requirements, because these controls have not been effective in reducing exposure in residences. In addition this option would do nothing to reduce current risks in New York, where the majority of co-residential facilities are located. These commenters supported a ban of PCE because this is the only way to protect the public with an ample margin of safety. These commenters suggested that a phase-out of PCE should be accompanied by a sunset provision for existing machines or else co-residential dry cleaners would have the incentive not to replace their existing equipment. Rather, dry cleaners would continue to use their old, high-emitting equipment well beyond the normal economic life, resulting in continued high exposures to residences.

Response: We have concluded that, based on available data, the NYCRR Part 232 controls have not been demonstrated to be effective in preventing significant exposures to PCE in certain cases.

After reviewing technical developments in the industry, available public health risk information, and the comments received, we have concluded that the option that best satisfies the requirements of CAA section 112(d)(6) for existing co-residential area sources is to phase out the use of PCE. In addition to the potential for co-residential dry cleaners to cause high individual cancer risks (as fully discussed in the proposed rule), we believe that the cancer incidence estimates for these sources also justifies the decision. Estimates of cancer incidence are helpful in characterizing cancer risks, because such estimates account for the full range of exposures that have been captured by the monitoring and provide a metric of the aggregate health impact taking into account the number of people exposed to varying levels of risk. Our estimate of annual cancer incidence for the approximately 1300 co-residential sources currently in operation is in the range of 0.2 to 2 cases per year, which is on par with the estimated annual incidence of 0.4 to 4 cases per year for the approximately 27,000 other area source cleaners. The near-parity of these two estimates, notwithstanding the much smaller number of co-residential vis-à-vis other sources, suggests that co-residential sources pose a disproportionate cancer incidence to their residents. Further, this estimate of total cancer incidence for the co-residential sources is at the high-end of cancer incidence estimates that we have generated for other source categories reviewed by the residual risk program to date.

As we have previously noted, these cancer incidence estimates carry significant uncertainties since they are sensitive to assumptions regarding the number of individuals exposed and the level of exposure borne by residents of un-monitored apartments. However, when viewed in the context of the other risk information and the availability of alternative dry cleaning processes, we believe that the incidence estimates provide additional support for a requirement for new installations at co-residential facilities to adopt a non-PCE solvent.

We have determined that a phase out that takes place too quickly would impose significant adverse impacts on dry cleaners. For these small businesses, which have substantial investments in their current equipment, it is appropriate to allow them sufficient time to recover the investment over the useful life of the equipment and raise the needed capital to fund alternative solvent systems. The final rule establishes a date 15 years from the date of the proposed rule, after which time all PCE systems at co-residential sources are prohibited. We anticipate that most systems will be relocated to nonresidential buildings or converted to alternative solvents prior to this date.

3. Economic Impact of PCE Phase-Out

Comment: Industry commenters opposed the phase-out of new PCE installations because it would cause a significant effect on a substantial number of small businesses. The commenters said that the EPA underestimated the costs of this option because the EPA analysis overestimated dry cleaner revenues, underestimated the cost of hydrocarbon equipment, underestimated the cost of meeting fire codes, and used a 7 percent interest rate, which is unrealistically low. In addition, the commenters maintained that any type of ban on PCE would send a misleading signal that PCE is unsafe and would cause landlords to not renew leases of dry cleaners. This severe economic impact was not accounted for in EPA's economic analysis.

Response: The estimates of impacts provided in the Agency's economic analysis for the rule are in terms of annualized compliance cost per revenues for parent firms. It is not in terms of compliance cost per profits as asserted by the commenter. The commenter states that the impact will be a "substantial" increase in costs and a decrease in profit margin far in excess of the five percent impact on year-to-year profits accepted as a benchmark. The benchmark of at least five percent impact on year-to-year profits as a benchmark for significant impacts is, however, not a benchmark that the Agency has recognized as such in the recent past. The cost-to-sales calculation provided in the economic impact analysis has been an accepted approach for indicating the potential economic impacts to small and other businesses as part of the process to determine the degree of small business impacts associated with a proposed rule.

We chose to use the industry revenue average for 1997 instead of the data from Census for 2002 because it was readily available to the model we chose to employ for generating the economic impact results at the time of the analysis. The value we used from the Census does reflect the average revenue per firm and applying this value is consistent with revenue estimates used in economic impact analyses that accompanied recent Agency rulemakings. A review of average revenue for firms in the dry cleaning

industry from the 2002 Economic Census showed that this average revenue was 10 percent higher than the value from the 1997 Economic Census. Hence, our economic impact estimates will be lower using average revenues per firm from the 2002 Census as compared to the values used in the current economic impact analysis.

It should be noted that use of the average revenue-per-firm estimate suggested by the commenter of $204,000 in the Agency's analysis would lead to higher estimated impacts to small businesses than calculated by EPA but would not lead to any impacts above three percent of sales, a benchmark among others often considered as significant in characterizing small business impacts.

The incremental cost between a PCE and a hydrocarbon machine is a reasonable estimate of the cost of eliminating PCE at a facility because, on balance, the rule revisions will not affect the economic life of a machine. We assume that at the end of the machine's 15-year economic life, the machine has no salvage value. Instead of purchasing a PCE machine, the owner incurs the incremental cost of purchasing a hydrocarbon machine. Some sources may be required by their landlord to retire their PCE machine before the end of its useful life; EPA acknowledges that such premature retirements may create a separate additional burden on owners. Other sources may choose to maintain their machine beyond its normal economic life. Because predicting these effects would be very difficult, we assume that these effects do not change our assumption of a 15 year economic life for these machines. A number of commenters agreed with our estimate of 15 years for the economic life of these machines.

Our cost estimate is a reasonable appraisal of costs. Our estimate that 50 percent of facilities outside New York that install hydrocarbon machines would need a sprinkler system is similar to the commenter's estimate of 66 percent. The chart of fire code geographic applicability provided by the commenter is not a sure indicator of whether a facility would need a sprinkler system because machine vendors are often able to obtain a case-by-case variance if they can demonstrate fire protection features integral to the machine. Regarding the cost per facility outside of New York City, the cost in the docket item cited by the commenter was from a machine vendor. We used a lower estimate provided by a sprinkler contractor. Sprinkler system costs for plants in New York City are particularly difficult to estimate because of the fact that actual costs are unavailable because few if any systems have been built because of their high cost. In addition, by the time PCE machines in co-residential facilities need to be replaced, between now and the sunset date in 2020, it is possible that a less combustible solvent will be available, and sprinkler systems not required for plants that can no longer use PCE.

The use of 7 percent in annualizing costs is consistent with the guidance of OMB Circular A–94. Besides the quote from Circular A–4 listed by the commenter in footnote 56 on page 30, the Circular also recommends that 7 percent be used for annualizing the costs of regulatory analyses. As mentioned in Circular A–4, "As a default position, OMB Circular A–94 states that a real discount rate of 7 percent should be used as a base-case for regulatory analysis. The 7 percent rate is an estimate of the average before-tax rate of return to private capital in the U.S. economy. It is a broad measure that reflects the returns to real estate and small business capital as well as corporate capital. It approximates the opportunity cost of capital, and it is the appropriate discount rate whenever the main effect of a regulation is to displace or alter the use of capital in the private sector. OMB revised Circular A–94 in 1992 after extensive internal review and public comment. In a recent analysis, OMB found that the average rate of return to capital remains near the 7 percent rate estimated in 1992. Circular A–94 also recommends using other discount rates to show the sensitivity of the estimates to the discount rate assumption." In addition to a 7 percent discount rate, we have also analyzed costs using a 3 percent discount rate, consistent with the requirements of Circular A–4.

4. Alternative Solvents

Comment: Some commenters opposed the use of alternative solvents because of the potential negative impacts. These potential impacts include uncertainty about the toxicity of cyclic siloxanes; increased volatile organic compound (VOC) emissions from hydrocarbons; safety hazard of carbon dioxide (CO_2); large quantities of wastewater from wet cleaners; and the fire hazard of hydrocarbons and cyclic siloxanes (D5).

Response: We recognize that each of the alternative processes has potential drawbacks. However, with the variety of choices of alternative systems that are currently available, dry cleaners can find a system that can work for their individual circumstances. The potential concerns brought up by the commenters are addressed below.

A dry cleaner that switches solvents from PCE to a hydrocarbon solvent would increase emissions of VOC, because hydrocarbon solvents are classified as a VOC and PCE is not. Increased VOC emissions could result in an increase in atmospheric ozone at some locations, depending on the mix of ozone precursors in the ambient air locally. Any new hydrocarbon machines would be subject to the new source performance standard (NSPS) for petroleum dry cleaners (40 CFR 60, subpart JJJ). The NSPS limits VOC emissions by requiring application of the best demonstrated control technology. The VOC emissions of a hydrocarbon machine at an average-sized facility are approximately 0.2 tons per year, which is a relatively small quantity for non-HAP VOC. Given the high risks posed by PCE in co-residential settings, we have concluded that the public health benefit of using alternative solvents, even if some of the alternatives are ozone precursors, supports elimination of PCE use in co-residential area sources (considering developments in practices, processes, and control technologies). In cases where VOC emissions from hydrocarbon machines would contribute significantly to ozone formation, the responsible air quality planning agency can require additional emission controls for VOC, as appropriate. Regarding HAP emissions, although benzene was once a significant component of Stoddard solvent alternatives it is now present only in trace amounts. We are unaware that any of the other solvents currently used in dry cleaning contain any of the CAA listed HAP.

EPA is not currently in a position to characterize the potential risks to human health or the environment associated with the use of decamethylcyclopentasiloxane (D5), an odorless, colorless siloxane fluid, as a dry cleaning solvent. In 2003, EPA received from Dow Corning the preliminary results of a two-year chronic toxicity and carcinogenicity study on D5 using rats. Preliminary results suggest that female rats exposed to the highest concentration of D5 exhibited a statistically significant increase of uterine tumors. The final results of the two-year study confirmed the significant increase in uterine tumors following exposure at the highest concentration of D5, while no significant increase in tumors was observed at lower doses. EPA is in the process of evaluating studies received on the mode of action to help determine whether a potential carcinogenic hazard

is associated with D5. Subsequent action may include external peer review of data and a determination whether it is appropriate to conduct a risk assessment for D5. EPA has developed a fact sheet describing its current state of knowledge on D5 that is available on the Garment and Textile Web site and that can be used by industry to guide decisions regarding the use of D5 in dry cleaning.

Hydrocarbon solvents and cyclic siloxanes can present a fire hazard because of their combustibility. However, hydrocarbon solvent dry cleaning machines have a long history of safety, as do cyclic siloxanes. We know of no fires in this country from the use of cyclic siloxanes or the synthetic hydrocarbon solvents currently in use. Dry cleaning machines that use these solvents are designed with special safety features, such as fireproof electrical connections, nitrogen blanketing, temperature controls to prevent explosion, and others.

For CO_2 systems, the commenters were referring to possible hazards due to the high pressure at which these systems operate. However, we are unaware of any safety-related accidents regarding CO_2 systems. The systems currently in use are designed to withstand the high pressures required. The pressures at which these machines operate are not extreme compared to many other processes, and the engineering to operate safely at these pressures is well understood.

Wet cleaning systems are widely used in the industry either to reduce PCE consumption or as a replacement for PCE dry cleaning. While wet cleaning generates wastewater, we are not aware of any health hazards from this waste. We expect that waste generated by wet cleaning systems will be significantly less hazardous than waste from PCE systems they replace.

G. Technical Corrections to the 1993 Dry Cleaning NESHAP

Based on comments received, we have made some technical corrections to the NESHAP in addition to those proposed. Many of these changes are needed to update the rule to reflect advances in PCE dry cleaning technology. Other changes harmonize the revisions with the existing NESHAP. The most significant technical changes are listed below. None of these changes affect the stringency of the rule or increase regulatory burden.

1. Additional Information Requested in the Notice of Compliance Status Report

We have added a requirement to indicate in the notice of compliance report if the dry cleaning facility is a major source or is located in a building with a residence or a business. This one-time requirement will impose no additional cost to the industry since the notice of compliance report is already required to be submitted.

2. Alternative Monitoring Requirement

We revised the monitoring requirement for refrigerated condensers to specify that owners and operators must monitor the high and low pressure of the refrigeration system, rather than the exit temperature, in cases where the system is equipped with pressure gauges. The pressure readings of the refrigeration system are the preferred monitoring parameters since these parameters are the most reliable indicators that the condenser is functioning properly during the drying phase, which represents maximum load conditions.

Virtually all machines have instrumentation for measuring the high and low pressures of the refrigeration system and vendor specifications for the pressure ranges that indicate proper operation of the condenser. However, for refrigeration systems that are not equipped with pressure gauges, the rule requires owners and operators to monitor the temperature of the gas-vapor outlet stream.

V. Impacts

A. Major Sources

The national capital cost of the final rule for major sources is $30,000, with an annual cost savings of about $250,000. The capital costs for individual facilities would range from $0 to $3,300 with a median cost of $3,300. Annualized costs would range from a cost savings of $84,000,000 per year to a cost of $1,319 per year. Most facilities would recognize a cost savings primarily from implementing the enhanced LDAR program. Leak detection and repair is a pollution prevention approach where reduced emissions translate into less PCE consumption and reduced operating costs because facilities would need to purchase less PCE. The highest maximum individual cancer risk are estimated to be reduced from a range of 50-in-1 million (using OPPTS potency values) to 400-in-1 million (using CalEPA potency values) down to a range of 20-in-1 million (using OPPTS potency values) to 200-in-1 million (using CalEPA potency values).

B. Area Sources

The final rule will reduce PCE emissions by an estimated 5,700 tons per year and will result in a net cost savings.

The capital costs to implement these requirements are $12 million. The enhanced LDAR program would cost about $5 million for an estimated 20,000 facilities to purchase a halogenated hydrocarbon detector at a cost of $250 each. About 200 facilities would be required to replace their existing transfer machines with dry-to-dry machines at a cost of about $36,000 each for a total industry cost of $7.5 million.

Annually, we estimate a cost savings to the industry of about $2.7 million per year. This cost savings would be realized because both replacement of transfer machines and enhanced LDAR will reduce annual PCE consumption. The reduction in annual PCE consumption at the 200 businesses that would replace transfer machines is more than sufficient to offset the annualized cost of the new equipment. In particular, most of the transfer machines are beyond the end of their economic life and it would be economically beneficial for the facilities to replace the transfer machines with dry-to-dry machines. Thus, we conclude the economic impacts to the affected businesses and facilities are negligible.

C. Co-Residential Sources

By the fifteenth year, the final rule will reduce PCE emissions from co-residential sources by an additional 317 tons/year. Cancer risks from all co-residential sources will be eliminated by the fifteenth year.

The national capital costs for new co-residential sources are $63.4 million, and the annualized costs are about $7.0 million in the fifteenth year. These cost estimates reflect the incremental capital and operating cost for 1,300 co-residential facilities to replace their PCE machines with machines using hydrocarbon solvent. The incremental cost was estimated as the difference between the costs of a new PCE machine meeting the NESHAP and a new machine using hydrocarbon solvents. The operating cost includes the cost of installing fire protection sprinklers in jurisdictions that are estimated to require sprinklers for hydrocarbon machines. The cost will be lower at facilities that already have sprinkler systems in place, that choose a less costly alternative garment cleaning option utilizing non-combustible solvents, or that choose to convert their facility to a drop shop and conduct PCE dry cleaning operations offsite.

An alternative calculation of the costs to co-residential sources using a net present value methodology shows that these costs are $3.5 million per year at

a 7 percent interest rate and $3.9 million per year at a 3 percent interest rate. These cost estimates are derived from the summing of the present value of the costs from the co-residential phase-out during the period over which the phase-out occurs, amortized over 15 years. This estimate provides a measure of the costs of the co-residential phase-out over the time period in which the phase-out takes place rather than an estimate of the costs for the fifteenth year.

VI. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to OMB review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, OMB has determined that it considers this final rule a "significant regulatory action" within the meaning of the Executive Order. The EPA has submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

B. Paperwork Reduction Act

The information collection requirements in the final rule have been submitted for approval to the OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* The Information Collection Request (ICR) document prepared by EPA has been assigned EPA ICR number 1415.06 and OMB Control Number 2060–0234.

The 2005 revisions to the Dry Cleaning NESHAP contain recordkeeping and reporting requirements beyond the recordkeeping and reporting requirements that were promulgated on September 22, 1993. Owners or operators will continue to keep records and submit required reports to EPA or the delegated State regulatory authority. Notifications, reports, and records are essential in determining compliance and are required, in general, of all sources subject to the 1993 Dry Cleaning NESHAP. Owners or operators subject to the 1993 Dry Cleaning NESHAP continue to maintain records and retain them for at least five years following the date of such measurements, reports, and records. Information collection requirements that were promulgated on September 22, 1993 in the Dry Cleaning NESHAP prior to the 2005 proposed amendments, as well the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all owners or operators subject to national emission standards, are documented in EPA ICR No. 1415.05.

The information collection requirements described here are only those notification, recordkeeping, and reporting requirements that are contained in the 2005 revisions to the Dry Cleaning NESHAP. To comply with the 2005 revisions to the 1993 Dry Cleaning NESHAP, owners or operators of dry cleaning facilities read instructions to determine how they are affected. All sources will begin an enhanced LDAR program that requires a handheld portable monitor. Major source facilities will purchase a PCE gas analyzer and area sources will purchase a halogenated hydrocarbon leak detector. Owners and operators will incur the capital/startup cost of purchasing the monitors, plus ongoing annual operation and maintenance costs. The total capital/startup cost for this ICR is $5,049,000. Annual operation and maintenance cost are $552,825.

Owners and operators of major and area sources conduct enhanced leak detection and repair and keep monthly records of enhanced leak detection and repair events.

Approximately 28,000 existing area sources and 12 existing major sources are subject to the rule and are subject to the 1993 Dry Cleaning NESHAP. We estimate that an average of 2,330 new area sources per year will become subject to the regulation in the next three years, but that the overall number of facilities will remain constant as the new owners will take over old existing facilities. No new major sources are expected. The estimated annual labor cost for major and area sources to comply with the 2005 rule is approximately $3.9 million.

The recordkeeping and reporting requirements are specifically authorized by CAA section 114 (42 U.S.C. 7414). All information submitted to us pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to our policies set forth in 40 CFR part 2, subpart B.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For the purposes of assessing the impacts of this final rule on small entities, small entity is defined as: (1) A small business based on the following Small Business Administration (SBA) size standards, which are based on annual sales receipts: NAICS 812310—Coin-Operated Laundries and Dry Cleaners—$6.0 million; NAICS 812320—Dry Cleaning and Laundry Services (Except Coin-Operated)—$4.0 million; NAICS 812332—Industrial Launderers—$12.0 million; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a

population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. Under these definitions, over 99 percent of commercial dry cleaning firms are small. For more information, refer to *http://www.sba.gov/size/sizetable2002.html*. The economic impacts of the regulatory alternatives were analyzed based on consumption of PCE, but are described in terms of comparing the compliance costs to dry cleaning revenues at affected firms. In addition, we used average revenues for firms in the dry cleaning industry instead of median revenues. This was because the Census data source that we utilized did not report medium revenues for firms by industry. For more detail, see the current Economic Impact Analysis in the public docket.

After considering the economic impacts of this final rule on small entities, I certify that the final rule will not have a significant economic impact on a substantial number of small entities. This certification is based on the economic impact of the final rule to affected small entities in the entire PCE dry cleaning source category and considers the economic impact associated with the options for co-residential facilities. Over 98 percent of the approximately 20,000 small entities directly regulated by the final rule, including both major and area sources, are expected to have costs of less than one percent of sales. The cost impacts for all regulated small entities range from cost savings to less than 1.9 percent of sales. The small entities directly regulated by the final rule are dry cleaning businesses within the NAICS codes 812310, 812320, and 812332. We have determined that all of the major sources affected by the final rule are owned by businesses within NAICS 812332. The final rule is expected to affect 11 ultimate parent businesses that will be regulated as major sources. Six of the parent businesses are small according to the SBA small business size standard. None of the six firms has an annualized cost of more than one percent of sales associated with meeting the requirements for major sources.

We have determined that virtually all of the affected small businesses that own area source dry cleaners are in NAICS 812320. Small businesses complying with the final area source requirements are expected to have the following impacts. Ninety-four percent of the approximately 20,000 small entities owning area sources directly regulated by the final rule, are expected to have costs of less than 0.9 percent of sales. The one-time cost of $250 for purchasing a halogenated hydrocarbon detector is less than 0.10 percent of the average annual revenues for dry cleaning businesses in NAICS 812320, and there are minimal annualized costs associated with a detector's use. Of the nearly 200 small businesses that have to replace their transfer machines (or one percent of the total number of affected small entities), most of these businesses are expected to experience an annual cost savings and the others are expected to have compliance costs of less than 1.2 percent of sales. Of the remaining 1,000 affected small businesses (or 3.5 percent of the total number of affected small entities), all of which are owners of co-residential facilities, the compliance costs based on the first option for co-residential area sources range from 0.9 to 1.9 percent of sales.

Cost impacts associated with the final decision for major sources are presented in section V.A of this preamble. These impacts are also presented for area sources in section V.B, and for co-residential sources in section V.C. These impacts are detailed in the BID in the public docket as memoranda five through seven. For more information on the small entity economic impacts associated with the final decisions for dry cleaners affected by the final rule, please refer to the Economic Impact Analysis in the public docket.

Although the final rule will not have a significant economic impact on a substantial number of small entities, we nonetheless tried to reduce the impact of the rule on small entities. When developing the final standards, we took special steps to ensure that the burdens imposed on small entities were minimal. We conducted several meetings with industry trade associations to discuss regulatory options and the corresponding burden on industry, such as recordkeeping and reporting. In response to comments, we revised the compliance period for major and area sources from 90 days to two years. Additionally, we added a provision to the rule that allows containers for separator water to be uncovered while the containers are in use.

Following publication of the final rule, copies of the **Federal Register** notice and, in some cases, background documents, will be publicly available to all industries, organizations, and trade associations that have had input during the regulation development, as well as State and local agencies.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

We have determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, the final rule is not subject to the requirements of sections 202 and 205 of the UMRA.

EPA has determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, the final rule is not subject to section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism," (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected dry cleaning facilities are owned or operated by State or local governments. Thus, Executive Order 13132 does not apply to the proposed rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications as specified in Executive Order 13175. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. No tribal governments own dry cleaning facilities subject to the final standards for dry cleaning facilities. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

While these final rule amendments are not subject to the Executive Order because they are not economically significant as defined in Executive Order 12866, the Agency believes this action represents reasonable further efforts to mitigate risks to the general public, including effects on children. This conclusion is based on our assessment of the imposed technological controls that would reduce the PCE impacts on human health associated with exposures to dry cleaning operations.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not a "significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy.

The final rule will have a negligible impact on energy consumption because less than one percent of the industry will have to install additional emission control equipment to comply. The cost of energy distribution should not be affected by the final rule at all since the standards do not affect energy distribution facilities. We also expect that there would be no impact on the import of foreign energy supplies, and no other adverse outcomes are expected to occur with regards to energy supplies. Further, we have concluded that the final rule is not likely to have any significant adverse energy effects.

I. National Technology Transfer Advancement Act

Section 12(d)of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113, 12(d) (15 U.S.C. 272 note), directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

The final revisions to the 1993 NESHAP for PCE dry cleaners do not include requirements for technical standards beyond what the NESHAP requires. Therefore, the requirements of the NTTAA do not apply to this action.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 et seq., as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule amendment and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final rule amendment in the **Federal Register**. The final rule amendment is not a "major rule" as defined by 5 U.S.C. 804(2). This final rule is effective on July 27, 2006.

List of Subjects in 40 CFR Part 63

Environmental Protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: July 13, 2006.

Stephen L. Johnson,

Administrator.

■ For reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart M—[Amended]

■ 2. Section 63.320 is amended as follows:

■ a. By revising paragraph (b).
■ b. By revising paragraph (c).
■ c. By revising paragraph (d).
■ d. By revising paragraph (e).

§ 63.320 Applicability.

* * * * *

(b) The compliance date for a new dry cleaning system depends on the date that construction or reconstruction commences.

(1) Each dry cleaning system that commences construction or reconstruction on or after December 9, 1991 and before December 21, 2005, shall be in compliance with the provisions of this subpart except § 63.322(o) beginning on September 22,

1993 or immediately upon startup, whichever is later, except for dry cleaning systems complying with section 112(i)(2) of the Clean Air Act; and shall be in compliance with the provisions of § 63.322(o) beginning on July 28, 2008, except as provided by § 63.6(b)(4), as applicable.

(2)(i) Each dry cleaning system that commences construction or reconstruction on or after December 21, 2005 shall be in compliance with the provisions of this subpart, except § 63.322(o), immediately upon startup; and shall be in compliance with the provisions of § 63.322(o) beginning on July 27, 2006 or immediately upon startup, whichever is later.

(ii) Each dry cleaning system that commences construction or reconstruction on or after December 21, 2005, but before July 13, 2006, and is located in a building with a residence, shall be in compliance with the provisions of this subpart, except § 63.322(o), immediately upon startup; shall be in compliance with the provisions of § 63.322(o)(5)(ii) beginning on July 27, 2006; and shall be in compliance with the provisions of § 63.322(o)(5)(i) beginning on July 27, 2009.

(3) Each dry cleaning system that commences construction or reconstruction on or after July 27, 2006, shall be in compliance with the provisions of this subpart, including § 63.322(o), immediately upon startup.

(c) Each dry cleaning system that commenced construction or reconstruction before December 9, 1991, and each new transfer machine system and its ancillary equipment that commenced construction or reconstruction on or after December 9, 1991 and before September 22, 1993, shall comply with §§ 63.322(c), (d), (i), (j), (k), (l), and (m); 63.323(d); and 63.324(a), (b), (d)(1), (d)(2), (d)(3), (d)(4), and (e) beginning on December 20, 1993, and shall comply with other provisions of this subpart except § 63.322(o) by September 23, 1996; and shall comply with § 63.322(o) by July 28, 2008.

(d) Each existing dry-to-dry machine and its ancillary equipment located in a dry cleaning facility that includes only dry-to-dry machines, and each existing transfer machine system and its ancillary equipment, and each new transfer machine system and its ancillary equipment installed between December 9, 1991 and September 22, 1993, as well as each existing dry-to-dry machine and its ancillary equipment, located in a dry cleaning facility that includes both transfer machine system(s) and dry-to-dry machine(s) is exempt from §§ 63.322, 63.323, and 63.324, except §§ 63.322(c), (d), (i), (j), (k), (l), (m), (o)(1), and (o)(4); 63.323(d); and 63.324(a), (b), (d)(1), (d)(2), (d)(3), (d)(4), and (e) if the total PCE consumption of the dry cleaning facility is less than 530 liters (140 gallons) per year. Consumption is determined according to § 63.323(d).

(e) Each existing transfer machine system and its ancillary equipment, and each new transfer machine system and its ancillary equipment installed between December 9, 1991 and September 22, 1993, located in a dry cleaning facility that includes only transfer machine system(s), is exempt from §§ 63.322, 63.323, and 63.324, except §§ 63.322(c), (d), (i), (j), (k), (l), (m), (o)(1), and (o)(4), 63.323(d), and 63.324(a), (b), (d)(1), (d)(2), (d)(3), (d)(4), and (e) if the PCE consumption of the dry cleaning facility is less than 760 liters (200 gallons) per year. Consumption is determined according to § 63.323(d).

* * * * *

■ 3. Section 63.321 is amended by revising the definition of Filter, and adding in alphabetical order definitions for Halogenated hydrocarbon detector, PCE gas analyzer, Residence, Vapor barrier enclosure, and Vapor leak to read as follows:

§ 63.321 Definitions.

* * * * *

Filter means a porous device through which PCE is passed to remove contaminants in suspension. Examples include, but are not limited to, lint filter, button trap, cartridge filter, tubular filter, regenerative filter, prefilter, polishing filter, and spin disc filter.

Halogenated hydrocarbon detector means a portable device capable of detecting vapor concentrations of PCE of 25 parts per million by volume and indicating a concentration of 25 parts per million by volume or greater by emitting an audible or visual signal that varies as the concentration changes.

* * * * *

PCE gas analyzer means a flame ionization detector, photoionization detector, or infrared analyzer capable of detecting vapor concentrations of PCE of 25 parts per million by volume.

* * * * *

Residence means any dwelling or housing in which people reside excluding short-term housing that is occupied by the same person for a period of less than 180 days (such as a hotel room).

* * * * *

Vapor barrier enclosure means a room that encloses a dry cleaning system and is constructed of vapor barrier material that is impermeable to perchloroethylene. The enclosure shall be equipped with a ventilation system that exhausts outside the building and is completely separate from the ventilation system for any other area of the building. The exhaust system shall be designed and operated to maintain negative pressure and a ventilation rate of at least one air change per five minutes. The vapor barrier enclosure shall be constructed of glass, plexiglass, polyvinyl chloride, PVC sheet 22 mil thick (0.022 in.), sheet metal, metal foil face composite board, or other materials that are impermeable to perchloroethylene vapor. The enclosure shall be constructed so that all joints and seams are sealed except for inlet make-up air and exhaust openings and the entry door.

Vapor leak means a PCE vapor concentration exceeding 25 parts per million by volume (50 parts per million by volume as methane) as indicated by a halogenated hydrocarbon detector or PCE gas analyzer.

* * * * *

■ 4. Section 63.322 is amended as follows:

■ a. By revising paragraph (e)(3).

■ b. By revising paragraph (j).

■ c. By revising paragraph (k) introductory text.

■ d. By revising paragraph (k)(11).

■ e. By revising paragraph (m).

■ f. By adding paragraph (o).

§ 63.322 Standards.

* * * * *

(e) * * *

(3) Shall prevent air drawn into the dry cleaning machine when the door of the machine is open from passing through the refrigerated condenser.

* * * * *

(j) The owner or operator of an affected facility shall store all PCE and wastes that contain PCE in solvent tanks or solvent containers with no perceptible leaks. The exception to this requirement is that containers for separator water may be uncovered, as necessary, for proper operation of the machine and still.

(k) The owner or operator of a dry cleaning system shall inspect the system weekly for perceptible leaks while the dry cleaning system is operating. Inspection with a halogenated hydrocarbon detector or PCE gas analyzer also fulfills the requirement for inspection for perceptible leaks. The following components shall be inspected:

* * * * *

(11) All Filter housings.

* * * * *

(m) The owner or operator of a dry cleaning system shall repair all leaks detected under paragraph (k) or (o)(1) of this section within 24 hours. If repair parts must be ordered, either a written or verbal order for those parts shall be initiated within 2 working days of detecting such a leak. Such repair parts shall be installed within 5 working days after receipt.

* * * * *

(o) Additional requirements:

(1) The owner or operator of a dry cleaning system shall inspect the components listed in paragraph (k) of this section for vapor leaks monthly while the component is in operation.

(i) Area sources shall conduct the inspections using a halogenated hydrocarbon detector or PCE gas analyzer that is operated according to the manufacturer's instructions. The operator shall place the probe inlet at the surface of each component interface where leakage could occur and move it slowly along the interface periphery.

(ii) Major sources shall conduct the inspections using a PCE gas analyzer operated according to EPA Method 21.

(iii) Any inspection conducted according to this paragraph shall satisfy the requirements to conduct an inspection for perceptible leaks under § 63.322(k) or (l) of this subpart.

(2) The owner or operator of each dry cleaning system installed after December 21, 2005, at an area source shall route the air-PCE gas-vapor stream contained within each dry cleaning machine through a refrigerated condenser and pass the air-PCE gas-vapor stream from inside the dry cleaning machine drum through a non-vented carbon adsorber or equivalent control device immediately before the door of the dry cleaning machine is opened. The carbon adsorber must be desorbed in accordance with manufacturer's instructions.

(3) The owner or operator of any dry cleaning system shall eliminate any emission of PCE during the transfer of articles between the washer and the dryer(s) or reclaimer(s).

(4) The owner or operator shall eliminate any emission of PCE from any dry cleaning system that is installed (including relocation of a used machine) after December 21, 2005, and that is located in a building with a residence.

(5)(i) After December 21, 2020, the owner or operator shall eliminate any emission of PCE from any dry cleaning system that is located in a building with a residence.

(ii) Sources demonstrating compliance under Section 63.320(b)(2)(ii) shall comply with paragraph (o)(5)(ii)(A) through (C), in addition to the other applicable requirements of this section:

(A) Operate the dry cleaning system inside a vapor barrier enclosure. The exhaust system for the enclosure shall be operated at all times that the dry cleaning system is in operation and during maintenance. The entry door to the enclosure may be open only when a person is entering or exiting the enclosure.

(B) Route the air-perchloroethylene gas-vapor stream contained within each dry cleaning machine through a refrigerated condenser and pass the air-perchloroethylene gas-vapor stream from inside the dry cleaning drum through a carbon adsorber or equivalent control device immediately before the door of the dry cleaning machine is opened. The carbon adsorber must be desorbed in accordance with manufacturer's instructions.

(C) Inspect the machine components listed in paragraph (k) of this section for vapor leaks weekly while the component is in operation. These inspections shall be conducted using a halogenated hydrocarbon detector or PCE gas analyzer that is operated according to the manufacturer's instructions. The operator shall place the probe inlet at the surface of each component interface where leakage could occur and move it slowly along the interface periphery.

■ 5. Section 63.323 is amended as follows:

■ a. By revising paragraph (a)(1).

■ b. By revising paragraphs (b) introductory text, (b)(1), and (b)(2).

■ c. By revising paragraph (c).

§ 63.323 Test methods and monitoring.

(a) * * *

(1) The owner or operator shall monitor the following parameters, as applicable, on a weekly basis:

(i) The refrigeration system high pressure and low pressure during the drying phase to determine if they are in the range specified in the manufacturer's operating instructions.

(ii) If the machine is not equipped with refrigeration system pressure gauges, the temperature of the air-perchloroethylene gas-vapor stream on the outlet side of the refrigerated condenser on a dry-to-dry machine, dryer, or reclaimer with a temperature sensor to determine if it is equal to or less than 7.2 °C (45 °F) before the end of the cool-down or drying cycle while the gas-vapor stream is flowing through the condenser. The temperature sensor shall be used according to the manufacturer's instructions and shall be designed to measure a temperature of 7.2 °C (45 °F) to an accuracy of ±1.1 °C (±2 °F).

* * * * *

(b) When a carbon adsorber is used to comply with § 63.322(a)(2) or exhaust is passed through a carbon adsorber immediately upon machine door opening to comply with § 63.322(b)(3) or § 63.322(o)(2), the owner or operator shall measure the concentration of PCE in the exhaust of the carbon adsorber weekly with a colorimetric detector tube or PCE gas analyzer. The measurement shall be taken while the dry cleaning machine is venting to that carbon adsorber at the end of the last dry cleaning cycle prior to desorption of that carbon adsorber or removal of the activated carbon to determine that the PCE concentration in the exhaust is equal to or less than 100 parts per million by volume. The owner or operator shall:

(1) Use a colorimetric detector tube or PCE gas analyzer designed to measure a concentration of 100 parts per million by volume of PCE in air to an accuracy of 25 parts per million by volume; and

(2) Use the colorimetric detector tube or PCE gas analyzer according to the manufacturer's instructions; and

* * * * *

(c) If the air-PCE gas vapor stream is passed through a carbon adsorber prior to machine door opening to comply with § 63.322(b)(3) or § 63.322(o)(2), the owner or operator of an affected facility shall measure the concentration of PCE in the dry cleaning machine drum at the end of the dry cleaning cycle weekly with a colorimetric detector tube or PCE gas analyzer to determine that the PCE concentration is equal to or less than 300 parts per million by volume. The owner or operator shall:

(1) Use a colorimetric detector tube or PCE gas analyzer designed to measure a concentration of 300 parts per million by volume of PCE in air to an accuracy of ±75 parts per million by volume; and

(2) Use the colorimetric detector tube or PCE gas analyzer according to the manufacturer's instructions; and

(3) Conduct the weekly monitoring by inserting the colorimetric detector or PCE gas analyzer tube into the open space above the articles at the rear of the dry cleaning machine drum immediately upon opening the dry cleaning machine door.

* * * * *

■ 6. Section 63.324 is amended as follows:

■ a. By revising paragraphs (d)(3), (d)(5), and (d)(6).

■ b. By adding paragraph (f).

§ 63.324 Reporting and recordkeeping requirements.

* * * * *

(d) * * *

(3) The dates when the dry cleaning system components are inspected for leaks, as specified in § 63.322(k), (l), or (o)(1), and the name or location of dry cleaning system components where leaks are detected;

* * * * *

(5) The date and temperature sensor monitoring results, as specified in § 63.323 if a refrigerated condenser is used to comply with § 63.322(a), (b), or (o); and

(6) The date and monitoring results, as specified in § 63.323, if a carbon adsorber is used to comply with § 63.322(a)(2), (b)(3), or (o)(2).

* * * * *

(f) Each owner or operator of a dry cleaning facility shall submit to the Administrator or delegated State authority by registered mail on or before July 28, 2008 a notification of compliance status providing the following information and signed by a responsible official who shall certify its accuracy:

(1) The name and address of the owner or operator;

(2) The address (that is, physical location) of the dry cleaning facility;

(3) If they are located in a building with a residence(s), even if the residence is vacant at the time of this notification;

(4) If they are located in a building with no other tenants, leased space, or owner occupants;

(5) Whether they are a major or area source;

(6) The yearly PCE solvent consumption based upon the yearly solvent consumption calculated according to § 63.323(d);

(7) Whether or not they are in compliance with each applicable requirement of § 63.322; and

(8) All information contained in the statement is accurate and true.

[FR Doc. 06–6447 Filed 7–26–06; 8:45 am]

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2003–0121; FRL–8190–5]

RIN 2060–AM43

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendments.

SUMMARY: On November 10, 2003, EPA promulgated national emission standards for hazardous air pollutants for miscellaneous organic chemical manufacturing. Several petitions for judicial review of the final rule were filed in the United States Court of Appeals for the District of Columbia Circuit. Petitioners expressed concern with various requirements in the final rule, including applicability of specific operations and processes, the leak detection and repair requirements for connectors, criteria to define affected wastewater streams requiring control, control requirements for wastewater streams that contain only soluble hazardous air pollutants, the definition of "process condensers," and recordkeeping requirements for Group 2 batch process vents. In this action, EPA amends the final rule to address these issues and to correct inconsistencies that have been discovered during the review process.

DATES: *Effective Date:* July 14, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2003–0121. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air and Radiation Docket, Docket ID No. EPA–HQ–OAR–2003–0121, EPA/DC, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Randy McDonald, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E143–01), U.S. EPA, Research Triangle Park, NC 27711, telephone number: (919) 541–5402, fax number: (919) 541–0246; e-mail address: *mcdonald.randy@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS code [1]	Examples of regulated entities
Industry	3251, 3252, 3253, 3254, 3255, 3256, and 3259, with several exceptions.	Producers of specialty organic chemicals, explosives, certain polymers and resins, and certain pesticide intermediates.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in 40 CFR 63.2435 of subpart FFFF (national emission standards for hazardous air pollutants (NESHAP) for miscellaneous organic chemical manufacturing). If you have any questions regarding the applicability of this action to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13 of subpart A (General Provisions).

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of the final action will also available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of the final action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg/.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final amendments is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by September 12, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the final amendments that was raised with reasonable specificity during the period for public comment may be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final amendments may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Organization of This Document. The information presented in this preamble is organized as follows:

I. Background
II. Summary of the Final Amendments
  A. Applicability
  B. Emission Limits, Compliance Options, and Initial Compliance Requirements
  C. Monitoring Requirements
  D. Recordkeeping and Reporting
III. Response to Comments
  A. Applicability

B. Requirements for Process Vents
C. Requirements for Wastewater
D. Requirements for Equipment Leaks
E. Initial Compliance Requirements
F. Monitoring Requirements
G. Recordkeeping and Reporting Requirements
H. Overlap With Other Rules
I. Definitions
J. Miscellaneous Technical Corrections
IV. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

On November 10, 2003, we promulgated NESHAP for miscellaneous organic chemical (MON) manufacturing as subpart FFFF of 40 CFR part 63. Petitions for review of the MON were filed in the United States Court of Appeals for the District of Columbia Circuit by American Chemistry Council, Eastman Chemical Company, Clariant LSM (America), Inc., Rohm and Haas Company, General Electric Company, Coke Oven Environmental Task Force, and Lyondell Chemical Company (collectively "Petitioners").[1] These matters were consolidated into *American Chemical Council, et al.* v. *EPA*, No. 04–1004, 04–1005, 04–1008, 04–1009, 04–1010, 04–1012, 04–1013 (District of Columbia Circuit). Issues raised by the petitioners included applicability of the final rule; leak detection and repair requirements for connectors; definitions of process condenser, continuous process vent, and Group 1 wastewater; treatment requirements for wastewater that is Group 1 only for soluble hazardous air pollutants (SHAP); recordkeeping for Group 2 batch process vents; and notification requirements for Group 2 emission points that become Group 1 emission points. In early October 2005, the parties signed a settlement agreement. Pursuant to section 113(g) of the CAA, notice of the settlement was published in the **Federal Register** on October 26, 2005 (70 FR 61814).

On December 8, 2005, we proposed amendments to subpart FFFF to address the issues raised by Petitioners and made other corrections and clarifications to ensure that the final rule is implemented as intended. We received a total of 20 comment letters from 18 stakeholders. Most of the letters were from companies that will have affected sources under subpart FFFF, three were from industry trade associations, three were from environmental consulting firms, and one was from a law firm on behalf of some of the petitioners. The final amendments reflect full consideration of the petition, and all of the public comments we received on the proposed amendments.

II. Summary of the Final Amendments

The final amendments clarify applicability of subpart FFFF, provide additional compliance options, modify initial and continuous compliance requirements, and simplify recordkeeping and reporting requirements. Significant changes are summarized in the sections below. Additional clarifications and corrections are highlighted in Table 1 to this preamble and in the preamble to the proposed amendments (70 FR 73098, December 8, 2005). Collectively, these provisions will reduce the burden associated with demonstrating compliance without affecting emissions control or the ability of enforcement agencies to ensure compliance.

A. Applicability

The final amendments exempt carbon monoxide production and additional polymer finishing operations from subpart FFFF. In the definition of the term "miscellaneous organic chemical manufacturing process," the final amendments clarify the end point of processes that produce solid products.

B. Emission Limits, Compliance Options, and Initial Compliance Requirements

Many of the changes in the final amendments involve requirements for process vents. For example, Table 2 in the amended rule allows floating roof technology to control batch process vent emissions from process tanks. The final amendments also change the definition of the term "continuous process vent" to include all continuous operations, not just reactors, air oxidation reactors, and distillation units. A corresponding change has been made in the definition of the term "surge control vessel." Another change to the definition of the term "continuous process vent" requires determinations of continuous process vents prior to combination with emissions from another miscellaneous organic chemical manufacturing process unit (MCPU).

Table 3 in the final rule currently requires control of "particulate matter (PM) hazardous air pollutant (HAP)" emissions from process vents at new sources. The amendments replace requirements for "PM HAP" with requirements for "HAP metals." One of the related changes is that the emissions threshold above which control is required has been changed from 400 pounds per year (lb/yr) of PM HAP to 150 lb/yr of HAP metals. Another change in the amended rule is that Method 29 of appendix A of 40 CFR part 60 is allowed as an alternative to Method 5 of appendix A of 40 CFR part 60.

We have amended the definition of the term "process condenser" to clarify what it means for a condenser to be "integral to the MCPU." Under the current definition, condensers that receive vapor streams from batch operations in an MCPU at temperatures below the boiling or bubble point of the HAP are not process condensers. The amended definition includes most of these condensers, provided they are capable of and normally used for the purpose of recovering chemicals for fuel value, use, or reuse, or for sale for fuel value, use, or reuse. Exceptions are provided for condensers that are considered to be part of recovery devices.

The final amendments specify corrected procedures for using specified equations to calculate uncontrolled emissions from process condensers. The revised procedures require consideration of the condenser exit gas temperature and composition of the condensate. Alternatively, uncontrolled emissions from process condensers may be estimated based on engineering assessments under the same conditions as the final rule currently allows for estimating emissions directly from the process vessels. The final amendments also specify initial compliance requirements for process condensers. You must either measure the exhaust gas temperature and show it is less than the boiling or bubble point of the substance in the process vessel or perform a material balance around the vessel and condenser to show that at least 99 percent of the material vaporized while boiling is condensed.

The final amendments specify that biofilters are an option for complying with the 95 percent reduction emission limit for batch process vents (see Table

[1] The Fertilizer Institute and Arteva Specialties S. 'ar.l also filed petitions for review but voluntarily withdrew their petitions.

2 to subpart FFFF of part 63). Related amendments in 40 CFR 63.2460(c)(9) specify initial and continuous compliance requirements for biofilters. A performance test must be conducted to demonstrate initial compliance. Either temperature or organic monitoring devices are required to demonstrate continuous compliance. Average temperatures must be determined if you elect to measure temperature at several locations in the biofilter bed. As for other types of control devices, the amendments related to biofilters also cross-reference the testing and continuous parameter monitoring system(s) (CPMS) requirements in 40 CFR part 63, subpart SS.

The final amendments add a compliance option in Table 3 of subpart FFFF of 40 CFR part 63 for hydrogen halide and halogen HAP emissions from process vents. A halogen atom mass flow rate emission limit of 0.45 kilograms per hour (kg/hr) is allowed as an alternative to the current emission limits that require either a 99 percent reduction or control to an outlet concentration limit of 20 parts per million by volume (ppmv). This mass emission limit applies to each individual continuous process vent and to the collection of all batch process vents within an MCPU.

The final amendments change several of the requirements for wastewater. The concentrations and mass discharge rates of partially soluble HAP (PSHAP), SHAP, and total HAP that define a Group 1 wastewater stream have been changed. The definition of the term "point of determination" (POD) has been changed to specify that the point where effluent is discharged from a scrubber or other control device is a POD. Methyl ethyl ketone has been removed from the list of PSHAP in Table 8 to subpart FFFF of part 63.[2] A new 40 CFR 63.2485(o) requires the CPMS records specified in 40 CFR 63.998(c)(1) in addition to the records specified in 40 CFR 63.147(d) for non-flare control devices. Finally, a new compliance option is included in 40 CFR 63.2485(n) that allows certain waste management units in a biotreatment system to be uncovered if the wastewater being treated is Group 1 only for SHAP. This option also allows lift stations with a volume larger than 10,000 gallons to have openings sized as necessary for proper venting as an alternative to the currently specified vent pipe dimensions in 40 CFR 63.136(e)(2)(ii)(A). Amendments in 40 CFR 63.2485(n) also added initial compliance procedures that are specific to the new compliance option.

For equipment leaks, the final amendments allow compliance with 40 CFR part 63, subpart H as an alternative to compliance with either 40 CFR part 63, subpart UU or 40 CFR part 65, subpart F. The amendments eliminate the option for existing sources of complying with 40 CFR part 63, subpart TT. However, the final amendments also allow two exceptions to the three available options. First, for pumps at an existing affected source, you may elect to comply with a leak definition of 10,000 parts per million (ppm) as an alternative to the leak definitions specified in the cross-referenced rules. Second, for connectors in gas service or light liquid service at any affected source, you may elect to comply with the requirements for connectors in heavy liquid service. The final amendments also specify that bench-scale processes are exempt from the equipment leak requirements.

The final amendments eliminate reporting requirements for offsite cleaning and reloading facilities that control emissions from rail cars and tank trucks that are used in vapor balancing for storage tanks at the affected source. For an offsite cleaning or reloading facility that is subject to any other NESHAP under 40 CFR part 63, the final amendments specify that compliance with the monitoring, recordkeeping, and reporting requirements in the other rule demonstrates compliance with the requirements in subpart FFFF of 40 CFR part 63.

Final amendments to 40 CFR 63.2445 clarify that an initial compliance demonstration must be conducted within 150 days after any of the following process changes: A Group 2 emission point becomes a Group 1 emission point, hydrogen halide and halogen HAP emissions from the sum of all process vents in a process increase to more than 1,000 lb/yr, or a small control device for process vent or transfer rack emissions becomes a large control device.

C. Monitoring Requirements

The final amendments include several changes to the parameter monitoring requirements specified in 40 CFR 63.2450(k). For halogen scrubbers, monitoring caustic strength of the effluent is allowed as an alternative to measuring pH. If the halogen scrubber controls emissions only from batch process vents, the caustic strength or pH may be measured daily instead of continuously. For absorbers that control organic compounds and use water as the scrubbing fluid, liquid and gas flow rates may be monitored instead of the parameters in the current rule. The periodic verification option for control devices that control less than 1 ton per year of HAP is now allowed for all control devices, not just those that control only batch process vents.

D. Recordkeeping and Reporting

The final amendments reduce or eliminate recordkeeping requirements in 40 CFR 63.2525(e) for Group 2 batch process vents. Recordkeeping is eliminated for Group 2 batch process vents that are always controlled with either a flare that meets the requirements of 40 CFR 63.987 or any other control device that meets the requirements for Group 1 batch process vents, provided the worst-case conditions for the control device includes the contribution of all Group 2 batch process vents. Reduced recordkeeping is allowed if non-reactive organic HAP is the only HAP in the process and usage is less than 10,000 lb/yr or if emissions are less than 1,000 lb/yr. Estimating uncontrolled organic HAP emissions is not required if you demonstrate that non-reactive organic HAP usage is less than 10,000 lb/yr. Data and supporting rationale explaining why non-reactive organic HAP usage will be less than 10,000 lb/yr must be included in your notification of compliance status report.

The final amendments also reduce or clarify reporting requirements. As clarification for process changes in 40 CFR 63.2520(e)(10), it should be noted that a new MCPU is created when a new product is made which is not part of an existing family of materials. Process changes to an existing MCPU such as the addition of new or different equipment, use of different feedstock, or addition of a parallel process may be a change in the operating scenario, but do not constitute a new MCPU. The definition of the term "batch process vent" has been amended to eliminate reporting requirements associated with determinations that emissions from batch operations have HAP emissions below the thresholds for batch process vents. The final amendments eliminate the requirement in 40 CFR 63.2520(e)(10)(ii)(C) of the final rule to provide a 60-day advance notification before batch process vents change from Group 2 to Group 1. Under the amended rule, you must document such a change in status in your notification of compliance status report in accordance with 40 CFR 63.2520(e)(10)(i). We changed 40 CFR 63.2465(b) to specify

[2] MEK has been removed as a result of its removal from the CAA section 112(b)(1) list of HAP. [70 FR 75047, December 19, 2005]

that the results of engineering assessments used to estimate uncontrolled hydrogen halide and halogen HAP emissions are to be documented in your notification of compliance status report, not your precompliance report. Finally, the amended rule requires operating logs (and copies of the applicable logs in compliance reports) only for processes with batch process vents from batch operations, not all processes.

III. Response to Comments

A. Applicability

Comment: Although not directly related to the proposed amendments, one commenter expressed concern that, despite previous attempts at clarification, a potential for overlap and conflict between the applicability provisions in the Miscellaneous Organic Chemical Manufacturing NESHAP (40 CFR part 63, subpart FFFF) and the miscellaneous coating manufacturing NESHAP (40 CFR part 63, subpart HHHHH) still exists. Based on the rules as currently written and additional guidance from EPA (70 FR 25678, May 11, 2005), the commenter understands that any process that produces a material that is used as a coating is subject to 40 CFR part 63, subpart HHHHH. The commenter has two concerns with this requirement. First, it is not clear which rule applies to the production of materials that have both coating and non-coating uses. Second, some coating manufacturing processes involve traditional chemical manufacturing operations, including reactions, which differ significantly from the processes consisting of mixing and blending operations that were used to develop the maximum achievable control technology (MACT) floor and regulatory requirements in 40 CFR part 63, subpart HHHHH. On the other hand, these processes are similar to processes that were used to develop the MACT floor and regulatory requirements in 40 CFR part 63, subpart FFFF.

To resolve the conflicts, the commenter requested that we issue a separate rulemaking to revise definitions in the Miscellaneous Coating Manufacturing NESHAP. The commenter, in conjunction with other companies, suggested changes to definitions in earlier communications with EPA. If changes are made before the compliance dates of both rules, needless effort to prepare and review precompliance reports for these situations can be avoided.

Response: We share the commenter's concern about the potential for conflict in applicability determinations. To clarify the applicability and eliminate the conflict, we have proposed changes to the definition of the term "coating" in the Miscellaneous Coating Manufacturing NESHAP (71 FR 28639, May 17, 2006). One of the proposed changes would clarify that only material produced by blending, mixing, dilution, or other formulation operations would be a coating. Thus, a process that involves only formulation operations would be subject to 40 CFR part 63, subpart HHHHH if the product is a coating. A second proposed change would clarify applicability for processes that involve chemical synthesis or separation of formulation components prior to the formulation operations. If the synthesized or separated material is stored as an isolated intermediate or final product prior to use in the formulation operation, the synthesis or separation process is subject to 40 CFR part 63, subpart FFFF. Thus, applicability of 40 CFR part 63, subpart FFFF would end with the storage vessel fed from the synthesis or separation operation, and 40 CFR part 63, subpart HHHHH would apply following storage through final production of the coating. When the synthesized or separated component is not stored before use in a formulation step, the second proposed change to the definition of the term "coating" would specify that a coating does not include materials made in processes where a formulation component is synthesized by chemical reaction or separation activity and then transferred to another vessel (without storage) where it is formulated to produce a material used as a coating. The preamble to these proposed amendments to the Miscellaneous Coating Manufacturing NESHAP states that comments must be received on or before July 3, 2006.

Comment: One commenter described how they think several tanks in a specific miscellaneous organic chemical manufacturing process would be classified under the amended rule. According to the commenter, a molten material from batch reactors is collected in tank A. Typically, the material from tank A is sent to a continuous centrifuge to remove a catalyst. The catalyst-free material is then transferred to either tank B or tank C. Still molten, material in tanks B and C is either transferred to rail cars for shipment or used onsite as feed material for a flaker or pastille maker. The flaker and pastille maker operates continuously, except when it is necessary to switch from one feed tank to the other. The commenter believes tank A is a surge control vessel, and tanks B and C are either storage tanks or surge control vessels.

Response: Although this is not the proper forum for a site-specific applicability determination, we will provide a general assessment based on the limited available information. Because it is managing the flow of material into a continuous operation, tank A is a surge control vessel. Since the material in tanks B and C is sometimes sold, these tanks mark the end of the process, and the tanks are storage tanks. In this case, the flaker and pastille maker is a separate process.

The determination would be more difficult if all of the material in tanks B and C was used onsite. If material were sometimes added to and withdrawn from these tanks simultaneously, then they would be managing flow to a continuous operation, and they would be surge control vessels. On the other hand, if it could be demonstrated that the tanks are being used solely for storage, then the molten material would be an isolated intermediate, and tanks B and C would be storage tanks. Note that in table 1 to this preamble we describe a change in the final amendments to the definition of "isolated intermediates." This change clarifies that storage equipment for isolated intermediates is part of the MCPU that produces the isolated intermediate.

Comment: One commenter thinks polymer products should not be regulated as "volatile organic liquids" under either subpart FFFF or other regulatory programs because they have very high molecular weights and negligible vapor pressure.

Response: Processes that produce certain polymer products are regulated under 40 CFR part 63, subpart FFFF if HAP are used in the process. However, only the HAP are subject to emission limits. The non-HAP polymer products themselves are not subject to emission limits under 40 CFR part 63, subpart FFFF. The requirements in other regulatory programs are not addressed in this response: Because today's action deals only with amendments to 40 CFR part 63, subpart FFFF.

B. Requirements for Process Vents

Comment: The proposed amendments included an additional compliance option for batch process vents that would allow the use of biofilters to comply with the 95 percent reduction option. One commenter requested that this option be made available for continuous process vents as well. The commenter realizes that, technically, biofilters may be used to comply with the 98 percent reduction option in table 1 to subpart FFFF, but the commenter

believes this is not feasible with current biofilter technology. To support his request, the commenter noted that biofilters have environmental benefits relative to the combustion devices they are likely to supplant. Specifically, both the consumption of fossil fuels and the generation of criteria pollutant emissions would be lower if continuous process vents are controlled using biofilters. The commenter also noted that there is no technological barrier to using biofilters to control emissions from continuous operations, and there is regulatory precedent for their use to control emissions from continuous operations (*i.e.*, 40 CFR part 63, subpart DDDD and subpart UUUU).

Response: We have decided not to include the requested biofilter option at this time. Although we agree that biofilters have some environmental advantages over combustion devices, we are concerned that the difference between 98 percent and 95 percent reduction in HAP emissions is not offset by the benefits of reduced fuel use and criteria pollutant emissions. Analysis of the offsets was not necessary for batch process vents because the rule already included a 95 percent reduction option before the biofilter option was proposed.

This issue is not closed. We have initiated a study to investigate the applicability of biofilters for continuous process vent emissions from miscellaneous organic chemical manufacturing processes. Some of the things we would like to determine are as follows. What level of control can be achieved? Does the level of control vary for different HAP? What effect do other emission stream characteristics such as flow rate and temperature have on the control efficiency? How much of the HAP removed from the emission stream is transferred to wastewater discharges? How much electricity is needed to run fans and pumps associated with a biofilter? How much solid waste is generated by biofilters, and how must it be disposed? Using the information collected, we will also reassess the environmental impacts of biofilters versus combustion devices. Depending on the results, we may decide to propose some type of biofilter option for continuous process vents in 40 CFR part 63, subpart FFFF in the future.

Comment: One of the proposed amendments added a compliance option for process vents that emit hydrogen halide and halogen HAP. This option, in entry 1.b. of Table 3 to subpart FFFF of 40 CFR part 63, would allow compliance by reducing the "halogen atom mass emission rate to ≤0.45 halogen HAP kg/hr by venting through a closed vent system to a halogen reduction device." Three commenters noted that it is unclear which vents need to be controlled when the collective hydrogen halide and halogen emissions from all vents in a process are at least 1,000 lb/yr. The commenters suggested clarifying that the limit applies to each individual process vent. According to two of the commenters, if a stream that is controlled to <0.45 kg/hr is in compliance, then it seems logical that any uncontrolled stream from the process that contains <0.45 kg/hr should also be in compliance.

Response: Application of the 0.45 kg/hr limit for hydrogen halide and halogen HAP differs for batch and continuous process vents. It applies to the sum of all batch vents and to each individual continuous process vent. This approach is consistent with the way limits are applied for organic HAP emissions from batch and continuous process vents. The language in Table 3 to subpart FFFF of 40 CFR part 63 has been changed to clarify the requirements.

Comment: One commenter requested clarification of the language in 40 CFR 63.2450(o), which currently states that "you may not use a flare to control halogenated vent streams or hydrogen halide and halogen HAP emissions." The commenter is concerned that this language appears to prohibit all vent streams with hydrogen halide and halogen HAP from flares, even if no control of hydrogen halide and halogen HAP is required for the stream. To clarify the paragraph, the commenter suggests changing it to read as follows: "You may not use a flare to control halogenated vent streams or as a control device for hydrogen halide and halogen HAP emissions to comply with Table 3."

Response: We have changed 40 CFR 63.2450(o) as suggested by the commenter because the suggested language is consistent with our intent, and it may eliminate confusion. If hydrogen halide and halogen HAP in a vent stream must be controlled to meet the emission limits in Table 3 to subpart FFFF of 40 CFR part 63, then that vent stream may not be vented to a flare. All other vent streams that contain hydrogen halide and halogen HAP may be vented to a flare. For example, a continuous process vent stream containing less than 0.45 kg/hr of hydrogen halide and halogen HAP could be sent to the flare.

Comment: Two commenters noted that the language in entry 1.a of Table 3 to subpart FFFF of 40 CFR part 63 appears to require the use of a single closed-vent system to convey hydrogen halide and halogen HAP from all process vents in a process to a control device(s). According to the commenters, this could be a problem because it is possible that the process vents within a process that must be controlled may be separated by distances that would make collection into a single closed-vent system impractical or uneconomical. The commenters suggested changing the language to allow for the use of a "combination of closed-vent systems."

Response: We did not intend to force the use of a single control device (or series of control devices) for all process vents within the process. Therefore, we have changed entries 1.a and 1.b in Table 3 to subpart FFFF of 40 CFR part 63 to allow venting through "one or more closed-vent systems." We also amended entries 1.a, 1.b, and 1.c in Table 2 to subpart FFFF of 40 CFR part 63 in the same manner. These changes provide flexibility to use as many separate control devices as necessary.

Comment: One commenter requested clarification of the language in 40 CFR 63.2495(b)(1), which currently specifies that "Hydrogen halides that are generated as a result of combustion control must be controlled according to the requirements of 40 CFR 63.994 and the requirements referenced therein." The commenter is concerned that this language appears to require the use of halogen reduction devices regardless of the halogen atom concentration in the emission stream that is combusted. This conflicts with provisions elsewhere in the rule that require the use of halogen reduction devices only when halogenated vent streams are combusted.

Response: To eliminate the inconsistency that the commenter identified, we have amended 40 CFR 63.2495(b)(1) to require control of hydrogen halides generated by combustion control only "if any vent stream routed to a combustion control is a halogenated vent stream."

Comment: One commenter stated that regenerative thermal oxidizers (RTO) should be recognized as a form of incineration that can be used for control as long as any combined control system meets the 98 percent control efficiency or outlet concentration limit.

Response: RTO are acceptable control devices under the rule. Nothing in the rule prohibits their use alone or in combination with other devices to meet specified emission limits for organic HAP.

C. Requirements for Wastewater

Comment: One commenter requested clarification of the POD for scrubbers. According to the commenter, the point where effluent is discharged from a

scrubber should be a POD, and the effluent itself should be process wastewater, only when the scrubber is used to comply with the emission limits for process vents. The commenter suggested adding language like that in 40 CFR 63.1256(a)(1)(iii) of the Pharmaceuticals Production NESHAP.

Response: We agree with the commenter that the requirements for scrubber effluent need to be clarified. On July 1, 2005, we published direct final rule amendments (70 FR 38554) and a parallel proposal (70 FR 38562) that specified requirements for effluent from control devices. We later withdrew these amendments because of adverse comment (70 FR 51269, August 30, 2005). As a result, the rule is now silent on the requirements for scrubber effluent.

We disagree with the commenter's assertion that only scrubbers that are used to meet emission limits for process vents should have a POD. If a process operates a few hours per year, it may have Group 2 batch process vent emissions with high HAP concentrations. If such emission streams are controlled with a scrubber, we believe that the effluent discharges should be considered for possible compliance with wastewater requirements.

After consideration of the comment and evaluation of requirements in other rules, we have decided to resolve the existing ambiguity by modifying the definition of "point of determination" in the final amendments. In general, 40 CFR part 63, subpart FFFF references the wastewater requirements in the Hazardous Organic NESHAP (HON), 40 CFR part 63, subpart G, including the POD definition in 40 CFR 63.111. According to this definition, a POD is each point where process wastewater exits the chemical manufacturing process unit (CMPU) (or MCPU, in the case of 40 CFR part 63, subpart FFFF). However, the term does not have the same meaning under 40 CFR part 63, subpart FFFF as it does in the HON due to an unintended consequence created by the decision to exclude control devices from the MCPU (whereas they are part of CMPU under the HON). To make the application of POD under 40 CFR part 63, subpart FFFF consistent with their application in the HON, the final amendments include a freestanding (i.e., non-cross-referenced) term "point of determination" in 40 CFR 63.2550(i) of 40 CFR part 63, subpart FFFF. This revised definition specifies that a POD is each point where process wastewater exits the MCPU or control device.

As a result of this change, effluent discharge points from all scrubbers, not just those that are used to meet emission limits for process vents, are POD. Discharge points from other types of control devices are also POD. The effluent also is process wastewater, as under the HON. To determine if the effluent is subject to requirements for wastewater, you must determine if it meets any of the Group 1 wastewater criteria, just like for other process wastewater streams.

Comment: Several commenters requested that methyl ethyl ketone (MEK) be deleted from the list of PSHAP in Table 8 to subpart FFFF of 40 CFR part 63 because MEK was removed from the list of HAP in the CAA on December 19, 2005 (70 FR 75047). One of the commenters suggested a separate rulemaking to address the situation before the compliance date.

Response: We agree with the commenters that MEK should no longer be listed in Table 8 to subpart FFFF of 40 CFR part 63 because MEK has been removed from the HAP list. Therefore, we removed MEK from Table 8 to subpart FFFF of 40 CFR part 63 in the final rule amendments.

D. Requirements for Equipment Leaks

Comment: One commenter requested that bench-scale operations be exempt from the MON just as in the HON at 40 CFR 63.160(f) and 40 CFR 63.190(f), the Pharmaceuticals Production NESHAP at 40 CFR 63.1255(a)(6), and the Pesticide Active Ingredient Production NESHAP at 40 CFR 63.1363(a)(6). The commenter states that the justification for excluding bench-scale operations from the other rules, as stated in the preamble to an amendment for the HON (60 FR 18071, April 10, 1995), is equally applicable to the MON source category.

Response: We agree with the commenter and have corrected this oversight by adding an exemption for bench-scale batch operations in a new 40 CFR 63.2480(d). Although the term "bench-scale batch operations" is defined in 40 CFR 63.161 of the HON, we also added the same definition in the final amendments to 40 CFR 63.2550(i) because the term is not defined in 40 CFR part 63, subpart UU or in 40 CFR part 65, subpart A.

Comment: One commenter opposed the proposed amendments to the requirements for equipment leaks at existing sources in Table 6 to subpart FFFF. These changes would eliminate the 40 CFR part 63, subpart TT option for MCPU with no continuous process vents in favor of a new above-the-floor option that would require all MCPU to comply with either 40 CFR part 63, subpart UU, or 40 CFR part 65, subpart F, both modified to allow sensory monitoring of connectors in place of Method 21 monitoring.

The commenter stated four objections to the proposed changes. First, the commenter does not believe we have met the statutory requirement to demonstrate that the costs of the new option are reasonable, particularly for equipment in an MCPU with no continuous process vents. To illustrate this concern, the commenter provided information for an example pump and concluded that the additional cost to comply with 40 CFR part 63, subpart UU instead of 40 CFR part 63, subpart TT could be over $70,000 per ton of HAP removed.

Second, the commenter disagrees with our assertion that a consistent set of options for all MCPU will simplify applicability because this determination needs to consider other rules that apply at the MON facilities. For example, if a facility with MON batch operations is also subject to the Organic Liquid Distribution NESHAP, for which 40 CFR part 63, subpart TT is a compliance option, then eliminating the 40 CFR part 63, subpart TT option from the MON could make applicability more complicated.

Third, even if the nationwide benefits of reduced connector monitoring for continuous operations more than offsets the additional nationwide burden to comply with the 40 CFR part 63, subpart UU for all MCPU, the commenter is concerned that the offsets are inequitably distributed. Facilities primarily engaged in batch chemical manufacturing would incur additional costs but receive little or no benefit, whereas facilities that primarily operate continuous chemical manufacturing processes will receive the benefits but incur little or no cost.

Fourth, the commenter stated that the new leak detection and repair (LDAR) options do not appropriately recognize the difference in potential environmental impact between batch and continuous operations. The commenter noted that, prior to the amendments, 40 CFR part 63, subpart FFFF allowed for the fundamental differences of scale and modes of operation between continuous and batch operations by properly allocating the stringency of equipment leak requirements. The commenter argued that the proposed change does neither. The higher stringency of 40 CFR part 63, subpart UU is appropriate for large continuous operations but not for small batch operations.

Response: In the analysis for the proposed amendments, the MACT floor

for all MCPU was an LDAR program equivalent to the requirements in 40 CFR part 63, subpart TT, and the above-the-floor option lowered the leak definition for pumps and valves to the level specified in 40 CFR part 63, subpart UU. Although we stand by our original conclusion that the average nationwide impacts of the proposed above-the-floor option are reasonable, we also share the commenter's concern that the benefits and costs are not distributed equitably among facilities with different types of operations, especially when considering the leak detection and repair program already implemented at the facility.

Upon closer examination of the results of the cost analysis, it is clear that the incremental impacts for pumps in MCPU that have no continuous process vents are much more significant than the impacts for valves in those same processes and the impacts for MCPU that have continuous process vents. To mitigate the excessive burden for batch operations already in compliance with 40 CFR part 63, subpart TT, we have modified the above-the-floor option to lower the pump leak definition only for MCPU with continuous process vents (the option still lowers the leak definition for valves in all MCPU). As a result of this change, the incremental impacts for both batch and continuous operations are reasonable. For the final amendments, we did not change the language in Table 6 to subpart FFFF of 40 CFR part 63 (i.e., the LDAR programs in 40 CFR part 63, subpart UU and 40 CFR part 65, subpart F are still the starting point for all MCPU). However, new language in 40 CFR 63.2480(b)(5) and (c)(5) specifies that you may elect to comply with a leak definition of 10,000 ppm for pumps in light liquid service in an MCPU that has no continuous process vents and is part of an existing source.

In addition to the changes described above for pumps, the final amendments also include an additional compliance option for equipment leaks. Many facilities with processes that are subject to 40 CFR part 63, subpart FFFF also have processes that are subject to the equipment leak provisions in 40 CFR part 63, subpart H. The requirements in 40 CFR part 63, subpart H are substantially similar to the requirements in 40 CFR part 63, subpart UU. Therefore, we decided to modify Table 6 of subpart FFFF to 40 CFR part 63 to allow compliance with 40 CFR part 63, subpart H as another alternative. This option provides additional flexibility, and it may reduce the burden for some owners and operators while achieving the same level of emissions control.

E. Initial Compliance Requirements

1. Design Evaluations

Comment: A proposed amendment to 40 CFR 63.2450(h) would clarify that the option to conduct a design evaluation instead of a performance test for a small control device applies only to control devices used to control process vents and transfer racks because other provisions in the rule already allow design evaluations for storage tanks and wastewater. Section 63.2450(h) also references the criteria for design evaluations in 40 CFR 63.1257(a)(1) of the Pharmaceuticals Production NESHAP. One commenter believes it would be preferable to require compliance with the design evaluation requirements in 40 CFR 63.985(b) for small control devices used to meet the emission limits in Tables 1, 3, and 5 to subpart FFFF of 40 CFR part 63, and require compliance with 40 CFR 63.1257(a)(1) only for control devices used to meet the emission limits specified in Table 2 to subpart FFFF of 40 CFR part 63. According to the commenter, referencing the design evaluation procedures in 40 CFR part 63, subpart SS for the emission types subject to Tables 1, 3, and 5 to subpart FFFF of 40 CFR part 63 is appropriate because the performance test and other requirements in 40 CFR part 63, subpart SS also apply to those emission types. The commenter also recommended adding the following statement: "For continuous process vents the design evaluation shall be conducted at maximum representative operating conditions for the process, unless the Administrator specifies or approves alternate operating conditions."

Response: Although written in very different styles, the intent of the design evaluation requirements in 40 CFR part 63, subpart SS and the Pharmaceuticals Production NESHAP are essentially the same, to the extent they overlap. We decided not to reference both sets of requirements because we believe it is clearer to reference only one wherever possible. We selected the criteria in the Pharmaceuticals Production NESHAP because they are slightly more comprehensive than the procedures in 40 CFR part 63, subpart SS (e.g., they include criteria for scrubbers and non-regenerative carbon adsorbers). Furthermore, the language in the Pharmaceuticals Production NESHAP is nearly identical to the language in 40 CFR 63.139 of the HON, which 40 CFR part 63, subpart FFFF references for wastewater control devices.

We agree with the commenter's suggested clarification regarding the conditions under which the design evaluation should be conducted for a control device that controls continuous process vents. This language is borrowed from 40 CFR 63.997(e)(1)(i), and it will ensure that design evaluations are conducted under the same conditions as performance tests. It also complements the instructions in 40 CFR 63.2460(c)(2)(ii), which specify conditions under which a design evaluation should be conducted for a control device that controls batch process vents. Thus, we added the commenter's suggested language in 40 CFR 63.2450(h). Along these same lines, we also added a statement specifying that a design evaluation for a control device that is used to control transfer racks must demonstrate that the required efficiency is achieved during the reasonably expected maximum transfer loading rate.

2. Requirements After Process Changes

Comment: Proposed amendments in 40 CFR 63.2445(d), (e), and (f) specify requirements that apply after various types of process changes. In each case, the proposed amendments specify that a performance test or design evaluation is required within 150 days of the process change. Two commenters requested clarification of the proposed amendments because they noted that an initial compliance demonstration does not always require a performance test or design evaluation. For example, one commenter pointed out that no performance test should be required if the facility complies with the alternative standard or routes the emission stream to a fuel gas system. The other commenter described a situation where a performance test should not be required because a previous test is still valid. According to this commenter, when production is scaled up so that Group 2 batch process vents become Group 1 batch process vents, production may be shifted to different equipment for which initial compliance was previously demonstrated under worst-case conditions that are not exceeded by the operating scenario for the new process. To clarify the amendments, one commenter suggested replacing the references to performance tests and design evaluations with a reference to "an initial compliance demonstration as specified in this subpart."

Response: Our intent was to require a performance test or design evaluation after the specified types of process changes only when a performance test or design evaluation would have been required to demonstrate initial

compliance if the situation after the change had existed at the time the facility first became subject to 40 CFR part 63, subpart FFFF. The commenters correctly observed that in some situations initial compliance can be demonstrated without a performance test or design evaluation, or it can be demonstrated using a previous performance test. Therefore, we revised 40 CFR 63.2445(d), (e), and (f) in the final rule amendments to require any applicable initial compliance demonstration instead of requiring only a new performance test or design evaluation.

3. Calculation of Uncontrolled Emissions

Comment: One commenter pointed out that the calculation of HAP emissions from process condensers requires knowledge of condensate receiver composition and condenser exit gas temperature (or direct knowledge of exit gas stream composition). In most cases, data on the condensate composition is not available. The commenter stated that typical errors made in estimating emissions following process condensers include use of condenser exit water temperature instead of exit gas temperature, lack of an applied material balance, and use of reactor vessel liquid phase mole fraction to determine partial pressure of condensables in the condenser exit gas (single most common mistake). When the operator has no knowledge of the liquid condensate mole fractions, a material balance must be used to determine the mole fractions present in equilibrium with the exiting emission stream. The commenter provided an example of a material balance based on noncondensables for a process operation involving toluene and xylene. The commenter further points out that for process operations where temperature and pressure are changing, the material balance may be complex. In summary, the commenter stated that it is essential that the noncondensable material balance be applied in conjunction with an iterative solution to solve condensate liquid mole fraction for cases where liquid composition in the receiver is not known.

Response: We agree with the commenter that the required procedures to calculate uncontrolled emissions when a vessel is equipped with a process condenser should be corrected to reflect the condenser exit gas temperature and composition of the condensate. The following assumptions apply for calculating uncontrolled emissions from process vent from a process condenser:

(1) For all condenser calculations one would use the condenser exit gas temperature and pressure as the reference conditions.

(2) It should be assumed that the condenser exit vent gas is in equilibrium with the liquid condensate which is also leaving the condenser based on the exit gas temperature. Therefore, the calculated vapor pressure for each volatile component in the condensate would have approximately the same calculated partial pressure of the same component in the exit vent gas from the condenser.

(3) Dalton's Law would be used to calculate the partial pressure of the noncondensable component (air, nitrogen, * * *) contained in the condenser exit vent gas. This is where the sum of all of the partial pressures is equal to the total system pressure and the partial pressure of the noncondensable component would be calculated by subtracting the sum of all volatile component vapor pressures from the total system pressure.

(4) Material balance considerations should be taken into account for each component at the condenser. The amount of each component that enters the condenser should be approximately equal to the amount that is calculated to leave the condenser through the exit vapor stream and the exit condensate liquid stream.

(5) The amount of each component that is emitted from the condenser should be determined first. The total HAP that are emitted from the condenser may then be calculated from the component emission totals. It is likely that many of the compounds that are emitted from the condenser may not be HAP but would need to be calculated as part of the overall condenser solution.

In all but the simplest cases (single component systems) the solution to the condenser problem will require a numerical iteration as part of the basic procedure. We are changing the procedures for calculating emissions from condensers to be as technically correct as possible. This is important because uncontrolled emission estimates are used as a threshold for requiring installation and operation of control devices.

Comment: As part of the proposed amendments, a new paragraph was added at 40 CFR 63.2460(b)(4) to require the use of procedures in 40 CFR 63.1257(d)(3)(i)(B) to calculate uncontrolled batch process vent emissions from a vessel equipped with a process condenser. Three commenters noted that there are some batch process steps where a process condenser is used, but the required equations do not adequately estimate the emissions. The commenters cited the following as examples: intermittent vents from continuous distillation columns, maintenance purges, or regenerator operations. To estimate uncontrolled emissions for such steps, the commenters believe 40 CFR part 63, subpart FFFF should allow the use of engineering assessments in accordance with 40 CFR 63.1257(d)(2)(ii) of the Pharmaceuticals Production NESHAP. According to one commenter, engineering assessments also should be allowed for emission episodes covered by the equations if the owner or operator can demonstrate to the Administrator that those methods are not appropriate.

Response: We agree with the commenters that the specified equations do not address all possible types of emission episodes from process condensers, just as they do not address all possible types of emission episodes directly from process equipment. Therefore, we have modified 40 CFR 63.2460(b)(4) in the final amendments to allow the use of engineering assessments for types of emission episodes not covered by the specified equations. However, the revised procedure for calculating condenser emissions will always apply. We also added the provision that allows engineering assessments covered by the equations in 40 CFR 63.1257(d)(3)(i)(B) if you can demonstrate that those methods are not appropriate. These changes make the procedures for estimating uncontrolled emissions from process condensers consistent with the procedures for estimating uncontrolled emissions directly from process equipment.

Comment: A proposed amendment in 40 CFR 63.2465(b) clarifies that uncontrolled hydrogen halide and halogen HAP emissions may be estimated using either the equations in 40 CFR 63.1257(d)(2)(i) or an engineering assessment in accordance with 40 CFR 63.1257(d)(2)(ii), whichever is appropriate. One commenter noted that in order to use an engineering assessment for emission episodes covered by the equations, 40 CFR 63.1257(d)(2)(ii) requires a demonstration that the equations are not appropriate. The commenter asked if information to support the demonstration should be documented in the notification of compliance status report.

Response: According to 40 CFR 63.1257(d)(2)(ii)(E), all information must be documented in the precompliance report. However, we

understand that the emission equations in 40 CFR 63.1257(d)(2)(i) were developed for organic HAP and decided that a demonstration that the equations are not appropriate for hydrogen halide and halogen HAP emissions would be an unnecessary burden. Therefore, 40 CFR 63.2465(b) of the final amendments specifies that the information to support an engineering assessment for estimating hydrogen halide and halogen HAP emissions must be submitted in the notification of compliance status report.

F. Monitoring Requirements

1. Absorbers

Comment: Five commenters objected to the proposed amendments to the monitoring requirements for absorbers in 40 CFR 63.2450(k)(5). These amendments would require continuous monitoring of liquid and gas flow, and records of the liquid-to-gas ratio, in addition to the monitoring and recordkeeping required in 40 CFR 63.990(c)(1), 63.993(c)(1), and 63.998(a)(2)(ii)(C). According to the commenters, the current monitoring requirements (liquid temperature and specific gravity) are sufficient to demonstrate compliance, and they believe we have not explained why these requirements are inadequate. They also noted that there is no precedent for the proposed monitoring (except for halogen scrubbers, for which flow monitoring is already required in 40 CFR 63.994), and it would add significant burden and cost to monitoring absorbers. Therefore, the commenters believe the proposed amendments should not be finalized.

Response: Our intent was to require liquid and gas flow monitoring only for absorbers where water is used as the scrubbing fluid. As the commenters pointed out, the rule already requires this monitoring for halogen scrubbers by referencing the requirements in 40 CFR 63.994. However, water can also be used to scrub organic compounds from an emission stream. We believe the same monitoring requirements that apply to halogen scrubbers should also apply to any other absorber that uses water as the scrubbing liquid. Therefore, 40 CFR 63.2450(k)(5) in the final amendments has been revised to require the liquid and gas flow monitoring only for absorbers that control organic compounds and use water as the scrubbing fluid.

2. Organic Monitoring Devices

Comment: The proposed amendments added a new 40 CFR 63.2460(c)(9) to specify requirements for biofilters that are used as control devices for batch process vents. Section 63.2460(c)(9)(iii) specified requirements for temperature monitoring devices and organic monitoring devices. This section also indicated that general requirements for continuous emissions monitoring system(s) (CEMS) are specified in 40 CFR 63.2450(j) and in Table 12 to subpart FFFF of 40 CFR part 63. The preamble to the proposed amendments explained that this rule language means the quality assurance/quality control and other requirements for CEMS in subpart A of 40 CFR part 63 would apply to organic monitoring devices. Three commenters disagreed with this statement. One of the commenters pointed out that a CEMS must provide a record of the emissions, whereas an organic monitoring device is required to provide an indication of concentration. As an example, this commenter noted that the monitored parameter for an organic monitoring device could be a calibrated indicator of HAP concentration such as the millivolts generated by a concentration sensor. According to another commenter, the references to CEMS in the amended explanations for citations in Table 12 to subpart FFFF of 40 CFR part 63 should be applicable only to CEMS that are used for compliance with the alternative standard in 40 CFR 63.2505. Thus, the three commenters recommended removing the proposed changes from 40 CFR 63.2460(c)(9)(iii), Table 12 to subpart FFFF of 40 CFR part 63, and all associated preamble discussions.

Response: The commenters' interpretation of the differences in requirements for CEMS and organic monitoring devices is correct. Requirements for CEMS were inappropriately applied to organic monitoring devices in 40 CFR 63.2460(c)(9)(iii) of the proposed amendments, and they have been removed from the final amendments. As a result of these changes, the use of an organic monitoring device with a biofilter is subject to the parameter monitoring requirements in 40 CFR part 63, subpart SS. All other organic monitoring devices, except those used with controls for wastewater systems, are also subject to the requirements in 40 CFR part 63, subpart SS. Organic monitoring devices used with controls for wastewater systems are subject to the similar parameter monitoring requirements in 40 CFR part 63, subpart G of the HON.

We disagree with the comments regarding the proposed changes in Table 12 to subpart FFFF of 40 CFR part 63. Nothing in the rule prohibits the use of a CEMS to monitor pollutant concentrations to demonstrate continuous compliance with a percent reduction requirement. For example, a control device might reduce HAP concentrations to less than 100 ppm. This would not be enough to demonstrate compliance with the alternative standard, but it might be more than 98 percent reduction. Most owners and operators in this situation might choose to comply with the organic monitoring device provisions and monitor a parameter like the millivolts generated by the concentration sensor. That would be acceptable. However, you also have the option to directly monitor the concentration. We believe that monitoring the concentration continuously makes the equipment a CEMS, and the requirements for CEMS should apply. The proposed changes to Table 12 to subpart FFFF of 40 CFR part 63 make it clear that requirements for CEMS apply anytime a CEMS is used (i.e., emissions concentrations are continuously monitored), but they do not apply to an organic monitoring device. Thus, the proposed changes to Table 12 to subpart FFFF of 40 CFR part 63 are retained in the final amendments.

3. Scrubber Monitoring

Comment: Sections 63.994(c) and 63.2450(k)(3) require continuous monitoring of either pH or caustic strength in the effluent from halogen scrubbers. One commenter argued that the requirement for continuous monitoring is "arbitrary and particularly burdensome to batch operators" and should be changed to daily monitoring to match the Pharmaceuticals Production NESHAP and the Pesticide Active Ingredient Production NESHAP.

Response: We decided to modify 40 CFR 63.2450(k)(3) in the final amendments to allow daily monitoring of pH or caustic strength as an alternative to continuous monitoring for halogen scrubbers used to control only batch process vents. This change minimizes the burden for batch operations and brings the monitoring requirements for such operations at MON sources in line with the monitoring requirements for batch operations at pharmaceutical and pesticide active ingredient (PAI) sources.

4. Periodic Verification

Comment: Section 63.2460(c)(5) of the final rule specifies alternative monitoring provisions, called periodic verifications, for control devices that control less than 1.0 ton per year HAP from batch process vents. One commenter suggested that the periodic

verification option should be available for monitoring control devices that control emissions from all types of emission points, not only batch process vents. To support this suggestion, the commenter noted that both the proposed rule (67 FR 16154, April 4, 2002) and the pharmaceuticals production NESHAP did not limit the use of the periodic verification provision to batch process vents.

Response: The purpose of the periodic verification option is to minimize the monitoring burden on small operations that are expected to contribute only a small fraction of the total emissions. We agree with the commenter that there is no need to restrict the option to controls for batch process operations. As the commenter noted, the proposed rule and other rules (pharmaceuticals production and PAI production) did not limit the option to controls for batch process vents. To correct this inadvertent oversight, the final amendments move the periodic verification requirements from 40 CFR 63.2460(c)(5) to 40 CFR 63.2450(k)(6) so that they will apply to control devices that control less than 1.0 ton per year of HAP from any emission points.

G. Recordkeeping and Reporting Requirements

1. Wastewater Control Devices

Comment: As part of the proposed amendments, a new paragraph with recordkeeping requirements for flare monitors was added in 40 CFR 63.2485(o)(1). One commenter believes the proposed provision mistakenly references requirements for nonflares. The commenter recommended revising the proposed language to match the subpart SS recordkeeping requirements for flares.

Response: Flares that are used to control wastewater emissions are subject to the requirements in 40 CFR part 63, subpart G of the HON. The proposed language in 40 CFR 63.2485(o)(1) was added to make the recordkeeping and reporting requirements for flares used to control wastewater systems consistent with the requirements in 40 CFR 63.998(a)(1)(iii) of subpart SS. Since proposal of the amendments we realized that the proposed language is unnecessary because 40 CFR 63.147(d)(1) contains the same recordkeeping requirement, and Table 20 to subpart G of 40 CFR part 63 (as referenced from 40 CFR 63.146(e)(1)) contains the same reporting requirement. Therefore, the proposed amendments to 40 CFR 63.2485(o)(1) were not included in the final amendments.

Comment: According to one commenter, the proposed 40 CFR 63.2485(o)(2) creates a recordkeeping conflict for nonflare control devices used for wastewater emissions. The section requires compliance with both 40 CFR 63.152(f) of subpart G and 40 CFR 63.998(c)(1) of subpart SS. Because some of the requirements are not consistent with each other, the commenter recommended revising 40 CFR 63.2485(o)(2) to read, "you must keep records as specified either in § 63.998(c)(1) or § 63.152(f) in addition to the other records required in § 63.147(d)."

Response: We disagree with the suggested change. Section 63.152(f) specifies requirements such as the frequency of monitoring measurements, procedures for developing daily or other average values, and the amount of time records must be kept. These procedures would overlap with procedures in 40 CFR 63.998(b), but subpart FFFF does not reference 40 CFR 63.998(b) for wastewater control devices. On the other hand, 40 CFR 63.998(c)(1) requires records of information such as calibration results, periods when the CPMS is inoperative, and the occurrence and duration of startup, shutdown, and malfunction of CPMS. For a source subject to the HON, comparable records may be required by 40 CFR 63.103, but this section of the HON is not referenced from 40 CFR part 63, subpart FFFF. Therefore, we retained the proposed requirement in the final amendments so that the same CPMS monitoring records are required for non-flare control devices regardless of the emission point that is controlled.

2. Operating Logs

Comment: As part of the proposed amendments, §§ 63.2520(e)(5)(ii)(C), 63.2520(e)(5)(iii)(K), and 63.2525(c) were modified to require operating logs only for "processes with batch vents." The preamble to the proposed amendments also stated that operating logs are not needed for processes that consist entirely of continuous operations. Two commenters agree with the preamble language, but they noted that the proposed rule language still requires operating logs for continuous operations with intermittent emissions because these operations fit the definition of "batch vents." Therefore, the commenters recommended changing the proposed language to refer to batch "operations."

Response: As the commenters noted, by referring to "processes with batch vents," the proposed rule language did not fully accomplish our goal as stated in the proposal preamble because continuous operations with intermittent emissions are defined as batch process vents. Therefore, 40 CFR 63.2520(e)(5)(ii)(C), 63.2520(e)(5)(iii)(K), and 63.2525(c) were revised in the final amendments to require operating logs only for "processes with batch process vents from batch operations."

3. Frequency of Recordkeeping Calculations for Group 2 Batch Process Vents

Comment: Sections 63.2520(e)(2) and (3) of the proposed amendments specified recordkeeping requirements for MCPU with Group 2 batch process vents for which you documented that the amount of non-reactive HAP used is less than 10,000 lb/yr or the uncontrolled organic HAP emissions are less than 1,000 lb/yr. These sections also require you to calculate daily rolling annual sums of either the non-reactive HAP usage or number of batches operated. Data may be accumulated for up to a month, and all calculations for each day in the month may be performed at one time. One commenter requested that these daily rolling annual sums be changed to monthly rolling annual sums.

According to the commenter, calculations on a daily basis will add to the compliance burden because a new system would be needed to ensure that production is assigned to the correct day. Of particular concern to the commenter is how to comply when a batch operates for longer than 1 day. The commenter believes that new procedures will need to be developed to arbitrarily assign products to individual days during the batch cycle. On the other hand, the commenter pointed out that many facilities already have monthly recordkeeping systems in place under their title V permits, and these systems include procedures to ensure that the monthly data is complete and accurate.

The commenter also argued that the daily calculations would not provide better information than monthly calculations. According to the commenter, the purpose of both procedures is to "track emissions from processes that are well below the Group 1 process vent standards," and a monthly sum would ensure this threshold was not exceeded.

Response: We rejected the suggestion to change the rolling annual sums from a daily to monthly basis for several reasons. First, daily calculation of the annual usage or number of batches is consistent with the basis for the 10,000 lb/yr emission threshold for Group 1 batch process vents. Less frequent calculations increases the potential that

short-term fluctuations and periods of non-compliance will be masked. Second, usage at 10,000 lb/yr is not necessarily "well below" the Group 1 emission threshold of 10,000 lb/yr. For example, usage may nearly equal batch process vent emissions for a process that consists of little more than a batch reactor. Third, we are not persuaded that the burden to collect data for daily calculations will be significantly different than collecting data for monthly calculations. The fundamental information about production and HAP usage that would be collected for monthly calculations most likely would be developed on a batch or daily basis. Handling data for processes that take more than one day also should not be difficult. Any consistent procedure should be acceptable. For example, your system could account for each batch on the day the batch is completed. Similarly, the amount of non-reactive HAP used in each batch could be assigned to the day the batch is completed, or you could elect to define some procedure to assign a percentage of the total usage to each day over which the process operated.

H. Overlap With Other Rules

Comment: The proposed amendments modified provisions in 40 CFR 63.2535(k) that are intended to minimize the burden of complying with equipment leak requirements when both 40 CFR part 63, subpart FFFF and another rule apply to the same process. The first sentence in this section specifies that an owner or operator may elect to comply with only 40 CFR part 63, subpart FFFF for equipment that is part of the affected source under 40 CFR part 63, subpart FFFF and is also subject to either 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V. If an owner or operator elects this method of compliance, the proposed second sentence requires all organic compounds, minus methane and ethane, to be considered as if they were HAP. One commenter noted that in this context the second sentence is unnecessary because all of the equipment described by the first sentence must be in HAP service. However, the commenter believes that this section also should allow sources to apply the requirements in 40 CFR part 63, subpart FFFF to equipment in an MCPU that is subject to 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V, but is not subject to 40 CFR part 63, subpart FFFF. The commenter notes that this requirement in conjunction with the proposed second sentence would make sense, and together these provisions would be consistent with 40 CFR 63.160(c) of the HON.

Response: Our intent with the proposed amendments was to include provisions in 40 CFR 63.2435(k) that are consistent with the provisions in 40 CFR 63.160(c) of the HON. We inadvertently neglected to include the first sentence from 40 CFR 63.160. Therefore, the final amendments to 40 CFR 63.2535(k) include the additional sentence as suggested by the commenter to make the provisions consistent with the provisions in 40 CFR 63.160(c).

Comment: Section 63.2535(c) specifies provisions that are intended to minimize the compliance burden when 40 CFR part 63, subpart FFFF and another rule (either 40 CFR part 60, subpart Kb or 40 CFR part 61, subpart Y) apply to the same storage tank. One commenter requested that this section be revised to include provisions similar to those for equipment leaks in 40 CFR 63.2535(k). The commenter believes such provisions would simplify compliance for storage tanks that are assigned to an MCPU but are not subject to the storage tank requirements in 40 CFR part 63, subpart FFFF because they contain little or no HAP. According to the commenter, such flexibility is provided in the HON.

Response: Although a storage tank with little or no HAP may be subject to 40 CFR part 60, subpart Kb or 40 CFR part 61, subpart Y and also be assigned to an MCPU, there is essentially no overlap because no requirements in 40 CFR part 63, subpart FFFF apply to such a tank. This situation is similar to that for shared storage tanks that are assigned to a process unit that is subject to one rule but is also used with a process unit that is subject to another rule. Unlike the situation for equipment leaks, we believe any reduction in burden achieved by complying with 40 CFR part 63, subpart FFFF for storage tanks in an MCPU that are not subject to requirements in 40 CFR part 63, subpart FFFF would be negligible. Furthermore, the HON does not include the provisions described by the commenter. Therefore, we have decided not to amend 40 CFR 63.2435(c) as suggested by the commenter.

I. Definitions

1. Miscellaneous Organic Chemical Manufacturing Process

Comment: As part of the amendments, the definition of "miscellaneous organic chemical manufacturing process" in 40 CFR 63.2550(i) was changed to specify an endpoint to processes that manufacture solid products. One commenter concurred with the concept of defining an end point for such processes. However, the commenter is concerned that the proposed definition could be misapplied on polymer production processes that have no dryer and no extruder or die-plate. The commenter explained that their solid-state polymerization process for polyethylene terephthalate (PET) operates without any of this equipment. The finished polymer is discharged from the reactors as a coarse, ready-to-use powder. Without clarification, the commenter is concerned that the proposed definition conceivably extends the PET process into the subsequent film manufacturing process, which would conflict with previous guidance EPA has provided regarding the applicability of 40 CFR part 63, subpart FFFF. To clarify this situation, the commenter suggested the endpoint for solid-state polymerization processes be "at the container or vessel used to collect or store the reacted polymer if subsequent drying is not required and the polymer is in a form amenable to its intended manufacturing purpose."

Response: We agree with the commenter that the proposed definition needs to be modified to clarify the endpoint of a solid-state polymerization process that does not include a dryer. We believe the reactor is the appropriate end of such a process, provided there are no HAP removal steps following the reactor. This point is comparable to the end points specified for other processes that manufacture solid products. The definition in the final amendments has been revised to reflect this decision.

Comment: In addition to the proposed endpoint described above for processes that produce solid products, one commenter thinks the miscellaneous organic chemical manufacturing process definition also should specify an endpoint for processes that produce liquid products. The commenter cited acrylic polymer manufacturing processes as examples of processes for which an endpoint is needed. According to the commenter, after the polymerization reaction, the product is an emulsion of polymer solids in water, and the residual HAP monomer concentration generally is low. The commenter suggested that EPA could establish an option that would exempt from regulation all processing steps after the point where the residual HAP monomer falls below some reasonable threshold concentration. The commenter pointed to the 5 weight percent HAP option in the Miscellaneous Coating Manufacturing NESHAP as a good example.

Response: This comment is similar to several comments on the original

proposed rule. The earlier commenters wanted the rule to exempt processing steps where the HAP content is less than 5 weight percent or HAP is present only as an impurity. In our response to those comments (see docket item No. EPA–HQ–OAR–2003–0121–0036), we explained that the rule includes numerous applicability cutoffs and exemptions that we think are sufficient.

For example, equipment leak requirements do not apply to equipment that contains or contacts fluid that is less than 5 percent organic HAP by weight. Storage tanks are not subject to requirements if the stored material has a maximum true vapor pressure less than 6.9 kilopascals. Emissions from transfer operations are exempt if the rack-weighted average partial pressure of organic HAP is less than 1.5 pounds per square inch absolute. Emissions from many continuous process operations are exempt if the HAP content is less than 0.005 weight percent, and emissions from other continuous operations and batch operations are exempt if the HAP concentration is less than 50 ppm. In addition, continuous process vents are exempt from some or all requirements if the total resource effectiveness, which is inversely related to the HAP emission rate, is greater than 1.9 or 5.0, respectively. Batch process vents are exempt from all but some recordkeeping requirements if the total organic HAP emissions from the collection of all batch vents in the process are less than 10,000 lb/yr. Strictly speaking, all Group 1 batch process vents are subject to control, regardless of their emission rate, but vents with low emission rates may not actually have to be controlled if the control or recovery from other vents in the process meets the overall reduction requirement. All of these exemption levels are based directly or depend on concentration of HAP. Furthermore, they were all developed as part of the MACT floor.

Although our earlier response did not address the issue of emulsions (or dispersions), we do not believe this should have any bearing on the exemption levels because such fluids are managed the same as other liquids. Finally, the 5 weight percent option in the Miscellaneous Coating Manufacturing NESHAP is not comparable or relevant to this discussion. That 5 percent limit was based on a determination that reducing the HAP content of existing HAP-based coating products to less than 5 percent would achieve comparable reductions to the MACT floor. A similar analysis is not feasible for miscellaneous organic chemical manufacturing processes. Therefore, we do not believe an additional exemption level is needed, and we have not created an exemption as suggested by the commenter.

2. Continuous Process Vent

Comment: Two commenters strongly objected to the proposed changes introduced in the new item 7 in the definition of the term "continuous process vent." The proposed language specified, in part, that "when a gas stream that originates as a continuous flow from a continuous operation is combined with gas streams from other process operations [], the determination of whether the gas stream is a continuous process vent must be made prior to the combination of the gas streams." One of the commenter's concerns was that the proposed changes will alter how some vents are handled under the HON and other NESHAP because the proposed language is not confined to gas streams from MCPU. For example, emission streams from batch operations within a HON process (which are batch process vents under 40 CFR part 63, subpart FFFF) that are combined with emissions from continuous operations within the HON process should not affect the point at which a continuous process vent is determined under the HON.

The commenters also believe the proposed regulatory language is far more expansive than needed to satisfy our stated reason for the change in the preamble, which they noted was to meet our intent that continuous process vents and batch process vents be separate, distinct streams. According to the commenters, only the mixing of potential continuous process vents with Group 2 process vents needs to be addressed because the rule is already clear that anything mixed with Group 1 batch process vents must be controlled. Furthermore, mixing potential continuous process vents with any other types of emission streams is already addressed by the referenced language in 40 CFR 63.107 of the HON and is consistent with the database used to determine the MACT floor for continuous process vents. As a result, both commenters strongly recommended revising the proposed language to minimize differences from the continuous process vent provisions in the HON.

Response: We agree with the commenter's assessment that several changes are needed to avoid confusion over the regulatory status of continuous process vents. First, the proposed language should have specified that the continuous operations of interest were only those in MCPU because we did not intend to affect determinations under other rules. After reconsideration, we also decided that there is no need to address the combination of potential continuous process vents and batch process vents. As the commenters pointed out, if a combined stream includes Group 1 batch process vents, the combined stream must be controlled as required for the Group 1 batch process vents. However, note that when Group 2 batch process vent emissions are combined with emissions from potential continuous process vents, the recordkeeping requirements for the Group 2 batch process vents still apply. In addition, by referring only to other *process operations* in the proposed language, we were trying to indicate that continuous process vent determinations could be downstream of the point where emissions from continuous process operations combine with emissions from storage tanks, wastewater systems, or other sources, consistent with 40 CFR 63.107.

Although our discussion in the preamble to the proposed amendments neglected to explain it, a related objective of the proposed language was to ensure that separate determinations are made for emissions from each MCPU. This concept is not part of the provisions in 40 CFR 63.107, and we continue to believe that it is important because it is consistent with the data used to develop the MACT floor for continuous process vents. Therefore, in the final amendments, we have revised item 7 in the definition of "continuous process vent" to specify that separate determinations are required for the emissions from each MCPU, even if emission streams from two or more MCPU are combined.

3. Continuous Operation

Comment: One commenter believes the definition of the term "continuous operation" should allow for the interruption of product flow during a switch from one feed tank to another if the materials are similar in nature. The commenter described a situation where a flaker or pastille maker is fed from either of two storage tanks. The commenter noted that the flaker and pastille maker equipment operates continuously, except when switching from one feed tank to the other.

Response: We have not changed the definition in the final rule because the rule already allows you to consider an operation to be a continuous operation even if there are periodic breaks in operation. We think the commenter may be misinterpreting the definition of "batch operation." Although this definition says a batch operation

involves intermittent or discontinuous feed, it also says addition of raw material and withdrawal of product do not occur simultaneously in a batch operation. Both conditions must be met to be a batch operation. Thus, even though there may be a break in operation when switching from one feed tank to another, as long as material is being added and withdrawn simultaneously while it is in operation, it is a continuous operation.

Comment: One commenter expressed concern that in our discussion of changes to the definition of "continuous process vent," we appeared to conclude that all atmospheric dryers are continuous operations with continuous process vents. The preamble stated that many atmospheric dryers "have emission characteristics that are sufficiently similar to other continuous process vents in our database such that they should be included in the definition of "continuous process vents." The commenter argued that atmospheric dryers used in batch specialty chemical manufacturing are substantively dissimilar to continuous process vents because emissions vary with time as a function of the batch cycle. Therefore, the commenter requested that we clarify that atmospheric dryer vents can be either batch or continuous process vents and that the classification is determined by an evaluation of the emission characteristics of the vent.

Response: The commenter is correct. Some atmospheric dryers are continuous operations with continuous process vents and others are batch operations with batch process vents. We did not mean to imply otherwise. As part of our analysis of the MACT floor for continuous process vents, we determined the characteristics of controlled dryers in both our continuous process database and batch process database. We confirmed that *some* of these dryers were continuous operations. Other dryers with controlled emissions were confirmed to be batch operations, and these were excluded from our analysis of continuous process vents.

4. Process Condenser and Recovery Device

Comment: Two commenters believe the proposed definition of the term "process condenser" is too expansive. The proposed definition reads as follows:

Process condenser means a condenser whose primary purpose is to recover material as an integral part of an MCPU. A primary condenser or condensers in series are considered to be integral to the MCPU if they are capable of and normally used for the purpose of recovering chemicals for fuel value (i.e., net positive heating value), use, reuse or for sale for fuel value, use, or reuse. All condensers recovering condensate from an MCPU at or above the boiling point or all condensers in line prior to a vacuum source are considered process condensers.

One of the commenters recommended modifying the definition to clarify that a condenser is not "integral to the process" if the condenser was intended to be a control device and it can be demonstrated that the process could technically or economically operate without it. This commenter described a situation where several condensers are used in a process to recover materials from gas streams. Condensate from these condensers is collected in single vessel and later reused in the process. Displaced gases from the collection vessel are routed through another condenser. Even though the final condenser recovers small amounts of material that are re-used, the commenter does not think it should be a process condenser.

The second commenter requested changes that would allow condensers to be considered an integral part of recovery devices. According to the commenter, if HAP are to be recovered from a vapor stream that is at a temperature below their bubble point, condensation must be involved at some point. For example, condensation may be necessary to dehumidify a vent stream before it enters a carbon adsorber. The commenter suggested two ways that the rule could be modified to allow condensers to be part of recovery devices. One way would be to modify the definition of the term "process condenser" to exclude condensers that meet the conditions of the second sentence of the proposed definition if those condensers also receive an emission stream that is below its bubble point, and they are located prior to any recovery device that is not a condenser. Alternatively, the commenter suggested editing the definition of the term "recovery device" to delete condensers from the list of examples of equipment that may be recovery devices, and indicate that the remaining examples of recovery devices include any integral condensation equipment.

Response: As discussed in the preamble to the proposed amendments, the main purpose of proposing a new definition was to align the requirements in the rule with the data that were used to develop the MACT floor for batch process vents. The final rule referenced the definition of "process condenser" in the Pharmaceuticals Production NESHAP. According to this definition, a condenser is a process condenser only if it supports a vapor-to-liquid phase change for periods of source equipment operation that are above the boiling or bubble point of substances at the liquid surface. Petitioners objected to this definition because they explained that it is inconsistent with the way industry representatives interpreted the term when they reported uncontrolled emissions in response to our information collection request (ICR) in 1997. They indicated that companies considered condensers to be integral to a process whenever condensate was returned to the process or used for fuel value, even if the inlet gas stream was at a temperature below the boiling or bubble point of the corresponding liquid. Thus, the final rule requires determination of uncontrolled emissions at different points than had been used in the processes that formed the basis for the MACT floor and the 10,000 lb/yr uncontrolled emissions threshold for Group 1 batch process vents.

To align the rule with the data provided in the ICR responses, we developed the proposed definition as shown above. One consequence of this definition is that it will reduce the number of condensers that can be used to comply with the 95 percent reduction recovery device option because designation as a process condenser is intended to preclude the recovery option. After considering the comments and review of the data, we have decided that the proposed definition is more expansive than it needs to be to address the issue raised by the petitioners. None of the 44 processes in the project data base that were used to establish the 10,000 lb/yr threshold for Group 1 batch process vents was controlled with a non-condenser recovery device. Therefore, we believe that condensers can be considered as part of a recovery device if they are followed by a device that is clearly a recovery device, and the condenser is needed for the proper functioning of the downstream recovery device. Rather than leave this determination open to subjective determinations, we decided to specify such exceptions to the process condenser definition in the definition itself. These situations involve condensers that remove moisture in order to prevent icing in a following condenser, remove moisture that would negatively affect adsorption capacity in a following carbon adsorber, or remove high molecular weight organic compounds or other organic compounds prior to a carbon adsorber if those compounds would be difficult to

remove during regeneration of the carbon.

In the preamble to the proposed amendments, we noted that the proposed definition of "process condenser" makes the concept of recovering chemicals with a condenser the same regardless of whether the vent is associated with a batch unit operation or a continuous unit operation. This was our intent, and, in addition, the recovery device definition also needs to be modified to allow recovery of chemicals for fuel value by devices associated with continuous process vents. To correct this oversight, the recovery device definition in the final amendments has been changed to allow equipment that is associated with continuous process vents to be a recovery device when it recovers chemicals for fuel value. The final definition retains the intent of the original definition for recovery devices that are used to reduce emissions from batch process vents; this equipment must recover chemicals to be reused in a process on site.

Finally, all of the changes described above have created a conflict between the definition of "process condenser" and "recovery device." Both definitions refer to recovery of chemicals for fuel value, use, or reuse. Thus, a condenser could meet both definitions. However, a process condenser is part of the MCPU and can not be considered a control device to meet the 95 percent control alternative in table 2.

J. Miscellaneous Technical Corrections

We have made several changes throughout subpart FFFF to correct inconsistencies that have been discovered during the review processes. Other editorial changes have also been made to improve clarity. These changes are described in Table 1 in this preamble.

TABLE 1.—MISCELLANEOUS TECHNICAL CORRECTIONS TO 40 CFR PART 63, SUBPART FFFF

Section of subpart FFFF	Description of correction
40 CFR 63.2435(b)(2) and 63.2525(e)(1)(i)	Replaced the word "produces" with the word "generates" to clarify that generation of any HAP, not only HAP that are an intended product, makes the MCPU subject to 40 CFR part 63, subpart FFFF.
40 CFR 63.2450(d), (e), and (f)	1. Redesignated paragraphs (d), (e), and (f) as paragraphs (e)(1), (2), and (3). 2. Reserved paragraph (d). 3. Added a new paragraph (f) to clarify flare compliance assessment procedures. Section 63.11(b)(6) of the General Provisions contains alternative procedures for flares that control hydrogen emissions. The alternative procedures are not included in 40 CFR part 63, subpart SS. The new provisions in paragraph (f) clarify that the alternative in the General Provisions is available under 40 CFR part 63, subpart FFFF.
40 CFR 63.2470(e)(2)(i) and (ii) and 63.2535(a)(2).	Offsite cleaning and reloading facilities must control emissions from tank trucks and railcars that are used in vapor balancing for storage tanks at the affected source. The final amendments include these new paragraphs to specify that such facilities may comply with the monitoring, recordkeeping, and reporting requirements in other applicable rules in 40 CFR part 63 as an alternative to the requirements in subpart FFFF. These changes make the requirements consistent with parallel requirements in 40 CFR part 63, subpart GGG.
40 CFR 63.2485(n)(2)(iv)(B)	Replaced "F_{bio}" with "f_{bio}."
40 CFR 63.2520(d)(2)(ix)	Replaced incorrect reference to 40 CFR 63.2535(i)(1) with correct reference to 40 CFR 63.2535(l)(1).
40 CFR 63.2520(e)(9) and 63.2525(a)	Restored references to 40 CFR part 63, subpart UU that were mistakenly removed in the proposed amendments.
40 CFR 63.2525(e)(1)(iii)	Replaced the undefined term "Group 2 batches" with the defined term "Group 2 batch process vents."
40 CFR 63.2550(b)	Added reference to terms defined in section 63.2 of 40 CFR part 65, subpart F.
40 CFR 63.2550(c)	Did not finalize proposed amendment that mistakenly removed this paragraph.
40 CFR 63.2550(i) introductory text	Restored reference to 40 CFR 63.1020, which was mistakenly removed in the proposed amendments.
40 CFR 63.2550(i)	1. Added definitions for the term "emission point". 2. Added a sentence to the definition of "isolated intermediate" to clarify that the storage equipment is part of the process that produces the isolated intermediate, not a process that uses the isolated intermediate as a raw material. The new sentence also clarifies that isolated intermediate storage equipment is not subject to the storage tank assignment procedures in 40 CFR 63.2445(d).
Table 3	Removed the extraneous word "with" from item 1.a.
Tables 4 and 5	Replaced references to 40 CFR 63.984 with references to 40 CFR 63.982(d). 40 CFR 63.982(d) not only references 40 CFR 63.984, but it also makes it clear that requirements for boilers and process heaters do not apply to fuel gas systems.

IV. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the

President's priorities, or the principles set forth in the Executive Order.

It has been determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The final amendments give owners and operators options to some requirements. For example, biofilters are allowed as an option to meet the emission limit for batch process vents. Other changes may result in a minor reduction in the burden. For example, one option allows an owner or operator to conduct sensory monitoring as an alternative to instrument monitoring of connectors. Another change eliminates the requirement to include data and results from an engineering assessment of emissions from batch operations in the precompliance report if the HAP concentration is determined to be less than 50 ppmv. Since all of these changes are either options or have the potential to result in minor reductions in the information collection burden, the ICR has not been revised.

OMB has previously approved the information collection requirements contained in the existing regulations (40 CFR part 63, subpart FFFF) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0533 (EPA ICR number 1969.02). A copy of the OMB approved ICR may be obtained from Susan Auby, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, or by calling (202) 566–1672. Include the ICR or OMB number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule amendments.

For purposes of assessing the impacts of the final rule amendments on small entities, small entity is defined as: (1) A small business ranging from up to 500 employees to up to 1,000 employees, depending on the NAICS code; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; or (3) a small organization that is any not-for-profit enterprise that is independently owned and operated and is not dominant in its field. The maximum number of employees to be considered a small business for each NAICS code is shown in the preamble to the proposed rule (67 FR 16178).

After considering the economic impacts of the final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant *adverse* economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the proposed rule on small entities." 5 U.S.C. 603 and 604. Thus, an agency may conclude that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule. The final amendments include additional compliance options for process tanks, batch process vents, equipment leaks, and SHAP-containing wastewater that provide small entities with greater flexibility to comply with the standards. Other amendments potentially reduce the recordkeeping and reporting burden. We have therefore concluded that the final rule amendments will relieve regulatory burden for all small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act (UMRA) of 1995, Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least-costly, most cost-effective, or least-burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The maximum total annual costs of the final rule for any year was estimated to be about $75 million, and the final amendments do not add new requirements that would increase that cost. Thus, the final amendments are not subject to the requirements of sections 202 and 205 of the UMRA. In addition, the final amendments contain no regulatory requirements that might significantly or uniquely affect small governments because they contain no requirements that apply to such governments or impose obligations upon them. Therefore, the final

amendments are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State or local governments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175. The final rule amendments provide an owner or operator with several additional options for complying with the emission limits and other requirements in the rule. Therefore, the final rule amendments will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. Thus, Executive Order 13175 does not apply to the final amendments.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final amendments are not subject to the Executive Order because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The final rule amendments do not constitute a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because they are not likely to have a significant adverse effect on the supply, distribution, or use of energy. The final amendments include additional compliance options that provide affected sources with greater flexibility to comply with the standards. Further, we have concluded that the final rule amendments are not likely to have any adverse energy effects.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law No. 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

During the rulemaking, the EPA conducted searches to identify VCS in addition to EPA test methods referenced by the final rule. The search and review results have been documented and placed in the docket for the NESHAP (Docket EPA–HQ–OAR–2003–0121). The final amendments do not require the use of any additional technical standards beyond those cited in the final rule. Therefore, EPA is not considering the use of any additional VCS for the final amendments.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule amendments are effective on July 14, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: June 23, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart FFFF—[Amended]

■ 2. Section 63.2435 is amended by:
■ a. Revising "product transfer racks" to read "transfer racks" in paragraph (b) introductory text;
■ b. Revising paragraphs (b)(1)(i), (b)(1)(ii), and (b)(2);
■ c. Revising paragraph (c) introductory text;
■ d. Revising paragraph (c)(4); and

■ e. Adding new paragraph (c)(7) to read as follows:

§ 63.2435 Am I subject to the requirements in this subpart?

* * * * *

(b) * * *

(1) * * *

(i) An organic chemical(s) classified using the 1987 version of SIC code 282, 283, 284, 285, 286, 287, 289, or 386, except as provided in paragraph (c)(5) of this section.

(ii) An organic chemical(s) classified using the 1997 version of NAICS code 325, except as provided in paragraph (c)(5) of this section.

* * * * *

(2) The MCPU processes, uses, or generates any of the organic HAP listed in section 112(b) of the CAA or hydrogen halide and halogen HAP, as defined in § 63.2550.

* * * * *

(c) The requirements in this subpart do not apply to the operations specified in paragraphs (c)(1) through (7) of this section.

* * * * *

(4) Fabricating operations (such as spinning or compressing a solid polymer into its end use); compounding operations (in which blending, melting, and resolidification of a solid polymer product occur for the purpose of incorporating additives, colorants, or stabilizers); and extrusion and drawing operations (converting an already produced solid polymer into a different shape by melting or mixing the polymer and then forcing it or pulling it through an orifice to create an extruded product). An operation is not exempt if it involves processing with HAP solvent or if an intended purpose of the operation is to remove residual HAP monomer.

* * * * *

(7) Carbon monoxide production.

* * * * *

■ 3. Section 63.2445 is amended by:

■ a. Revising paragraph (b) and the first sentence in paragraph (c); and

■ b. Adding new paragraphs (d), (e), and (f) to read as follows:

§ 63.2445 When do I have to comply with this subpart?

* * * * *

(b) If you have an existing source on November 10, 2003, you must comply with the requirements for existing sources in this subpart no later than May 10, 2008.

(c) You must meet the notification requirements in § 63.2515 according to the dates specified in that section and in subpart A of this part 63. * * *

(d) If you have a Group 2 emission point that becomes a Group 1 emission point after the compliance date for your affected source, you must comply with the Group 1 requirements beginning on the date the switch occurs. An initial compliance demonstration as specified in this subpart must be conducted within 150 days after the switch occurs.

(e) If, after the compliance date for your affected source, hydrogen halide and halogen HAP emissions from process vents in a process increase to more than 1,000 lb/yr, or HAP metals emissions from a process at a new affected source increase to more than 150 lb/yr, you must comply with the applicable emission limits specified in Table 3 to this subpart and the associated compliance requirements beginning on the date the emissions exceed the applicable threshold. An initial compliance demonstration as specified in this subpart must be conducted within 150 days after the switch occurs.

(f) If you have a small control device for process vent or transfer rack emissions that becomes a large control device, as defined in § 63.2550(i), you must comply with monitoring and associated recordkeeping and reporting requirements for large control devices beginning on the date the switch occurs. An initial compliance demonstration as specified in this subpart must be conducted within 150 days after the switch occurs.

■ 4. Section 63.2450 is amended by:

■ a. Removing and reserving paragraph (d);

■ b. Revising paragraphs (e) and (f);

■ c. Revising paragraph (h);

■ d. Revising paragraph (k) introductory text, paragraph (k)(3), paragraph (k)(4) introductory text, and paragraph (k)(4)(i); and

■ e. Adding new paragraphs (k)(4)(iv), (k)(5), and (k)(6) to read as follows:

§ 63.2450 What are my general requirements for complying with this subpart?

* * * * *

(d) [Reserved]

(e) *Requirements for control devices.*

(1) Except when complying with § 63.2485, if you reduce organic HAP emissions by venting emissions through a closed-vent system to any combination of control devices (except a flare) or recovery devices, you must meet the requirements of § 63.982(c) and the requirements referenced therein.

(2) Except when complying with § 63.2485, if you reduce organic HAP emissions by venting emissions through a closed-vent system to a flare, you must meet the requirements of § 63.982(b) and the requirements referenced therein.

(3) If you use a halogen reduction device to reduce hydrogen halide and halogen HAP emissions from halogenated vent streams, you must meet the requirements of § 63.994 and the requirements referenced therein. If you use a halogen reduction device before a combustion device, you must determine the halogen atom emission rate prior to the combustion device according to the procedures in § 63.115(d)(2)(v).

(f) *Requirements for flare compliance assessments.*

(1) As part of a flare compliance assessment required in § 63.987(b), you have the option of demonstrating compliance with the requirements of § 63.11(b) by complying with the requirements in either § 63.11(b)(6)(i) or § 63.987(b)(3)(ii).

(2) If you elect to meet the requirements in § 63.11(b)(6)(i), you must keep flare compliance assessment records as specified in paragraphs (f)(2)(i) and (ii) of this section.

(i) Keep records as specified in § 63.998(a)(1)(i), except that a record of the heat content determination is not required.

(ii) Keep records of the flare diameter, hydrogen content, exit velocity, and maximum permitted velocity. Include these records in the flare compliance report required in § 63.999(a)(2).

* * * * *

(h) *Design evaluation.* To determine the percent reduction of a small control device that is used to comply with an emission limit specified in Table 1, 2, 3, or 5 to this subpart, you may elect to conduct a design evaluation as specified in § 63.1257(a)(1) instead of a performance test as specified in subpart SS of this part 63. You must establish the value(s) and basis for the operating limits as part of the design evaluation. For continuous process vents, the design evaluation must be conducted at maximum representative operating conditions for the process, unless the Administrator specifies or approves alternate operating conditions. For transfer racks, the design evaluation must demonstrate that the control device achieves the required control efficiency during the reasonably expected maximum transfer loading rate.

* * * * *

(k) *Continuous parameter monitoring.* The provisions in paragraphs (k)(1) through (6) of this section apply in addition to the requirements for continuous parameter monitoring

system (CPMS) in subpart SS of this part 63.

* * * * *

(3) As an alternative to continuously measuring and recording pH as specified in §§ 63.994(c)(1)(i) and 63.998(a)(2)(ii)(D), you may elect to continuously monitor and record the caustic strength of the effluent. For halogen scrubbers used to control only batch process vents you may elect to monitor and record either the pH or the caustic strength of the scrubber effluent at least once per day.

(4) As an alternative to the inlet and outlet temperature monitoring requirements for catalytic incinerators as specified in § 63.988(c)(2) and the related recordkeeping requirements specified in § 63.998(a)(2)(ii)(B)(*2*) and (c)(2)(ii), you may elect to comply with the requirements specified in paragraphs (k)(4)(i) through (iv) of this section.

(i) Monitor and record the inlet temperature as specified in subpart SS of this part 63.

* * * * *

(iv) Recording the downstream temperature and temperature difference across the catalyst bed as specified in § 63.998(a)(2)(ii)(B)(*2*) and (b)(2)(ii) is not required.

(5) For absorbers that control organic compounds and use water as the scrubbing fluid, you must conduct monitoring and recordkeeping as specified in paragraphs (k)(5)(i) through (iii) of this section instead of the monitoring and recordkeeping requirements specified in §§ 63.990(c)(1), 63.993(c)(1), and 63.998(a)(2)(ii)(C).

(i) You must use a flow meter capable of providing a continuous record of the absorber influent liquid flow.

(ii) You must determine gas stream flow using one of the procedures specified in § 63.994(c)(1)(ii)(A) through (D).

(iii) You must record the absorber liquid-to-gas ratio averaged over the time period of any performance test.

(6) For a control device with total inlet HAP emissions less than 1 tpy, you must establish an operating limit(s) for a parameter(s) that you will measure and record at least once per averaging period (i.e., daily or block) to verify that the control device is operating properly. You may elect to measure the same parameter(s) that is required for control devices that control inlet HAP emissions equal to or greater than 1 tpy. If the parameter will not be measured continuously, you must request approval of your proposed procedure in the precompliance report. You must identify the operating limit(s) and the measurement frequency, and you must provide rationale to support how these measurements demonstrate the control device is operating properly.

* * * * *

■ 5. Section 63.2460 is amended by:

■ a. Revising paragraph (b) introductory text and paragraphs (b)(1), (b)(2), and (b)(3);

■ b. Redesignating paragraph (b)(4) as paragraph (b)(5) and revising "paragraph (b)(4)(i), (ii), or (iii)" to read "paragraph (b)(5)(i), (ii), or (iii)" in redesignated paragraph (b)(5) introductory text;

■ c. Adding new paragraphs (b)(4), (b)(6), and (b)(7);

■ d. Revising paragraph (c) introductory text, paragraph (c)(1), paragraph (c)(2)(iii), and the first sentence in paragraph (c)(2)(v);

■ e. Removing and reserving paragraph (c)(5), and

■ f. Adding new paragraphs (c)(8) and (c)(9) to read as follows:

§ 63.2460 What requirements must I meet for batch process vents?

* * * * *

(b) *Group status.* If a process has batch process vents, as defined in § 63.2550, you must determine the group status of the batch process vents by determining and summing the uncontrolled organic HAP emissions from each of the batch process vents within the process using the procedures specified in § 63.1257(d)(2)(i) and (ii), except as specified in paragraphs (b)(1) through (7) of this section.

(1) To calculate emissions caused by the heating of a vessel without a process condenser to a temperature lower than the boiling point, you must use the procedures in § 63.1257(d)(2)(i)(C)(*3*).

(2) To calculate emissions from depressurization of a vessel without a process condenser, you must use the procedures in § 63.1257(d)(2)(i)(D)(*10*).

(3) To calculate emissions from vacuum systems for the purposes of this subpart, the receiving vessel is part of the vacuum system, and terms used in Equation 33 to 40 CFR part 63, subpart GGG, are defined as follows:

P_{system} = absolute pressure of the receiving vessel;

P_i = partial pressure of the HAP determined at the exit temperature and exit pressure conditions of the condenser or at the conditions of the dedicated receiver;

P_j = partial pressure of condensables (including HAP) determined at the exit temperature and exit pressure conditions of the condenser or at the conditions of the dedicated receiver;

MW_{HAP} = molecular weight of the HAP determined at the exit temperature and exit pressure conditions of the condenser or at the conditions of the dedicated receiver.

(4) To calculate uncontrolled emissions when a vessel is equipped with a process condenser, you must use the procedures in § 63.1257(d)(3)(i)(B), except as specified in paragraphs (b)(4)(i) through (vii) of this section.

(i) You must determine the flowrate of gas (or volume of gas), partial pressures of condensables, temperature (T), and HAP molecular weight (MW_{HAP}) at the exit temperature and exit pressure conditions of the condenser or at the conditions of the dedicated receiver.

(ii) You must assume that all of the components contained in the condenser exit vent stream are in equilibrium with the same components in the exit condensate stream (except for noncondensables).

(iii) You must perform a material balance for each component.

(iv) For the emissions from gas evolution, the term for time, t, must be used in Equation 12 to 40 CFR part 63, subpart GGG.

(v) Emissions from empty vessel purging shall be calculated using Equation 36 to 40 CFR part 63, subpart GGG and the exit temperature and exit pressure conditions of the condenser or the conditions of the dedicated receiver.

(vi) You must conduct an engineering assessment as specified in § 63.1257(d)(2)(ii) for each emission episode that is not due to vapor displacement, purging, heating, depressurization, vacuum operations, gas evolution, air drying, or empty vessel purging. The requirements of paragraphs (b)(3) through (4) of this section shall apply.

(vii) You may elect to conduct an engineering assessment if you can demonstrate to the Administrator that the methods in § 63.1257(d)(3)(i)(B) are not appropriate.

* * * * *

(6) You may change from Group 2 to Group 1 in accordance with either paragraph (b)(6)(i) or (ii) of this section. You must comply with the requirements of this section and submit the test report in the next Compliance report.

(i) You may switch at any time after operating as Group 2 for at least 1 year so that you can show compliance with the 10,000 pounds per year (lb/yr) threshold for Group 2 batch process vents for at least 365 days before the switch. You may elect to start keeping records of emissions from Group 2 batch process vents before the compliance date. Report a switch based on this

provision in your next compliance report in accordance with § 63.2520(e)(10)(i).

(ii) If the conditions in paragraph (b)(6)(i) of this section are not applicable, you must provide a 60-day advance notice in accordance with § 63.2520(e)(10)(ii) before switching.

(7) As an alternative to determining the uncontrolled organic HAP emissions as specified in § 63.1257(d)(2)(i) and (ii), you may elect to demonstrate that non-reactive organic HAP are the only HAP used in the process and non-reactive HAP usage in the process is less than 10,000 lb/yr. You must provide data and supporting rationale in your notification of compliance status report explaining why the non-reactive organic HAP usage will be less than 10,000 lb/yr. You must keep records of the non-reactive organic HAP usage as specified in § 63.2525(e)(2) and include information in compliance reports as specified in § 63.2520(e)(5)(iv).

(c) Exceptions to the requirements in subparts SS and WW of this part 63 are specified in paragraphs (c)(1) through (9) of this section.

(1) *Process condensers.* Process condensers, as defined in § 63.2550(i), are not considered to be control devices for batch process vents. You must determine whether a condenser is a control device for a batch process vent or a process condenser from which the uncontrolled HAP emissions are evaluated as part of the initial compliance demonstration for each MCPU and report the results with supporting rationale in your notification of compliance status report.

(2) * * *

(iii) As an alternative to conducting a performance test or design evaluation to demonstrate initial compliance with a percent reduction requirement for a condenser, you may determine controlled emissions using the procedures specified in § 63.1257(d)(3)(i)(B) and paragraphs (b)(3) through (4) of this section.

* * * * *

(v) If a process condenser is used for any boiling operations, you must demonstrate that it is properly operated according to the procedures specified in § 63.1257(d)(2)(i)(C)(*4*)(*ii*) and (d)(3)(iii)(B), and the demonstration must occur only during the boiling operation. * * *

* * * * *

(8) *Terminology.* When the term "storage vessel" is used in subpart WW of this part 63, the term "process tank," as defined in § 63.2550(i), applies for the purposes of this section.

(9) *Requirements for a biofilter.* If you use a biofilter to meet either the 95 percent reduction requirement or outlet concentration requirement specified in Table 2 to this subpart, you must meet the requirements specified in paragraphs (c)(9)(i) through (iv) of this section.

(i) *Operational requirements.* The biofilter must be operated at all times when emissions are vented to it.

(ii) *Performance tests.* To demonstrate initial compliance, you must conduct a performance test according to the procedures in § 63.997 and paragraphs (c)(9)(ii)(A) through (D) of this section. The design evaluation option for small control devices is not applicable if you use a biofilter.

(A) Keep up-to-date, readily accessible continuous records of either the biofilter bed temperature averaged over the full period of the performance test or the outlet total organic HAP or TOC concentration averaged over the full period of the performance test. Include these data in your notification of compliance status report as required by § 63.999(b)(3)(ii).

(B) Record either the percent reduction of total organic HAP achieved by the biofilter determined as specified in § 63.997(e)(2)(iv) or the concentration of TOC or total organic HAP determined as specified in § 63.997(e)(2)(iii) at the outlet of the biofilter, as applicable.

(C) If you monitor the biofilter bed temperature, you may elect to use multiple thermocouples in representative locations throughout the biofilter bed and calculate the average biofilter bed temperature across these thermocouples prior to reducing the temperature data to 15 minute (or shorter) averages for purposes of establishing operating limits for the biofilter. If you use multiple thermocouples, include your rationale for their site selection in your notification of compliance status report.

(D) Submit a performance test report as specified in § 63.999(a)(2)(i) and (ii). Include the records from paragraph (c)(9)(ii)(B) of this section in your performance test report.

(iii) *Monitoring requirements.* Use either a biofilter bed temperature monitoring device (or multiple devices) capable of providing a continuous record or an organic monitoring device capable of providing a continuous record. Keep records of temperature or other parameter monitoring results as specified in § 63.998(b) and (c), as applicable. General requirements for monitoring are contained in § 63.996. If you monitor temperature, the operating temperature range must be based on only the temperatures measured during the performance test; these data may not be supplemented by engineering assessments or manufacturer's recommendations as otherwise allowed in § 63.999(b)(3)(ii)(A). If you establish the operating range (minimum and maximum temperatures) using data from previous performance tests in accordance with § 63.996(c)(6), replacement of the biofilter media with the same type of media is not considered a process change under § 63.997(b)(1). You may expand your biofilter bed temperature operating range by conducting a repeat performance test that demonstrates compliance with the 95 percent reduction requirement or outlet concentration limit, as applicable.

(iv) *Repeat performance tests.* You must conduct a repeat performance test using the applicable methods specified in § 63.997 within 2 years following the previous performance test and within 150 days after each replacement of any portion of the biofilter bed media with a different type of media or each replacement of more than 50 percent (by volume) of the biofilter bed media with the same type of media.

■ 6. Section 63.2465 is amended by revising the section heading, paragraph (b), and paragraph (d) to read as follows:

§ 63.2465 What requirements must I meet for process vents that emit hydrogen halide and halogen HAP or HAP metals?

* * * * *

(b) If any process vents within a process emit hydrogen halide and halogen HAP, you must determine and sum the uncontrolled hydrogen halide and halogen HAP emissions from each of the process vents within the process using the procedures specified in § 63.1257(d)(2)(i) and/or (ii), as appropriate. When § 63.1257(d)(2)(ii)(E) requires documentation to be submitted in the precompliance report, it means the notification of compliance status report for the purposes of this paragraph.

* * * * *

(d) To demonstrate compliance with the emission limit in Table 3 to this subpart for HAP metals at a new source, you must comply with paragraphs (d)(1) through (3) of this section.

(1) Determine the mass emission rate of HAP metals based on process knowledge, engineering assessment, or test data.

(2) Conduct an initial performance test of each control device that is used to comply with the emission limit for HAP metals specified in Table 3 to this subpart. Conduct the performance test according to the procedures in § 63.997. Use Method 29 of appendix A of 40 CFR part 60 to determine the HAP metals at the inlet and outlet of each control

device, or use Method 5 of appendix A of 40 CFR part 60 to determine the total particulate matter (PM) at the inlet and outlet of each control device. You have demonstrated initial compliance if the overall reduction of either HAP metals or total PM from the process is greater than or equal to 97 percent by weight.

(3) Comply with the monitoring requirements specified in § 63.1366(b)(1)(xi) for each fabric filter used to control HAP metals.

■ 7. Section 63.2470 is amended by:

■ a. Removing and reserving paragraph (b); and

■ b. Revising paragraph (e)(2) to read as follows:

§ 63.2470 What requirements must I meet for storage tanks?

* * * * *

(e) * * *

(2) To comply with § 63.1253(f)(6)(i), the owner or operator of an offsite cleaning or reloading facility must comply with §§ 63.2445 through 63.2550 instead of complying with § 63.1253(f)(7)(ii), except as specified in paragraph (e)(2)(i) or (ii) of this section.

(i) The reporting requirements in § 63.2520 do not apply to the owner or operator of the offsite cleaning or reloading facility.

(ii) As an alternative to complying with the monitoring, recordkeeping, and reporting provisions in §§ 63.2445 through 63.2550, the owner or operator of an offsite cleaning or reloading facility may comply as specified in § 63.2535(a)(2) with any other subpart of this part 63 which has monitoring, recordkeeping, and reporting provisions as specified in § 63.2535(a)(2).

* * * * *

■ 8. Section 63.2475 is amended by removing paragraph (c).

■ 9. Section 63.2480 is revised to read as follows:

§ 63.2480 What requirements must I meet for equipment leaks?

(a) You must meet each requirement in Table 6 to this subpart that applies to your equipment leaks, except as specified in paragraphs (b) through (d) of this section.

(b) If you comply with either subpart H or subpart UU of this part 63, you may elect to comply with the provisions in paragraphs (b)(1) through (5) of this section as an alternative to the referenced provisions in subpart H or subpart UU of this part.

(1) The requirements for pressure testing in § 63.179(b) or § 63.1036(b) may be applied to all processes, not just batch processes.

(2) For the purposes of this subpart, pressure testing for leaks in accordance with § 63.179(b) or § 63.1036(b) is not required after reconfiguration of an equipment train if flexible hose connections are the only disturbed equipment.

(3) For an existing source, you are not required to develop an initial list of identification numbers for connectors as would otherwise be required under § 63.1022(b)(1) or § 63.181(b)(1)(i).

(4) For connectors in gas/vapor and light liquid service at an existing source, you may elect to comply with the requirements in § 63.169 or § 63.1029 for connectors in heavy liquid service, including all associated recordkeeping and reporting requirements, rather than the requirements of § 63.174 or § 63.1027.

(5) For pumps in light liquid service in an MCPU that has no continuous process vents and is part of an existing source, you may elect to consider the leak definition that defines a leak to be 10,000 parts per million (ppm) or greater as an alternative to the values specified in § 63.1026(b)(2)(i) through (iii) or § 63.163(b)(2).

(c) If you comply with 40 CFR part 65, subpart F, you may elect to comply with the provisions in paragraphs (c)(1) through (9) of this section as an alternative to the referenced provisions in 40 CFR part 65, subpart F.

(1) The requirements for pressure testing in § 65.117(b) may be applied to all processes, not just batch processes.

(2) For the purposes of this subpart, pressure testing for leaks in accordance with § 65.117(b) is not required after reconfiguration of an equipment train if flexible hose connections are the only disturbed equipment.

(3) For an existing source, you are not required to develop an initial list of identification numbers for connectors as would otherwise be required under § 65.103(b)(1).

(4) You may elect to comply with the monitoring and repair requirements specified in § 65.108(e)(3) as an alternative to the requirements specified in § 65.108(a) through (d) for any connectors at your affected source.

(5) For pumps in light liquid service in an MCPU that has no continuous process vents and is part of an existing source, you may elect to consider the leak definition that defines a leak to be 10,000 ppm or greater as an alternative to the values specified in § 65.107(b)(2)(i) through (iii).

(6) When 40 CFR part 65, subpart F refers to the implementation date specified in § 65.1(f), it means the compliance date specified in § 63.2445.

(7) When §§ 65.105(f) and 65.117(d)(3) refer to § 65.4, it means § 63.2525.

(8) When § 65.120(a) refers to § 65.5(d), it means § 63.2515.

(9) When § 65.120(b) refers to § 65.5(e), it means § 63.2520.

(d) The provisions of this section do not apply to bench-scale processes, regardless of whether the processes are located at the same plant site as a process subject to the provisions of this subpart.

■ 10. Section 63.2485 is amended by revising paragraph (a) and paragraphs (c)(1) through (3) and by adding new paragraphs (m), (n), and (o) to read as follows:

§ 63.2485 What requirements must I meet for wastewater streams and liquid streams in open systems within an MCPU?

(a) You must meet each requirement in Table 7 to this subpart that applies to your wastewater streams and liquid streams in open systems within an MCPU, except as specified in paragraphs (b) through (o) of this section.

* * * * *

(c) * * *

(1) The total annual average concentration of compounds in Table 8 to this subpart is greater than or equal to 10,000 ppmw at any flowrate, and the total annual load of compounds in Table 8 to this subpart is greater than or equal to 200 lb/yr.

(2) The total annual average concentration of compounds in Table 8 to this subpart is greater than or equal to 1,000 ppmw, and the annual average flowrate is greater than or equal to 1 l/min.

(3) The combined total annual average concentration of compounds in Tables 8 and 9 to this subpart is greater than or equal to 30,000 ppmw, and the combined total annual load of compounds in Tables 8 and 9 to this subpart is greater than or equal to 1 tpy.

* * * * *

(m) When § 63.132(f) refers to "a concentration of greater than 10,000 ppmw of Table 9 compounds," the phrase "a concentration of greater than 30,000 ppmw of total partially soluble HAP (PSHAP) and soluble HAP (SHAP) or greater than 10,000 ppmw of PSHAP" shall apply for the purposes of this subpart.

(n) *Alternative requirements for wastewater that is Group 1 for soluble HAP only.* The option specified in this paragraph (n) applies to wastewater that is Group 1 for soluble HAP in accordance with paragraph (c)(3) of this section and is discharged to biological treatment. Except as provided in paragraph (n)(4) of this section, this option does not apply to wastewater

that is Group 1 for partially soluble HAP in accordance with paragraph (c)(1), (c)(2), or (c)(4) of this section. For wastewater that is Group 1 for SHAP, you need not comply with §§ 63.133 through 63.137 for any equalization unit, neutralization unit, and/or clarifier prior to the activated sludge unit, and you need not comply with the venting requirements in § 63.136(e)(2)(ii)(A) for lift stations with a volume larger than 10,000 gal, provided you comply with the requirements specified in paragraphs (n)(1) through (3) of this section and all otherwise applicable requirements specified in Table 7 to this subpart. For this option, the treatment requirements in § 63.138 and the performance testing requirements in § 63.145 do not apply to the biological treatment unit, except as specified in paragraphs (n)(2)(i) through (iv) of this section.

(1) Wastewater must be hard-piped between the equalization unit, clarifier, and activated sludge unit. This requirement does not apply to the transfer between any of these types of units that are part of the same structure and one unit overflows into the next.

(2) Calculate the destruction efficiency of the biological treatment unit using Equation 1 of this section in accordance with the procedures described in paragraphs (n)(2)(i) through (vi) of this section. You have demonstrated initial compliance if E is greater than or equal to 90 percent.

$$E = \frac{(QMW_a - QMG_e - QMG_n - QMG_c)(F_{bio})}{QMW_a} \times 100 \qquad \text{(Eq. 1)}$$

Where:

E = destruction efficiency of total PSHAP and SHAP for the biological treatment unit including the equalization unit, neutralization unit, and/or clarifier, percent;

QMW_a = mass flow rate of total PSHAP and SHAP compounds entering the equalization unit (or whichever of the three types of units is first), kilograms per hour (kg/hr);

QMG_e = mass flow rate of total PSHAP and SHAP compounds emitted from the equalization unit, kg/hr;

QMG_n = mass flow rate of total PSHAP and SHAP compounds emitted from the neutralization unit, kg/hr;

QMG_c = mass flow rate of total PSHAP and SHAP compounds emitted from the clarifier, kg/hr

F_{bio} = site-specific fraction of PSHAP and SHAP compounds biodegraded in the biological treatment unit.

(i) Include all PSHAP and SHAP compounds in both Group 1 and Group 2 wastewater streams from all MCPU, except you may exclude any compounds that meet the criteria specified in § 63.145(a)(6)(ii) or (iii).

(ii) Conduct the demonstration under representative process unit and treatment unit operating conditions in accordance with § 63.145(a)(3) and (4).

(iii) Determine PSHAP and SHAP concentrations and the total wastewater flow rate at the inlet to the equalization unit in accordance with § 63.145(f)(1) and (2). References in § 63.145(f)(1) and (2) to required mass removal and actual mass removal do not apply for the purposes of this section.

(iv) Determine F_{bio} for the activated sludge unit as specified in § 63.145(h), except as specified in paragraph (n)(2)(iv)(A) or paragraph (n)(2)(iv)(B) of this section.

(A) If the biological treatment process meets both of the requirements specified in § 63.145(h)(1)(i) and (ii), you may elect to replace the F_{bio} term in Equation 1 of this section with the numeral "1."

(B) You may elect to assume f_{bio} is zero for any compounds on List 2 of Table 36 in subpart G.

(v) Determine QMG_e, QMG_n, and QMG_c using EPA's WATER9 model or the most recent update to this model, and conduct testing or use other procedures to validate the modeling results.

(vi) Submit the data and results of your demonstration, including both a description of and the results of your WATER9 modeling validation procedures, in your notification of compliance status report as specified in § 63.2520(d)(2)(ii).

(3) As an alternative to the venting requirements in § 63.136(e)(2)(ii)(A), a lift station with a volume larger than 10,000 gal may have openings necessary for proper venting of the lift station. The size and other design characteristics of these openings may be established based on manufacturer recommendations or engineering judgment for venting under normal operating conditions. You must describe the design of such openings and your supporting calculations and other rationale in your notification of compliance status report.

(4) For any wastewater streams that are Group 1 for both PSHAP and SHAP, you may elect to meet the requirements specified in Table 7 to this subpart for the PSHAP and then comply with paragraphs (n)(1) through (3) of this section for the SHAP in the wastewater system. You may determine the SHAP mass removal rate, in kg/hr, in treatment units that are used to meet the requirements for PSHAP and add this amount to both the numerator and denominator in Equation 1 of this section.

(o) *Compliance records.* For each CPMS used to monitor a nonflare control device for wastewater emissions, you must keep records as specified in § 63.998(c)(1) in addition to the records required in § 63.147(d).

■ 11. Section 63.2495 is amended by revising paragraph (b)(1) to read as follows:

§ 63.2495 How do I comply with the pollution prevention standard?

* * * * *

(b) * * *

(1) You must comply with the emission limitations and work practice standards contained in Tables 1 through 7 of this subpart for all HAP that are generated in the MCPU and that are not included in consumption, as defined in § 63.2550. If any vent stream routed to the combustion control is a halogenated vent stream, as defined in § 63.2550, then hydrogen halides that are generated as a result of combustion control must be controlled according to the requirements of § 63.994 and the requirements referenced therein.

* * * * *

■ 12. Section 63.2520 is amended by:

■ a. Revising paragraph (c)(4);

■ b. Revising paragraph (d)(2)(i) and (d)(2)(ix);

■ c. Revising paragraphs (e)(5) introductory text, (e)(5)(ii)(C), and (e)(5)(iii)(K) and adding new paragraph (e)(5)(iv);

■ d. Revising paragraph (e)(9); and

■ e. Revising the first two sentences of paragraph (e)(10)(i) and paragraph (e)(10)(ii)(C) to read as follows:

§ 63.2520 What reports must I submit and when?

* * * * *

(c) * * *

(4) Data and rationale used to support an engineering assessment to calculate uncontrolled emissions in accordance with § 63.1257(d)(2)(ii). This requirement does not apply to

calculations of hydrogen halide and halogen HAP emissions as specified in § 63.2465(b), to determinations that the total HAP concentration is less than 50 ppmv, or if you use previous test data to establish the uncontrolled emissions.

* * * * *

(d) * * *

(2) * * *

(i) The results of any applicability determinations, emission calculations, or analyses used to identify and quantify HAP usage or HAP emissions from the affected source.

* * * * *

(ix) Records as specified in § 63.2535(l)(1) through (3) of process units used to create a PUG and calculations of the initial primary product of the PUG.

(e) * * *

(5) The compliance report must contain the information on deviations, as defined in § 63.2550, according to paragraphs (e)(5)(i), (ii), (iii), and (iv) of this section.

* * * * *

(ii) * * *

(C) Operating logs of processes with batch vents from batch operations for the day(s) during which the deviation occurred, except operating logs are not required for deviations of the work practice standards for equipment leaks.

(iii) * * *

(K) Operating logs of processes with batch vents from batch operations for each day(s) during which the deviation occurred.

* * * * *

(iv) If you documented in your notification of compliance status report that an MCPU has Group 2 batch process vents because the non-reactive HAP is the only HAP and usage is less than 10,000 lb/yr, the total uncontrolled organic HAP emissions from the batch process vents in an MCPU will be less than 1,000 lb/yr for the anticipated number of standard batches, or total uncontrolled hydrogen halide and halogen HAP emissions from all batch process vents and continuous process vents in a process are less than 1,000 lb/yr, include the records associated with each calculation required by § 63.2525(e) that exceeds an applicable HAP usage or emissions threshold.

* * * * *

(9) Applicable records and information for periodic reports as specified in referenced subparts F, G, H, SS, UU, WW, and GGG of this part and subpart F of 40 CFR part 65.

(10) * * *

(i) Except as specified in paragraph (e)(10)(ii) of this section, whenever you make a process change, or change any of the information submitted in the notification of compliance status report or a previous compliance report, that is not within the scope of an existing operating scenario, you must document the change in your compliance report. A process change does not include moving within a range of conditions identified in the standard batch, and a nonstandard batch does not constitute a process change. * * *

* * * * *

(ii) * * *

(C) A change from Group 2 to Group 1 for any emission point except for batch process vents that meet the conditions specified in § 63.2460(b)(6)(i).

■ 13. Section 63.2525 is amended by revising paragraphs (a), (c), and (e) to read as follows:

§ 63.2525 What records must I keep?

* * * * *

(a) Each applicable record required by subpart A of this part 63 and in referenced subparts F, G, SS, UU, WW, and GGG of this part 63 and in referenced subpart F of 40 CFR part 65.

* * * * *

(c) A schedule or log of operating scenarios for processes with batch vents from batch operations updated each time a different operating scenario is put into effect.

* * * * *

(e) The information specified in paragraph (e)(2), (3), or (4) of this section, as applicable, for each process with Group 2 batch process vents or uncontrolled hydrogen halide and halogen HAP emissions from the sum of all batch and continuous process vents less than 1,000 lb/yr. No records are required for situations described in paragraph (e)(1) of this section.

(1) No records are required if you documented in your notification of compliance status report that the MCPU meets any of the situations described in paragraph (e)(1)(i), (ii), or (iii) of this section.

(i) The MCPU does not process, use, or generate HAP.

(ii) You control the Group 2 batch process vents using a flare that meets the requirements of § 63.987.

(iii) You control the Group 2 batch process vents using a control device for which your determination of worst case for initial compliance includes the contribution of all Group 2 batch process vents.

(2) If you documented in your notification of compliance status report that an MCPU has Group 2 batch process vents because the non-reactive organic HAP is the only HAP and usage is less than 10,000 lb/yr, as specified in § 63.2460(b)(7), you must keep records of the amount of HAP material used, and calculate the daily rolling annual sum of the amount used no less frequently than monthly. If a record indicates usage exceeds 10,000 lb/yr, you must estimate emissions for the preceding 12 months based on the number of batches operated and the estimated emissions for a standard batch, and you must begin recordkeeping as specified in paragraph (e)(4) of this section. After 1 year, you may revert to recording only usage if the usage during the year is less than 10,000 lb.

(3) If you documented in your notification of compliance status report that total uncontrolled organic HAP emissions from the batch process vents in an MCPU will be less than 1,000 lb/yr for the anticipated number of standard batches, then you must keep records of the number of batches operated and calculate a daily rolling annual sum of batches operated no less frequently than monthly. If the number of batches operated results in organic HAP emissions that exceed 1,000 lb/yr, you must estimate emissions for the preceding 12 months based on the number of batches operated and the estimated emissions for a standard batch, and you must begin recordkeeping as specified in paragraph (e)(4) of this section. After 1 year, you may revert to recording only the number of batches if the number of batches operated during the year results in less than 1,000 lb of organic HAP emissions.

(4) If you meet none of the conditions specified in paragraphs (e)(1) through (3) of this section, you must keep records of the information specified in paragraphs (e)(4)(i) through (iv) of this section.

(i) A record of the day each batch was completed and/or the operating hours per day for continuous operations with hydrogen halide and halogen emissions.

(ii) A record of whether each batch operated was considered a standard batch.

(iii) The estimated uncontrolled and controlled emissions for each batch that is considered to be a nonstandard batch.

(iv) Records of the daily 365-day rolling summations of emissions, or alternative records that correlate to the emissions (e.g., number of batches), calculated no less frequently than monthly.

* * * * *

■ 14. Section 63.2535 is amended by revising paragraphs (a) and (k) to read as follows:

§ 63.2535 What compliance options do I have if part of my plant is subject to both this subpart and another subpart?

* * * * *

(a) *Compliance with other subparts of this part 63.* (1) If you have an MCPU that includes a batch process vent that also is part of a CMPU as defined in subparts F and G of this part 63, you must comply with the emission limits; operating limits; work practice standards; and the compliance, monitoring, reporting, and recordkeeping requirements for batch process vents in this subpart, and you must continue to comply with the requirements in subparts F, G, and H of this part 63 that are applicable to the CMPU and associated equipment.

(2) After the compliance dates specified in § 63.2445, at an offsite reloading or cleaning facility subject to § 63.1253(f), as referenced from § 63.2470(e), compliance with the monitoring, recordkeeping, and reporting provisions of any other subpart of this part 63 constitutes compliance with the monitoring, recordkeeping, and reporting provisions of § 63.1253(f)(7)(ii) or § 63.1253(f)(7)(iii). You must identify in your notification of compliance status report required by § 63.2520(d) the subpart of this part 63 with which the owner or operator of the offsite reloading or cleaning facility complies.

* * * * *

(k) *Compliance with 40 CFR part 60, subpart VV, and 40 CFR part 61, subpart V.* After the compliance date specified in § 63.2445, if you have an affected source with equipment that is also subject to the requirements of 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, you may elect to apply this subpart to all such equipment. After the compliance date specified in § 63.2445, if you have an affected source with equipment to which this subpart does not apply, but which is subject to the requirements of 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, you may elect to apply this subpart to all such equipment. If you elect either of these methods of compliance, you must consider all total organic compounds, minus methane and ethane, in such equipment for purposes of compliance with this subpart, as if they were organic HAP. Compliance with the provisions of this subpart, in the manner described in this paragraph (k), will constitute compliance with 40 CFR part 60, subpart VV and 40 CFR part 61, subpart V, as applicable.

* * * * *

■ 15. Section 63.2550 is amended by:

■ a. Revising paragraph (b);

■ b. Revising the last sentence in paragraph (i) introductory text;

■ c. Revising paragraph (8) in the definition of the term "batch process vent" in paragraph (i);

■ d. Adding new paragraphs (6) and (7) to the definition of the term "continuous process vent" in paragraph (i);

■ e. Revising the definition of the term "Group 1 continuous process vent" in paragraph (i);

■ f. Revising the definition of the term "isolated intermediate" in paragraph (i);

■ g. Adding new paragraph (6) to the definition of the term "miscellaneous organic chemical manufacturing process" in paragraph (i);

■ h. Revising the definition of the term "recovery device" in paragraph (i);

■ i. Revising the definition of the term "surge control vessel" in paragraph (i);

■ j. Revising the introductory text of the definition of the term "wastewater" in paragraph (i); and

■ k. Adding, in alphabetical order, new definitions for the terms "biofilter," "continuous operation," "emission point," "halogen atoms," "HAP metals," "point of determination," and "process condenser" in paragraph (i) to read as follows:

§ 63.2550 What definitions apply to this subpart?

* * * * *

(b) For an affected source complying with the requirements in 40 CFR part 65, subpart F, the terms used in this subpart and in 40 CFR part 65, subpart F have the meaning given to them in § 65.2.

* * * * *

(i) * * * If a term is defined in § 63.2, § 63.101, § 63.111, § 63.981, § 63.1020, § 63.1061, § 63.1251, or § 65.2 and in this paragraph (i), the definition in this paragraph (i) applies for the purposes of this subpart.

* * * * *

Batch process vent * * *

(8) Emission streams from emission episodes that are undiluted and uncontrolled containing less than 50 ppmv HAP are not part of any batch process vent. A vent from a unit operation, or a vent from multiple unit operations that are manifolded together, from which total uncontrolled HAP emissions are less than 200 lb/yr is not a batch process vent; emissions for all emission episodes associated with the unit operation(s) must be included in the determination of the total mass emitted. The HAP concentration or mass emission rate may be determined using any of the following: process knowledge that no HAP are present in the emission stream; an engineering assessment as discussed in § 63.1257(d)(2)(ii), except that you do not need to demonstrate that the equations in § 63.1257(d)(2)(i) do not apply, and the precompliance reporting requirements specified in § 63.1257(d)(2)(ii)(E) do not apply for the purposes of this demonstration; equations specified in § 63.1257(d)(2)(i), as applicable; test data using Method 18 of 40 CFR part 60, appendix A; or any other test method that has been validated according to the procedures in Method 301 of appendix A of this part.

* * * * *

Biofilter means an enclosed control system such as a tank or series of tanks with a fixed roof that contact emissions with a solid media (such as bark) and use microbiological activity to transform organic pollutants in a process vent stream to innocuous compounds such as carbon dioxide, water, and inorganic salts. Wastewater treatment processes such as aeration lagoons or activated sludge systems are not considered to be biofilters.

* * * * *

Continuous operation means any operation that is not a batch operation.

Continuous process vent * * *

(6) The references to an "air oxidation reactor, distillation unit, or reactor" in § 63.107 mean any continuous operation for the purposes of this subpart.

(7) A separate determination is required for the emissions from each MCPU, even if emission streams from two or more MCPU are combined prior to discharge to the atmosphere or to a control device.

* * * * *

Emission point means each continuous process vent, batch process vent, storage tank, transfer rack, and wastewater stream.

* * * * *

Group 1 continuous process vent means a continuous process vent for which the flow rate is greater than or equal to 0.005 standard cubic meter per minute, and the total resource effectiveness index value, calculated according to § 63.2455(b), is less than or equal to 1.9 at an existing source and less than or equal to 5.0 at a new source.

* * * * *

Halogen atoms mean chlorine and fluorine.

HAP metals means the metal portion of antimony compounds, arsenic compounds, beryllium compounds, cadmium compounds, chromium compounds, cobalt compounds, lead compounds, manganese compounds, mercury compounds, nickel compounds, and selenium compounds.

* * * * *

Isolated intermediate means a product of a process that is stored before subsequent processing. An isolated intermediate is usually a product of a chemical synthesis, fermentation, or biological extraction process. Storage of an isolated intermediate marks the end of a process. Storage occurs at any time the intermediate is placed in equipment used solely for storage. The storage equipment is part of the MCPU that produces the isolated intermediate and is not assigned as specified in § 63.2435(d).

Miscellaneous organic chemical manufacturing process * * *

(6) The end of a process that produces a solid material is either up to and including the dryer or extruder, or for a polymer production process without a dryer or extruder, it is up to and including the extruder, die plate, or solid-state reactor, except in two cases. If the dryer, extruder, die plate, or solid-state reactor is followed by an operation that is designed and operated to remove HAP solvent or residual HAP monomer from the solid, then the solvent removal operation is the last step in the process. If the dried solid is diluted or mixed with a HAP-based solvent, then the solvent removal operation is the last step in the process.

* * * * *

Point of determination means each point where process wastewater exits the MCPU or control device.

Note to definition for point of determination: The regulation allows determination of the characteristics of a wastewater stream: At the point of determination; or downstream of the point of determination if corrections are made for changes in flow rate and annual average concentration of soluble HAP and partially soluble HAP compounds as determined according to procedures in § 63.144 of subpart G in this part 63. Such changes include losses by air emissions; reduction of annual average concentration or changes in flow rate by mixing with other water or wastewater streams; and reduction in flow rate or annual average concentration by treating or otherwise handling the wastewater stream to remove or destroy HAP.

* * * * *

Process condenser means a condenser whose primary purpose is to recover material as an integral part of an MCPU. All condensers recovering condensate from an MCPU at or above the boiling point or all condensers in line prior to a vacuum source are considered process condensers. Typically, a primary condenser or condensers in series are considered to be integral to the MCPU if they are capable of and normally used for the purpose of recovering chemicals for fuel value (i.e., net positive heating value), use, reuse or for sale for fuel value, use, or reuse. This definition does not apply to a condenser that is used to remove materials that would hinder performance of a downstream recovery device as follows:

(1) To remove water vapor that would cause icing in a downstream condenser, or

(2) To remove water vapor that would negatively affect the adsorption capacity of carbon in a downstream carbon adsorber, or

(3) To remove high molecular weight organic compounds or other organic compounds that would be difficult to remove during regeneration of a downstream carbon adsorber.

* * * * *

Recovery device means an individual unit of equipment used for the purpose of recovering chemicals from process vent streams and from wastewater streams for fuel value (i.e., net positive heating value), use, reuse, or for sale for fuel value, use, or reuse. For the purposes of meeting requirements in Table 2 to this subpart, the recovery device must not be a process condenser and must recover chemicals to be reused in a process on site. Examples of equipment that may be recovery devices include absorbers, carbon adsorbers, condensers, oil-water separators or organic-water separators, or organic removal devices such as decanters, strippers, or thin-film evaporation units. To be a recovery device for a wastewater stream, a decanter and any other equipment based on the operating principle of gravity separation must receive only multi-phase liquid streams.

* * * * *

Surge control vessel means feed drums, recycle drums, and intermediate vessels as part of any continuous operation. Surge control vessels are used within an MCPU when in-process storage, mixing, or management of flowrates or volumes is needed to introduce material into continuous operations.

* * * * *

Wastewater means water that is discarded from an MCPU or control device through a POD and that contains either: an annual average concentration of compounds in Tables 8 and 9 to this subpart of at least 5 ppmw and has an annual average flowrate of 0.02 liters per minute or greater; or an annual average concentration of compounds in Tables 8 and 9 to this subpart of at least 10,000 ppmw at any flowrate. Wastewater means process wastewater or maintenance wastewater. The following are not considered wastewater for the purposes of this subpart:

* * * * *

■ 16. Table 2 to subpart FFFF of part 63 is amended by revising entry 1 to read as follows:

TABLE 2 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS AND WORK PRACTICE STANDARDS FOR BATCH PROCESS VENTS

* * * * * * *

For each . . .	Then you must . . .	And you must . . .
1. Process with Group 1 batch process vents.	a. Reduce collective uncontrolled organic HAP emissions from the sum of all batch process vents within the process by ≥98 percent by weight by venting emissions from a sufficient number of the vents through one or more closed-vent systems to any combination of control devices (except a flare); or	Not applicable.
	b. Reduce collective uncontrolled organic HAP emissions from the sum of all batch process vents within the process by ≥95 percent by weight by venting emissions from a sufficient number of the vents through one or more closed-vent systems to any combination of recovery devices or a biofilter, except you may elect to comply with the requirements of subpart WW of this part for any process tank; or	Not applicable.

TABLE 2 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS AND WORK PRACTICE STANDARDS FOR BATCH PROCESS VENTS—Continued

For each . . .	Then you must . . .	And you must . . .
	c. Reduce uncontrolled organic HAP emissions from one or more batch process vents within the process by venting through a closed-vent system to a flare or by venting through one or more closed-vent systems to any combination of control devices (excluding a flare) that reduce organic HAP to an outlet concentration ≤20 ppmv as TOC or total organic HAP.	For all other batch process vents within the process, reduce collective organic HAP emissions as specified in item 1.a and/or item 1.b of this table.

■ 17. Table 3 to subpart FFFF of part 63 is revised to read as follows:

TABLE 3 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS FOR HYDROGEN HALIDE AND HALOGEN HAP EMISSIONS OR HAP METALS EMISSIONS FROM PROCESS VENTS

For each . . .	You must . . .
1. Process with uncontrolled hydrogen halide and halogen HAP emissions from process vents ≥1,000 lb/yr.	a. Reduce collective hydrogen halide and halogen HAP emissions by ≥99 percent by weight or to an outlet concentration ≤20 ppmv by venting through one or more closed-vent systems to any combination of control devices, or b. Reduce the halogen atom mass emission rate from the sum of all batch process vents and each individual continuous process vent to ≤0.45 kg/hr by venting through one or more closed-vent systems to a halogen reduction device.
2. Process at a new source with uncontrolled emissions from process vents ≥150 lb/yr of HAP metals.	Reduce overall emissions of HAP metals by ≥97 percent by weight.

■ 18. Table 4 to subpart FFFF of part 63 is amended by revising entry 1 to read as follows:

TABLE 4 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS FOR STORAGE TANKS

For each . . .	For which . . .	Then you must . . .
1. Group 1 storage tank	a. The maximum true vapor pressure of total HAP at the storage temperature is ≥76.6 kilopascals.	i. Reduce total HAP emissions by ≥95 percent by weight or to ≤20 ppmv of TOC or organic HAP and ≤20 ppmv of hydrogen halide and halogen HAP by venting emissions through a closed vent system to any combination of control devices (excluding a flare); or ii. Reduce total organic HAP emissions by venting emissions through a closed vent system to a flare; or iii. Reduce total HAP emissions by venting emissions to a fuel gas system or process in accordance with §63.982(d) and the requirements referenced therein.
	b. The maximum true vapor pressure of total HAP at the storage temperature is <76.6 kilopascals.	i. Comply with the requirements of subpart WW of this part, except as specified in §63.2470; or

TABLE 4 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS FOR STORAGE TANKS—Continued

For each . . .	For which . . .	Then you must . . .
		ii. Reduce total HAP emissions by ≥95 percent by weight or to ≤20 ppmv of TOC or organic HAP and ≤20 ppmv of hydrogen halide and halogen HAP by venting emissions through a closed vent system to any combination of control devices (excluding a flare); or iii. Reduce total organic HAP emissions by venting emissions through a closed vent system to a flare; or iv. Reduce total HAP emissions by venting emissions to a fuel gas system or process in accordance with §63.982(d) and the requirements referenced therein.

■ 19. Table 5 to subpart FFFF of part 63 is amended by revising entry 1 to read as follows:

TABLE 5 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS AND WORK PRACTICE STANDARDS FOR TRANSFER RACKS

For each . . .	You must . . .
1. Group 1 transfer rack	a. Reduce emissions of total organic HAP by ≥98 percent by weight or to an outlet concentration ≤20 ppmv as organic HAP or TOC by venting emissions through a closed-vent system to any combination of control devices (except a flare); or b. Reduce emissions of total organic HAP by venting emissions through a closed-vent system to a flare; or c. Reduce emissions of total organic HAP by venting emissions to a fuel gas system or process in accordance with §63.982(d) and the requirements referenced therein; or d. Use a vapor balancing system designed and operated to collect organic HAP vapors displaced from tank trucks and railcars during loading and route the collected HAP vapors to the storage tank from which the liquid being loaded originated or to another storage tank connected by a common header.

■ 20. Table 6 to subpart FFFF of part 63 is amended by revising entry 1 to read as follows:

TABLE 6 TO SUBPART FFFF OF PART 63.—REQUIREMENTS FOR EQUIPMENT LEAKS

For all . . .	You must . . .
1. Equipment that is in organic HAP service.	a. Comply with the requirements of subpart UU of this part 63 and the requirements referenced therein, except as specified in §63.2480(b) and (d); or b. Comply with the requirements of subpart H of this part 63 and the requirements referenced therein, except as specified in §63.2480(b) and (d); or c. Comply with the requirements of 40 CFR part 65, subpart F and the requirements referenced therein, except as specified in §63.2480(c) and (d).

■ 21. Table 8 to subpart FFFF of part 63 is amended by removing entry 10 and redesignating entries 11 through 61 as entries 10 through 60.

■ 22. Table 12 to subpart FFFF of part 63 is amended as follows:

■ a. Removing the entries for §§ 63.8(c)(4)(i)–(ii) and 63.10(e)(1)–(2);

■ b. Adding new entries for §§ 63.8(c)(4)(i), 63.8(c)(4)(ii), 63.10(e)(1), 63.10(e)(2)(i), and 63.10(e)(2)(ii); and

■ c. Revising the entries for §§ 63.8(c)(4), 63.8(c)(6), 63.8(c)(7)–(8), 63.8(d), 63.8(e), 63.9(g), 63.10(b)(2)(xiii), and 63.10(c)(1)–(6), (9)–(15).

TABLE 12 TO SUBPART FFFF OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFF

* * * * * * *

Citation	Subject	Explanation
* *	* *	* * *
§ 63.8(c)(4)	CMS Requirements	Only for CEMS. Requirements for CPMS are specified in referenced subparts G and SS of part 63. Requirements for COMS do not apply because subpart FFFF does not require continuous opacity monitoring systems (COMS).
§ 63.8(c)(4)(i)	COMS Measurement and Recording Frequency.	No; subpart FFFF does not require COMS.
§ 63.8(c)(4)(ii)	CEMS Measurement and Recording Frequency.	Yes.
* *	* *	* * *
§ 63.8(c)(6)	CMS Requirements	Only for CEMS; requirements for CPMS are specified in referenced subparts G and SS of this part 63. Requirements for COMS do not apply because subpart FFFF does not require COMS.
§ 63.8(c)(7)–(8)	CMS Requirements	Only for CEMS. Requirements for CPMS are specified in referenced subparts G and SS of part 63. Requirements for COMS do not apply because subpart FFFF does not require COMS.
§ 63.8(d)	CMS Quality Control	Only for CEMS.
§ 63.8(e)	CMS Performance Evaluation	Only for CEMS. Section 63.8(e)(5)(ii) does not apply because subpart FFFF does not require COMS.
* *	* *	* * *
§ 63.9(g)	Additional Notifications When Using CMS.	Only for CEMS. Section 63.9(g)(2) does not apply because subpart FFFF does not require COMS.
* *	* *	* * *
§ 63.10(b)(2)(xiii)	Records	Only for CEMS.
* *	* *	* * *
§ 63.10(c)(1)–(6),(9)–(15)	Records	Only for CEMS. Recordkeeping requirements for CPMS are specified in referenced subparts G and SS of this part 63.
* *	* *	* * *
§ 63.10(e)(1)	Additional CEMS Reports	Yes.
§ 63.10(e)(2)(i)	Additional CMS Reports	Only for CEMS.
§ 63.10(e)(2)(ii)	Additional COMS Reports	No. Subpart FFFF does not require COMS.

40 CFR Part 63

[EPA–HQ–OAR–2002–0083; FRL–8196–6]

RIN 2060–AE48

National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action amends the national emission standards for hazardous air pollutants (NESHAP) for integrated iron and steel manufacturing facilities. The final amendments add a new compliance option, revise emission limitations, reduce the frequency of repeat performance tests for certain emission units, add corrective action requirements, and clarify monitoring, recordkeeping, and reporting requirements.

DATES: *Effective Date:* This final rule is effective on July 13, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0083. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air & Radiation Docket, Docket ID No. EPA–HQ–OAR–2002–0083, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Phil Mulrine, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Metals and Minerals Group (D243–02), Research Triangle Park, North Carolina 27711, telephone number: (919) 541–5289, fax number: (919) 541–3207, e-mail address: *mulrine.phil@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. The regulated categories and entities affected by the NESHAP include:

Category	NAICS code [1]	Examples of regulated entities
Industry	331111	Integrated iron and steel mills, steel companies, sinter plants, blast furnaces, basic oxygen process furnace (BOPF) shops.
Federal government		Not affected.
State/local/tribal government		Not affected.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. To determine whether your facility is be regulated by this action, you should examine the applicability criteria in 40 CFR 63.7781 of subpart FFFFF (NESHAP for Integrated Iron and Steel Manufacturing Facilities). If you have any questions regarding the applicability of this action to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13 of subpart A (General Provisions).

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's final action will also be available on the Worldwide Web through the Technology Transfer Network (TTN). Following signature, a copy of the final action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg/.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by September 11, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule amendments may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Organization of This Document. The information presented in this preamble is organized as follows:

I. Background
II. Summary of the Final Amendments
III. Impacts of the Final Amendments
IV. Response to Comments on the Proposed Amendments
A. Equivalency of Opacity Limit
B. Monitoring Requirements
C. Applicability to Sinter Coolers Without Stacks
D. Applicability to Discharges Inside Buildings
E. Operating Limit
F. Corrective Action
G. Startup, Shutdown, and Malfunctions
H. Applicability of MACT Standards
I. Subsequent Performance Tests for Baghouses
J. Opacity Observations for Sinter Cooler
K. Compliance Date
V. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

On May 20, 2003 (68 FR 27646), we issued the NESHAP for integrated iron and steel manufacturing facilities (40 CFR part 63, subpart FFFFF). The NESHAP implement section 112(d) of the CAA by requiring all major sources to meet emission standards for

hazardous air pollutants (HAP) reflecting application of the maximum achievable control technology (MACT). The NESHAP establish emission limitations for emission sources in each new or existing sinter plant, blast furnace, and basic oxygen process furnace (BOPF) shop.

After publication of the NESHAP, five steel companies and one trade association filed a petition for review challenging the final standards (*AK Steel Corporation et al.* v. *U.S. Environmental Protection Agency,* no. 03–1207, D.C. Cir.). The petitioners raised the following issues:

- Failing to respond to substantive industry comments questioning the definitions, subcategorization, control technologies identified, emission standards, testing and monitoring, and other aspects of the proposed rule;
- Failing to provide justification for setting standards for ladle metallurgy operations, sinter plant discharge ends, and sinter coolers;
- Requiring bag leak detection systems to be used for positive pressure baghouse systems that discharge without stacks or from baghouse systems with continuous emission monitors;
- Applying emission standards to control devices that do not discharge to the ambient air;
- Imposing stringent testing, monitoring, inspection, and reporting requirements on insignificant sources;
- Providing for the establishment of source-specific opacity limitations based on opacity observations made during required source performance testing and by specifying use of infeasible technical requirements for such observations; and
- Failing to adequately consider health threshold levels and to allow for alternative emission standards, performance testing requirements or monitoring methods that are demonstrated to provide comparable protection to public health and the environment.

EPA and industry petitioners entered into a settlement agreement whereby EPA agreed to sign a notice proposing certain amendments by September 23, 2005. See 70 FR 36383, June 23, 2005 (public notice of settlement agreement pursuant to section 113 of the CAA; EPA received no adverse comment on this notice of settlement). These amendments were proposed on August 30, 2005 (70 FR 51306). Three organizations commented on the proposed amendments during the 60-day comment period which ended on October 31, 2005. EPA and the petitioners anticipate that the final amendments to the NESHAP will resolve the petitioners' concerns.

II. Summary of the Final Amendments

The final amendments revise the applicability of the emission limits for sinter cooler stacks at new and existing sinter plants. The revised limits apply to each sinter cooler instead of to each sinter cooler stack. The final amendments also establish a 10 percent opacity limit for a sinter cooler at an existing sinter plant instead of the particulate matter (PM) emission limit of 0.03 grains per dry standard cubic feet (gr/dscf). In response to comments, we have added a new compliance date for a sinter cooler at an existing sinter plant and require compliance by January 13, 2007. We have also added a provision to the opacity test procedures which describes the general direction an observer should take for observations of uncovered portions of sinter coolers.

The final amendments add a new footnote to Table 1 of subpart FFFFF to clarify that PM limits do not apply to discharges inside a building or structure housing a discharge end at an existing sinter plant, inside a casthouse at an existing blast furnace, or inside an existing basic oxygen process furnace (BOPF) shop because these discharges are subject to opacity limits. In response to comments, we have revised the proposed footnote to clarify that it applies only to control devices installed before August 30, 2005.

The frequency for conducting subsequent performance tests has been changed from twice each permit term to once each permit term for emission units equipped with a baghouse. Repeat performance tests are still required at least twice each permit term for a sinter cooler at an existing sinter plant, for each unit equipped with a control device other than a baghouse, and each affected source without a title V operating permit.

The final amendments also revise the operating limit in 40 CFR 63.7790(b)(3) for an electrostatic precipitator (ESP) that controls emissions from a BOPF. The revised operating limit requires the plant owner or operator to maintain the hourly average opacity of emissions from the control device at or below 10 percent.

Section 63.7830(b) of the NESHAP requires a bag leak detection system for each baghouse used to meet a PM limit. The final amendments add an alternative allowing plants to use a continuous opacity monitoring system (COMS) to monitor the opacity of emissions exiting each control device stack. A bag leak detection system or COMS is not required for a positive-pressure baghouse not equipped with exhaust gas stacks that was installed before August 30, 2005.

The final amendments revise the requirements for operation and maintenance (O&M) plans. The corrective action procedures in 40 CFR 63.7800(b)(4) are expanded to apply to baghouses equipped with COMS in addition to those with bag leak detection systems. Plants must initiate corrective action if a bag leak detection system alarm is triggered or if emissions from a baghouse equipped with a COMS exceed an hourly average opacity of 5 percent.

Corrective action procedures also apply to other types of control devices. If a venturi scrubber equipped with continuous parameter monitoring systems (CPMS) or an ESP equipped with a COMS exceeds the opacity operating limit, plants must take corrective action consistent with their site-specific monitoring plan. New provisions added to 40 CFR 63.7833 require plants to initiate corrective action to determine the cause of the exceedance within 1 hour and to measure operating parameter value(s) for the emission unit within 24 hours of the exceedance. If the measured value(s) meet the applicable operating limit, the corrective action is successful and the emission unit is in compliance with the applicable operating limit. If the initial corrective action is not successful, additional corrective action is required within the next 24 hours. Plants must re-measure the operating parameter(s) and if the corrective action is successful, the emission unit is in compliance with the applicable operating limit. If the second attempt at corrective action is not successful, the plant must report the exceedance as a deviation in the next semiannual compliance report.

The final amendments also clarify the requirements for establishing venturi scrubber parametric operating limits in 40 CFR 63.7824(b) by stating that plants may establish the limit during the initial performance test or during any other performance test that meets the emission limit. We have also revised the definition of "ladle metallurgy" by stating that vacuum degassing is not included in the definition. The final amendments also make clarifying changes to certain monitoring, recordkeeping, and reporting requirements cited in Table 4 to subpart FFFFF (Applicability of General Provisions to Subpart FFFFF) and correct errors in certain entries.

III. Impacts of the Final Amendments

The final amendments do not affect the level of emissions control required by the existing NESHAP or the nonair, health, environmental, and energy impacts. However, the costs of implementing the existing rule will be reduced in future years. For example, the reduction in subsequent performance tests for an emissions source equipped with a baghouse will reduce the nationwide cost of PM testing over the next 5 years from $270,000/year to $180,000/year, a savings of $90,000/year.

IV. Response to Comments on the Proposed Amendments

A. Equivalency of Opacity Limit

Comment: One commenter asked if the opacity limit for sinter coolers would achieve the same emission level, be equally protective of public health, and measure the same pollutants and the same levels of emissions as the PM limit of 0.03 gr/dscf?

Response: The opacity limit is a better representation of the MACT floor and will ensure that all sinter coolers perform at the MACT level of control or better. The limit will achieve lower emission levels (and presumably be more protective of public health) than the concentration limit of 0.03 gr/dscf in the current rule because it will apply to all sinter coolers, not just to those with stacks. However, we did not perform a risk analysis and evaluate protection of public health for the MACT standard because residual risk will be assessed no later than 8 years following the promulgation of the MACT standard (section 112(f)(2) of the CAA). See *Sierra Club* v. *EPA*, 353 F.3d 976, 990 (D.C. Cir. 2004) (Roberts, J.) (EPA is not to consider risk when promulgating section 112(d) MACT standards because that is the province of the residual risk analysis to be conducted under section 112(f)). The opacity limit and concentration limit are a measure of the same pollutant, PM, which is a surrogate for particulate metal HAP.

B. Monitoring Requirements

Comment: One commenter stated that the reason for changing to an opacity limit was the inability to measure PM emissions from sinter coolers without stacks. The commenter expressed concerne that the MACT technology is not being achieved for monitoring or measuring emissions and asked if this would be a problem if a facility were required to modernize its monitoring equipment to implement MACT. The commenter recommended that a MACT standard be implemented for monitoring to ensure the best monitoring technology is in place.

Response: MACT standards are based on the level of control achieved by the best-performing sources and a further evaluation of what further reductions could be achieved considering cost, energy, and nonair environmental impacts. Continuous monitoring requirements are not determined by a MACT floor or beyond-the-floor analysis. The continuous monitoring requirements are selected after consideration of many factors, such as the type of control device, source characteristics, and how to ensure that the MACT emission limit is being met on a continuous basis. The standard requires monitoring of capture and control systems to ensure they are operating properly, and these monitoring requirements are provided in the section of the rule entitled "Continuous Compliance Requirements" (40 CFR 63.7830 through 63.7835). See also *Sierra Club*, 353 F.3d at 991 (CAA section 114(a)(3) does not require continuous monitoring). For fugitive emissions that by definition are not emitted through stacks, opacity observations by EPA Method 9 (40 CFR part 60, appendix A) are the most effective means of monitoring to ensure compliance. We are not aware of a monitoring technology that is better than Method 9 for fugitive emissions.

C. Applicability to Sinter Coolers Without Stacks

Comment: One commenter believed that the proposed amendments did not apply an emission limit to sinter coolers without stacks.

Response: The commenter misunderstood the proposed rule amendments. The proposed amendments applied a MACT emission limit of 10 percent opacity to coolers without stacks.

D. Applicability to Discharges Inside Buildings

Comment: One commenter pointed out that the proposed amendments did not apply to discharges inside buildings and asked if the health of workers would be adequately protected from these emissions. Does this open a loophole that allows a facility to discharge inside a building to avoid an emission limit? What if the air discharged inside a building is emitted to the ambient air through the ventilation system?

Response: The capture and control systems reduce worker exposure to fugitive emissions that occur within the building. The air discharged inside the building exits through the building's roof monitor. The applicable emission limit for emissions from the building is the opacity limit, and the air discharged inside the building is subject to this limit. However, we agree that control devices installed on or after proposal of the final amendments (August 30, 2005) should be designed and operated to meet the PM emissions limit, and we are including this provision in the final amendments.

E. Operating Limit

Comment: One commenter asked if the hourly average operating limit for monitoring electrostatic precipitators (ESP) included time when the facility is not operating. If so, the facility could average in zeros to meet the hourly limit. The commenter stated that changing from a 6-minute average to an hourly average did not appear to be protective of public health.

Response: The hourly average does not include time when the facility is not operating because BOPF shops contain two steelmaking furnaces (a few have three furnaces), and at least one of these furnaces is almost always at some point in the steel production cycle. For example, if one furnace finishes a steelmaking "heat", the second furnace begins a heat while the first furnace is being tapped. The exception is during a shutdown, and in that case, parametric monitoring is not required or relevant.

As we stated earlier, residual risk remaining after the MACT standard and the extent to which further risk-based controls may be needed to protect public health with an ample margin of safety will be assessed 8 years following the promulgation of the MACT standard.

F. Corrective Action

Comment: One commenter said that the proposed corrective action procedures for ESP and baghouses are flawed because they do not require the facility to correct the problem and only require they report it in their semiannual compliance report. The authorized agency should be notified immediately of the violation. Otherwise, the agency may not know about the violation until 6 months later. In general, EPA should require monthly reports instead of semiannual reports so that the implementing agency and public know much sooner when a violation occurs, and an appropriate remedy can be instigated much sooner.

Response: This comment is beyond the scope of the proposed amendments. We did not propose any changes to the NESHAP that affected the semiannual reporting requirements or otherwise reopened the issue of the

appropriateness of those requirements; consequently, they are not subject to public comment. In the event any response is considered necessary, however, we note that the semiannual reporting requirements are consistent with § 63.10(e)(3) of the General Provisions (40 CFR part 63, subpart A), and we have no reason to impose more stringent requirements for the integrated iron and steel industry.

For more background, the commenter should examine our responses to public comments on semiannual reporting requirements in our final rule amendments to the General Provisions that reduced recordkeeping and reporting requirements (64 FR 7458, February 12, 1999). We explained that:

> * * * EPA's experience over the past ten years with a variety of NSPS and NESHAP rulemakings covering industries of all types suggests that semi-annual reporting provides sufficiently timely information to both ensure compliance and enable adequate enforcement of applicable requirements, while imposing less burden on the affected industry than would quarterly reporting.

It is in the facility's interest to ensure that the corrective actions are successful to avoid penalties and fines. The facility may be found in violation and subject to penalties and fines if the corrective actions continue to be unsuccessful. A continued pattern of non-compliance may be considered in determining the magnitude of penalties.

G. Startup, Shutdown, and Malfunctions

Comment: One commenter stated that the startup, shutdown, and malfunction (SSM) requirements were not protective enough because they allow a facility to craft a plan such that an SSM event is not an exceedance as long as the facility's response is consistent with the SSM plan. Furthermore, the facility should not be allowed to modify the SSM plan without prior Administrator approval.

Response: This comment is also beyond the scope of the proposed amendments. We did not propose, solicit comment on, or otherwise reopen this issue. If any response is considered necessary, however, we note that the SSM requirements come directly from the NESHAP General Provisions in 40 CFR part 63, and we have no reason to implement different requirements for this standard.

For further information, the commenter can consult our proposed amendments to the General Provisions (70 FR 43992, July 29, 2005). In that notice we discuss the "general duty clause" in the General Provisions and note that:

> * * * following the SSM plan itself is no "safe harbor" for sources if the plan is found to be deficient. That is, a source could not use "following the plan" as a defense for an inadequate program to minimize emissions.

With respect to review of the plan or revisions, we stated:

> Review of each SSM plan, from each facility, by the permitting authority, for adequacy prior to implementation is neither reasonable nor necessary. There are thousands of sources required to develop SSM plans, and each plan is tailored to its source. Some plans are closely tied and cross referenced to other operating materials at the source. Many, and perhaps most, plans contain CBI. The burden on the permitting authorities to review every plan would be enormous.

However, it is important to note that the Administrator (or an authorized permitting authority) may at any time require a facility owner or operator to submit a copy of an SSM plan.

H. Applicability of MACT Standards

Comment: One commenter asked if MACT standards were still in place with the proposed change that requires bag leak detection systems only for baghouses with stacks.

Response: The MACT standards are still in place for all affected sources operating with baghouses. All such sources are subject to a MACT PM emissions limit expressed in gr/dscf. In addition, all baghouses are subject to extensive inspection and monitoring requirements in § 63.7831(b)(4). The requirements applying to all baghouses include daily monitoring of pressure drop across each baghouse cell, weekly visual inspections to confirm dust is removed from hoppers, daily checks of compressed air supply for pulse-jet baghouses, monitoring cleaning cycles, monthly checks of the bag cleaning mechanism and bag tension, and inspections to assess physical integrity and fan wear or corrosion.

I. Subsequent Performance Tests for Baghouses

Comment: One commenter objected to the change of requiring performance tests every 2.5 years to every 5 years for baghouses. The reasoning that bag leak detection systems are in place is not adequate justification because they may not be working properly. The commenter also asked EPA to clarify what a "minor" emission unit means and asked if major units would be affected by the reduction in the frequency of performance testing.

Response: A performance test provides a "snap shot" of performance, usually as the average of three 1-hour runs. However, we require continuous monitoring of the control device, and in this case, bag leak detectors provide assurance of proper operation on a continuous basis. Section 63.7831(f) of the rule provides detailed requirements for the proper installation, operation, and maintenance of bag leak detectors. Moreover, the monitoring requirements in § 63.7830(b)(4) discussed earlier include inspections and other monitoring in addition to the bag leak detection system. The combination of bag leak detectors and the extensive inspection and monitoring requirements for baghouses provide more assurance of proper operation than would more frequent snapshot performance tests. Consequently, we concluded that performance testing more frequently than once per permit term for these baghouses was not necessary. This testing frequency is consistent with many existing operating permits.

We used the term "minor" in a qualitative way (i.e., it is not a term defined in the rule) to describe baghouses applied to ancillary processes that do not generate the large volume of emissions associated with primary production processes such as the sinter plant windboxes and steelmaking furnaces. The ancillary processes include hot metal transfer, desulfurization, and ladle metallurgy.

J. Opacity Observations of Sinter Cooler

Comment: In principle, the commenter supports EPA's decision to revise the emission limit for sinter coolers from a grain loading limit to an opacity limit because some sinter coolers are open to the ambient air, with their emissions to the atmosphere being fugitive in nature, rather than through a stack. However, the commenter feels that design considerations at some sinter coolers that do not use a stack make accurate opacity observations problematic. At the commenter's sinter plant, air is forced upward through the cooler bed, a donut-shaped ring approximately 5 feet wide and 50 feet in diameter at its outside edge. Emissions rise upward from the bed and into the atmosphere. The commenter contends that a visible emission observer would have a difficult time accurately assessing opacity due to overlapping or mingling of other plumes. These plumes are primarily from the discharge end of the sinter strand, from material handling sources, and from the side of the cooler that is directly opposite of the side from which the observations are recorded. Similarly, the commenter feels that heat waves from one side of the cooler can interfere with the accuracy of opacity readings made from the other side of the cooler. The commenter argues that these conditions can impart a positive bias to the readings, which could raise the

potential for exceedances of the opacity standard. The commenter requests language in the final rule that provides for a work practice/operational standard in lieu of the opacity standard.

Response: Representatives of EPA and the State agency visited the commenter's sinter plant and evaluated the commenter's concerns regarding an observer's ability to perform accurate visible emissions observations. We agree that performing visible emissions observations at this source is more problematic than at most sources. First, performing observations from ground level at this source does not give the observer an adequate view of all potential emission sources in proximity to the cooler. An observer could mistake emissions from the sinter strand discharge end for cooler emissions, and therefore, readings should be taken from some elevated level. We identified at least two elevated positions at this source from which observations can be made. However, while there are a number of platforms that are adjacent to the cooler that are accessible for this purpose, we acknowledge that the east platform is situated such that intense heat from the bed is likely to disqualify this position as a safety matter.

Regarding the commenter's concerns related to emissions from one side of the cooler interfering with the accurate observations of emissions from the opposite side of the cooler, we concluded that this issue is adequately addressed by existing rule language and guidance for EPA Method 9 (40 CFR part 60, appendix A). While there can be emissions from the feed end of the cooler, these emissions will decrease essentially to zero a short distance from the feed end. When no emissions are visible from the opposite side of the cooler, Method 9 observations of the sinter cooler can occur without multiple plume distortion. As a regulatory matter, reading through multiple plumes is essentially prohibited by section 2.1 of Method 9. Therefore, if any visible emissions arise from the discharge side of the sinter cooler during the Method 9 test that cause an interference with sinter cooler readings, the test must be discontinued.

A similar issue is the potential interference from heat waves. We agree that heat waves can have an influence (positive bias) on readings, depending on their intensity and relative location to the observer and the plume that is being read. Additional language in section 2.1 of Method 9 provides direction on how this should be addressed: "The qualified observer shall stand at a distance sufficient to provide a clear view of the emissions * * *". This language dictates that the observer must be far enough from the heat waves and at such an angle to ensure that observations are made at such a height as to remove any potential interference. We feel that this language also addresses the commenter's concerns regarding other potential emission sources. Consequently, we do not see a need to change the rule language to address this issue.

We decided that two other issues raised by the commenter during the site visit warrant discussion. One issue is that Method 9 does not address in what general direction an observer should be viewing an emission source of this type. If the observer is looking tangentially along the arc of the cooler, readings would have a positive bias compared to the observer looking approximately perpendicular to the tangent of the bed generally toward the center of the cooler. We have added language to the rule to clarify this. The second issue relates to potential positive bias due to luminescence of the plume and background used. This is mentioned in the preamble to Method 9 as exerting an influence on the appearance of a plume. Numerous structures near the sinter plant cooler can cause the plume being observed and/or the background to be in shadows. Consistent with Method 9, observers of sinter coolers should not read opacity when shadows may influence observations. Because this issue is discussed in the preamble to Method 9, we decided that the language in the current rule should not be changed.

We have considered the commenter's request for the option of an alternative work practice or operating standard, in lieu of an opacity standard. However, there are too many process variables that can affect emissions from the cooler to provide for a meaningful alternative. These variables include the types of raw materials used in the sintering process, bed depth, bed speed, uniformity of the surface of the bed, fan speed, and the condition of the grates, windbox ductwork, and fan. Changing just one of these variables may be insufficient to affect cooler emissions. Changes to a combination of variables may be needed at one point in time, where a different combination may be needed at another point in time.

K. Compliance Date

Comment: Sinter coolers without stacks were not regulated under the original PM limit, but would be regulated for the first time under the proposed opacity limit. Two commenters requested a 3-year extension from the compliance date of the original rule (May 22, 2006). This would allow time to design a compliance strategy, evaluate control options, and install controls that may be necessary to comply with the new standard.

Response: We agree that the 10 percent opacity limit is a new standard for sinter coolers. We concluded that it is permissible for us to establish a new compliance date for the sinter cooler standard, i.e., a compliance date not tied to the compliance date of the previous standard for sinter coolers in the original rule. See CAA section 112(i)(3)(A) (which ties compliance dates to the effective dates of "any emissions standard" promulgated under section 112, and so does not tie the date to an initially adopted standard). However, compliance is still to be as expeditious as possible. It is our engineering judgment that 6 months from date of publication is a reasonable time for compliance for most sources because most sources will not have to install additional controls. It is possible that individual sources may require more time to comply and may petition EPA for more time pursuant to the case-by-case extension mechanism in CAA section 112(i)(3)(B), which is codified in 40 CFR 63.6(i)(4)(i). This provision allows individual sources to submit compliance extension requests of up to 1 year where the extension is necessary for the installation of controls.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to review by the Office of Management and Budget (OMB) and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that the final rule amendments are not a "significant regulatory action" under the terms of Executive Order 12866 and are, therefore, not subject to OMB review.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The final amendments provide additional flexibility through revised requirements for monitoring operational parameters which would not increase the existing information collection burden. Other changes, such as the reduction in subsequent PM performance tests for certain emissions sources, are expected to decrease the information collection burden in future years. However, OMB has previously approved the information collection requirements contained in the existing regulations (40 CFR part 63, subpart FFFFF) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0517, EPA Information Collection Request (ICR) number 2003.02. A copy of the OMB-approved ICR may be obtained from Susan Auby, Collection Strategies Division, U.S. EPA (2822T), 1200 Pennsylvania Ave., NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR part 63 are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with these final rule amendments.

For the purposes of assessing the impacts of today's proposed amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. The final rule amendments will not impose any requirements on small entities. None of the regulated integrated iron and steel manufacturing facilities are small businesses.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, today's final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments, because they contain no requirements that apply to such governments or impose obligations upon them.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. They would not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected plants are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires EPA

to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175. No tribal governments own plants subject to the MACT standards for integrated iron and steel manufacturing. Thus, Executive Order 13175 does not apply to the final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule amendments are not subject to the Executive Order because they are based on control technology and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The final rule amendments are not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law 104–113, 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities, unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by one or more VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

The final rule amendments do not involve technical standards. Therefore, EPA is not considering the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the final amendments and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final amendments are effective on July 13, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: July 6, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart FFFFF—[AMENDED]

■ 2. Section 63.7783 is amended by revising paragraph (a) to read as follows:

§ 63.7783 When do I have to comply with this subpart?

(a) If you have an existing affected source, you must comply with each emission limitation and operation and maintenance requirement in this subpart that applies to you by the dates specified in paragraphs (a)(1) and (2) of this section.

(1) No later than May 22, 2006 for all emissions sources at an existing affected source except for a sinter cooler at an existing sinter plant.

(2) No later than January 13, 2007 for a sinter cooler at an existing sinter plant.

* * * * *

■ 3. Section 63.7790 is amended by revising paragraph (b)(3) to read as follows:

§ 63.7790 What emission limitations must I meet?

* * * * *

(b) * * *

(3) For each electrostatic precipitator applied to emissions from a BOPF, you must maintain the hourly average opacity of emissions exiting the control device at or below 10 percent.

* * * * *

■ 4. Section 63.7800 is amended by:
■ a. Revising the second sentence in paragraph (b) introductory text;
■ b. Revising paragraph (b)(4) introductory text;
■ c. Revising paragraph (b)(4)(vi);
■ d. Redesignating paragraph (b)(5) as (b)(7); and
■ e. Adding new paragraphs (b)(5) and (b)(6) to read as follows:

§ 63.7800 What are my operation and maintenance requirements?

* * * * *

(b) * * * Each plan must address the elements in paragraphs (b)(1) through (7) of this section.

* * * * *

(4) Corrective action procedures for baghouses equipped with bag leak detection systems or continuous opacity monitoring systems (COMS). In the event a bag leak detection system alarm is triggered or emissions from a baghouse equipped with a COMS exceed an hourly average opacity of 5 percent, you must initiate corrective action to determine the cause of the alarm within 1 hour of the alarm, initiate corrective action to correct the cause of the problem within 24 hours of the alarm, and complete the corrective action as soon as practicable. Corrective actions may include, but are not limited to:

* * * * *

(vi) Shutting down the process producing the particulate emissions.

(5) Corrective action procedures for venturi scrubbers equipped with continuous parameter monitoring systems (CPMS). In the event a venturi scrubber exceeds the operating limit in § 63.7790(b)(2), you must take corrective actions consistent with your site-specific monitoring plan in accordance with § 63.7831(a).

(6) Corrective action procedures for electrostatic precipitators equipped with COMS. In the event an electrostatic

precipitator exceeds the operating limit in § 63.7790(b)(3), you must take corrective actions consistent with your site-specific monitoring plan in accordance with § 63.7831(a).

* * * * *

■ 5. Section 63.7821 is revised to read as follows:

(a) You must conduct subsequent performance tests to demonstrate compliance with all applicable PM and opacity limits in Table 1 to this subpart at the frequencies specified in paragraphs (b) through (d) of this section.

(b) For each sinter cooler at an existing sinter plant and each emissions unit equipped with a control device other than a baghouse, you must conduct subsequent performance tests no less frequently than twice (at mid-term and renewal) during each term of your title V operating permit.

(c) For each emissions unit equipped with a baghouse, you must conduct subsequent performance tests no less frequently than once during each term of your title V operating permit.

(d) For sources without a title V operating permit, you must conduct subsequent performance tests every 2.5 years.

■ 6. Section 63.7823 is amended by adding paragraph (e) to read as follows:

§ 63.7823 What test methods and other procedures must I use to demonstrate initial compliance with the opacity limits?

* * * * *

(e) To determine compliance with the applicable opacity limit in Table 1 to this subpart for a sinter cooler at an existing sinter plant:

(1) Using a certified observer, determine the opacity of emissions according to Method 9 in appendix A to part 60 of this chapter.

(2) Obtain a minimum of 30 6-minute block averages.

(3) Make visible emission observations of uncovered portions of sinter plant coolers with the observer's line of sight generally in the direction of the center of the cooler.

■ 7. Section 63.7824 is amended by:

■ a. Adding a second sentence to the end of paragraph (b) introductory text;

■ b. Revising paragraph (b)(1);

■ c. Removing paragraph (c);

■ d. Redesignating paragraphs (d) through (g) as paragraphs (c) through (f);

■ e. Revising newly designated paragraph (c) introductory text and newly designated paragraph (c)(3);

■ f. Revising newly designated paragraph (d) introductory text; and

■ g. Revising newly designated paragraph (e) introductory text and newly designated paragraph (e)(4) to read as follows:

§ 63.7824 What test methods and other procedures must I use to establish and demonstrate initial compliance with operating limits?

* * * * *

(b) * * * You may establish the parametric monitoring limit during the initial performance test or during any other performance test run that meets the emission limit.

(1) Using the CPMS required in § 63.7830(c), measure and record the pressure drop and scrubber water flow rate during each run of the particulate matter performance test.

* * * * *

(c) You may change the operating limits for a capture system or venturi scrubber if you meet the requirements in paragraphs (c)(1) through (3) of this section.

* * * * *

(3) Establish revised operating limits according to the applicable procedures in paragraphs (a) and (b) of this section for a control device or capture system.

(d) For each sinter plant subject to the operating limit for the oil content of the sinter plant feedstock in § 63.7790(d)(1), you must demonstrate initial compliance according to the procedures in paragraphs (d)(1) through (3) of this section.

* * * * *

(e) To demonstrate initial compliance with the alternative operating limit for volatile organic compound emissions from the sinter plant windbox exhaust stream in § 63.7790(d)(2), follow the test methods and procedures in paragraphs (e)(1) through (5) of this section.

* * * * *

(4) Continue the sampling and analysis procedures in paragraphs (e)(1) through (3) of this section for 30 consecutive days.

* * * * *

■ 8. Section 63.7825 is amended by:

■ a. Revising paragraphs (a)(2) and (a)(3);

■ b. Removing paragraph (a)(4); and

■ c. Revising paragraph (b) to read as follows:

§ 63.7825 How do I demonstrate initial compliance with the emission limitations that apply to me?

(a) * * *

(2) For each capture system subject to the operating limit in § 63.7790(b)(1), you have established appropriate site-specific operating limit(s) and have a record of the operating parameter data measured during the performance test in accordance with § 63.7824(a)(1); and

(3) For each venturi scrubber subject to the operating limits for pressure drop and scrubber water flow rate in § 63.7790(b)(2), you have established appropriate site-specific operating limits and have a record of the pressure drop and scrubber water flow rate measured during the performance test in accordance with § 63.7824(b).

(b) For each existing or new sinter plant subject to the operating limit in § 63.7790(d)(1), you have demonstrated initial compliance if the 30-day rolling average of the oil content of the feedstock, measured during the initial performance test in accordance with § 63.7824(d) is no more than 0.02 percent. For each existing or new sinter plant subject to the alternative operating limit in § 63.7790(d)(2), you have demonstrated initial compliance if the 30-day rolling average of the volatile organic compound emissions from the sinter plant windbox exhaust stream, measured during the initial performance test in accordance with § 63.7824(e) is no more than 0.2 lb/ton of sinter produced.

* * * * *

■ 9. Section 63.7826 is amended by revising paragraph (b)(1) to read as follows:

§ 63.7826 How do I demonstrate initial compliance with the operation and maintenance requirements that apply to me?

* * * * *

(b) * * *

(1) Prepared the control device operation and maintenance plan according to the requirements of § 63.7800(b), including a preventative maintenance schedule and, as applicable, detailed descriptions of the corrective action procedures for baghouses and other control devices;

* * * * *

■ 10. Section 63.7830 is amended by revising paragraphs (b), (d), (e)(1), and (e)(2) to read as follows:

§ 63.7830 What are my monitoring requirements?

* * * * *

(b) Except as provided in paragraph (b)(3) of this section, you must meet the requirements in paragraph (b)(1) or (2) of this section for each baghouse applied to meet any particulate emission limit in Table 1 to this subpart. You must conduct inspections of each baghouse according to the requirements in paragraph (b)(4) of this section.

(1) Install, operate, and maintain a bag leak detection system according to § 63.7831(f) and monitor the relative change in particulate matter loadings

according to the requirements in § 63.7832; or

(2) If you do not install and operate a bag leak detection system, you must install, operate, and maintain a COMS according to the requirements in § 63.7831(h) and monitor the hourly average opacity of emissions exiting each control device stack according to the requirements in § 63.7832.

(3) A bag leak detection system and COMS are not required for a baghouse that meets the requirements in paragraphs (b)(3)(i) and (ii) of this section.

(i) The baghouse is a positive pressure baghouse and is not equipped with exhaust gas stacks; and

(ii) The baghouse was installed before August 30, 2005.

(4) You must conduct inspections of each baghouse at the specified frequencies according to the requirements in paragraphs (b)(4)(i) through (viii) of this section.

(i) Monitor the pressure drop across each baghouse cell each day to ensure pressure drop is within the normal operating range identified in the manual.

(ii) Confirm that dust is being removed from hoppers through weekly visual inspections or other means of ensuring the proper functioning of removal mechanisms.

(iii) Check the compressed air supply for pulse-jet baghouses each day.

(iv) Monitor cleaning cycles to ensure proper operation using an appropriate methodology.

(v) Check bag cleaning mechanisms for proper functioning through monthly visual inspection or equivalent means.

(vi) Make monthly visual checks of bag tension on reverse air and shaker-type baghouses to ensure that bags are not kinked (kneed or bent) or laying on their sides. You do not have to make this check for shaker-type baghouses using self-tensioning (spring-loaded) devices.

(vii) Confirm the physical integrity of the baghouse through quarterly visual inspections of the baghouse interior for air leaks.

(viii) Inspect fans for wear, material buildup, and corrosion through quarterly visual inspections, vibration detectors, or equivalent means.

* * * * *

(d) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3), you must install, operate, and maintain a COMS according to the requirements in § 63.7831(h) and monitor the hourly average opacity of emissions exiting each control device stack according to the requirements in § 63.7832.

(e) * * *

(1) Compute and record the 30-day rolling average of the oil content of the feedstock for each operating day using the procedures in § 63.7824(d); or

(2) Compute and record the 30-day rolling average of the volatile organic compound emissions (lbs/ton of sinter) for each operating day using the procedures in § 63.7824(e).

■ 11. Section 63.7831 is amended by:

■ a. Revising paragraphs (a) introductory text, (a)(5) and (a)(6), and adding new paragraphs (a)(7) and (a)(8);

■ b. Revising paragraph (f) introductory text; and

■ c. Revising paragraphs (h) introductory text and (h)(4) to read as follows:

§ 63.7831 What are the installation, operation, and maintenance requirements for my monitors?

(a) For each CPMS required in § 63.7830, you must develop and make available for inspection upon request by the permitting authority a site-specific monitoring plan that addresses the requirements in paragraphs (a)(1) through (8) of this section.

* * * * *

(5) Ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d);

(6) Ongoing recordkeeping and reporting procedures in accordance with the general requirements of §§ 63.10(c), (e)(1), and (e)(2)(i);

(7) Corrective action procedures you will follow in the event a venturi scrubber exceeds the operating limit in § 63.7790(b)(2); and

(8) Corrective action procedures you will follow in the event an electrostatic precipitator exceeds the operating limit in § 63.7790(b)(3).

* * * * *

(f) For each baghouse equipped with a bag leak detection system according to § 63.7830(b)(1), you must install, operate, and maintain the bag leak detection system according to the requirements in paragraphs (f)(1) through (7) of this section.

* * * * *

(h) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3) and each baghouse equipped with a COMS according to § 63.7830(b)(2), you must install, operate, and maintain each COMS according to the requirements in paragraphs (h)(1) through (4) of this section.

* * * * *

(4) COMS data must be reduced to 6-minute averages as specified in § 63.8(g)(2) and to hourly averages where required by this subpart.

■ 12. Section 63.7833 is amended by:

■ a. Revising paragraph (c);

■ b. Revising paragraph (d) introductory text and adding new paragraph (d)(4);

■ c. Revising paragraphs (e) introductory text, and (e)(1), and adding new paragraph (e)(3);

■ d. Revising paragraphs (f)(1)(i) and (f)(2)(i); and

■ e. Adding new paragraph (g) to read as follows:

§ 63.7833 How do I demonstrate continuous compliance with the emission limitations that apply to me?

* * * * *

(c) For each baghouse applied to meet any particulate emission limit in Table 1 to this subpart, you must demonstrate continuous compliance by meeting the requirements in paragraph (c)(1) or (2) of this section as applicable, and paragraphs (c)(3) and (4) of this section:

(1) For a baghouse equipped with a bag leak detection system, operating and maintaining each bag leak detection system according to § 63.7831(f) and recording all information needed to document conformance with these requirements. If you increase or decrease the sensitivity of the bag leak detection system beyond the limits specified in § 63.7831(f)(6), you must include a copy of the required written certification by a responsible official in the next semiannual compliance report.

(2) For a baghouse equipped with a COMS, operating and maintaining each COMS and reducing the COMS data according to § 63.7831(h).

(3) Inspecting each baghouse according to the requirements in § 63.7830(b)(4) and maintaining all records needed to document conformance with these requirements.

(4) Maintaining records of the time you initiated corrective action in the event of a bag leak detection system alarm or when the hourly average opacity exceeded 5 percent, the corrective action(s) taken, and the date on which corrective action was completed.

(d) For each venturi scrubber subject to the operating limits for pressure drop and scrubber water flow rate in § 63.7790(b)(2), you must demonstrate continuous compliance by meeting the requirements of paragraphs (d)(1) through (4) of this section:

* * * * *

(4) If the hourly average pressure drop or scrubber water flow rate is below the operating limits, you must follow the corrective action procedures in paragraph (g) of this section.

(e) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3), you must demonstrate

continuous compliance by meeting the requirements of paragraphs (e)(1) through (3) of this section:

(1) Maintaining the hourly average opacity of emissions no higher than 10 percent; and

* * * * *

(3) If the hourly average opacity of emissions exceeds 10 percent, you must follow the corrective action procedures in paragraph (g) of this section.

(f) * * *

(1) * * *

(i) Computing and recording the 30-day rolling average of the percent oil content for each operating day according to the performance test procedures in § 63.7824(d);

* * * * *

(2) * * *

(i) Computing and recording the 30-day rolling average of the volatile organic compound emissions for each operating day according to the performance test procedures in § 63.7824(e);

* * * * *

(g) If the hourly average pressure drop or water flow rate for a venturi scrubber or hourly average opacity for an electrostatic precipitator exceeds the operating limit, you must follow the procedures in paragraphs (g)(1) through (4) of this section.

(1) You must initiate corrective action to determine the cause of the exceedance within 1 hour. During any period of corrective action, you must continue to monitor and record all required operating parameters for equipment that remains in operation. Within 24 hours of the exceedance, you must measure and record the hourly average operating parameter value for the emission unit on which corrective action was taken. If the hourly average parameter value meets the applicable operating limit, then the corrective action was successful and the emission unit is in compliance with the applicable operating limit.

(2) If the initial corrective action required in paragraph (g)(1) of this section was not successful, you must complete additional corrective action within the next 24 hours (48 hours from the time of the exceedance). During any period of corrective action, you must continue to monitor and record all required operating parameters for equipment that remains in operation. After this second 24-hour period, you must again measure and record the hourly average operating parameter value for the emission unit on which corrective action was taken. If the hourly average parameter value meets the applicable operating limit, then the corrective action was successful and the emission unit is in compliance with the applicable operating limit.

(3) For purposes of paragraphs (g)(1) and (2) of this section, in the case of an exceedance of the hourly average opacity operating limit for an electrostatic precipitator, measurements of the hourly average opacity based on visible emission observations in accordance with Method 9 (40 CFR part 60, appendix A) may be taken to evaluate the effectiveness of corrective action.

(4) If the second attempt at corrective action required in paragraph (g)(2) of this section was not successful, you must report the exceedance as a deviation in your next semiannual compliance report according to § 63.7841(b).

■ 13. Section 63.7834 is amended by revising paragraph (a) to read as follows:

§ 63.7834 How do I demonstrate continuous compliance with the operation and maintenance requirements that apply to me?

(a) For each capture system and control device subject to an operating limit in § 63.7790(b), you must demonstrate continuous compliance with the operation and maintenance requirements in § 63.7800(b) by meeting the requirements of paragraphs (a)(1) through (4) of this section:

(1) Making monthly inspections of capture systems and initiating corrective action according to § 63.7800(b)(1) and recording all information needed to document conformance with these requirements;

(2) Performing preventative maintenance according to § 63.7800(b)(2) and recording all information needed to document conformance with these requirements;

(3) Initiating and completing corrective action for a baghouse equipped with a bag leak detection system or COMS according to § 63.7800(b)(4) and recording all information needed to document conformance with these requirements, including the time you initiated corrective action, the corrective action(s) taken, and date on which corrective action was completed.

(4) Initiating and completing corrective action for a venturi scrubber equipped with a CPMS or an electrostatic precipitator equipped with a COMS according to § 63.7833(g) and recording all information needed to document conformance with these requirements, including the time you initiated corrective action, the corrective action(s) taken within the first 24 hours according to § 63.7833(g)(1) and whether they were successful, the corrective action(s) taken within the second 24 hours according to § 63.7833(g)(2) and whether they were successful, and the date on which corrective action was completed.

* * * * *

■ 14. Section 63.7835 is amended by revising the first sentence in paragraph (a) to read as follows:

§ 63.7835 What other requirements must I meet to demonstrate continuous compliance?

(a) *Deviations.* Except as provided in § 63.7833(g), you must report each instance in which you did not meet each emission limitation in § 63.7790 that applies to you. * * *

* * * * *

■ 15. Section 63.7851 is amended by revising paragraph (c)(2) to read as follows:

§ 63.7851 Who implements and enforces this subpart?

* * * * *

(c) * * *

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90, except for approval of an alternative method for the oil content of the sinter plant feedstock or volatile organic compound measurements for the sinter plant windbox exhaust stream stack as provided in § 63.7824(f).

* * * * *

■ 16. Section 63.7852 is amended by revising the definition of term "Ladle metallurgy" to read as follows:

§ 63.7852 What definitions apply to this subpart?

* * * * *

Ladle metallurgy means a secondary steelmaking process that is performed typically in a ladle after initial refining in a basic oxygen process furnace to adjust or amend the chemical and/or mechanical properties of steel. This definition does not include vacuum degassing.

* * * * *

■ 17. Table 1 to subpart FFFFF of part 63 is amended by revising entries 3, 5, 6, 7, 9, 10, and 11; and by revising the footnotes to read as follows:

TABLE 1 TO SUBPART FFFFF OF PART 63.—EMISSION AND OPACITY LIMITS

For . . .	You must comply with each of the following . . .
* * * * * * *	
3. Each discharge end at an existing sinter plant	a. You must not cause to be discharged to the atmosphere any gases that exit from one or more control devices that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf [1] [2]; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the building or structure housing the discharge end that exhibit opacity greater than 20 percent (6-minute average).
* * * * * * *	
5. Each sinter cooler at an existing sinter plant	You must not cause to be discharged to the atmosphere any emissions that exhibit opacity greater than 10 percent (6-minute average).
6. Each sinter cooler at a new sinter plant	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.01 gr/dscf.
7. Each casthouse at an existing blast furnace	a. You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf [2]; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the casthouse or structure housing the blast furnace that exhibit opacity greater than 20 percent (6-minute average).
* * * * * * *	
9. Each BOPF at a new or existing shop	a. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with a closed hood system at a new or existing BOPF shop that contain, on a flow-weighted basis, particulate matter in excess of 0.03 gr/dscf during the primary oxygen blow [2] [3]; and b. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with an open hood system that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf during the steel production cycle for an existing BOPF shop [2] [3] or 0.01 gr/dscf during the steel production cycle for a new BOPF shop [3]; and c. You must not cause to be discharged to the atmosphere any gases that exit from a control device used solely for the collection of secondary emissions from the BOPF that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.0052 gr/dscf for a new BOPF shop.
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.003 gr/dscf for a new BOPF shop.
11. Each ladle metallurgy operation at a new or existing BOPF shop	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.004 gr/dscf for a new BOPF shop.
* * * * * * *	

[1] This limit applies if the cooler is vented to the same control device as the discharge end.
[2] This concentration limit (gr/dscf) for a control device does not apply to discharges inside a building or structure housing the discharge end at an existing sinter plant, inside a casthouse at an existing blast furnace, or inside an existing BOPF shop if the control device was installed before August 30, 2005.
[3] This limit applies to control devices operated in parallel for a single BOPF during the oxygen blow.

■ 18. Table 2 to subpart FFFFF of part 63 is amended by revising entries 5 and 6 to read as follows:

TABLE 2 TO SUBPART FFFFF OF PART 63.—INITIAL COMPLIANCE WITH EMISSION AND OPACITY LIMITS

For . . .	You have demonstrated initial compliance if . . .

TABLE 2 TO SUBPART FFFFF OF PART 63.—INITIAL COMPLIANCE WITH EMISSION AND OPACITY LIMITS—Continued

For . . .	You have demonstrated initial compliance if . . .
* * * * * * *	
5. Each sinter cooler at an existing sinter plant	The opacity of emissions, determined according to the performance test procedures in § 63.7823(e), did not exceed 10 percent (6-minute average).
6. Each sinter cooler at a new sinter plant	The average concentration of particulate matter, measured according to the performance test procedures in § 63.7822(b), did not exceed 0.01 gr/dscf.
* * * * * * *	

■ 19. Table 3 to subpart FFFFF of part 63 is revised to read as follows:

TABLE 3 TO SUBPART FFFFF OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS

[As required in § 63.7833(a), you must demonstrate continuous compliance with the emission and opacity limits according to the following table.]

For . . .	You must demonstrate continuous compliance by . . .
1. Each windbox exhaust stream at an existing sinter plant	a. Maintaining emissions of particulate matter at or below 0.4 lb/ton of product sinter; and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
2. Each windbox exhaust stream at a new sinter plant	a. Maintaining emissions of particulate matter at or below 0.3 lb/ton of product sinter; and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
3. Each discharge end at an existing sinter plant	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.02 gr/dscf; and b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 20 percent (6-minute average); and c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
4. Each discharge end at a new sinter plant	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.01 gr/dscf; and b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 10 percent (6-minute average); and c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
5. Each sinter cooler at an existing sinter plant	a. Maintaining the opacity of emissions that exit any sinter cooler at or below 10 percent (6-minute average); and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
6. Each sinter cooler at a new sinter plant	a. Maintaining emissions of particulate matter at or below 0.1 gr/dscf; and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
7. Each casthouse at an existing blast furnace	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf; and b. Maintaining the opacity of secondary emissions that exit any opening in the casthouse or structure housing the casthouse at or below 20 percent (6-minute average); and c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
8. Each casthouse at a new blast furnace	a. Maintaining emissions of particulate matter from a control device at or below 0.003 gr/dscf; and b. Maintaining the opacity of secondary emissions that exit any opening in the casthouse or structure housing the casthouse at or below 15 percent (6-minute average); and c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
9. Each BOPF at a new or existing BOPF shop	a. Maintaining emissions of particulate matter from the primary control system for a BOPF with a closed hood system at or below 0.03 gr/dscf; and

TABLE 3 TO SUBPART FFFFF OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS—Continued

[As required in § 63.7833(a), you must demonstrate continuous compliance with the emission and opacity limits according to the following table.]

For . . .	You must demonstrate continuous compliance by . . .
	b. Maintaining emissions of particulate matter from the primary control system for a BOPF with an open hood system at or below 0.02 gr/dscf for an existing BOPF shop or 0.01 gr/dscf for a new BOPF shop; and c. Maintaining emissions of particulate matter from a control device applied solely to secondary emissions from a BOPF at or below 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop; and d. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF or 0.003 gr/dscf for a new BOPF; and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
11. Each ladle metallurgy operation at a new or existing BOPF shop	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop; and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
12. Each roof monitor at an existing BOPF shop	a. Maintaining the opacity of secondary emissions that exit any opening in the BOPF shop or other building housing the BOPF shop or shop operation at or below 20 percent (3-minute average); and b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
13. Each roof monitor at a new BOPF shop	a. Maintaining the opacity (for any set of 6-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a bottom-blown BOPF or shop operation at or below 10 percent, except that one 6-minute period greater than 10 percent but no more than 20 percent may occur once per steel production cycle; and b. Maintaining the opacity (for any set of 3-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a top-blown BOPF or shop operation at or below 10 percent, except that one 3-minute period greater than 10 percent but less than 20 percent may occur once per steel production cycle; and c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.

■ 20. Table 4 to subpart FFFFF of part 63 is amended as follows:

■ a. By revising entry § 63.6(h)(2)(i).

■ b. By adding entries § 63.6(i) and § 63.6(j).

■ c. By revising entries §§ 63.8 through 63.10.

* * * * *

TABLE 4 TO SUBPART FFFFF OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF

* * * * * * *

Citation	Subject	Applies to Subpart FFFFF	Explanation
* *	* *	* *	* *
§ 63.6(h)(2)(i)	Determining Compliance with Opacity and VE Standards.	No	Subpart FFFFF specifies methods and procedures for determining compliance with opacity emission and operating limits.
§ 63.6(i)	Extension of Compliance with Emission Standards.	Yes.	
§ 63.6(j)	Exemption from Compliance with Emission Standards.	Yes.	
* *	* *	* *	* *
§ 63.8(a)(1)–(3), (b), (c)(1)–(3), (c)(4)(i)–(ii), (c)(5)–(6), (c)(7)–(8), (f)(1)–(5), (g)(1)–(4).	Monitoring Requirements	Yes	CMS requirements in §§ 63.8(c)(4)(i)–(ii), (c)(5)–(6), (d), and (e) apply only to COMS.

TABLE 4 TO SUBPART FFFFF OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF—Continued

Citation	Subject	Applies to Subpart FFFFF	Explanation
§ 63.8(a)(4)	Additional Monitoring Requirements for Control Devices in § 63.11.	No	Subpart FFFFF does not require flares.
§ 63.8(c)(4)	Continuous Monitoring System Requirements.	No	Subpart FFFFF specifies requirements for operation of CMS.
§ 63.8(f)(6)	RATA Alternative	No.	
§ 63.8(g)(5)	Data Reduction	No	Subpart FFFFF specifies data reduction requirements.
§ 63.9	Notification Requirements	Yes	Additional notifications for CMS in § 63.9(g) apply only to COMS.
§ 63.10(a), (b)(1), (b)(2)(i)–(xii), (b)(2)(xiv), (b)(3), (c)(1)–(6), (c)(9)–(15), (d), (e)(1)–(2), (e)(4), (f).	Recordkeeping and Reporting Requirements.	Yes	Additional records for CMS in § 63.10(c)(1)–(6), (9)–(15), and reports in § 63.10(d)(1)–(2) apply only to COMS.
§ 63.10(b)(2) (xiii)	CMS Records for RATA Alternative.	No.	
§ 63.10(c)(7)–(8)	Records of Excess Emissions and Parameter Monitoring Exceedances for CMS.	No	Subpart FFFFF specifies record requirements.
§ 63.10(e)(3)	Excess Emission Reports	No	Subpart FFFFF specifies reporting requirements

BILLING CODE 6560–50–P

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Part 1

[WT Docket No. 05–211; DA 06–1280]

Commercial Spectrum Enhancement Act and Modernization of the Commission's Competitive Bidding Rules and Procedures

AGENCY: Federal Communications Commission.

ACTION: Final rule; correction.

SUMMARY: The Federal Communications Commission published in the **Federal Register** of May 4, 2006, a document that included new or modified information collections. This document corrects the ordering clause in paragraph 52.

DATES: Effective June 16, 2006.

FOR FURTHER INFORMATION CONTACT: Brian Carter, Auction and Spectrum Access Division, Wireless Telecommunications Bureau at (202) 418–0660.

SUPPLEMENTARY INFORMATION: This is a summary of the *Erratum and Notice of Office of Management and Budget Approval of Information Collections* released on June 16, 2006. The complete text of the *Erratum and Notice of Office of Management and Budget Approval of Information Collections* and related Commission documents, is available for public inspection and copying from 8 a.m. to 4:30 p.m. Monday through Thursday or from 8 a.m. to 11:30 a.m. on Friday at the FCC Reference Information Center, Portals II, 445 12th Street, SW., Room CY–A257, Washington, DC 20554. The *Erratum and Notice of Office of Management and Budget Approval of Information Collections* and related Commission documents may also be purchased from the Commission's duplicating contractor, Best Copy and Printing, Inc. (BCPI), Portals II, 445 12th Street, SW., Room CY–B402, Washington, DC 20554, telephone 202–488–5300, facsimile 202–488–5563, or you may contact BCPI at its Web site: *http://www.BCPIWEB.com.*

On April 25, 2006, the Federal Communications Commission (Commission) released a *Second Report and Order and Second Further Notice of Proposed Rule Making (Designated Entity Second Report and Order)*, 71 FR 26245, May 4, 2006. The *Designated Entity Second Report and Order* included new or modified information collections. The *Erratum and Notice of Office of Management and Budget Approval of Information Collections* (Erratum) corrects paragraph 103 of the *Designated Entity Second Report and Order*, which appeared as paragraph 52 in the **Federal Register** of May 4, 2006. The Commission may conduct the information collections required by §§ 1.2105(a)(2)(ii)(B), 1.2110(b)(1)(i) and (ii), and 1.2112(b)(1)(iii) and (iv), as amended by the *Designated Entity Second Report and Order* consistent with the Paperwork Reduction Act of 1995. *See* Public Information Collection Approved by Office of Management and Budget, 71 FR 34935, June 16, 2006.

In FR Doc. 06–4257 published on May 4, 2006, (71 FR 26245) make the following corrections. On page 26250, in the third column, paragraph 52 is corrected to read as follows:

Accordingly, *it is ordered*, that, pursuant to sections 4(i), 303(r), and 309(j) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i), 303(r), and 309(j), the *Second Report and Order* is hereby *adopted* and Part 1 of the Commission's rules, 47 CFR Part 1, is *amended* as set forth in Appendix B, effective 30 days after publication in the **Federal Register**, except for the grandfathering provisions, which are effective upon release. The Commission will not conduct or sponsor any new or modified information collections required pursuant to Sections 1.913(a)(6); 1.913(b); 1.919(b)(5); 1.2105(a)(2)(ii)(B); 1.2110(b)(1)(i) and (ii); 1.2110(j) and (n); 1.2111(a), (b), and (c)(2) and (3); 1.2112(b)(1)(iii) and (iv), and (2)(iii), (v) and (vii); and 1.2114(b), (f), and (g) of the amended rules adopted herein until approval by the Office of Management and Budget (OMB) has been obtained under the Paperwork Reduction Act of 1995, Pub. L. 104–13. The Commission will publish notice in the **Federal Register** announcing such OMB approval.

Federal Communications Commission.

Gary D. Michaels,

Deputy Chief, Auctions and Spectrum Access Division, WTB.

[FR Doc. E6–11050 Filed 7–12–06; 8:45 am]

BILLING CODE 6712–01–P

From the shoreline at 46°43′10.00″ N, 092°10′31.66″ W, then south to 46°43′06.24″ N, 092°10′31.66″ W, then east to 46°43′06.24″ N, 092°09′41.76″ W, then north to the shoreline at 46°43′10.04″ N, 092°09′41.76″ W. [Datum NAD 83].

(b) *Effective period.* This rule is effective from 8 a.m. CST on May 31, 2006 until 8 p.m. CST on November 30, 2006.

(c) *Regulations.* (1) In accordance with the general regulations in § 165.23 of this part, entry into, transiting, or anchoring within this safety zone is prohibited unless authorized by the Captain of the Port Duluth, or his designated on-scene representative.

(2) This safety zone is closed to all vessel traffic, except as may be permitted by the Captain of the Port Duluth or his designated on-scene representative.

(3) The "designated on-scene representative" of the Captain of the Port is any Coast Guard commissioned, warrant or petty officer who has been designated by the Captain of the Port to act on his behalf. The designated on-scene representative of the Captain of the Port will be aboard either a Coast Guard or Coast Guard Auxiliary vessel. The Captain of the Port or his designated on-scene representative may be contacted by calling Coast Guard Marine Safety Unit Duluth at (218) 720–5286.

(4) Vessel operators desiring to enter or operate within the safety zone shall contact the Captain of the Port Duluth to obtain permission to do so. Vessel operators given permission to enter or operate in the safety zone shall comply with all directions given to them by the Captain of the Port Duluth or his designated on-scene representative.

Dated: May 25, 2006.

G.T. Croot,

Commander, U.S. Coast Guard, Captain of the Port Duluth.

Spinosad; Pesticide Tolerance Technical Correction

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; technical correction.

SUMMARY: EPA issued a final rule in the **Federal Register** of March 8, 2006 (FRL–7758–2) concerning the establishment of tolerances for residues of spinosad in or on various commodities. This document is being issued to correct a typographical omission.

DATES: This final rule is effective June 23, 2006.

ADDRESSES: EPA has established a docket for this action under docket identification (ID) number EPA–HQ–OPP–2006–0510. All documents in the docket are listed on the regulations.gov web site. Although listed in the index, some information is not publicly available, e.g., Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either in the electronic docket at *http://www.regulations.gov*, or, if only available in hard copy, at the Office of Pesticide Programs (OPP) Regulatory Public Docket in Rm. S-4400, One Potomac Yard (South Building), 2777 S. Crystal Drive Arlington, VA. The hours of operation of this Docket Facility are from 8:30 a.m. to 4 p.m., Monday through Friday, excluding legal holidays. The Docket telephone number is (703) 305-5805.

FOR FURTHER INFORMATION CONTACT: Sidney Jackson, Registration Division (7505P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave., NW., Washington DC 20460-0001; telephone number: (703) 305-7610; e-mail address:*jackson.sidney@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this Action Apply to Me?

The Agency included in the final rule a list of those who may be potentially affected by this action. If you have questions regarding the applicability of this action to a particular entity, consult the person listed under the **FOR FURTHER INFORMATION CONTACT.**

B. How Can I Access Electronic Copies of this Document and Other Related Information?

In addition to using regulations.gov, you may access this **Federal Register** document electronically through the EPA Internet under the "**Federal Register**" listings at *http://www.epa.gov/fedrgstr.*

II. What Does this Correction Do?

FR Doc. 06–1939 published in the **Federal Register** of March 8, 2006 (71 FR 11519) (FRL–7758–2) is corrected as follows:

On page 11526, in the amendment to §180.495 (a), the table establishing tolerances appeared as a two column table. The table should have appeared as a three column table. The omitted third column should include the heading "Expiration/Revocation Date", and the entry "None" to correspond to the tolerance listed in each row. This document is being published to correct that omission.

III. Why is this Correction Issued as a Final Rule?

Section 553 of the Administrative Procedure Act (APA), 5 U.S.C. 553(b)(B), provides that, when an Agency for good cause finds that notice and public procedure are impracticable, unnecessary or contrary to the public interest, the Agency may issue a final rule without providing notice and an opportunity for public comment. EPA has determined that there is good cause for making today's technical correction final without prior proposal and opportunity for comment, because because the use of notice and comment procedures are unnecessary to effectuate this correction. EPA finds that this constitutes good cause under 5 U.S.C. 553(b)(B).

IV. Do Any of the Statutory and Executive Order Reviews Apply to this Action?

No. This action only corrects typographically omissions for a previously published final rule and does not impose any new requirements. EPA's compliance with the statutes and Executive Orders for the underlying rule

RIN 2060–AI66

National Emission Standards for the Printing and Publishing Industry

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: EPA is taking direct final action on amendments to the national emission standards for hazardous air pollutants (NESHAP) for the printing and publishing industry which were promulgated on May 30, 1996, under the authority of section 112 of the Clean Air Act (CAA). The direct final rule amendments amend specific provisions in the Printing and Publishing Industry NESHAP to resolve issues and questions raised after promulgation of the final rule and to correct errors in the regulatory text. This action also makes direct final rule amendments to the Paper and Other Web Coating NESHAP and the Printing, Coating, and Dyeing of Fabric and Other Textiles NESHAP to clarify the interaction between these rules and the Printing and Publishing Industry NESHAP.

DATES: The direct final rule is effective on August 22, 2006 without further notice, unless EPA receives adverse written comment by June 23, 2006 or by July 10, 2006 if a public hearing is requested by June 5, 2006. If adverse comments are received, EPA will publish a timely withdrawal in the **Federal Register** indicating which amendments, sections or paragraphs will become effective and which are being withdrawn due to adverse comment. If anyone contacts EPA requesting to speak at a public hearing, a public hearing will be held on June 8, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2004–0441. All documents in the docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, *e.g.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

Public Hearing. If a public hearing is held, it will be held at 10 a.m. at the EPA's Environmental Research Center Auditorium, Research Triangle Park, NC, or at an alternate site nearby.

FOR FURTHER INFORMATION CONTACT: For further information contact Mr. David Salman, EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (D205–01), Research Triangle Park, NC 27711; telephone number (919) 541–0859; fax number (919) 541–0246; e-mail address: *salman.dave@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS* code	Examples of potentially regulated entities
Industry	322212	Folding Paperboard Box Manufacturing.
	322221	Coated and Laminated Packaging Paper and Plastics Film Manufacturing.
	322222	Coated and Laminated Paper Manufacturing.
	322223	Plastics, Foil, and Coated Paper Bag Manufacturing.
	322224	Uncoated Paper and Multiwall Bag Manufacturing.
	322225	Laminated Aluminum Foil Manufacturing for Flexible Packaging.
	323111	Commercial Gravure Printing.
	323112	Commercial Flexographic Printing.
	323119	Other Commercial Printing.
	326192	Resilient Floor Covering Manufacturing.

*North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria of the rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's direct final NESHAP will also be available on the WWW through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the NESHAP will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg/*. The TTN at EPA's Web site provides information and technology exchange in various areas of air pollution control.

Comments. We are publishing the direct final rule amendments without prior proposal because we view the amendments as noncontroversial and do not anticipate adverse comments. However, in the Proposed Rules section of this **Federal Register** notice, we are publishing a separate document that will serve as the proposal to amend the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK), the Paper and Other Web Coating NESHAP (40 CFR part 63, subpart JJJJ), and the Printing, Coating, and Dyeing of Fabric and Other Textiles NESHAP (40 CFR part 63, subpart OOOO) if adverse comments are filed. Instructions for submitting comments are provided in that document. If we receive any adverse comments on one or more distinct amendments, we will publish a timely withdrawal in the **Federal Register** informing the public which provisions will become effective, and which provisions are being withdrawn due to adverse comment. We will address all public comments in a subsequent final rule, should the EPA determine to issue one. Any of the distinct amendments in today's direct final rule for which we do not receive adverse comment will become effective on the previously mentioned date. We will not institute a second comment period on the direct final rule amendments. Any parties interested in commenting must do so at this time.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the direct final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 24, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the direct final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal proceeding brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
II. Amendments
A. Applicability
B. Designation of Affected Source
C. Definitions
D. Standards: Publication Rotogravure Printing
E. Standards: Product and Packaging Rotogravure and Wide-Web Flexographic Printing
F. Performance Test Methods
G. Monitoring Requirements
H. Recordkeeping Requirements
I. Reporting Requirements
J. Appendix A to 40 CFR Part 63, Subpart KK
III. Statutory and Executive Order Reviews
A. Executive Order 12866, Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility
D. Unfunded Mandates Reform Act
E. Executive Order 13132, Federalism
F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act.

I. Background

On May 30 1996, we issued the final NESHAP for the printing and publishing industry (61 FR 27140). The final NESHAP established standards to control organic hazardous air pollutant (HAP) emissions from new and existing publication rotogravure, product and packaging rotogravure, and wide-web flexographic printing operations.

Since promulgation of the rule, various issues and questions have been raised by stakeholders and some errors have been identified in the regulatory text. Today's action includes direct final rule amendments that resolve inconsistencies, clarify language, and add additional compliance flexibility. We are also making direct final rule amendments to the Paper and Other Web Coating NESHAP (40 CFR part 63, subpart JJJJ), and the Printing, Coating, and Dyeing of Fabric and Other Textiles NESHAP (40 CFR part 63, subpart OOOO) to clarify the interaction between these rules and the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK). None of the amendments will have any discernable effect on the stringency of the rules.

II. Amendments

The discussion in this section of the preamble pertains to the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK) unless otherwise noted as applying to the Paper and Other Web Coating NESHAP (40 CFR part 63, subpart JJJJ) or the Printing, Coating, and Dyeing of Fabric and Other Textiles NESHAP (40 CFR part 63, subpart OOOO).

A. Applicability

The final rule contains a provision which some sources can use to establish and maintain themselves as area sources of HAP with respect to the Printing and Publishing Industry NESHAP. EPA has received many questions about whether this provision in 40 CFR 63.820(a)(2) is an optional or mandatory provision for sources that wish to establish and maintain themselves as area sources. We have added language to 40 CFR 63.820(a)(2) to emphasize that this is an optional provision. Facilities which establish and maintain themselves as area sources through other mechanisms, as described in 40 CFR 63.820(a)(7), are not subject to this subpart.

B. Designation of Affected Source

In 40 CFR 63.821(a)(3), the final rule provides an option for including "stand-alone coating equipment" in product and packaging rotogravure or wide-web flexographic printing affected sources. We have amended 40 CFR 63.821(a)(3) to now refer to "stand-alone equipment" rather than "stand-alone coating equipment." This change provides the owner or operator with more flexibility for bringing additional equipment into the product and packaging rotogravure or wide-web flexographic printing affected source. This may simplify the compliance demonstration for some affected sources because they will not need to separately quantify the materials used on stand-alone equipment in order to exclude them from the compliance demonstration as is necessary when stand-alone equipment is not part of the product and packaging rotogravure or wide-web flexographic printing affected source. This may also simplify the compliance demonstration for affected sources which vent emissions from product and packaging rotogravure or wide-web flexographic presses and from stand-alone equipment to a common control device.

Consistent with this change, we have also amended 40 CFR 63.3300(a) of the Paper and Other Web Coating NESHAP (40 CFR part 63, subpart JJJJ) to now refer to "stand-alone equipment" rather than "stand-alone coating equipment."

In response to several requests we have added options in 40 CFR 63.821(a)(4) for including narrow-web flexographic presses and in 40 CFR 63.821(a)(5) for including proof presses in product and packaging rotogravure or wide-web flexographic printing affected sources. These options may simplify the compliance demonstration for some affected sources because they will not need to separately quantify the materials used on narrow-web flexographic presses or proof presses in order to exclude them from the compliance demonstration as is necessary when narrow-web flexographic presses and proof presses are not part of the product and packaging rotogravure or wide-web flexographic printing affected source.

We have corrected 40 CFR 63.821(a)(2)(ii)(A) to state that the total mass of materials applied by the press using product and packaging rotogravure "print" stations be included in the numerator. The final rule incorrectly referred to product and packaging rotogravure "work" stations in the numerator.

We have added a new 40 CFR 63.821(a)(6) to clarify that certain operations affiliated with product and packaging rotogravure or wide-web flexographic printing affected sources are part of the printing and publishing industry source category, but are not part of the product and packaging rotogravure or wide-web flexographic printing affected source. These affiliated operations include mixing or dissolving of ink or coating ingredients prior to application; ink or coating mixing for viscosity adjustment, color tint or additive blending, or pH adjustment; cleaning of ink or coating lines and line parts; handling and storage of inks, coatings and solvents; and conveyance and treatment of wastewater. Including these affiliated operations in the printing and publishing source category is consistent with 40 CFR 63.7985(d)(2) of the Miscellaneous Coating Manufacturing NESHAP (40 CFR part 63, subpart HHHHH) which exempts these affiliated operations from coverage under that rule. They were excluded from the product and packaging rotogravure or wide-web flexographic printing affected source in the final rule because they were not within the scope of the data collected and used to establish the floor and the maximum achievable control technology (MACT) standard for these affected sources.

These affiliated operations continue to be part of publication rotogravure affected sources as described in 40 CFR 63.821(a)(1). The material balance records kept for the solvent recovery systems used by all publication rotogravure facilities were broader in scope and included these affiliated operations. As a result, they form part of the basis for the floor and the MACT standard for publication rotogravure affected sources.

We have added a new 40 CFR 63.821(a)(7) to clarify that certain lithographic presses, letterpress presses, or screen printing presses, referred to in this new paragraph as "other presses," are part of the printing and publishing industry source category, but are not part of the publication rotogravure affected source or the product and packaging rotogravure or wide-web flexographic printing affected source unless the owner or operator chooses to include them in the affected source as stand-alone equipment as provided in 40 CFR 63.821(a)(3). A definition of the term "other presses" has been added to the rule.

Rotogravure, flexography, lithography, letterpress, and screen printing were all part of the printing and publishing source category in the "Initial List of Categories of Sources Under Section 112(c)(1) of the Clean Air Act Amendments of 1990" published on July 16, 1992 (57 FR 31576). The source category was described in detail in "Documentation for Developing the Initial Source Category List" (EPA–450/3–91–030, July 1992). The publication rotogravure affected source in the final rule addresses the publication rotogravure printing process. The product and packaging rotogravure or wide-web flexographic printing affected source in the final rule addresses the product and packaging rotogravure and wide-web flexographic printing processes. Lithography, letterpress, and screen printing are different printing processes than publication rotogravure, product and packaging rotogravure, and flexographic printing. Lithographic, letterpress, and screen printing presses that did not also meet the definition of rotogravure press or wide-web flexographic press (*i.e.*, that had no rotogravure print stations and no wide-web flexographic print stations), therefore, were not part of the publication rotogravure affected source, or the product and packaging rotogravure or wide-web flexographic printing affected source in the final rule.

We have added a new 40 CFR 63.821(a)(8) to clarify that narrow-web flexographic presses are part of the printing and publishing industry source category, but are not part of the publication rotogravure affected source or the product and packaging rotogravure or wide-web flexographic printing affected source unless the owner or operator chooses to include them in the product and packaging rotogravure or wide-web flexographic printing affected source as provided in 40 CFR 63.821(a)(3) through (5). The rule did not previously treat narrow-web flexographic presses as part of either of these affected sources. We are providing the option of including them in the product and packaging rotogravure or wide-web flexographic printing affected source because this may simplify the compliance

demonstration for some affected sources that previously had to separately quantify the materials used on these presses in order to exclude them from the compliance demonstration.

We have added the word "affected" to 40 CFR 63.821(b)(1) and (2) to clarify that these paragraphs apply to "affected sources."

C. Definitions

We have added, removed, and revised a number of definitions in the rule. These changes add clarity and consistency to the rule.

We added a definition of "coating" to clarify that in addition to solvent-borne coatings and waterborne coatings, materials with 100 percent or near 100 percent solids such as wax coatings, wax laminations, extrusion coatings, ultra-violet cured coatings, etc., are coatings. Materials used to form unsupported substrates such as calendaring of vinyl, blown film, cast film, etc., are not coatings.

We added a definition of "flexible packaging." This term is used in the revised definition of "printing operation."

We added a definition of "narrow-web flexographic press" to complement the already existing definition of "wide-web flexographic press."

We added a definition of "other press" to complement the use of that term in 40 CFR 63.821(a)(7).

We added a definition of "publication rotogravure press" to complement the definition of "rotogravure press." This definition clarifies that a publication rotogravure press may include one or more flexographic imprinters and that a publication rotogravure press with one or more flexographic imprinters is not a flexographic press.

We added a definition of "stand-alone equipment" and removed the definition of "stand-alone coating equipment." This change provides the owner or operator with additional flexibility for bringing additional equipment into the product and packaging rotogravure or wide-web flexographic printing affected source. We also removed the definitions of "coating operation" and "coating station." Since these two terms were used only in the definition of stand-alone coating equipment and they are not used in the definition of stand-alone equipment, these two definitions are no longer needed.

We revised the definition of "certified product data sheet" (CPDS) to refer to 40 CFR 63.827(b) rather than to Method 311 or 40 CFR 63.827(b) since Method 311 is discussed in 40 CFR 63.827(b). We included volatile matter weight fraction along with solids weight fraction in the reference to 40 CFR 63.827(c) since both of these attributes are addressed in 40 CFR 63.827(c). We also explained how a material safety data sheet may serve as a CPDS.

We revised the definition of "control device efficiency" to refer to organic HAP emissions rather than to HAP emissions. The word "organic" was inadvertently omitted from the original definition.

We revised the definitions of "flexographic press" and "rotogravure press" to clarify that the unwind or feed section may contain more than one unwind or feed station. For example, a press that prints on paper and then laminates plastic film to the paper will have an unwind or feed station for the paper, and an unwind or feed station for the plastic that is being laminated to the paper. Both are included in the unwind or feed section.

We revised the definition of "flexographic print station" to clarify the meaning of the term and to distinguish it from certain operations which take place on "other presses."

We revised the definition of "printing operation" to include fabric or other textiles for use in flexible packaging, and to exclude wood furniture components and wood building products. Fabric is printed by roller (intaglio), rotary screen, ink jet, and other printing techniques. Rotogravure and flexographic printing are not traditional fabric printing techniques because the materials used are too fluid. Today, there is some rotogravure or flexographic printing of non-woven substrates, which may meet the definition of "fabric" or "textile" in the Printing, Coating, and Dyeing of Fabrics and Other Textiles NESHAP (40 CFR part 63, subpart OOOO). This includes rotogravure or flexographic printing of fabric or other textiles for use in flexible packaging which is most appropriately covered by the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK). Therefore, we are including rotogravure or flexographic printing of fabric or other textiles for use in flexible packaging in the definition of "printing operation" in the Printing and Publishing Industry NESHAP.

Consistent with this change, we have also amended 40 CFR 63.4281 of the Printing, Coating, and Dyeing of Fabrics and Other Textiles NESHAP (40 CFR part 63, subpart OOOO) by adding a new paragraph (d)(4) which states that equipment used to coat or print on fabric or other textiles for use in flexible packaging that is included in an affected source under the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK) is not part of an affected source under the Printing, Coating, and Dyeing of Fabrics and Other Textiles NESHAP.

There is some rotogravure printing of wood furniture components and wood building products. These wood printing operations are covered by the Wood Furniture Manufacturing Operations NESHAP (40 CFR part 63, subpart JJ) or the Surface Coating of Wood Building Products NESHAP (40 CFR part 63, subpart QQQQ). Therefore, we are excluding them from the definition of "printing operation" in the Printing and Publishing Industry NESHAP (40 CFR part 63, subpart KK).

We revised the definition of "proof press" by broadening it to include checking the quality of substrates, inks, or other solids-containing materials. Proof presses sometimes serve these other purposes, for example, at a paper mill or ink manufacturing facility.

We corrected the definition of "rotogravure print station" to use the term "print station" rather than the term "work station" in the body of the definition and revised this definition to clarify that other types of materials that may not be referred to by the supplier or by the user as inks can be applied by rotogravure print stations. The term "ink" in the definition in the final rule was intended to include any solids containing material since materials that might be characterized by the supplier or by the user as inks, coatings, or adhesives are applied on rotogravure print stations.

We revised the definition of "work station" to clarify that work stations are present on equipment other than rotogravure or wide-web flexographic presses. For example, work stations are present on proof presses and stand-alone equipment.

The symbol H was used in two different ways in the final rule. To resolve this inconsistency, we revised the definition of the symbol H and changed the symbol used in equation 8 from H to H_{app}. The symbol H is now defined to mean the monthly organic HAP emitted in kilograms. The symbol H_{app} is defined to mean the total monthly organic HAP applied in kilograms. Since the symbol H_{app} is only used in equation 8, we have placed the definition of H_{app} immediately after that equation.

The symbols C_i and MW_i were used only in equation 20 in the final rule. The definitions of these symbols were inconsistent with the manner in which the results of Methods 25 and 25A are expressed. The definitions referred to individual organic compounds. The results of Methods 25 and 25A, however, are expressed as carbon. We

have added a new symbol C_c for use in equation 20. The definition of C_c is consistent with the manner in which the results of Methods 25 and 25A are expressed. Since C_c is used only in equation 20, we have placed the definition of C_c immediately after that equation. The symbols MW_i and C_i are not needed and have been removed. The symbols M_f and Q_{sd} are used only in equation 20. We have moved the definitions of these symbols to immediately after that equation.

D. Standards: Publication Rotogravure Printing.

We revised 40 CFR 63.824(b)(1)(i)(A) and (b)(3)(i) by inserting a comma between "varnish" and "adhesive" to clarify that these are two different types of materials.

We revised 40 CFR 63.824(b)(1)(ii)(A) and (b)(2)(ii) to clarify the continuous emission monitoring requirements for solvent recovery devices and oxidizers. For solvent recovery devices, a single continuous volumetric gas flow measurement should be sufficient since the inlet and outlet volumetric gas flow rates for a solvent recovery device are essentially equal. For oxidizers, separate continuous volumetric gas flow measurements of the inlet and outlet volumetric gas flow rates are required.

E. Standards: Product and Packaging Rotogravure and Wide-Web Flexographic Printing

We corrected the first sentence of 40 CFR 63.825(b) introductory text to refer to "organic HAP emissions" rather than to "emissions."

We revised 40 CFR 63.825(b)(6) to use the symbol H_{app} instead of H because the symbol H is used with a different meaning elsewhere in the final rule. We defined H_{app} in 40 CFR 63.825(b)(6) in the same way in which H was previously used in this paragraph of the final rule.

We revised 40 CFR 63.825(c)(2)(iii) and (d)(2) to clarify the continuous emission monitoring requirements for solvent recovery devices and oxidizers. For solvent recovery devices, a single continuous volumetric gas flow measurement should be sufficient since the inlet and outlet volumetric gas flow rates for a solvent recovery device are essentially equal. For oxidizers, separate continuous volumetric gas flow measurements of the inlet and outlet volumetric gas flow rates are required.

We revised 40 CFR 63.825(d)(1)(iv) to refer to a common oxidizer rather than a common solvent recovery system because 40 CFR 63.825(d) describes compliance demonstration requirements for oxidizers.

F. Performance Test Methods

We revised 40 CFR 63.827(a)(1)(i) and (ii) to clarify that there must be continuous emission monitors for both total organic volatile matter concentration and volumetric gas flow rate, and that the continuous emission monitoring must be done in accordance with the requirements of this subpart. Both concentration and flow data are needed to calculate the total organic volatile matter mass flow.

In 40 CFR 63.827(b) of the final rule, the provisions for using manufacturers formulation data for determining organic HAP content required the inclusion of all HAP present at a level greater than 0.1 weight percent in any raw material used. This requirement was based on indications from ink and coating manufacturers that they were already receiving this level of information from their raw material suppliers. A trade association representing certain raw material suppliers submitted information showing that ink and coating manufacturers are not receiving this level of information from their suppliers. Rather, they are receiving information consistent with the requirements of the Occupational Safety and Health Administration (OSHA) hazard communication standards which require the identification of hazardous constituents present at greater than or equal to 0.1 weight percent for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and greater than or equal to 1.0 weight percent for other hazardous constituents. We revised 40 CFR 63.827(b) to make it consistent with the OSHA hazard communication standards, included some examples, and clarified that test data and formulation data can be provided by suppliers or independent third parties.

We revised 40 CFR 63.827(c) by including some examples, specifying how to calculate weight solids fraction from volatile matter weight fraction, and clarifying that test data and formulation data can be provided by suppliers or independent third parties.

We revised 40 CFR 63.827(d)(1)(vi) to clarify that the same method must be used to determine inlet and outlet organic volatile matter concentration, and that the 50 parts per million by volume levels for Method 25A are expressed on an as carbon basis.

We revised 40 CFR 63.827(d)(1)(viii) to clarify that the results of Methods 25 and 25A are expressed on an as carbon basis and to define the symbols used in equation 20 immediately after that equation.

In 40 CFR 63.827(e)(1) and (2) the final rule referred to the capture efficiency procedures in appendix B to 40 CFR 52.741 and 40 CFR 52.741(a)(4)(iii)(B). We revised 40 CFR 63.827(e)(1) and (2) to refer to Methods 204 and 204A through F of 40 CFR part 51, appendix M. These methods did not exist when the final rule was published on May 30, 1996. They are updated versions of the procedures specified in the final rule.

G. Monitoring Requirements

We revised 40 CFR 63.828(a)(3) to clarify that there must be continuous emission monitors for both total organic volatile matter concentration and volumetric gas flow rate. Both concentration and flow data are needed to calculate the total organic volatile matter mass flow.

H. Recordkeeping Requirements

We corrected 40 CFR 63.829(e)(1) and (2) to state that records must be kept of the total mass, as opposed to volume, of each material applied on product and packaging rotogravure or wide-web flexographic printing presses during each month. This is consistent with 40 CFR 63.821(b)(2) and 40 CFR 63.827(b)(2) which require these measurements to be done on a mass basis.

I. Reporting Requirements

We revised 40 CFR 63.830(b)(6) to clarify that summary reports are required even if the affected source does not have any control devices or does not take the performance of any control devices into account in demonstrating compliance with the emission limitations in 40 CFR 63.824 or 40 CFR 63.825. As stated in 40 CFR 63.830(b)(6)(i) through (iv), these summary reports must include information about various types of exceedances. These types of exceedances can occur at sources with or without control devices.

J. Appendix A to 40 CFR Part 63, Subpart KK

We revised appendix A to subpart KK to make several clarifications. In paragraph 3.2 of appendix A we have clarified that the confidence intervals are two-sided, changed the designation of the table to Table A–1, changed the table references to Table A–1, and corrected the table entry for 11 valid test runs. In paragraph 4.8 of appendix A we have changed the table reference to Table A–1.

III. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether this regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is, therefore, not subject to OMB review.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. This action adds clarifications and corrections to the final standards. However, OMB has previously approved the information collection requirements contained in the existing regulations (69 FR 3912, January 27, 2004) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.*, and has assigned OMB control number 2060–0335 (EPA ICR No. 1739.04). A copy of the Information Collection Request (ICR) may be obtained from Ms. Susan Auby by mail at the Office of Environmental Information, Collection Strategies Division (2822), EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. You also may download a copy from the internet at *http://www.epa.gov/icr*. Include the ICR number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Analysis

EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the direct final rule amendments.

For purposes of assessing the impacts of today's direct final rule on small entities, small entity is defined as: (1) A small business ranging from 500 to 1,000 as defined by the Small Business Administration's regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impact of today's direct final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. We conducted an assessment of the impact of the May 30, 1996 final rule on small businesses within the industries affected by that rule. This analysis allowed us to conclude that there would not be a significant economic impact on a substantial number of small entities from the implementation of that rule. There is nothing contained in the direct final rule amendments that will impose an economic impact on small businesses in any way not considered in the analysis of the May 30, 1996 final rule; this means that the direct final rule amendments have no incremental economic impact on small businesses beyond what was already examined in the final rule.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows us to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The direct final rule amendments apply to affected sources in the printing and publishing industry and clarify and correct errors in the final rule and, therefore, add no additional burden on sources. Thus, the direct final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10,

1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. No printing and publishing facilities subject to the direct final rule amendments are owned by State or local governments. Therefore, State and local governments will not have any direct compliance costs resulting from the direct final rule amendments. Furthermore, the direct final rule amendments do not require these governments to take on any new responsibilities. Thus, Executive Order 13132 does not apply to the direct final rule amendments.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, because we are not aware of any Indian tribal governments or communities affected by the direct final rule amendments. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

EPA specifically solicits additional comment on the direct final rule amendments from tribal officials.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The direct final rule amendments are not subject to Executive Order 13045 because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

These amendments add references to EPA Methods 204 and 204A through F of 40 CFR part 51, appendix M for determining capture efficiency. These methods replace the capture efficiency procedures of appendix B to 40 CFR 52.741 and 40 CFR 52.741(a)(4)(iii)(B). EPA Methods 204 and 204A through F are updated versions of the previously used procedures.

Consistent with the NTTAA, EPA conducted searches to identify VCS in addition to these EPA methods. No applicable VCS were identified for EPA Methods 204 and 204A–F. The search and review results have been documented and are placed in the docket for the amendments.

EPA test methods included in the rule are specified in 40 CFR 63.827. Under 40 CFR 63.7(f) and 40 CFR 63.8(f) of subpart A of the General Provisions, a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any of the EPA testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing the direct final rule amendments and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule amendments in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. The direct final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule amendments will be effective on August 22, 2006.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, and Reporting and recordkeeping requirements.

Dated: May 18, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, Title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart KK—[Amended]

■ 2. Section 63.820 is amended by revising paragraph (a)(2) introductory text to read as follows:

§ 63.820 Applicability.

(a) * * *

(2) Each new and existing facility at which publication rotogravure, product and packaging rotogravure, or wide-web flexographic printing presses are operated for which the owner or operator chooses to commit to and meets the criteria of paragraphs (a)(2)(i) and (ii) of this section for purposes of establishing the facility to be an area source of HAP with respect to this subpart. A facility which establishes area source status through some other mechanism, as described in paragraph (a)(7) of this section, is not subject to the provisions of this subpart.

* * * * *

■ 3. Section 63.821 is amended by:

■ a. Revising paragraphs (a)(1), (a)(2) introductory text, (a)(2)(i), (a)(2)(ii)(A), and (a)(3).

■ b. Adding paragraphs (a)(4) through (a)(8).

■ c. Revising paragraphs (b)(1) and (b)(2) to read as follows:

§ 63.821 Designation of Affected Sources.

(a) * * *

(1) All of the publication rotogravure presses and all related equipment, including proof presses, cylinder and parts cleaners, ink and solvent mixing and storage equipment, and solvent recovery equipment at a facility.

(2) All of the product and packaging rotogravure or wide-web flexographic printing presses at a facility plus any other equipment at that facility which the owner or operator chooses to include in accordance with paragraphs (a)(3) or (a)(4) of this section, except

(i) Proof presses, unless the owner or operator chooses to include proof presses in the affected source in accordance with paragraph (a)(5) of this section.

(ii) * * *

(A) the sum of the total mass of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, and other materials applied by the press using product and packaging rotogravure print stations and the total mass of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, and other materials applied by the press using wide-web flexographic print stations in each month never exceeds 5 percent of the total mass of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, and other materials applied by the press in that month, including all inboard and outboard stations; and

* * * * *

(3) The owner or operator of an affected source, as defined in paragraph (a)(2) of this section, may elect to include in that affected source stand-alone equipment subject to the following provisions:

(i) Stand-alone equipment meeting any of the criteria specified in this subparagraph is eligible for inclusion:

(A) The stand-alone equipment and one or more product and packaging rotogravure or wide-web flexographic presses are used to apply solids-containing materials to the same web or substrate; or

(B) The stand-alone equipment and one or more product and packaging rotogravure or wide-web flexographic presses apply a common solids-containing material; or

(C) A common control device is used to control organic HAP emissions from the stand-alone equipment and from one or more product and packaging rotogravure or wide-web flexographic printing presses;

(ii) All eligible stand-alone equipment located at the facility is included in the affected source; and

(iii) No product and packaging rotogravure or wide-web flexographic presses are excluded from the affected source under the provisions of paragraph (a)(2)(ii) of this section.

(4) The owner or operator of an affected source, as defined in paragraph (a)(2) of this section, may elect to include in that affected source narrow-web flexographic presses subject to the following provisions:

(i) Each narrow-web flexographic press meeting any of the criteria specified in this subparagraph is eligible for inclusion:

(A) The narrow-web flexographic press and one or more product and packaging rotogravure or wide-web flexographic presses are used to apply solids containing material to the same web or substrate; or

(B) The narrow-web flexographic press and one or more product and packaging rotogravure or wide-web flexographic presses apply a common solids-containing material; or

(C) A common control device is used to control organic HAP emissions from the narrow-web flexographic press and from one or more product and packaging rotogravure or wide-web flexographic presses; and

(ii) All eligible narrow-web flexographic presses located at the facility are included in the affected source.

(5) The owner or operator of an affected source, as defined in paragraph (a)(2) of this section, may elect to include in that affected source rotogravure proof presses or flexographic proof presses subject to the following provisions:

(i) Each proof press meeting any of the criteria specified in this subparagraph is eligible for inclusion.

(A) The proof press and one or more product and packaging rotogravure or wide-web flexographic presses apply a common solids-containing material; or

(B) A common control device is used to control organic HAP emissions from the proof press and from one or more product and packaging rotogravure or wide-web flexographic presses; and

(ii) All eligible proof presses located at the facility are included in the affected source.

(6) Affiliated operations such as mixing or dissolving of ink or coating ingredients prior to application; ink or coating mixing for viscosity adjustment, color tint or additive blending, or pH adjustment; cleaning of ink or coating lines and line parts; handling and storage of inks, coatings, and solvents; and conveyance and treatment of wastewater are part of the printing and publishing industry source category, but are not part of the product and packaging rotogravure or wide-web flexographic printing affected source.

(7) Other presses are part of the printing and publishing industry source category, but are not part of the publication rotogravure affected source or the product and packaging rotogravure or wide-web flexographic printing affected source and are, therefore, exempt from the requirements of this subpart except as provided in paragraph (a)(3) of this section.

(8) Narrow web-flexographic presses are part of the printing and publishing industry source category, but are not part of the publication rotogravure affected source or the product and packaging rotogravure or wide-web flexographic printing affected source and are, therefore, exempt from the requirements of this subpart except as provided in paragraphs (a)(3) through (5) of this section.

(b) * * *

(1) The owner or operator of the affected source applies no more than 500 kilograms (kg) per month, for every month, of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, and other materials on product and packaging rotogravure or wide-web flexographic printing presses, or

(2) The owner or operator of the affected source applies no more than

400 kg per month, for every month, of organic HAP on product and packaging rotogravure or wide-web flexographic printing presses.

* * * * *

■ 4. Section 63.822 is amended by:
■ a. Adding in alphabetical order in paragraph (a) definitions for "coating," "flexible packaging," "narrow-web flexographic press," "other press," "publication rotogravure press," and "stand-alone equipment."
■ b. Removing the definitions of "coating operation," "coating station," and "stand-alone coating equipment" from paragraph (a).
■ c. Revising the definitions in paragraph (a) of "certified product data sheet (CPDS)," "control device efficiency," "flexographic press," "flexographic print station," "printing operation," "proof press," "rotogravure press," "rotogravure print station," and "work station."
■ d. Revising paragraph (b)(12).
■ e. Removing and reserving paragraphs (b)(6), (b)(22), (b)(32), and (b)(36) to read as follows:

§ 63.822 Definitions.

(a) * * *

* * * * *

Certified product data sheet (CPDS) means documentation furnished by suppliers of inks, coatings, varnishes, adhesives, primers, solvents, and other materials or by an independent third party that provides the organic HAP weight fraction of these materials determined in accordance with § 63.827(b), or the volatile matter weight fraction or solids weight fraction determined in accordance with § 63.827(c). A material safety data sheet (MSDS) may serve as a CPDS provided the MSDS meets the data requirements of § 63.827(b) and (c). The purpose of the CPDS is to assist the owner or operator in demonstrating compliance with the emission limitations presented in §§ 63.824–63.825.

Coating means material applied onto or impregnated into a substrate for decorative, protective, or functional purposes. Such materials include, but are not limited to, solvent-borne coatings, waterborne coatings, wax coatings, wax laminations, extrusion coatings, extrusion laminations, 100 percent solid adhesives, ultra-violet cured coatings, electron beam cured coatings, hot melt coatings, and cold seal coatings. Materials used to form unsupported substrates such as calendaring of vinyl, blown film, cast film, extruded film, and coextruded film are not considered coatings.

* * * * *

Control device efficiency means the ratio of organic HAP emissions recovered or destroyed by a control device to the total organic HAP emissions that are introduced into the control device, expressed as a percentage.

* * * * *

Flexible packaging means any package or part of a package the shape of which can be readily changed. Flexible packaging includes, but is not limited to, bags, pouches, labels, liners and wraps utilizing paper, plastic, film, aluminum foil, metalized or coated paper or film, or any combination of these materials.

Flexographic press means an unwind or feed section, which may include more than one unwind or feed station (such as on a laminator), a series of individual work stations, one or more of which is a flexographic print station, any dryers (including interstage dryers and overhead tunnel dryers) associated with the work stations, and a rewind, stack, or collection section. The work stations may be oriented vertically, horizontally, or around the circumference of a single large impression cylinder. Inboard and outboard work stations, including those employing any other technology, such as rotogravure, are included if they are capable of printing or coating on the same substrate. A publication rotogravure press with one or more flexographic imprinters is not a flexographic press.

Flexographic print station means a print station on which a flexographic printing operation is conducted. A flexographic print station includes an anilox roller that transfers material to a raised image (type or art) on a plate cylinder. The material is then transferred from the image on the plate cylinder to the web or sheet to be printed. A flexographic print station may include a fountain roller to transfer material from the reservoir to the anilox roller, or material may be transferred directly from the reservoir to the anilox roller. The materials applied are of a fluid, rather than paste, consistency.

* * * * *

Narrow-web flexographic press means a flexographic press that is not capable of printing substrates greater than 18 inches in width and that does not also meet the definition of rotogravure press (i.e., it has no rotogravure print stations).

* * * * *

Other press means a lithographic press, letterpress press, or screen printing press that does not meet the definition of rotogravure press or flexographic press (i.e., it has no rotogravure print stations and no flexographic print stations), and that does not print on fabric or other textiles as defined in the Printing, Coating, and Dyeing of Fabrics and Other Textiles NESHAP (40 CFR part 63, subpart OOOO), wood furniture components as defined in the Wood Furniture Manufacturing Operations NESHAP (40 CFR part 63, subpart JJ) or wood building products as defined in the Surface Coating of Wood Building Products NESHAP (40 CFR part 63, subpart QQQQ).

* * * * *

Printing operation means the formation of words, designs, or pictures on a substrate other than wood furniture components as defined in the Wood Furniture Manufacturing Operations NESHAP (40 CFR part 63, subpart JJ), wood building products as defined in the Surface Coating of Wood Building Products NESHAP (40 CFR part 63, subpart QQQQ), and fabric or other textiles as defined in the Printing, Coating, and Dyeing of Fabric and Other Textiles NESHAP (40 CFR part 63, subpart OOOO), except for fabric or other textiles for use in flexible packaging.

* * * * *

Proof press means any press which prints only non-saleable items used to check the quality of image formation of rotogravure cylinders or flexographic plates; substrates such as paper, plastic film, metal foil, or vinyl; or ink, coating varnish, adhesive, primer, or other solids-containing material.

* * * * *

Publication rotogravure press means a rotogravure press used for publication rotogravure printing. A publication rotogravure press may include one or more flexographic imprinters. A publication rotogravure press with one or more flexographic imprinters is not a flexographic press.

* * * * *

Rotogravure press means an unwind or feed section, which may include more than one unwind or feed station (such as on a laminator), a series of individual work stations, one or more of which is a rotogravure print station, any dryers associated with the work stations, and a rewind, stack, or collection section. Inboard and outboard work stations, including those employing any other technology, such as flexography, are included if they are capable of printing or coating on the same substrate.

Rotogravure print station means a print station on which a rotogravure printing operation is conducted. A

rotogravure print station includes a rotogravure cylinder and supply for ink or other solids containing material. The image (type and art) to be printed is etched or engraved below the surface of the rotogravure cylinder. On a rotogravure cylinder the printing image consists of millions of minute cells.

* * * * *

Stand-alone equipment means an unwind or feed section, which may include more than one unwind or feed station (such as on a laminator); a series of one or more work stations and any associated dryers; and a rewind, stack, or collection section that is not part of a product and packaging rotogravure or wide-web flexographic press. Stand-alone equipment is sometimes referred to as "off-line" equipment.

* * * * *

Work station means a unit on which material is deposited onto a substrate.

(b) * * *

(6) [Reserved]

* * * * *

(12) H = the monthly organic HAP emitted, kg.

* * * * *

(22) [Reserved]

* * * * *

(32) [Reserved]

* * * * *

(36) [Reserved]

* * * * *

■ 5. Section 63.824 is amended by revising paragraphs (b)(1)(i)(A), (b)(1)(ii)(A), (b)(2)(ii), and (b)(3)(i) to read as follows:

§ 63.824 Standards: Publication rotogravure printing.

* * * * *

(b) * * *

(1) * * *

(i) * * *

(A) Measure the mass of each ink, coating, varnish, adhesive, primer, solvent, and other material used by the affected source during the month.

* * * * *

(ii) * * *

(A) Install continuous emission monitors to collect the data necessary to calculate the total organic volatile matter mass flow in the gas stream entering and the total organic volatile matter mass flow in the gas stream exiting the solvent recovery device for each month such that the percent control efficiency (E) of the solvent recovery device can be calculated for the month. This requires continuous emission monitoring of the total organic volatile matter concentration in the gas stream entering the solvent recovery device, the total organic volatile matter concentration in the gas stream exiting the solvent recovery device, and the volumetric gas flow rate through the solvent recovery device. A single continuous volumetric gas flow measurement should be sufficient for a solvent recovery device since the inlet and outlet volumetric gas flow rates for a solvent recovery device are essentially equal. Each month's individual inlet concentration values and corresponding individual gas flow rate values are multiplied and then summed to get the total organic volatile matter mass flow in the gas stream entering the solvent recovery device for the month. Each month's individual outlet concentration values and corresponding individual gas flow rate values are multiplied and then summed to get the total organic volatile matter mass flow in the gas stream exiting the solvent recovery device for the month.

* * * * *

(2) * * *

(ii) Use continuous emission monitors, conduct an initial performance test of capture efficiency, and continuously monitor a site specific operating parameter to assure capture efficiency. The percent control efficiency of the oxidizer shall be demonstrated in accordance with the requirements of paragraph (b)(1)(ii) of this section except that separate continuous measurements of the inlet volumetric gas flow rate and the outlet volumetric gas flow rate are required for an oxidizer.

(3) * * *

(i) Measure the mass of each ink, coating, varnish, adhesive, primer, solvent, and other material used in the affected source during the month.

* * * * *

■ 6. Section 63.825 is amended by:

■ a. Revising the first sentence of paragraph (b) introductory text.

■ b. Revising paragraph (b)(6).

■ c. Revising paragraph (c)(2)(iii).

■ d. Revising paragraph (d)(1)(iv).

■ e. Revising paragraph (d)(2) to read as follows:

§ 63.825 Standards: Product and packaging rotogravure and wide-web flexographic printing.

* * * * *

(b) Each product and packaging rotogravure or wide-web flexographic printing affected source shall limit organic HAP emissions to no more than 5 percent of the organic HAP applied for the month; or to no more than 4 percent of the mass of inks, coatings, varnishes, adhesives, primers, solvents, reducers, thinners, and other materials applied for the month; or to no more than 20 percent of the mass of solids applied for the month; or to a calculated equivalent allowable mass based on the organic HAP and solids contents of the inks, coatings, varnishes, adhesives, primers, solvents, reducers, thinners, and other materials applied for the month. * * *

* * * * *

(6) Demonstrate that the total monthly organic HAP applied, H_{app}, as determined by Equation 8, is less than the calculated equivalent allowable organic HAP, H_a, as determined by paragraph (e) of this section.

$$H_{app} = \sum_{i=1}^{p} M_i C_{hi} + \sum_{j=1}^{q} M_j C_{hj} \qquad \text{Eq. 8}$$

Where:

H_{app} = Total monthly organic HAP applied, kg.

* * * * *

(c) * * *

(2) * * *

(iii) Install continuous emission monitors to collect the data necessary to calculate the total organic volatile matter mass flow in the gas stream entering and the total organic volatile mass flow in the gas stream exiting the solvent recovery device for each month such that the percent control efficiency (E) of the solvent recovery device can be calculated for the month. This requires continuous emission monitoring of the total organic volatile matter concentration in the gas stream entering the solvent recovery device, the total organic volatile matter concentration in the gas stream exiting the solvent recovery device, and the volumetric gas flow rate through the solvent recovery device. A single continuous volumetric gas flow measurement should be sufficient for a solvent recovery device since the inlet and outlet volumetric gas flow rates for a solvent recovery device are essentially equal. Each month's individual inlet concentration values and corresponding individual gas flow rate values are multiplied and then summed to get the total organic volatile matter mass flow in the gas stream entering the solvent recovery device for the month. Each month's individual outlet concentration values and corresponding individual gas flow rate values are multiplied and then summed to get the total organic volatile matter mass flow in the gas stream exiting the solvent recovery device for the month.

* * * * *

(d) * * *

(1) * * *

(iv) If demonstrating compliance on the basis of organic HAP emission rate based on solids applied, organic HAP emission rate based on materials

applied, or emission of less than the calculated allowable organic HAP, measure the mass of each ink, coating, varnish, adhesive, primer, solvent, and other material applied on the press or group of presses controlled by a common control device during the month.

* * * * *

(2) Use continuous emission monitors, conduct an initial performance test of capture efficiency, and continuously monitor a site specific operating parameter to assure capture efficiency. The percent control efficiency of the oxidizer shall be demonstrated in accordance with the requirements of paragraph (c)(2) of this section except that separate continuous volumetric gas flow measurements of the inlet and outlet volumetric gas flow rates are required for an oxidizer.

* * * * *

■ 7. Section 63.827 is amended by:
■ a. Revising paragraphs (a)(1)(i) and (a)(1)(ii).
■ b. Revising paragraph (b).
■ c. Revising paragraph (c).
■ d. Revising paragraphs (d)(1)(vi) and (d)(1)(viii).
■ e. Revising paragraphs (e)(1) and (e)(2) to read as follows:

§ 63.827 Performance Test Methods.

(a) * * *

(1) * * *

(i) It is equipped with continuous emission monitors for determining total organic volatile matter concentration and the volumetric gas flow rate, and capture efficiency has been determined in accordance with the requirements of this subpart, such that an overall organic HAP control efficiency can be calculated, and

(ii) The continuous emission monitors are used to demonstrate continuous compliance in accordance with § 63.824(b)(1)(ii), § 63.825(b)(2)(ii), § 63.825(c)(2), or § 63.825(d)(2), as applicable, and § 63.828, or

* * * * *

(b) Determination of the weight fraction organic HAP of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, diluents, and other materials used by a publication rotogravure affected source shall be conducted according to paragraph (b)(1) of this section. Determination of the weight fraction organic HAP of inks, coatings, varnishes, adhesives, primers, solvents, thinners, reducers, diluents, and other materials applied by a product and packaging rotogravure or wide-web flexographic printing affected source shall be conducted according to paragraph (b)(2) of this section. If the weight fraction organic HAP values are not determined using the procedures in paragraphs (b)(1) or (b)(2) of this section, the owner or operator must submit an alternative test method for determining their values for approval by the Administrator in accordance with § 63.7(f). The recovery efficiency of the test method must be determined for all of the target organic HAP and a correction factor, if necessary, must be determined and applied.

(1) Each owner or operator of a publication rotogravure affected source shall determine the weight fraction organic HAP of each ink, coating, varnish, adhesive, primer, solvent, and other material used by following one of the procedures in paragraphs (b)(1)(i) through (iii) of this section:

(i) The owner or operator may test the material in accordance with Method 311 of appendix A of this part. The Method 311 determination may be performed by the owner or operator of the affected source, the supplier of the material, or an independent third party. The organic HAP content determined by Method 311 must be calculated according to the criteria and procedures in paragraphs (b)(1)(i)(A) through (C) of this section.

(A) Include each organic HAP determined to be present at greater than or equal to 0.1 weight percent for Occupational Safety and Health Administration (OSHA)-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and greater than or equal to 1.0 weight percent for other organic HAP compounds.

(B) Express the weight fraction of each organic HAP included according to paragraph (b)(1)(i)(A) of this section as a value truncated to four places after the decimal point (for example, 0.3791).

(C) Calculate the total weight fraction of organic HAP in the tested material by summing the weight fraction of each organic HAP included according to paragraph (b)(1)(i)(A) of this section and truncating the result to three places after the decimal point (for example, 0.763).

(ii) The owner or operator may determine the weight fraction volatile matter of the material in accordance with § 63.827(c)(1) and use this value for the weight fraction organic HAP for all compliance purposes.

(iii) The owner or operator may use formulation data to determine the weight fraction organic HAP of a material. Formulation data may be provided to the owner or operator on a CPDS by the supplier of the material or an independent third party. Formulation data may be used provided that the weight fraction organic HAP is calculated according to the criteria and procedures in paragraphs (b)(1)(iii)(A) through (D) of this section. In the event of an inconsistency between the formulation data and the result of Method 311 of appendix A of this part, where the test result is higher, the Method 311 data will take precedence unless, after consultation, the owner or operator can demonstrate to the satisfaction of the enforcement agency that the formulation data are correct.

(A) For each raw material used in making the material, include each organic HAP present in that raw material at greater than or equal to 0.1 weight percent for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and greater than or equal to 1.0 weight percent for other organic HAP compounds. The weight fraction of each such organic HAP in each raw material must be determined by Method 311 of appendix A of this part, by an alternate method approved by the Administrator, or from a CPDS provided by the raw material supplier or an independent third party. The weight fraction of each such organic HAP in each raw material must be expressed as a value truncated to four places after the decimal point (for example, 0.1291).

(B) For each raw material used in making the material, the weight fraction contribution of each organic HAP, which is included according to paragraph (b)(1)(iii)(A) of this section, in that raw material to the weight fraction organic HAP of the material is calculated by multiplying the weight fraction, truncated to four places after the decimal point (for example, 0.1291), of that organic HAP in that raw material times the weight fraction of that raw material, truncated to four places after the decimal point (for example, 0.2246), in the material. The product of each such multiplication is to be truncated to four places after the decimal point (for example, 0.1291 times 0.2246 yields 0.02899586 which truncates to 0.0289).

(C) For each organic HAP which is included according to paragraph (b)(1)(iii)(A) of this section, the total weight fraction of that organic HAP in the material is calculated by adding the weight fraction contribution of that organic HAP from each raw material in which that organic HAP is included according to paragraph (b)(1)(iii)(A) of this section. The sum of each such addition must be expressed to four places after the decimal point.

(D) The total weight fraction of organic HAP in the material is the sum of the counted individual organic HAP weight fractions. This sum must be truncated to three places after the decimal point (for example, 0.763).

(2) Each owner or operator of a product and packaging rotogravure or

wide-web flexographic printing affected source shall determine the organic HAP weight fraction of each ink, coating, varnish, adhesive, primer, solvent, and other material applied by following one of the procedures in paragraphs (b)(2)(i) through (iii) of this section:

(i) The owner or operator may test the material in accordance with Method 311 of appendix A of this part. The Method 311 determination may be performed by the owner or operator of the affected source, the supplier of the material, or an independent third party. The organic HAP content determined by Method 311 must be calculated according to the criteria and procedures in paragraphs (b)(2)(i)(A) through (C) of this section.

(A) Include each organic HAP determined to be present at greater than or equal to 0.1 weight percent for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and greater than or equal to 1.0 weight percent for other organic HAP compounds.

(B) Express the weight fraction of each organic HAP included according to paragraph (b)(2)(i)(A) of this section as a value truncated to four places after the decimal point (for example, 0.3791).

(C) Calculate the total weight fraction of organic HAP in the tested material by summing the weight fraction of each organic HAP included according to paragraph (b)(2)(i)(A) of this section and truncating the result to three places after the decimal point (for example, 0.763).

(ii) The owner or operator may determine the weight fraction volatile matter of the material in accordance with § 63.827(c)(2) and use this value for the weight fraction organic HAP for all compliance purposes.

(iii) The owner or operator may use formulation data to determine the weight fraction organic HAP of a material. Formulation data may be provided to the owner or operator on a CPDS by the supplier of the material or an independent third party. Formulation data may be used provided that the weight fraction organic HAP is calculated according to the criteria and procedures in paragraphs (b)(2)(iii)(A) through (D) of this section. In the event of an inconsistency between the formulation data and the result of Method 311 of appendix A of this part, where the test result is higher, the Method 311 data will take precedence unless, after consultation, the owner or operator can demonstrate to the satisfaction of the enforcement agency that the formulation data are correct.

(A) For each raw material used in making the material, include each organic HAP present in that raw material at greater than or equal to 0.1 weight percent for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and greater than or equal to 1.0 weight percent for other organic HAP compounds. The weight fraction of each such organic HAP in each raw material must be determined by Method 311 of appendix A of this part, by an alternate method approved by the Administrator, or from a CPDS provided by the raw material supplier or an independent third party. The weight fraction of each such organic HAP in each raw material must be expressed as a value truncated to four places after the decimal point (for example, 0.1291).

(B) For each raw material used in making the material, the weight fraction contribution of each organic HAP, which is included according to paragraph (b)(2)(iii)(A) of this section, in that raw material to the weight fraction organic HAP of the material is calculated by multiplying the weight fraction, truncated to four places after the decimal point (for example, 0.1291), of that organic HAP in that raw material times the weight fraction of that raw material, truncated to four places after the decimal point (for example, 0.2246), in the material. The product of each such multiplication is truncated to four places after the decimal point (for example, 0.1291 times 0.2246 yields 0.02899586 which truncates to 0.0289).

(C) For each organic HAP which is included according to paragraph (b)(2)(iii)(A) of this section, the total weight fraction of that organic HAP in the material is calculated by adding the weight fraction contribution of that organic HAP from each raw material in which that organic HAP is included according to paragraph (b)(2)(iii)(A) of this section. The sum of each such addition must be expressed to four places after the decimal point.

(D) The total weight fraction of organic HAP in the material is the sum of the counted individual organic HAP weight fractions. This sum is to be truncated to three places after the decimal point (for example, 0.763).

(c) Determination of the weight fraction volatile matter content of inks, coatings, varnishes, adhesives, primers, solvents, reducers, thinners, diluents, and other materials used by a publication rotogravure affected source shall be conducted according to paragraph (c)(1) of this section. Determination of the weight fraction volatile matter content and weight fraction solids content of inks, coatings, varnishes, adhesives, primers, solvents, reducers, thinners, diluents, and other materials applied by a product and packaging rotogravure or wide-web flexographic printing affected source shall be conducted according to paragraph (c)(2) of this section.

(1) Each owner or operator of a publication rotogravure affected source shall determine the volatile matter weight fraction of each ink, coating, varnish, adhesive, primer, solvent, reducer, thinner, diluent, and other material used by following the procedures in paragraph (b)(1)(i) of this section, or by using formulation data as described in paragraph (c)(3) of this section.

(i) Determine the volatile matter weight fraction of the material using Method 24A of 40 CFR part 60, appendix A. The Method 24A determination may be performed by the owner or operator of the affected source, the supplier of the material, or an independent third party. The Method 24A result shall be truncated to three places after the decimal point (for example, 0.763). If these values cannot be determined using Method 24A, the owner or operator shall submit an alternative technique for determining their values for approval by the Administrator.

(2) Each owner or operator of a product and packaging rotogravure or wide-web flexographic printing affected source shall determine the volatile matter weight fraction and solids weight fraction of each ink, coating, varnish, adhesive, primer, solvent, reducer, thinner, diluent, and other material applied by following the procedures in paragraphs (b)(2)(i) and (ii) of this section, or by using formulation data as described in paragraph (c)(3) of this section.

(i) Determine the volatile matter weight fraction of the material using Method 24 of 40 CFR part 60, appendix A. The Method 24 determination may be performed by the owner or operator of the affected source, the supplier of the material, or an independent third party. The Method 24 result shall be truncated to three places after the decimal point (for example, 0.763). If these values cannot be determined using Method 24, the owner or operator shall submit an alternative technique for determining their values for approval by the Administrator.

(ii) Calculate the solids weight fraction Method 24 result by subtracting the volatile matter weight fraction Method 24 result from 1.000. This calculation may be performed by the owner or operator, the supplier of the material, or an independent third party.

(3) The owner or operator may use formulation data to determine the volatile matter weight fraction or solids weight fraction of a material. Formulation data may be provided to

the owner or operator on a CPDS by the supplier of the material or an independent third party. The volatile matter weight fraction and solids weight fraction shall be truncated to three places after the decimal point (for example, 0.763). In the event of any inconsistency between the formulation data and the result of Method 24 or Method 24A of 40 CFR part 60, appendix A, where the test result for volatile matter weight fraction is higher or the test result for solids weight fraction is lower, the applicable test method data will take precedence unless, after consultation, the owner or operator can demonstrate to the satisfaction of the enforcement agency that the formulation data are correct.

(d) * * *

(1) * * *

(vi) Method 25 of 40 CFR part 60, appendix A, shall be used to determine organic volatile matter concentration, except as provided in paragraphs (d)(1)(vi)(A) through (D) of this section. The owner or operator shall submit notice of the intended test method to the Administrator for approval along with notice of the performance test required under § 63.7(c). The same method must be used for both the inlet and outlet measurements. The owner or operator may use Method 25A of 40 CFR part 60, appendix A, if (A) An exhaust gas organic volatile matter concentration of 50 parts per million by volume (ppmv) or less as carbon is required to comply with the standards of §§ 63.824–63.825, or

(B) The organic volatile matter concentration at the inlet to the control system and the required level of control are such to result in exhaust gas organic volatile matter concentrations of 50 ppmv or less as carbon, or

(C) Because of the high efficiency of the control device, the anticipated organic volatile matter concentration at the control device exhaust is 50 ppmv or less as carbon, regardless of inlet concentration, or

(D) The control device is not an oxidizer.

* * * * *

(viii) Organic volatile matter mass flow rates shall be determined using Equation 20:

$$M_f = Q_{sd} C_c [12.0] [0.0416] [10^{-6}] \quad \text{Eq. 20}$$

Where:

M_f = Total organic volatile matter mass flow rate, kg/hour (h).

Q_{sd} = Volumetric flow rate of gases entering or exiting the control device, as determined according to § 63.827(d)(1)(ii), dry standard cubic meters (dscm)/h.

C_c = Concentration of organic compounds as carbon, ppmv.

12.0 = Molecular weight of carbon.

0.0416 = Conversion factor for molar volume, kg-moles per cubic meter (mol/m3) (@ 293 Kelvin (K) and 760 millimeters of mercury (mmHg)).

* * * * *

(e) * * *

(1) You may assume your capture efficiency equals 100 percent if your capture system is a permanent total enclosure (PTE). You must confirm that your capture system is a PTE by demonstrating that it meets the requirements of section 6 of Method 204 of 40 CFR part 51, appendix M, and that all exhaust gases from the enclosure are delivered to a control device.

(2) You may determine capture efficiency according to the protocols for testing with temporary total enclosures that are specified in Methods 204 and 204A through F of 40 CFR part 51, appendix M. You may exclude never controlled work stations from such capture efficiency determinations.

* * * * *

■ 8. Section 63.828 is amended by revising paragraph (a)(3) to read as follows:

§ 63.828 Monitoring Requirements.

(a) * * *

(3) An owner or operator complying with §§ 63.824–63.825 through continuous emission monitoring of a control device shall install, calibrate, operate, and maintain continuous emission monitors to measure total organic volatile matter concentration and volumetric gas flow rate in accordance with § 63.824(b)(1)(ii), § 63.825(b)(2)(ii), § 63.825(c)(2), or § 63.825(d)(2), as applicable.

* * * * *

■ 9. Section 63.829 is amended by revising paragraphs (e)(1) and (e)(2) to read as follows:

§ 63.829 Recordkeeping Requirements.

* * * * *

(e) * * *

(1) For each facility which meets the criteria of § 63.821(b)(1), the owner or operator shall maintain records of the total mass of each material applied on product and packaging rotogravure or wide-web flexographic printing presses during each month.

(2) For each facility which meets the criteria of § 63.821(b)(2), the owner or operator shall maintain records of the total mass and organic HAP content of each material applied on product and packaging rotogravure or wide-web flexographic printing presses during each month.

* * * * *

■ 10. Section 63.830 is amended by revising paragraph (b)(6) introductory text to read as follows:

§ 63.830 Reporting Requirements.

* * * * *

(b) * * *

(6) A summary report specified in § 63.10(e)(3) of this part shall be submitted on a semi-annual basis (i.e., once every 6-month period). These summary reports are required even if the affected source does not have any control devices or does not take the performance of any control devices into account in demonstrating compliance with the emission limitations in § 63.824 or § 63.825. In addition to a report of operating parameter exceedances as required by § 63.10(e)(3)(i), the summary report shall include, as applicable:

* * * * *

■ 11. Appendix A is amended by revising paragraphs 3.2 and 4.8 to read as follows:

Appendix A to Subpart KK of Part 63—Data Quality Objective and Lower Confidence Limit Approaches for Alternative Capture Efficiency Protocols and Test Methods

* * * * *

3.2 The DQO calculation is made as follows using Equations 1 and 2:

$$P = \left[\frac{a}{x_{avg}}\right] 100 \quad \text{Eq. 1}$$

$$a = \frac{t_{0.975} s}{\sqrt{n}} \quad \text{Eq. 2}$$

Where:

a = Distance from the average measured CE value to the endpoints of the 95-percent (two-sided) confidence interval for the measured value.

n = Number of valid test runs.
P = DQO indicator statistic, distance from the average measured CE value to the endpoints of the 95-percent (two-sided) confidence interval, expressed as a percent of the average measured CE value.
s = Sample standard deviation.
$t_{0.975}$ = t-value at the 95-percent (two-sided) confidence level (see Table A–1).
x_{avg} = Average measured CE value (calculated from all valid test runs).
x_i = The CE value calculated from the ith test run.

TABLE A–1.—t-VALUES

Number of valid test runs, n	$t_{0.975}$	$t_{0.90}$
1 or 2	N/A	N/A
3	4.303	1.886
4	3.182	1.638
5	2.776	1.533
6	2.571	1.476
7	2.447	1.440
8	2.365	1.415
9	2.306	1.397
10	2.262	1.383
11	2.228	1.372
12	2.201	1.363
13	2.179	1.356
14	2.160	1.350
15	2.145	1.345
16	2.131	1.341
17	2.120	1.337
18	2.110	1.333
19	2.101	1.330
20	2.093	1.328
21	2.086	1.325

* * * * *

4.8 The LCL is calculated at an 80 percent (two-sided) confidence level as follows using Equation 11:

$$LC_i = x_{avg} - \frac{t_{0.90}s}{\sqrt{n}} \qquad \text{Eq. 11}$$

Where:
LC_i = LCL at an 80-percent (two-sided) confidence level.
n = Number of valid test runs.
s = Sample standard deviation.
$t_{0.90}$ = t-value at the 80-percent (two-sided) confidence level (see Table A–1).
x_{avg} = Average measured CE value (calculated from all valid test runs).
* * * * *

Subpart JJJJ—[Amended]

■ 12. Section 63.3300 is amended by revising paragraph (a) to read as follows:

§ 63.3300 Which of my emission sources are affected by this subpart?

* * * * *

(a) Any web coating line that is stand-alone equipment under subpart KK of this part (National Emission Standards for the Printing and Publishing Industry) which the owner or operator includes in the affected source under subpart KK.

* * * * *

Subpart OOOO—[Amended]

■ 13. Section 63.4281 is amended by:
■ a. Revising paragraph (d) introductory text.
■ b. Adding paragraphs (d)(4) to read as follows:

§ 63.4281 Am I subject to this subpart?

* * * * *

(d) Web coating lines specified in paragraphs (d)(1) through (4) of this section are not part of the affected source of this subpart.

* * * * *

(4) Any web coating line that coats or prints fabric or other textiles for use in flexible packaging and that is included in an affected source under subpart KK of this part (National Emission Standards for the Printing and Publishing Industry).

* * * * *

Health Resources and Services Administration

42 CFR Part 102

RIN 0906–AA60

Smallpox Vaccine Injury Compensation Program: Smallpox (Vaccinia) Vaccine Injury Table

AGENCY: Health Resources and Services Administration (HRSA), HHS.

ACTION: Adoption of interim final rule as final rule with an amendment.

SUMMARY: This document adopts the Smallpox (Vaccinia) Vaccine Injury Table (the Table) Interim Final Rule as the Final Rule with an amendment, as follows: the Final Rule clarifies that, in order for the presumption of causation to apply, the time intervals listed on the Table refer specifically to the period in which the first symptom or manifestation of onset of injury must appear following administration of the smallpox vaccine or exposure to vaccinia, and that the time intervals listed have no relevance to time of diagnosis of the injury.

DATES: The Interim Final Rule, published on August 27, 2003, was effective on that date, and is adopted as the Final Rule with an amendment effective May 24, 2006.

FOR FURTHER INFORMATION CONTACT: Paul T. Clark, Director, Smallpox Vaccine Injury Compensation Program, Healthcare Systems Bureau, Health Resources and Services Administration, (301) 443–2330.

SUPPLEMENTARY INFORMATION:

Background

The Smallpox Emergency Personnel Protection Act of 2003 (SEPPA), Pub. L. 108–20, 117 Stat. 638, directed the Secretary of Health and Human Services (the Secretary) to establish the Smallpox Vaccine Injury Compensation Program (the Program). Secondary to other payers, the Program provides medical, lost employment income, and death benefits for eligible individuals who sustained covered injuries as a result of receiving smallpox vaccine or other covered countermeasures, or as a result of accidental exposure to vaccinia. Congress appropriated $42 million in fiscal year (FY) 2003 for the administration of, and payment of benefits under, the Program. The Consolidated Appropriations Act of 2005 reduced this appropriation to $22 million. The Departments of Labor, Health and Human Services, and Education, and Related Agencies Appropriations Act, 2006 (Pub. L. 109–149) further reduced the Program's appropriation by $10 million to a total of $12 million.

Individuals who receive a smallpox vaccination under a Department of Health and Human Services (HHS), State, or local emergency response plan approved by HHS within the period described in the Secretary's Declaration, and who sustain a covered injury may be eligible for benefits under SEPPA. Individuals who contracted vaccinia through contact with such individuals or other eligible vaccinia contacts and who sustain a covered injury may also be eligible for benefits. In the case of death resulting directly from receipt of the smallpox vaccine or exposure to vaccinia by eligible individuals, certain of their survivors may be considered for death benefits. If an eligible individual who sustained a covered injury dies from another cause before payment of benefits has been made under the Program, the estate may qualify for payment of unreimbursed medical expenses incurred and employment income lost as a result of the covered injury, secondary to other payers. SEPPA directed the Secretary to establish a table identifying adverse effects (including injuries, disabilities,

Environmental Protection Agency

40 CFR Parts 63 and 65
National Emission Standards for Hazardous Air Pollutants: General Provisions; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 63 and 65

[EPA–HQ–OAR–2004–0094; FRL–8055–5]

RIN 2060–AM89

National Emission Standards for Hazardous Air Pollutants: General Provisions

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates amendments to certain aspects of startup, shutdown, and malfunction (SSM) requirements affecting sources subject to the national emission standards for hazardous air pollutants (NESHAP) in response to a July 29, 2003 petition to reconsider certain aspects of amendments to the NESHAP General Provisions published on May 30, 2003.

EFFECTIVE DATE: This final rule is effective on April 20, 2006.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2004–0094. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information may not be publicly available, *i.e.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the EPA Docket Center, Docket ID No. EPA–HQ–OAR–2004–0094, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Rick Colyer, U.S. EPA Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Program Design Group (C504–05), Research Triangle Park, NC 27711; telephone number (919) 541–5262; fax number (919) 541–5600; e-mail address: *colyer.rick@epa.gov*.

SUPPLEMENTARY INFORMATION:

I. General Information

Regulated Entities. Categories and entities potentially regulated by this action include sources in all source categories regulated under 40 CFR parts 63 and 65 that must develop a startup, shutdown, and malfunction plan.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's final rule amendments will also be available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of this action will be posted on the TTN's policy and guidance page for newly promulgated rules at *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by June 19, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule amendments may not be challenged separately in any civil or criminal proceeding brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. General Information
II. Summary of Final Amendments
III. Responses to Comments
IV. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

II. Summary of Final Amendments

The NESHAP General Provisions were first promulgated on March 16, 1994 (59 FR 12408). We subsequently proposed a variety of amendments to the initial rule based in part on settlement negotiations with industrial trade organizations, which had sought judicial review of the rule, and in part on our practical experience in developing and implementing NESHAP, also known as maximum achievable control technology (MACT) standards, under the General Provisions (66 FR 16318; March 23, 2001). We then promulgated final amendments to the General Provisions pursuant to that proposal (67 FR 16582; April 5, 2002).

On April 25, 2002, Sierra Club filed a petition seeking judicial review of those final amendments, *Sierra Club* v. *U.S. Environmental Protection Agency*, No. 02–1135 (DC Circuit). The Sierra Club also filed a petition seeking administrative reconsideration of certain provisions in the final amendments, pursuant to Clean Air Act (CAA) section 307(d)(7)(B).

Shortly after the filing of the petition, EPA commenced discussions with the Sierra Club concerning a settlement agreement. We reached initial agreement with the Sierra Club on the terms of a settlement and lodged the tentative agreement with the court on August 15, 2002, under which we agreed to propose a rule to make specified amendments to the General Provisions.

Following execution of the final settlement agreement, we published proposed amendments effectuating its terms (67 FR 72875; December 9, 2002). Most of the General Provisions amendments dealt with clarifying the general duty to minimize emissions and its relationship to the startup, shutdown, and malfunction (SSM) plans required under 40 CFR 63.6(e)(3).

We issued final amendments (68 FR 32586; May 30, 2003) that require that a source must promptly submit a copy of its plan to its permitting authority if and when the permitting authority requests that the plan be submitted. The final amendments also require the permitting authority to obtain a copy of the plan from a facility if a member of the public makes a specific and reasonable request to examine or receive a copy. We noted that the permitting authority should work with the requester to clarify any request if it is overly broad or insufficiently specific.

After promulgation of the amendments, the NRDC petitioned EPA on July 29, 2003, under section 307(d)(7)(D) of the CAA, to reconsider the public access aspects of the SSM plan provisions. Specifically, NRDC opposed the criteria for the public to access SSM plans, i.e., that a plan may be obtained only if the request is "specific and reasonable." The NRDC concluded that the final amendments

allow the Administrator to block a citizen's access to SSM plans just by declaring the request not "specific and reasonable."

On July 29, 2005 (70 FR 43992), we announced our reconsideration of these issues arising from the final amendments of May 30, 2003, regarding SSM plans, and proposed additional amendments to the General Provisions and conforming amendments to other parts 63 and 65 subparts. Today's notice responds to comments on the July 29, 2005 proposal and promulgates final rule amendments.

By removing the requirement that the SSM plan must be followed during periods of SSM, the final amendments allow sources flexibility to address emissions during periods of SSM. This in no way alters the obligation and requirement set out at 40 CFR 63.6(e)(1)(i) that source owners or operators "minimize emissions" at all times, including periods of SSM. Root cause analysis of excess emissions events may generally be the most effective means in many industry sectors to assist a source in meeting its regulatory obligation to minimize emissions at all times including during periods of SSM. Appropriately conducted root cause analysis should determine the fundamental cause of an excess emissions event, and identify the steps and corrective action necessary to ensure that the excess emission does not arise again. Through this process, we have determined that fewer and fewer excess emission events occur over time. Thus, performing a root cause or similar analysis and implementing corrective action may often be relevant in determining whether a source has met the good air pollution control measures standard. The final amendments do not change the current approach to minimizing emissions during periods of SSM, and we fully expect owners or operators to follow their SSM plans during periods of SSM. Owners or operators are also still required to keep records of and report actions taken during SSM periods to minimize emissions whenever there is an exceedance of an emissions limit (or a potential exceedance in the case of a malfunction). (See discussion of recordkeeping and recording requirements below.) We expect few owners or operators to deviate from their plans, and only when necessary due to unanticipated types of malfunctions, emergencies that are not amenable to strict adherence to the plan at the time, safety considerations that preclude following the plan as written, or when emissions can be better minimized by taking steps that are different from those set forth in the plan. Even then, the owner or operator must report such deviations and demonstrate how emissions were minimized when the plan was not followed. This is consistent with the prior provisions, except that deviation from the plan is no longer a violation of the SSM requirements of the General Provisions regulations. This change has been made in all the parts 63 and 65 subparts that had previously required the plan to be followed.

We are also removing the requirement that the Administrator obtain a copy of a source's SSM plan whenever requested by a member of the public. The public may obtain a copy of any plan obtained by the Administrator from a source. This includes any permitting authority (state or local agency) that has been delegated the authority to enforce standards under parts 63 and 65. Under the amendments, any permitting authority with delegation will still have the discretion to obtain plans requested by the public, but will not be required to do so. EPA's position is that SSM plans should not be viewed as compliance plans under section 502(b)(8) or 503(c) of the Clean Air Act or under EPA's Title V regulations at 40 CFR 70.5(c)(8). This is the most reasonable interpretation of those statutory and regulatory provisions and is consistent with EPA's position on implementation issues associated with SSM plan requirements discussed in more detail in the response to comment section below.[1]

The definition of "compliance schedule" in section 501(3) of the CAA equates "schedule of compliance" to "schedule of remedial measures." Nothing in this definition or in any other provision of the CAA suggests that SSM plans must be considered "compliance plans." In fact, the definition of compliance schedule suggests that the primary purpose of "compliance schedules" and "compliance plans" is to set out measures to be taken to remedy noncompliance. EPA's title V regulations at 40 CFR 70.5(c)(8), which describe what is to be included in a compliance plan, further support the reasonableness of EPA's view that SSM plans should not be considered compliance plans. Those regulations provide that a compliance plan must include a description of the compliance status of the source, a statement that the source will continue to comply with applicable requirements and, if the source is not in compliance with an applicable requirement, a narrative describing how compliance will be achieved. SSM plans serve a purpose different from that of compliance plans (see discussion below) and do not include the components described above that are required in compliance plans. Thus, EPA's position that SSM plans are not compliance plans is reasonable.

Plans available to the public will have confidential business information removed. Startup, shutdown, and malfunction plans are similar to the risk management plans prepared under section 112(r) to prevent accidental releases of HAP and may likely contain information that is protected as CBI or that may be sensitive from a security standpoint. For these reasons, many facilities are reluctant to provide the details of their plans and permitting authorities are reluctant to request them except when necessary. While these plans may be redacted prior to public release to remove CBI, this imposes additional burden on both the facilities and the permitting agencies. Thus we believe the limitation we are imposing in the final rule strikes a reasonable balance between the public's right to know, protection against acts of terrorism, and protection of a facility's CBI.

The amendments also make clarifying edits that reporting and recordkeeping is only required when a startup or shutdown causes the applicable emission standards to be exceeded, and for any occurrence of malfunction which also includes potential exceedances[2] and that such recordkeeping and reporting shall include information on actions taken during such periods of SSM to minimize emissions in conformance with § 63.6(e)(1)(i). When such actions are consistent with the plan the report can include a checklist, as is currently allowed for recordkeeping. Reports would allow a member of the public to review the actions taken and whether or not they conform to the general duty to minimize emissions. We are also revising the definitions for malfunction

[1] In the preamble to the proposal, we suggested that EPA does not have the authority to treat SSM plans as compliance plans or to require permitting authorities to make such plans available to the public. (70 FR 43994–95; July 29, 2005). Upon further consideration, we believe that the term "compliance plan" is somewhat ambiguous. However, for the reasons set forth below and in the response to comment section, we believe that an interpretation that SSM plans are not compliance plans is reasonable and appropriate.

[2] A malfunction is defined as any sudden, infrequent, and not reasonably preventable failure of air pollution control and monitoring equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded.

throughout parts 63 and 65 in various subparts for consistency with the previously revised definition in the General Provisions.

III. Responses to Comments

General

Comment: One commenter thought EPA should not have considered petitions from parties who did not participate in previous rulemakings, and that EPA should have denied NRDC's petition for reconsideration.

Response: The EPA granted reconsideration on a narrow issue and has properly followed Section 307(d) of the CAA.

Enforcement

Comment: Several commenters were concerned that the amendments would render the SSM provisions essentially unenforceable. They felt that removal of the requirement to follow the plan would allow owners or operators to do anything they want during SSM periods with no accountability and will lead to increases in emissions if the plan is not followed. More specifically, Sierra Club asserts that section 304 of the CAA guarantees a citizen's right to enforce CAA requirements and that section 504(a) of the CAA requires that title V permits contain enforceable limits and standards and conditions necessary to assure compliance. Sierra Club alleges that if the requirement that a source implement its SSM plan is eliminated, there would be no means by which to measure a source's compliance with the general duty to minimize emissions. Sierra Club further argues that without the ability to measure a source's actions during an SSM event against that source's SSM plans, the public can't enforce the general duty requirement.

Sierra Club also asserts that proving a violation of the general duty standard would be virtually impossible given the vagueness of the standard. Sierra Club argues that EPA's proposed scheme renders the MACT standard unenforceable because if the SSM plan is not incorporated into the title V permit as a requirement, there will be no information in the title V permit indicating when the limit applies. Sierra Club believes that EPA's seeks to create a system in which adherence to plan can be used as a defense, but failure to follow a plan is not a violation.

Comments submitted by Tulane Environmental Law Clinic on behalf of St. Benard Citizens for Environmental Quality and Louisiana Bucket Brigade argue that the requirement to develop an SSM plan is (even under EPA's proposal) an applicable requirement and that the only way to assure compliance with this applicable requirement is to require that it be submitted to the regulatory agency and be available to the public.

Response: As summarized in the previous section, we do not believe the amendments will change anything with respect to how owners and operators will react during periods of SSM except that they will have the flexibility to depart from a SSM plan when doing so makes sense under the circumstances. They are still required to develop SSM plans, minimize emissions during periods of SSM, and keep records and report SSM events if there is an exceedance (or could have been, in the case of malfunctions) of an applicable MACT standard. We expect owners and operators to continue to follow the SSM plans with respect to most SSM events because those plans should generally set forth the best way to minimize emissions. Those who fail to follow their plan will undergo additional scrutiny, as they do now, to determine if emissions were minimized during SSM periods. The amendments should have no practical effects on a source's obligation to minimize emissions during periods of SSM.

EPA's intention is that the recordkeeping and reporting requirements will provide the permitting authority and the public with information to determine whether the general duty to minimize emissions has been satisfied any time there is an exceedance (or could have been, in the case of malfunctions). We have evaluated the recordkeeping and reporting requirements in light of comments on the availability of information necessary to evaluate compliance with the general duty requirement and have decided to amend the recordkeeping and reporting requirements to clarify that a source must keep records of and report actions taken during an SSM event any time there is an exceedance. Revisions to § 63.10(d)(5)(i) and (ii) require that a description of actions taken to minimize emissions be included in SSM reports whether or not the SSM plan was followed. In the case where the plan is followed, a checklist may suffice, and in the case of multiple events, only one checklist is necessary (*e.g.*, multiple startups of batch processes where the procedure to minimize emissions is always the same). With respect to recordkeeping, the rules currently require sources to keep a record of actions taken during SSM events (40 CFR 63.10(b)(2)(iv) and (v)). Where actions were consistent with an SSM plan, the rules require records of "all information necessary to demonstrate conformance" with the plan and provide that such information can be recorded in the form of a checklist. (§ 63.10(b)(2)(v)) We are amending these rules today to clarify that such records or checklist must include all actions taken during the SSM event to minimize emissions. We are also making conforming changes to 40 CFR 63.6(e)(3)(iii).

With these clarifications, any time there is an exceedance of an emission limit (or could have been in the case of malfunctions) and thus a possibility that the general duty requirement was violated, there will be a report filed that will describe what actions were taken to minimize emissions that will be available to the public.

Any member of the public could use the information in these reports to evaluate whether adequate steps were taken to meet the general duty requirement. This information is likely to be of as much if not more use in determining compliance with the general duty requirement than a facility's general SSM plan because the information will be specific to the particular SSM event that caused the exceedance. We note that the public can also request that the permitting authority obtain the SSM plan if information in the SSM report suggests that the contents of the SSM plan would help determine if there was a violation of the general duty requirement. However, even if the permitting authority is not willing to obtain the SSM plan, the required reports should provide adequate information to determine whether there is a violation of the general duty requirement and thus a basis for a citizen suit. In any such citizen suit, plaintiffs can seek to obtain the SSM plan through discovery.

The general duty to minimize emissions is not too vague to be enforced as suggested by Sierra Club. Though the general duty to minimize emissions may not provide absolute certainty in all cases, there will be many circumstances in which compliance or non-compliance will be clear. A regulation that does not reach constitutionally protected conduct is not facially vague unless it is impermissibly vague in all its applications. (*Village of Hoffman Estates* v. *Flipside, Hoffman Estates, Inc.*, 455 U.S. 489, 496(1982); *Sweet Home Chapter of Communities for a Greater Oregon* v. *Babbit*, 1.F.3d. 1, 4 (D.C. Cir. 1994).

Further, it is not impossible to know when the MACT applies without knowing how the facility defines startup, shutdown and malfunction in

its SSM plan. EPA regulations define the terms startup shutdown and malfunction and it is these definitions that apply when determining whether a facility is legitimately claiming to be experiencing a period of SSM.

With respect to the argument that the only way to assure compliance with the duty to develop a plan is to require that it be submitted to permitting authority and be available to the public, assuring compliance does not require that the Agency observe compliance first hand. It is perfectly appropriate for the Agency to rely on certifications (title V regulations require sources to certify compliance with all applicable requirements (40 CFR 70.5(c)(9))) or on inspection, record keeping and reporting authorities of section 114 of the CAA to decide on a case by case basis when to inspect or request copies of documents

Comment: Two commenters said that emissions during SSM events should be required to comply with the NESHAP standard. One commenter said EPA had failed to support a general assumption that sources cannot meet emission limitations during periods of SSM or that setting emission limitations during these periods is not feasible.

Response: These commenters raise issues that are outside of the scope of this rulemaking. The general duty provision has been in place since 1994. Moreover, comments concerning whether a particular source type can meet a particular emission standard during periods of startup, shutdown or malfunction could be raised when the emissions standards for that source are developed. As one commenter noted, "EPA can, and in some instances has, included requirements for compliance during SSM in source-specific NESHAP standards."

Though these comments raise issues that are outside the scope of this rulemaking, we note that in the May 8, 2004 **Federal Register** notice EPA stated "EPA believes that it has discretion to make reasonable distinctions concerning those particular activities to which the emission limitations in a MACT standard apply" (68 FR 32586, 32590; May 30, 2003). We also note that the EPA SIP guidance cited by one commenter is not relevant to the scope of EPA's authority to consider periods of SSM in promulgating NESHAP standards.

Comment: Several commenters stated that the sources should be required to provide the permitting authorities with copies of SSM plans even absent a request because the permitting authorities need to review SSM plans before problems arise. These commenters also felt that greater public access to the plans is beneficial because such scrutiny can help ensure that the plans are adequate and the general duty to minimize emissions can be met.

Response: We do not believe that it is necessary to have each owner or operator automatically submit its SSM plan. Our regulations make it clear that all a permitting authority has to do is request the SSM plan and the owner or operator is required to provide it. While the authority to request the plan is derived from section 114, there is no special order or document that needs to be issued to obtain the SSM plan. Thus, the permitting authority may review any plan and may also make it available to the public. We do not believe prior review and approval of plans are necessary; rather, in most cases, review of reports required to be submitted by a facility when emission limitations are exceeded (or could have been in the case of malfunctions) will allow the permitting authority and the public to determine whether emissions were minimized during periods of SSM. However, if it so chooses, a permitting authority is free to request SSM plans and review them prior to any SSM events occurring. Typically, permitting authorities will more often review and assess SSM plan of sources with numerous and frequent periods of SSM. It may not be necessary to review plans of sources with few or infrequent SSM events, allowing the permitting authority to direct its resources to more productive endeavors. The permitting authority has the discretion to review as many plans as it wants in order to ensure, that emissions are minimized during periods of SSM.

Comment: Several commenters thought it made no sense to require that plans be developed but not require them to be followed.

Response: We disagree. Development of SSM plans help sources to think through and document actions to take during SSM events. Plans will help sources more expeditiously address SSM events to minimize emissions during those periods. Once the plans are developed, sources will have every incentive to follow the plans if appropriate, or face additional scrutiny if the plans are not followed. In any event, sources are required to minimize emissions regardless of whether the plans are followed. By not requiring strict adherence to the SSM plan, we are allowing the source additional flexibility as to how it will minimize emissions. Plans also may help permitting authorities streamline determinations of whether emissions are minimized. If it is established that emissions are minimized by following the plan during a particular SSM event, making that determination when a subsequent similar SSM event occurs should be much less burdensome assuming the plan has not been revised.

Comment: Several commenters felt that if an SSM plan is developed in good faith and is not "obviously deficient," it should be considered a "safe harbor." Others felt that following the plan should not be a safe harbor.

Response: We believe that following the SSM plan should not be a safe harbor. Where the SSM plan is out of date or deficient or the circumstances clearly called for other steps to minimize emissions, blind adherence to the plan should not be sufficient. We leave to the discretion of the permitting authority the question of how much weight to give the SSM plan in a particular situation. However, assuming that the plan was made in good faith and not deficient, we believe that in most cases following the SSM plan should help establish that the source was minimizing emissions.

Comment: Several commenters thought there should be a requirement that sources periodically review and update their SSM plans. Two commenters stated that because implementation of SSM plans will no longer be required, sources will be less likely to periodically review and update SSM plans.

Response: Our regulations already require sources to keep their SSM plans current, *i.e.*, up to date, and to review and change the plans to ensure that emissions are minimized. "The owner or operator must maintain at the affected source a current startup, shutdown, and malfunction plan and must make the plan available upon request for inspection and copying by the Administrator" (§ 63.6(e)(3)(v)). Plans are required to address potential expected SSMs to minimize emissions. Plans should be updated whenever changes are necessary to address new or different types of SSM events as provided for in paragraphs 63.6(e)(3)(vii) and (viii). Moreover, the Administrator (or delegated authority) has the ability under § 63.6(e)(3)(vii) to require that SSM plans be revised if they are deficient or not current.

Applicable Requirements

Comment: Numerous commenters agreed with the EPA's position at proposal that the SSM plan details themselves are not the applicable requirements under the Act, but the general duty clause (§ 63.6(e)(1)) is. They further agreed that the plan

elements should not be incorporated into the title V permits.

One commenter believed that the SSM plan elements should be applicable requirements. Another commenter thought that the requirement to follow the plan should be an applicable requirement in the title V permit but the individual elements of the SSM plan should not be considered incorporated into the permit.

Response: As explained in our proposal (70 FR 43992; July 29, 2005), we believe that the general duty to minimize emissions is the applicable requirement, not the SSM plan itself. However, we note that the SSM plan is a useful tool for sources to demonstrate—and for permitting authorities to confirm—that the general duty to minimize emissions is met. We do not agree that requiring implementation of the SSM plan is necessary to assure compliance with general duty requirement. The SSM plan is a useful tool that may help the permitting authority determine compliance depending on the circumstances, but it is not "necessary." As explained above, compliance with the general duty requirement can be achieved through different means such as examining SSM reports to determine whether general duty has been satisfied. The case law cited by Sierra Club is not on point. Both *Waterkeeper Alliance, Inc.* v *EPA*, 399 F.3d. 486 (2nd Cir. 2005) and *Environmental Defense Center, Inc.* v. *EPA*, 344 F.2d. 832 (9th Cir.2003) involved EPA regulatory schemes under which plans developed by the regulated entity, which were not reviewed or approved by the regulatory agency (nutrient development plans and stormwater management plans under the Clean Water Act, respectively), served to establish binding requirements, compliance with which would automatically satisfy an underlying statutory or regulatory requirement. SSM plans are not binding requirements and, as explained above, adherence with an SSM plan does not necessarily establish compliance with the general duty requirement.

Comment: One commenter wanted clarification on the relationship of the SSM plan requirements to title V, specifically what language should be included in the permit regarding the requirement to develop a plan. The commenter notes that § 63.6(e)(3)(ix) explicitly refers to a title V requirement whereas other provisions do not; the comment suggests an edit to the paragraph that would clarify the provision.

Response: The intent of § 63.6(e)(3)(ix) was to ensure that the only requirement with respect to the title V permit was that an SSM plan be developed, that the elements of the plan are not to be incorporated into the permit, and that changes to the plan would not trigger a permit modification. The commenter's suggested edits are helpful and have been incorporated into the paragraph.

Conforming Changes to Other Subparts

Comment: Several commenters supported the conforming changes to the other subparts with respect to the requirement to follow the plan. One commenter stated that EPA failed to explain its reason for changing specific part 63 subparts and how the changes would affect the specific source categories.

Response: Although there was no explicit statement explaining why the other subparts were being amended, these changes were made merely to conform to the changes being made in the General Provisions. Many of the part 63 subparts repeated requirements in the General Provisions about following the SSM plan and had to be revised to be consistent with the changes to the General Provisions. Because the changes in the individual subparts are necessary for conformance with the General Provisions, we felt that no explanation was required.

Impacts

Comment: One commenter stated that EPA failed to comply with Executive Order 12898 on Environmental Justice. The commenter asserts that the amendments will adversely affect minority and low income communities around the sources.

Response: Executive Order 12898 establishes a Federal policy for incorporating environmental justice into Federal agency actions by directing agencies to identify and address, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies and activities on minority and low-income populations. The EPA has considered the impact of the proposal on minority and low income populations. We do not believe that these amendments will have any adverse effects on emissions during periods of SSM. Therefore, there should not be any adverse impact on minority and low income populations as a result of these amendments. The amendments do not affect the underlying requirement to minimize emissions during SSM events. Owners or operators are still required to develop SSM plans to address emissions during these periods. They are required to report immediately when the plans are not followed and semiannually when the plans are followed and emission limitations are exceeded (or could have been in the case of malfunctions) and describe steps taken to minimize emissions. The only difference from current regulations is that the source is not required to follow the plan, especially when the situation may call for other action or when safety considerations override following the plan as written.

Comment: One commenter stated that EPA failed to comply with Executive Order 13045 on Protection of Children for Environmental Health and Safety Risk. The commenter disagrees with EPA's position that the Executive Order only applies to regulations that are based on health or safety risks.

Response: Executive Order 13045 does not apply to this proposal because, as is explained above, it does not change any emission standard, it is not economically significant and because it is not based on health and safety risks.

SSM Plan Availability

Comment: There were numerous comments on SSM plan availability to permitting authorities and the public. Some governmental commenters stated that it is difficult to obtain SSM plans using section 114 of the Act, and that permitting authorities should not be required to obtain the information through a request made under section 114 of the Act. One commenter stated that part 63 does not clearly state that permitting authorities can request and receive copies of the plans and that the provisions should be amended to make this clear and to require that the plan be provided within 30 days. The commenter stated that state laws allowing access to information vary from state to state and are sometimes vague. Several industry commenters stated that SSM plans should be available only through CAA section 114 requests.

Response: The existing part 63 regulations already require a source to (1) allow the permitting authority to inspect the SSM plan at the premises or (2) "promptly" submit the plan to the permitting authority if the permitting authority makes a written request for it. The regulations state that the "Administrator may at any time request in writing that the owner or operator submit a copy of any startup, shutdown, and malfunction plan (or portion thereof) * * * [and] the owner or operator must promptly submit a copy of the requested plan (or a portion thereof) to the Administrator" (§ 63.6(d)(3)(v)). The authority for this provision is section 114(a) of the Act.

However, there is no special procedure or order required; the Administrator or the permitting authority need only request the SSM plan in writing. The Administrator or permitting authority may also inspect and copy the SSM plan at the premises: "The owner or operator must maintain at the affected source a current startup, shutdown, and malfunction plan and must make the plan available upon request for inspection and copying by the Administrator" (§ 63.6(e)(3)(v)). The authority for this inspection provision is also section 114(a). Under section 114(b), states may develop and submit to the Administrator a procedure for carrying out section 114 in the state, and the Administrator may delegate his/her authority to the state. All permitting authorities that have obtained delegation of part 63 standards have already demonstrated that they have state authority equivalent to section 114 to monitor, to inspect, and to obtain records, including SSM plans. Accordingly, permitting authorities should have no difficulty in obtaining plans. The underlying authority for the part 63 provisions allowing permitting authorities to inspect or obtain copies of SSM plans is based on section 114(a) or its state equivalent. Because all SSM plans are obtained under section 114(a) or its state equivalent, any plans so obtained must be available to the public under section 114(c) of the Act, which provides that any records obtained under section 114(a) "shall be available to the public," with the exception of portions considered confidential.

Comment: Several commenters agreed that permitting authorities should not be required to obtain SSM plans whenever a member of the public requests one. Other commenters disagreed and believed that any member of the public should be able to request an SSM plan. Several commenters thought the public should be able to review the plans to determine if emissions are minimized and argued that denying public access makes general duty unenforceable.

Response: As discussed above, we do not believe that the details of SSM plans are compliance plans or are required to be available under title V. As discussed above, recordkeeping and reporting requirements will provide regulators and the public with adequate information concerning actions taken during periods of SSM. Permitting authorities can obtain and review plans as necessary, and all plans that are obtained will be available to the public subject to limitation on availability of CBI.

Comment: Several commenters believed the proposal effectively cut off public access to plans.

Response: We disagree. Public access to SSM plans is still available, in the case where the permitting authority has obtained a plan. We believe that most permitting authorities will request a plan from a source when presented with a reasonable request for the plan. There is no federal requirement to do so, however, and unless otherwise specified under state statute or regulations, state and local authorities have the discretion to obtain the plan upon public request.

Comment: Several commenters argued that companies will not be responsive to requests for SSM plans from the public.

Response: We recognize that some companies might choose not to respond to requests from the public. However, we hope and expect that other companies would indeed respond to public requests. Moreover, as explained above, the public may ask the permitting authority to obtain the SSM plan. Where the public has made a reasonable request, we believe that the permitting authority would likely be responsive and obtain the plan from the source. Because the authority to obtain such plan is based on section 114 of the Act or its state equivalent, any plan obtained by the permitting authority will be available to the public.

Comment: Another commenter noted that the difficulty of "untangling" SSM plans from facility operating procedures and CBI are not good reasons for restricting public access.

Response: As stated earlier, all SSM plans obtained by the permitting authority are publicly accessible. We are sensitive to the effort involved by some sources to create a standalone SSM plan for submittal, but do not believe requiring all plans to be submitted automatically for review is justified. However, permitting authorities will obtain SSM plans as necessary, regardless of the burden imposed on the source to develop a standalone document.

Comment: The same commenter maintained that the paperwork burden on permitting authorities also should not be a reason for not requiring submittal of SSM plans.

Response: Permitting authorities may obtain any SSM plan that it wants. Thousands of sources are required to prepare SSM plans, and we believe the permitting authority should have the discretion to obtain those it feels are appropriate. For the reasons discussed above, we do not think it is necessary to impose a requirement that all plans be automatically submitted to the permitting authority, especially if this results in the permitting authority reallocating resources from enforcement and implementation to handling paper. We think it is best for the individual permitting authority to make that decision. If they so choose, they can routinely ask all sources to submit SSM plans.

Confidential Business Information (CBI)

Comment: Two commenters noted that plans can be sanitized of their CBI-sensitive information prior to submittal to the permitting authority, but other commenters insisted that SSM plans not be released because of sensitive information. One commenter additionally noted that SSM plans may contain security-sensitive information and provide a roadmap to terrorists seeking to disrupt a facility.

Response: Plans may be submitted with CBI identified; such submittals will be treated in accordance with requirements applicable to claims of CBI. We also agree that plans can be "cleansed" of CBI and other sensitive information and submitted. The public will have access to any non-CBI submittal and non-CBI portions of plans with CBI identified. This is what happens now.

Comment: Some commenters stated that limiting public access to plans and removing the requirement to implement the SSM plan makes it difficult for the public to determine when an emission exceedance constitutes a violation of a MACT standard. These commenters also stated that reducing public access to SSM plans hinders citizen enforcement efforts.

Response: These amendments do not change the ability of the public to determine when an emissions exceedance constitutes a violation of a MACT standard and shouldn't make enforcement of the general duty requirement more difficult. Plans previously available are still available for public review. Permitting authorities may obtain any SSM plan from any source and allow the public to examine it. Sources must report what procedures and actions it did take during periods of SSM if there was an exceedance of an emission limit (or could have been in the case of malfunctions). Such reports are also available to the public. As explained above, this information can be used by the public and the permitting authority to support enforcement efforts.

Reporting

Comment: One commenter stated that without a requirement to implement SSM plans, the regulation should require reporting of all SSM events so that the general duty can be evaluated

for each event. Another commenter added that only those SSM events that exceeded the emission standards be reported.

Response: We agree that all SSM events that exceed (or could have exceeded, in the case of malfunctions) the emission limitations be reported. We also agree that as long as the emission limitations are being met, SSM events need not be reported (except those malfunctions that could have exceeded the emission limitations), *i.e.*, as long as the relevant standards are being met, there is no benefit to a reporting requirement in terms of assuring compliance with the general duty standard. We have made clarifying edits in the regulatory language.

Comment: One commenter did not think that facilities should have to report whether or not they followed their SSM plan. Another commenter did not think sources should have to report immediately if the SSM plan was not followed.

Response: We disagree. Information on whether or not an SSM plan was followed gives the permitting authority and the public information that can help them determine if further scrutiny of a source is in order. If the permitting authority has reviewed a source's SSM plan and determined that it is adequate, information that the source followed that plan during an SSM event could be helpful to the regulator in determining whether to investigate the event. Not following the plan may or may not indicate a problem, but such information would be very helpful to the permitting authority and the public in order to determine if additional scrutiny or investigation of the event is necessary. Immediate reporting if the plan was not followed is appropriate to alert the permitting authority and the public of a potential problem.

Comment: One commenter questioned why SSM events still have to be reported as deviations if emission limitations do not apply.

Response: The general duty to minimize emissions is the applicable requirement during SSM events. In order to effectively enforce this requirement, it is important to have information about SSM events that involve exceedances (or potential exceedances in the case of malfunctions) in order to determine whether further scrutiny is appropriate. Deviations do not necessarily equate to violations.

Recordkeeping

Comment: Numerous commenters agreed with the elimination of certain recordkeeping requirements for startups and shutdowns when relevant emission standards are not exceeded. One commenter was not clear on how burden had been relieved; the commenter cites § 63.6(e)(3)(iii) and asked what documentation was necessary.

Response: The amendments and the clarifications we are promulgating today relieve the recordkeeping burden for startups and shutdowns that do not result in a exceedance of an emissions limitation.

Regulatory Language

Comment: Several commenters pointed out that some subparts have their own SSM provisions and do not cite subpart A as the applicable requirements. The proposal should have not referenced subpart A but instead continued to reference the applicable provisions within their subparts.

Response: We agree with the commenters and have made the suggested edits.

Comment: Several commenters noted that the reference to § 63.6(e) instead of the requirement to follow the SSM plan was overly broad, and in fact should have referred more narrowly to the general duty to minimize emissions since that is the applicable requirement.

Response: We agree with the commenters and have made the suggested edit to refer to § 63.6(e)(1).

Comment: One commenter suggested clarifying changes to ensure reporting and recordkeeping for startups and shutdowns is required only when the applicable emission limitation is exceeded.

Response: We agree and have made the suggested edits. As explained above, as long as the standards are being attained there is no need to report.

Comment: Several commenters recommended revising the definition for "malfunction" in other subparts where it occurs to be consistent with the definition in subpart A. One commenter also suggested revising the general duty provision where it occurs in other subparts to be consistent with subpart A.

Response: We agree this is appropriate for consistency and have revised the definitions and provisions accordingly.

Comment: A couple of commenters recommended incorporating paragraph § 63.6(e)(3)(ix) into the General Provisions applicability table in all of the applicable subparts.

Response: We agree that § 63.6(e)(3)(ix) should apply to all the applicable part 63 subparts. We have revised all of the applicable General Provisions applicability tables accordingly.

IV. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must determine whether this regulatory action is "significant," and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, OMB has notified EPA that it considers this a "significant regulatory action" within the meaning of the Executive Order. The EPA has submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

B. Paperwork Reduction Act

As required by the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, the OMB must clear any reporting and recordkeeping requirements that qualify as an information collection request (ICR) under the PRA.

Approval of an ICR is not required in connection with these final amendments. This is because the General Provisions do not themselves require any reporting and recordkeeping activities, and no ICR was submitted in connection with their original promulgation or their subsequent amendment. Any recordkeeping and reporting requirements are imposed only through the incorporation of specific elements of the General Provisions in the individual MACT standards which are promulgated for

particular source categories which have their own ICRs. In any case, we believe that adoption of the amendments will not materially alter the burden imposed on affected sources through the incorporation of the General Provisions in individual MACT standards. We anticipate that any incremental changes in the recordkeeping and reporting burden estimate for individual MACT standards will be addressed in the context of the periodic renewal process required by the PRA.

However, OMB has previously approved the information collection requirements contained in the existing regulations of 40 CFR parts 63 and 65 under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* A copy of the OMB approved Information Collection Request (ICR) for any of the existing regulations may be obtained from Susan Auby, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with this final rule.

For purposes of assessing the impacts of the final rule amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administration's (SBA) regulations at 13 CFR 121.201 for each applicable subpart; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and that is not dominant in its field.

After considering the economic impacts of today's final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analysis is to identify and address regulatory alternatives which minimize any significant economic impact on a substantial number of small entities (5 U.S.C. 603–604). Thus, an agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule.

Small entities that are subject to MACT standards would not be required to take any action under the final rule amendments; the amendments simply remove the requirement that sources must follow their SSM plan. However, we do not expect sources will address periods of SSM any differently than they do now.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, today's final rule amendments are not subject to sections 202 and 205 of the UMRA. The EPA has also determined that the final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments. Thus, today's final rule amendments are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications and will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. Thus, Executive Order 13175 does not apply to the final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule amendments are not subject to Executive Order 13045 because they are not "economically significant" and are based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The final rule amendments are not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because they do not have an economically significant adverse effect on the supply, distribution, or use of energy.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through the OMB, explanations when the Agency decides not to use available and applicable VCS.

The final rule amendments do not involve technical standards. Therefore, EPA did not consider the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. The final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The final rule amendments are effective on April 20, 2006.

List of Subjects in 40 CFR Parts 63 and 65

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: March 31, 2006.

Stephen L. Johnson,

Administrator.

■ For the reasons cited in the preamble, title 40, chapter I, parts 63 and 65 of the Code of Federal Regulations are amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 2. Section 63.6 is amended by:
■ a. Revising the first sentence in paragraph (e)(1)(ii);
■ b. Removing the first sentence in paragraph (e)(3)(i) introductory text and adding two new sentences in its place;
■ c. Removing and reserving paragraph (e)(3)(ii);
■ d. Revising the first through third sentences in paragraph (e)(3)(iii);
■ e. Removing the sixth sentence in paragraph (e)(3)(v); and
■ f. Revising the first and second sentences in paragraph (e)(3)(ix) to read as follows:

§ 63.6 Compliance with standards and maintenance requirements.

* * * * *

(e) * * *

(1) * * *

(ii) Malfunctions must be corrected as soon as practicable after their occurrence. * * *

* * * * *

(3) * * *

(i) The owner or operator of an affected source must develop a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, and malfunction; and a program of corrective action for malfunctioning process, air pollution control, and monitoring equipment used to comply with the relevant standard. The startup, shutdown, and malfunction plan does not need to address any scenario that would not cause the source to exceed an applicable emission limitation in the relevant standard.

* * *

* * * * *

(ii) [Reserved]

(iii) When actions taken by the owner or operator during a startup or shutdown (and the startup or shutdown causes the source to exceed any applicable emission limitation in the relevant emission standards), or malfunction (including actions taken to correct a malfunction) are consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator must keep records for that event which demonstrate that the procedures specified in the plan were followed. These records may take the form of a "checklist," or other effective form of recordkeeping that confirms conformance with the startup, shutdown, and malfunction plan and describes the actions taken for that

event. In addition, the owner or operator must keep records of these events as specified in paragraph 63.10(b), including records of the occurrence and duration of each startup or shutdown (if the startup or shutdown causes the source to exceed any applicable emission limitation in the relevant emission standards), or malfunction of operation and each malfunction of the air pollution control and monitoring equipment. * * *

* * * * *

(ix) The title V permit for an affected source must require that the owner or operator develop a startup, shutdown, and malfunction plan which conforms to the provisions of this part, but may do so by citing to the relevant subpart or subparagraphs of paragraph (e) of this section. However, any revisions made to the startup, shutdown, and malfunction plan in accordance with the procedures established by this part shall not be deemed to constitute permit revisions under part 70 or part 71 of this chapter and the elements of the startup, shutdown, and malfunction plan shall not be considered an applicable requirement as defined in § 70.2 and § 71.2 of this chapter. * * *

* * * * *

■ 3. Section 63.8 is amended by revising paragraph (c)(1)(iii) to read as follows:

§ 63.8 Monitoring requirements.

* * * * *

(c) * * *

(1) * * *

(iii) The owner or operator of an affected source must develop a written startup, shutdown, and malfunction plan for CMS as specified in § 63.6(e)(3).

* * * * *

■ 4. Section 63.10 is amended by:

■ a. Revising paragraphs (b)(2)(i), (ii), and (iv), and the first sentence in paragraph (b)(2)(v); and

■ b. Revising the first four sentences in paragraph (d)(5)(i) and the first and second sentences in (d)(5)(ii) to read as follows:

§ 63.10 Recordkeeping and reporting requirements.

* * * * *

(b) * * *

(2) * * *

(i) The occurrence and duration of each startup or shutdown when the startup or shutdown causes the source to exceed any applicable emission limitation in the relevant emission standards;

(ii) The occurrence and duration of each malfunction of operation (*i.e.*, process equipment) or the required air pollution control and monitoring equipment;

* * * * *

(iv)(A) Actions taken during periods of startup or shutdown when the source exceeded applicable emission limitations in a relevant standard and when the actions taken are different from the procedures specified in the affected source's startup, shutdown, and malfunction plan (see § 63.6(e)(3)); or

(B) Actions taken during periods of malfunction (including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation) when the actions taken are different from the procedures specified in the affected source's startup, shutdown, and malfunction plan (see § 63.6(e)(3));

(v) All information necessary, including actions taken, to demonstrate conformance with the affected source's startup, shutdown, and malfunction plan (see § 63.6(e)(3)) when all actions taken during periods of startup or shutdown (and the startup or shutdown causes the source to exceed any applicable emission limitation in the relevant emission standards), and malfunction (including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation) are consistent with the procedures specified in such plan. * * *

* * * * *

(d) * * *

(5)(i) * * * If actions taken by an owner or operator during a startup or shutdown (and the startup or shutdown causes the source to exceed any applicable emission limitation in the relevant emission standards), or malfunction of an affected source (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan (see § 63.6(e)(3)), the owner or operator shall state such information in a startup, shutdown, and malfunction report. Actions taken to minimize emissions during such startups, shutdowns, and malfunctions shall be summarized in the report and may be done in checklist form; if actions taken are the same for each event, only one checklist is necessary. Such a report shall also include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. Reports shall only be required if a startup or shutdown caused the source to exceed any applicable emission limitation in the relevant emission standards, or if a malfunction occurred during the reporting period. * * *

(ii) * * * Notwithstanding the allowance to reduce the frequency of reporting for periodic startup, shutdown, and malfunction reports under paragraph (d)(5)(i) of this section, any time an action taken by an owner or operator during a startup or shutdown that caused the source to exceed any applicable emission limitation in the relevant emission standards, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall report the actions taken for that event within 2 working days after commencing actions inconsistent with the plan followed by a letter within 7 working days after the end of the event. The immediate report required under this paragraph (d)(5)(ii) shall consist of a telephone call (or facsimile (FAX) transmission) to the Administrator within 2 working days after commencing actions inconsistent with the plan, and it shall be followed by a letter, delivered or postmarked within 7 working days after the end of the event, that contains the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, explaining the circumstances of the event, the reasons for not following the startup, shutdown, and malfunction plan, describing all excess emissions and/or parameter monitoring exceedances which are believed to have occurred (or could have occurred in the case of malfunctions), and actions taken to minimize emissions in conformance with § 63.6(e)(1)(i). * * *

* * * * *

Subpart F—[Amended]

■ 5. Section 63.102 is amended by revising paragraph (a)(4) to read as follows:

§ 63.102 General standards.

(a) * * *

(4) During start-ups, shutdowns, and malfunctions when the requirements of this subpart F, subparts G and/or H of this part do not apply pursuant to paragraphs (a)(1) through (a)(3) of this section, the owner or operator shall implement, to the extent reasonably available, measures to prevent or minimize excess emissions to the extent practical. The general duty to minimize

emissions during a period of startup, shutdown, or malfunction does not require the owner or operator to achieve emission levels that would be required by the applicable standard at other times if this is not consistent with safety and good air pollution control practices, nor does it require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures (including the startup, shutdown, and malfunction plan required in § 63.6(e)(3)), review of operation and maintenance records, and inspection of the source. The measures to be taken may include, but are not limited to, air pollution control technologies, recovery technologies, work practices, pollution prevention, monitoring, and/or changes in the manner of operation of the source. Back-up control devices are not required, but may be used if available.

* * * * *

■ 6. Section 63.105 is amended by revising paragraph (d) to read as follows:

§ 63.105 Maintenance wastewater requirements.

* * * * *

(d) The owner or operator shall incorporate the procedures described in paragraphs (b) and (c) of this section as part of the startup, shutdown, and malfunction plan required under § 63.6(e)(3).

* * * * *

■ 7. Table 3 to Subpart F is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 3 to Subpart F of Part 63—General Provisions Applicability to Subparts F, G, and H to Subpart F

Reference	Applies to subparts F, G, and H	Comment
* *	* * *	* *
63.6(e)(3)(ix)	Yes.	
* *	* * *	* *

* * * * *

Subpart G—[Amended]

■ 8. Section 63.152 is amended by revising paragraphs (c)(2)(ii)(C)(*1*) and (g)(2)(iv)(A) to read as follows:

§ 63.152 General reporting and continuous records.

* * * * *

(c) * * *

(2) * * *

(ii) * * *

(C) * * *

(*1*) *Periods of startup, shutdown, or malfunction.* During periods of startup, shutdown, or malfunction when the source is operated during such periods in accordance with § 63.102(a)(4).

* * * * *

(g) * * *

(2) * * *

(iv) * * *

(A) The daily average value during any startup, shutdown, or malfunction shall not be considered an excursion for purposes of this paragraph (g)(2), if the owner or operator operates the source during such periods in accordance with § 63.102(a)(4).

* * * * *

Subpart L—[Amended]

■ 9. Section 63.301 is amended by revising the first sentence in the definition of *malfunction* to read as follows:

§ 63.301 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 10. Section 63.310 is amended by revising paragraphs (b) and (c) to read as follows:

§ 63.310 Requirements for startups, shutdowns, and malfunctions.

* * * * *

(b) Each owner or operator of a coke oven battery shall develop, according to paragraph (c) of this section, a written startup, shutdown, and malfunction plan that describes procedures for operating the battery, including associated air pollution control equipment, during a period of a startup, shutdown, or malfunction in a manner consistent with good air pollution control practices for minimizing emissions, and procedures for correcting malfunctioning process and air pollution control equipment as quickly as practicable.

(c) Malfunctions shall be corrected as soon as practicable after their occurrence.

* * * * *

Subpart N—[Amended]

■ 11. Section 63.342 is amended by:

■ a. Revising paragraphs (f)(1)(i) and (ii); and

■ b. Revising the first sentence in paragraph (f)(3)(i) introductory text to read as follows:

§ 63.342 Standards.

* * * * *

(f) * * *

(1)(i) At all times, including periods of startup, shutdown, and malfunction, owners or operators shall operate and maintain any affected source, including associated air pollution control devices and monitoring equipment, in a manner consistent with good air pollution control practices.

(ii) Malfunctions shall be corrected as soon as practicable after their occurrence.

* * * * *

(3) *Operation and maintenance plan.* (i) The owner or operator of an affected source subject to paragraph (f) of this section shall prepare an operation and maintenance plan no later than the compliance date, except for hard chromium electroplaters and the chromium anodizing operations in California which have until January 25, 1998. * * *

* * * * *

Subpart U—[Amended]

§ 63.480 [Amended]

■ 12. Section 63.480 is amended by removing the third sentence in paragraph (j)(1).

■ 13. Section 63.506 is amended by:

■ a. Revising the first sentence in paragraph (b)(1) introductory text; and

■ b. Revising paragraph (h)(2)(iv)(A) to read as follows:

§ 63.506 General recordkeeping and reporting provisions.

* * * * *

(b) * * *

(1) * * * The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan as specified in § 63.6(e)(3). * * *

* * * * *

(h) * * *

(2) * * *

(iv) * * *

(A) The daily average or batch cycle daily average value during any startup, shutdown, or malfunction shall not be considered an excursion for purposes of paragraph (h)(2) of this section, if the owner or operator operates the source during such periods in accordance with § 63.6(e)(1).

* * * * *

■ 14. Table 1 to Subpart U is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 1 to Subpart U of Part 63—Applicability of General Provisions to Subpart U Affected Sources

Reference	Applies to subpart U	Explanation
* *	* *	* *
§ 63.6(e)(3)(ix)	Yes.	
* *	* *	* *

* * * * *

Subpart W—[Amended]

■ 15. Section 63.526 is amended by revising paragraph (c) to read as follows:

§ 63.526 Monitoring requirements.

* * * * *

(c) Periods of time when monitoring measurements exceed the parameter values do not constitute a violation if they occur during a startup, shutdown, or malfunction, and the facility is operated in accordance with § 63.6(e)(1).

* * * * *

Subpart Y—[Amended]

■ 16. Section 63.562 is amended by revising the first sentence of paragraph (e)(2) introductory text to read as follows:

§ 63.562 Standards.

* * * * *

(e) * * *

(2) The owner or operator of an affected source shall develop a written operation and maintenance plan that describes in detail a program of corrective action for varying (*i.e.*, exceeding baseline parameters) air pollution control equipment and monitoring equipment, based on monitoring requirements in § 63.564, used to comply with these emissions standards. * * *

* * * * *

Subpart AA—[Amended]

■ 17. Section 63.600 is amended by revising paragraph (e) to read as follows:

§ 63.600 Applicability.

* * * * *

(e) The emission limitations and operating parameter requirements of this subpart do not apply during periods of startup, shutdown, or malfunction, as those terms are defined in § 63.2, provided that the source is operated in accordance with § 63.6(e)(1)(i).

Subpart BB—[Amended]

■ 18. Section 63.620 is amended by revising paragraph (e) to read as follows:

§ 63.620 Applicability.

* * * * *

(e) The emission limitations and operating parameter requirements of this subpart do not apply during periods of startup, shutdown, or malfunction, as those terms are defined in § 63.2, provided that the source is operated in accordance with § 63.6(e)(1)(i).

Subpart DD—[Amended]

■ 19. Section 63.695 is amended by revising paragraph (e)(6)(i)(A) to read as follows:

§ 63.695 Inspection and monitoring requirements.

* * * * *

(e) * * *

(6) * * *

(i) * * *

(A) During a period of startup, shutdown, or malfunction when the affected facility is operated during such period in accordance with § 63.6(e)(1); or

* * * * *

Subpart GG—[Amended]

■ 20. Section 63.743 is amended by revising the first sentence in paragraph (b) introductory text as follows:

§ 63.743 Standards: General.

* * * * *

(b) * * * Each owner or operator that uses an air pollution control device or equipment to control HAP emissions shall prepare a startup, shutdown, and malfunction plan in accordance with § 63.6. * * *

* * * * *

Subpart HH—[Amended]

■ 21. Section 63.773 is amended by revising paragraph (d)(8)(i)(A) to read as follows:

§ 63.773 Inspection and monitoring requirements.

* * * * *

(d) * * *

(8) * * *

(i) * * *

(A) During a period of startup, shutdown, or malfunction when the affected facility is operated during such period in accordance with § 63.6(e)(1); or

* * * * *

■ 22. Table 2 to Subpart HH is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 2 to Subpart HH of Part 63—Applicability of 40 CFR Part 63 General Provisions to Subpart HH

General provisions reference	Applies to subpart HH	Explanation
* * * * * * *		
§ 63.6(e)(3)(ix)	Yes.	
* * * * * * *		

Subpart LL—[Amended]

■ 23. Section 63.848 is amended by revising the first sentence in paragraph (h) to read as follows:

§ 63.848 Emission monitoring requirements.

* * * * *

(h) * * * If a monitoring device for a primary control device measures an operating parameter outside the limit(s) established pursuant to § 63.847(h), if visible emissions indicating abnormal operation are observed from the exhaust stack of a control device during a daily inspection, or if a problem is detected during the daily inspection of a wet roof scrubber for potline secondary emission control, the owner or operator shall initiate corrective action procedures within 1 hour. * * *

* * * * *

■ 24. Section 63.850 is amended by revising the first sentence in paragraph (c) introductory text to read as follows:

§ 63.850 Notification, reporting, and recordkeeping requirements.

* * * * *

(c) * * * The owner or operator shall develop a written plan as described in § 63.6(e)(3) that contains specific procedures to be followed for operating the source and maintaining the source during periods of startup, shutdown, and malfunction and a program of corrective action for malfunctioning process and control systems used to comply with the standards. * * *

* * * * *

Subpart MM—[Amended]

■ 25. Section 63.864 is amended by revising paragraphs (k)(1) introductory text and the first sentence in paragraph (k)(2)(v) to read as follows:

§ 63.864 Monitoring requirements.

* * * * *

(k) * * * (1) Following the compliance date, owners or operators of all affected sources or process units are required to implement corrective action if the monitoring exceedances in paragraphs (k)(1)(i) through (vi) of this section occur:

* * * * *

(2) * * *

(v) For the hog fuel dryer at Weyerhaeuser Paper Company's Cosmopolis, Washington facility (Emission Unit no. HD–14), when corrective action is not initiated within 1 hour of a bag leak detection system alarm and the alarm is engaged for more than 5 percent of the total operating time in a 6-month block reporting period. * * *

* * * * *

■ 26. Section 63.866 is amended by revising the first sentence in paragraph (a) introductory text to read as follows:

§ 63.866 Recordkeeping requirements.

(a) * * * The owner or operator must develop a written plan as described in § 63.6(e)(3) that contains specific procedures for operating the source and maintaining the source during periods of startup, shutdown, and malfunction, and a program of corrective action for malfunctioning process and control systems used to comply with the standards. * * *

* * * * *

Subpart SS—[Amended]

■ 27. Section 63.998 is amended by:
■ a. Revising paragraph (b)(2)(iii);
■ b. Revising paragraph (b)(6)(i)(A); and
■ c. Revising the second sentence in paragraph (b)(6)(ii) to read as follows:

§ 63.998 Recordkeeping requirements.

* * * * *

(b) * * *

(2) * * *

(iii) Startups, shutdowns, and malfunctions, if the owner or operator operates the source during such periods in accordance with § 63.1111(a) and maintains the records specified in paragraph (d)(3) of this section.

* * * * *

(6)(i) * * *

(A) The daily average value during any startup, shutdown, or malfunction shall not be considered an excursion if the owner or operator operates the source during such periods in accordance with § 63.1111(a) and maintains the records specified in paragraph (d)(3) of this section.

* * * * *

(ii) * * * If a source has developed a startup, shutdown and malfunction plan, and a monitored parameter is outside its established range or monitoring data are not collected during periods of start-up, shutdown, or malfunction (and the source is operated during such periods in accordance with § 63.1111(a)) or during periods of nonoperation of the process unit or portion thereof (resulting in cessation of the emissions to which monitoring applies), then the excursion is not a violation and, in cases where continuous monitoring is required, the excursion does not count as the excused excursion for determining compliance.

* * * * *

Subpart YY—[Amended]

■ 28. Section 63.1101 is amended by revising the first sentence in the definition of *malfunction* to read as follows:

§ 63.1101 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 29. Section 63.1108 is amended by:
■ a. Removing the second sentence in paragraph (a)(1) introductory text;
■ b. Revising paragraph (a)(6); and
■ c. Revising paragraph (b)(2)(i) to read as follows:

§ 63.1108 Compliance with standards and operation and maintenance requirements.

(a) * * *

(6) Malfunctions shall be corrected as soon as practical after their occurrence.

* * * * *

(b) * * *

(2) * * *

(i) During periods of startup, shutdown, or malfunction (and the source is operated during such periods in accordance with § 63.1111(a)), or

* * * * *

■ 30. Section 63.1111 is amended by revising the first and fifth sentences in paragraph (a)(1) introductory text and revising paragraph (a)(2) to read as follows:

§ 63.1111 Startup, shutdown, and malfunction.

(a) * * * (1) *Description and purpose of plan.* The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the affected source during periods of startup, shutdown, and malfunction. * * * The requirement to develop this plan shall be incorporated into the source's title V permit. * * *

* * * * *

(2) *Operation of source.* During periods of startup, shutdown, and malfunction, the owner or operator of an affected source subject to this subpart YY shall operate and maintain such affected source (including associated air pollution control equipment and CPMS) in a manner consistent with safety and good air pollution control practices for minimizing emissions to the extent practical. The general duty to minimize emissions during a period of startup, shutdown, or malfunction does not require the owner or operator to achieve emission levels that would be required by the applicable standard at other times if this is not consistent with safety and good air pollution control practices, nor does it require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures (including the startup, shutdown, and malfunction plan required by this section), review of operation and maintenance records, and inspection of the source.

* * * * *

Subpart CCC—[Amended]

■ 31. Section 63.1164 is amended by revising the last sentence in paragraph (c) introductory text and revising paragraph (c)(1) to read as follows:

§ 63.1164 Reporting requirements.

* * * * *

(c) * * * Malfunctions must be corrected as soon as practicable after their occurrence.

(1) *Plan.* As required by § 63.6(e)(3) of subpart A of this part, the owner or operator shall develop a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, or malfunction, and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the relevant standards.

* * * * *

Subpart EEE—[Amended]

■ 32. Section 63.1206 is amended by revising paragraphs (c)(2)(v)(A)(*2*) and (c)(2)(v)(B)(*4*) to read as follows:

§ 63.1206 When and how must you comply with the standards and operating requirements?

* * * * *

(c) * * *

(2) * * *

(v) * * *

(A) * * *

(*2*) Although the automatic waste feed cutoff requirements continue to apply during a malfunction, an exceedance of an emission standard monitored by a CEMS or COMS or operating limit specified under § 63.1209 is not a violation of this subpart EEE if you operate in accordance with § 63.6(e)(1).

* * * * *

(B) * * *

(*4*) Although the automatic waste feed cutoff requirements of this paragraph (c)(2)(v)(B)(*4*) apply during startup and shutdown, an exceedance of an emission standard or operating limit is not a violation of this subpart EEE if you operate in accordance with § 63.6(e)(1).

* * * * *

Subpart GGG—[Amended]

■ 33. Section 63.1251 is amended by revising the first sentence in the definition of *malfunction* to read as follows:

§ 63.1251 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, emissions monitoring equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 34. Section 63.1256 is amended by revising paragraph (a)(4)(iii) to read as follows:

§ 63.1256 Standards: wastewater.

(a) * * *

(4) * * *

(iii) The owner or operator shall incorporate the procedures described in paragraphs (a)(4)(i) and (ii) of this section as part of the startup, shutdown, and malfunction plan required under § 63.6(e)(3).

* * * * *

■ 35. Section 63.1258 is amended by revising paragraph (b)(8)(iv) to read as follows:

§ 63.1258 Monitoring requirements.

* * * * *

(b) * * *

(8) * * *

(iv) Periods of time when monitoring measurements exceed the parameter values as well as periods of inadequate monitoring data do not constitute a violation if they occur during a start-up, shutdown, or malfunction, and the facility operates in accordance with § 63.6(e)(1).

* * * * *

■ 36. Section 63.1259 is amended by revising the first sentence in paragraph (a)(3) introductory text to read as follows:

§ 63.1259 Recordkeeping requirements.

(a) * * *

(3) * * * The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan as specified in § 63.6(e)(3). * * *

* * * * *

Subpart HHH—[Amended]

■ 37. Section 63.1283 is amended by revising paragraph (d)(8)(i)(A) to read as follows:

§ 63.1283 Inspection and monitoring requirements.

* * * * *

(d) * * *

(8) * * *

(i) * * *

(A) During a period of startup, shutdown, or malfunction when the affected facility is operated during such period in accordance with § 63.6(e)(1); or

* * * * *

■ 38. Table 2 to Subpart HHH is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Appendix: Table 2 to Subpart HHH of Part 63—Applicability of 40 CFR Part 63 General Provisions to Subpart HHH

General provisions reference	Applies to subpart HHH	Explanation
* * * * * * *		
§ 63.6(e)(3)(ix)	Yes.	
* * * * * * *		

Subpart JJJ—[Amended]

§ 63.1310 [Amended]

■ 39. Section 63.1310 is amended by removing the third sentence in paragraph (j)(1).

■ 40. Section 63.1335 is amended by:

■ a. Revising the first sentence in paragraph (b)(1) introductory text; and

■ b. Revising paragraph (h)(2)(iv)(A) to read as follows:

§ 63.1335 General recordkeeping and reporting provisions.

* * * * *

(b) * * *

(1) * * * The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan as specified in § 63.6(e)(3). * * *

* * * * *

(h) * * *

(2) * * *

(iv) * * *

(A) The daily average or (batch cycle daily average) value during any startup, shutdown, or malfunction shall not be considered an excursion for purposes of paragraph (h)(2) of this section, if the owner or operator follows the applicable provisions of § 63.6(e)(1).

* * * * *

■ 41. Table 1 to Subpart JJJ is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 1 to Subpart JJJ of Part 63—Applicability of General Provisions to Subpart JJJ Affected Sources

Reference	Applies to subpart JJJ	Explanation
* * * * * * *		
§ 63.6(e)(3)(ix)	Yes.	
* * * * * * *		

Subpart MMM—[Amended]

■ 42. Section 63.1361 is amended by revising the first sentence in the definition of *malfunction* to read as follows:

§ 63.1361 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, emissions monitoring equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 43. Section 63.1366 is amended by revising paragraph (b)(8)(iv) to read as follows:

§ 63.1366 Monitoring and inspection requirements.

* * * * *

(b) * * *

(8) * * *

(iv) Periods of time when monitoring measurements exceed the parameter values as well as periods of inadequate monitoring data do not constitute a violation if they occur during a startup, shutdown, or malfunction, and the facility operates in accordance with § 63.6(e)(1).

* * * * *

■ 44. Section 63.1367 is amended by revising the first sentence in paragraph (a)(3) introductory text to read as follows:

§ 63.1367 Recordkeeping requirements.

(a) * * *

(3) * * * The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan as specified in § 63.6(e)(3). * * *

* * * * *

Subpart NNN—[Amended]

■ 45. Section 63.1386 is amended by revising the first sentence in paragraph (c)(1) introductory text to read as follows:

§ 63.1386 Notification, recordkeeping, and reporting requirements.

* * * * *

(c) * * *

(1) The owner or operator shall develop a written plan as described in § 63.6(e)(3) that contains specific procedures to be followed for operating the source and maintaining the source during periods of startup, shutdown, and malfunction and a program of corrective action for malfunctioning process modifications and control systems used to comply with the standards. * * *

* * * * *

Subpart OOO—[Amended]

§ 63.1400 [Amended]

■ 46. Section 63.1400 is amended by removing the third sentence in paragraph (k)(1) and by removing the last sentence in paragraph (k)(2).

■ 47. Section 63.1402 is amended by revising the first sentence in the definition of *malfunction* in paragraph (b) to read as follows:

§ 63.1402 Definitions.

* * * * *

(b) * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment or process equipment, or failure of a process to operate in a normal or usual manner, or opening of a safety device which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 48. Section 63.1413 is amended by revising the first sentence in paragraph (h)(4) introductory text and paragraph (h)(5) introductory text to read as follows:

§ 63.1413 Compliance demonstration procedures.

* * * * *

(h) * * *

(4) *Deviation from the emission standard.* If an affected source is not operated during periods of startup, shutdown, or malfunction in accordance with § 63.6(e)(1), there has been a deviation from the emission standard.

* * *

* * * * *

(5) *Situations that are not deviations.* If an affected source is operated during periods of startup, shutdown, or malfunction in accordance with § 63.6(e)(1), and any of the situations listed in paragraphs (h)(5)(i) through (iv) of this section occur, such situations shall not be considered to be deviations.

* * * * *

■ 49. Section 63.1416 is amended by:

■ a. Revising the first sentence in paragraph (b) introductory text; and

■ b. Revising paragraph (h)(2)(iv) to read as follows:

§ 63.1416 Recordkeeping requirements.

* * * * *

(b) * * * The owner or operator of an affected source shall develop a startup, shutdown, and malfunction plan as specified in § 63.6(e)(3) and shall keep the plan on-site. * * *

* * * * *

(h) * * *

(2) * * *

(iv) For purposes of paragraph (h)(2) of this section, a deviation means that the daily average, batch cycle daily average, or block average value of monitoring data for a parameter is greater than the maximum, or less than the minimum established value, except that the daily average, batch cycle daily average, or block average value during any startup, shutdown, or malfunction shall not be considered a deviation, if the owner or operator operates the source during such periods in accordance with § 63.6(e)(1).

■ 50. Table 1 to Subpart OOO is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 1 to Subpart OOO of Part 63—Applicability of General Provisions to Subpart OOO Affected Sources

Reference	Applies to subpart OOO	Explanation
* *	* *	* *
63.6(e)(3)(ix)	Yes.	
* *	* *	* *

* * * * *

Subpart PPP—[Amended]

§ 63.1420 [Amended]

■ 51. Section 63.1420 is amended by removing the third sentence in paragraph (h)(1).

■ 52. Section 63.1439 is amended by:

■ a. Revising the first sentence in paragraph (b)(1) introductory text; and

■ b. Revising paragraph (h)(2)(iv)(A) to read as follows:

§ 63.1439 General recordkeeping and reporting provisions.

* * * * *

(b) * * *

(1) * * * The owner or operator of an affected source shall develop a written startup, shutdown, and malfunction plan as specified in § 63.6(e)(3). * * *

* * * * *

(h) * * *

(2) * * *

(iv) * * *

(A) The daily average value during any startup, shutdown, or malfunction shall not be considered an excursion for purposes of paragraph (h)(2) of this section, if the owner or operator operates the source during such periods in accordance with § 63.6(e)(1).

* * * * *

■ 53. Table 1 to Subpart PPP is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 1 to Subpart PPP of Part 63—Applicability of General Provisions to Subpart PPP Affected Sources

Reference	Applies to subpart PPP	Explanation
* *	* *	* *
63.6(e)(3)(ix)	Yes.	
* *	* *	* *

* * * * *

Subpart QQQ—[Amended]

■ 54. Section 63.1448 is amended by revising paragraph (c) to read as follows:

§ 63.1448 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 55. Section 63.1453 is amended by revising paragraph (c)(1)(ii) to read as follows:

§ 63.1453 How do I demonstrate continuous compliance with the emission limitations, work practice standards, and operation and maintenance requirements that apply to me?

* * * * *

(c) * * *

(1) * * *

(ii) Alarms that occur during startup, shutdown, or malfunction are not included in the calculation if the condition is described in the startup, shutdown, and malfunction plan, and you operated the source during such periods in accordance with § 63.6(e)(1).

* * * * *

Subpart RRR—[Amended]

■ 56. Section 63.1516 is amended by revising the first sentence in paragraph (a) introductory text as follows:

§ 63.1516 Reports.

(a) * * * The owner or operator must develop a written plan as described in

§ 63.6(e)(3) that contains specific procedures to be followed for operating and maintaining the source during periods of startup, shutdown, and malfunction, and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the standard. * * *

* * * * *

Subpart TTT—[Amended]

57. Section 63.1542 is amended by revising the first sentence in the definition of malfunction to read as follows:

§ 63.1542 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 58. Section 63.1547 is amended by revising paragraph (g)(2) to read as follows:

§ 63.1547 Monitoring requirements.

* * * * *

(g) * * *

(2) Alarms that occur during startup, shutdown, or malfunction shall not be included in the calculation if the condition is described in the startup, shutdown, and malfunction plan and the owner or operator operates the source during such periods in accordance with § 63.6(e)(1).

* * * * *

Subpart UUU—[Amended]

■ 59. Section 63.1570 is amended by:

■ a. Revising paragraph (d);

■ b. Removing and reserving paragraph (e); and

■ c. Revising paragraph (g) to read as follows:

§ 63.1570 What are my general requirements for complying with this subpart?

* * * * *

(d) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

(e) [Reserved]

* * * * *

(g) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). The SSMP must include elements designed to minimize the frequency of such periods (i.e., root cause analysis). The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

■ 60. Table 44 to Subpart UUU is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 44 to Subpart UUU of Part 63—Applicability of NESHAP General Provisions to Subpart UUU

* * * * *

Citation	Subject	Applies to subpart UUU	Explanation
*	*	*	*
§ 63.6(e)(3)(ix)		Yes.	
*	*	*	*

Subpart XXX—[Amended]

■ 61. Section 63.1651 is amended by revising the first sentence in the definition of malfunction to read as follows:

§ 63.1651 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 62. Section 63.1656 is amended by revising paragraph (e)(2)(ii) to read as follows:

§ 63.1656 Performance testing, test methods, and compliance demonstrations.

* * * * *

(e) * * *

(2) * * *

(ii) Do not include alarms that occur during startup, shutdown, and malfunction in the calculation if the condition is described in the startup, shutdown, and malfunction plan and the owner or operator operates the source during such periods in accordance with § 63.6(e)(1).

* * * * *

Subpart AAAA—[Amended]

■ 63. Section 63.1960 is amended by revising the fourth and sixth sentences to read as follows:

§ 63.1960 How is compliance determined?

* * * Finally, you must develop a written SSM plan according to the provisions in 40 CFR 63.6(e)(3). * * * Failure to write or maintain a copy of the SSM plan is a deviation from the requirements of this subpart.

* * * * *

■ 64. Section 63.1965 is amended by revising paragraph (c) to read as follows:

§ 63.1965 What is a deviation?

* * * * *

(c) A deviation occurs when a SSM plan is not developed or maintained on site.

Subpart CCCC—[Amended]

■ 65. Section 63.2150 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.2150 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written malfunction plan. * * *

■ 66. Section 63.2164 is amended by revising paragraph (a) to read as follows:

§ 63.2164 If I monitor brew ethanol, what are my monitoring installation, operation, and maintenance requirements?

(a) Each CEMS must be installed, operated, and maintained according to manufacturer's specifications and in accordance with § 63.6(e)(1).

* * * * *

§ 63.2171 [Amended]

■ 67. Section 63.2171 is amended by removing paragraph (d).

Subpart DDDD—[Amended]

■ 68. Section 63.2250 is amended by revising paragraph (c) to read as follows:

§ 63.2250 What are the general requirements?

* * * * *

(c) You must develop a written SSMP according to the provisions in § 63.6(e)(3).

* * * * *

■ 69. Section 63.2271 is amended by removing and reserving paragraph (b)(1) and revising the first sentence in paragraph (b)(2) to read as follows:

§ 63.2271 How do I demonstrate continuous compliance with the compliance options, operating requirements, and work practice requirements?

* * * * *

(b) * * *

(1) [Reserved]

(2) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the EPA Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart EEEE—[Amended]

■ 70. Section 63.2350 is amended by revising paragraph (c) to read as follows:

§ 63.2350 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction (SSM) plan according to the provisions in § 63.6(e)(3).

§ 63.2378 [Amended]

■ 71. Section 63.2378 is amended by removing the third sentence of paragraph (b)(1).

■ 72. Table 12 to subpart EEEE is amended by revising the citation to § 63.8(c)(1)(i)–(iii) to read as follows:

Table 12 to Subpart EEEE of Part 63—Applicability of General Provisions to Subpart EEEE

* * * * *

Citation	Subject	Brief description	Applies to subpart EEEE
*	*	*	*
§ 63.8(c) (1)(i)—(iii)	Routine and Predictable SSM.	Keep parts for routine repairs readily available; reporting requirements for SSM when action is described in SSM plan..	Yes.
*	*	*	*

Subpart FFFF—[Amended]

■ 73. Table 12 to Subpart FFFF is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 12 to Subpart FFFF of Part 63—Applicability of General Provisions to Subpart FFFF

* * * * *

Citation	Subject	Explanation
*	*	*
§ 63.6(e)(3)(ix)	SSMP incorporation into title V permit	Yes.
*	*	*

Subpart GGGG—[Amended]

■ 74. Table 1 to § 63.2850 is amended by revising the paragraph (a) entries to read as follows:

§ 63.2850 How do I comply with the hazardous air pollutant emission standards?

* * * * *

Table 1 to § 63.2850—Requirements for Compliance With HAP Emission Standards

Are you required to . . .	For periods of normal operation?	For initial startup periods subject to § 63.2850(c)(2) or (d)(2)?	For malfunction periods subject to § 63.2850(e)(2)?
(a) Operate and maintain your source in accordance with general duty provisions of § 63.6(e)?	Yes. Additionally, the HAP emission limits will apply.	Yes, you are required to minimize emissions to the extent practible throughout the initial startup period. Such measures should be described in the SSM plan.	Yes, you are required to minimizwe emissions to the extent practible throughout the initial startup period. Such measures should be described in the SSM plan.
*	*	*	*

* * * * *

■ 75. Section 63.2852 is amended by revising the first sentence to read as follows:

§ 63.2852 What is a startup, shutdown, and malfunction plan?

You must develop a written SSM plan in accordance with § 63.6(e)(3). * * *

■ 76. Table 1 to § 63.2870 is amended by revising the entry for "§ 63.6(e)(1) through (e)(3)(ii) and § 63.6(e)(3)(v) through (vii)"; by removing the entry

"§ 63.6(e)(3)(v)(iii)" and adding in it's place a new entry for "§ 63.6(e)(3)(iii)"; and by adding in numerical order a new entry for "§ 63.6(e)(3)(ix)" to read as follows:

§ 63.2870 What parts of the General Provisions apply to me?

* * * * *

Table 1 to § 63.2870—Applicability of 40 CFR Part 63, Subpart A, to 40 CFR, Part 63, Subpart GGGG

General provisions citation	Subject of citation	Brief description of requirement	Applies to subpart	Explanation
*	*	*	*	*
§ 63.6(e)(1) through (e)(3)(ii) and § 63.6(e)(3)(v) through (vii).	Operation and maintenance requirements.		Yes	Minimize emissions to the extent practical.
§ 63.6(e)(3)(iii)	Operation and maintenance requirements.		No	Minimize emissions to the extent practical
*	*	*	*	*
§ 63.6(e)(3)(ix)	Title V permit		Yes.	
*	*	*	*	*

■ 77. Section 63.2872(c) is amended by:
■ a. Revising the second sentence in the definition of *initial startup period;* and
■ b. Revising the third sentence in the definition of *malfunction period* to read as follows:

§ 63.2872 What definitions apply to this subpart?

* * * * *

(c) * * *

Initial startup period means * * * During an initial startup period, a source complies with the standards by minimizing HAP emissions to the extent practical. * * *

* * * * *

Malfunction period means * * * During a malfunction period, a source complies with the standards by minimizing HAP emissions to the extent practical. * * *

* * * * *

Subpart HHHH—[Amended]

■ 78. Section 63.2984 is amended by revising paragraph (b) to read as follows:

§ 63.2984 What operating limits must I meet?

* * * * *

(b) When during a period of normal operations you detect that an operating parameter deviates from the limit or range established in paragraph (a) of this section, you must initiate corrective actions within 1 hour according to the provisions of your OMM plan. The corrective actions must be completed in an expeditious manner as specified in the OMM plan.

* * * * *

■ 79. Section 63.2986 is amended by revising the first sentence in paragraph (g)(3) to read as follows:

§ 63.2986 How do I comply with the standards?

* * * * *

(g) * * *

(3) You must develop a written SSMP according to the provisions in § 63.6(e)(3). * * *

Subpart IIII—[Amended]

■ 80. Section 63.3100 is amended by revising the first sentence in paragraph (f) to read as follows:

§ 63.3100 What are my general requirements for complying with this subpart?

* * * * *

(f) If your affected source uses emission capture systems and add-on control devices, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). * * *

■ 81. Section 63.3163 is amended by:
■ a. Removing and reserving paragraph (g); and
■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.3163 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart KKKK—[Amended]

■ 82. Section 63.3500 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.3500 What are my general requirements for complying with this subpart?

* * * * *

(c) If your affected source uses an emission capture system and add-on control device for purposes of complying with this subpart, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). * * *

■ 83. Section 63.3542 is amended by:
■ a. Removing and reserving paragraph (g); and
■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.3542 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

■ 84. Section 63.3552 is amended by:
■ a. Removing and reserving paragraph (f); and
■ b. Revising the first sentence in paragraph (g) to read as follows:

§ 63.3552 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(f) [Reserved]

(g) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart MMMM—[Amended]

■ 85. Section 63.3900 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.3900 What are my general requirements for complying with this subpart?

* * * * *

(c) If your affected source uses an emission capture system and add-on control device, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). * * *

§ 63.3963 [Amended]

■ 86. Section 63.3963 is amended by removing and reserving paragraph (g).

Subpart NNNN—[Amended]

■ 87. Section 63.4100 is amended by revising the first sentence in paragraph (d) to read as follows:

§ 63.4100 What are my general requirements for complying with this subpart?

* * * * *

(d) If your affected source uses an emission capture system and add-on control device, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). * * *

■ 88. Section 63.4110 is amended by revising paragraph (b)(9)(v) to read as follows:

§ 63.4110 What notifications must I submit?

* * * * *

(b) * * *

(9) * * *

(v) A statement of whether or not you developed the startup, shutdown, and malfunction plan required by § 63.4100(d).

* * * * *

■ 89. Section 63.4163 is amended by:

■ a. Removing and reserving paragraph (g); and

■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.4163 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e). * * *

* * * * *

Subpart OOOO—[Amended]

■ 90. Section 63.4300 is amended by:

■ a. Revising paragraph (a)(3)(i); and

■ b. Revising the first sentence in paragraph (c) to read as follows:

§ 63.4300 What are my general requirements for complying with this subpart?

(a) * * *

(3) * * *

(i) The web coating/printing or dyeing/finishing operation(s) must be in compliance with the applicable emission limit in Table 1 to this subpart or minimize emissions at all times as required by § 63.6(e)(1).

* * * * *

(c) If your affected source uses an emission capture system and add-on control device, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). * * *

■ 91. Section 63.4310 is amended by revising paragraph (c)(9)(iv) to read as follows:

§ 63.4310 What notifications must I submit?

* * * * *

(c) * * *

(9) * * *

(iv) A statement of whether or not you developed and implemented the work practice plan required by § 63.4293 and developed the startup, shutdown, and malfunction plan required by § 63.4300.

■ 92. Section 63.4342 is amended by:

■ a. Removing and reserving paragraph (g); and

■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.4342 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing or dyeing/finishing operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

■ 93. Section 63.4352 is amended by:

■ a. Removing and reserving paragraph (g); and

■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.4352 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart PPPP—[Amended]

■ 94. Section 63.4500 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.4500 What are my general requirements for complying with this subpart?

* * * * *

(c) If your affected source uses an emission capture system and add-on control device, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). * * *

§ 63.4563 [Amended]

■ 95. Section 63.4563 is amended by removing and reserving paragraph (g).

Section QQQQ—[Amended]

■ 96. Section 63.4700 is amended by revising the first sentence in paragraph (d) to read as follows:

§ 63.4700 What are my general requirements for complying with this subpart?

* * * * *

(d) If your affected source uses an emission capture system and add-on control device, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). * * *

■ 97. Section 63.4763 is amended by:

■ a. Removing and reserving paragraph (g); and

■ b. Revising the first sentence in paragraph (h) to read as follows:

§ 63.4763 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(g) [Reserved]

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of SSM of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart RRRR—[Amended]

■ 98. Section 63.4900 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.4900 What are my general requirements for complying with this subpart?

* * * * *

(c) If your affected source uses an emission capture system and add-on control device to comply with the emission limitations in § 63.4890, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). * * *

§ 63.4962 [Amended]

■ 99. Section 63.4962 is amended by removing and reserving paragraph (g).

Subpart UUUU—[Amended]

■ 100. Section 63.5515 is amended by revising paragraph (c) to read as follows:

§ 63.5515 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction (SSM) plan according to the provisions in § 63.6(e)(3).

* * * * *

■ 101. Section 63.5555 is amended by:

■ a. Removing and reserving paragraph (c); and

■ b. Revising paragraph (d) to read as follows:

§ 63.5555 How do I demonstrate continuous compliance with the emission limits, operating limits, and work practice standards?

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). The Administrator will determine whether deviations that occur during a period you identify as a startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

■ 102. Table 10 to subpart UUUU of part 63 is amended by revising the citation to § 63.8(c)(1)(i) to read as follows:

Table 10 to Subpart UUUU of Part 63—Applicability of General Provisions to Subpart UUUU

* * * * *

Citation	Subject	Brief description	Applies to subpart UUUU
*	*	*	*
§ 63.8(c)(1)(i)	Routine and Predictable SSM	Keep parts for routine repairs readily available; reporting requirements for SSM when action is described in SSM plan.	Yes.
*	*	*	*

Subpart WWWW—[Amended]

■ 103. Section 63.5835 is amended by revising paragraph (d) to read as follows:

§ 63.5835 What are my general requirements for complying with this subpart?

* * * * *

(d) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3) for any organic HAP emissions limits you meet using an add-on control.

■ 104. Section 63.5900 is amended by:

■ a. Revising paragraph (d); and

■ b. Revising the first sentence in paragraph (e) to read as follows:

§ 63.5900 How do I demonstrate continuous compliance with the standards?

* * * * *

(d) When you use an add-on control device to meet standards in § 63.5805, you are not required to meet those standards during periods of startup, shutdown, or malfunction, but you must operate your affected source to minimize emissions in accordance with § 63.6(e)(1).

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of malfunction for those affected sources and standards specified in paragraph (d) of this section are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

Subpart XXXX—[Amended]

■ 105. Section 63.5990 is amended by revising paragraph (d) to read as follows:

§ 63.5990 What are my general requirements for complying with this subpart?

* * * * *

(d) For each affected source that complies with the emission limits in Tables 1 through 3 to this subpart using a control device, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

* * * * *

Subpart YYYY—[Amended]

■ 106. Section 63.6140 is amended by revising paragraph (c) to read as follows:

§ 63.6140 How do I demonstrate continuous compliance with the emission and operating limitations?

* * * * *

(c) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, and malfunction are not violations if you have operated your stationary combustion turbine in accordance with § 63.6(e)(1)(i).

■ 107. Section 63.6175 is amended by revising paragraph (4) under the definition of *deviation* to read as follows:

§ 63.6175 What definitions apply to this subpart?

* * * * *

Deviation * * *

* * * * *

(4) Fails to satisfy the general duty to minimize emissions established by § 63.6(e)(1)(i).

* * * * *

Subpart ZZZZ—[Amended]

■ 108. Section 63.6640 is amended by:

■ a. Removing and reserving paragraph (c); and

■ b. Revising the first sentence in paragraph (d) to read as follows:

§ 63.6640 How do I demonstrate continuous compliance with the emission limitations and operating limitations?

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations from the emission or operating limitations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

■ 109. Section 63.6675 is amended by revising paragraph (4) under the definition of *deviation* and by revising the first sentence in the definition of *malfunction* to read as follows:

§ 63.6675 What definitions apply to this subpart?

* * * * *

Deviation * * *

* * * * *

(4) Fails to satisfy the general duty to minimize emissions established by § 63.6(e)(1)(i).

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

Subpart AAAAA—[Amended]

■ 110. Section 63.7100 is amended by revising paragraph (e) to read as follows:

§ 63.7100 What are my general requirements for complying with this subpart?

* * * * *

(e) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

■ 111. Section 63.7121 is amended by:

■ a. Removing and reserving paragraph (c); and

■ b. Revising the first sentence in paragraph (d) to read as follows:

§ 63.7121 How do I demonstrate continuous compliance with the emission limitations standard?

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart BBBBB—[Amended]

■ 112. Section 63.7185 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.7185 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP). * * *

* * * * *

§ 63.7187 [Amended]

■ 113. Section 63.7187 is amended by removing and reserving paragraph (d).

Subpart CCCCC—[Amended]

■ 114. Section 63.7310 is amended by revising paragraph (c) to read as follows:

§ 63.7310 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 115. Section 63.7336 is amended by removing introductory text in paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.7336 What other requirements must I meet to demonstrate continuous compliance?

* * * * *

(b) *Startup, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

Subpart DDDDD—[Amended]

■ 116. Section 63.7505 is amended by revising paragraph (e) to read as follows:

§ 63.7505 What are my general requirements for complying with this subpart?

* * * * *

(e) If you have an applicable emission limit or work practice standard, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

■ 117. Section 63.7540 is amended by:

■ a. Revising the first sentence in paragraph (a)(9);

■ b. Removing and reserving paragraph (c); and

■ c. Revising the first sentence in paragraph (d) to read as follows:

§ 63.7540 How do I demonstrate continuous compliance with the emission limits and work practice standards?

(a) * * *

(9) If your unit is controlled with a fabric filter, and you demonstrate continuous compliance using a bag leak detection system, you must initiate corrective action within 1 hour of a bag leak detection system alarm and complete corrective actions as soon as practical, and operate and maintain the fabric filter system such that the alarm does not sound more than 5 percent of the operating time during a 6-month period. * * *

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you

demonstrate to the EPA Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

■ 118. Table 10 to subpart DDDDD of part 63 is amended by revising the citation to § 63.8(c)(1)(iii) to read as follows:

Table 10 to Subpart DDDDD of Part 63—Applicability of General Provisions to Subpart DDDDD

* * * * *

Citation	Subject	Brief description	Applicable
*	*	*	*
§ 63.8(c)(1)(iii)	Compliance with Operation and Maintenance.	Must develop an SSMP for CMS	Yes.
*	*	*	*

Subpart EEEEE—[Amended]

■ 119. Section 63.7720 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.7720 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). * * *

■ 120. Section 63.7746 is amended by removing introductory text in paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.7746 What other requirements must I meet to demonstrate continuous compliance?

* * * * *

(b) *Startups, shutdowns, and malfunctions.* (1) Consistent with the requirements of §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

Subpart FFFFF—[Amended]

■ 121. Section 63.7810 is amended by revising paragraph (c) to read as follows:

§ 63.7810 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 122. Section 63.7835 is amended by removing introductory text to paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.7835 What other requirements must I meet to demonstrate continuous compliance?

* * * * *

(b) *Startups, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

Subpart GGGGG—[Amended]

■ 123. Section 63.7935 is amended by:

■ a. Revising paragraph (c);

■ b. Removing and reserving paragraph (d); and

■ c. Revising the first sentence in paragraph (f) to read as follows:

§ 63.7935 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

(d) [Reserved]

* * * * *

(f) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

■ 124. Table 3 to subpart GGGGG of part 63 is amended by revising the citation to § 63.8(c)(1)(i) to read as follows:

Table 3 to Subpart GGGGG of Part 63—Applicability of General Provisions to Subpart GGGGG

* * * * *

Citation	Subject	Brief description	Applies to subpart GGGGG
*	*	*	*
§ 63.8(c)(1)(i)	Routine and Predictable SSM	Keep parts for routine repairs readily available; reporting requirements for SSM when action is described in SSM plan.	Yes.
*	*	*	*

Subpart HHHHH—[Amended]

■ 125. Table 10 to Subpart HHHHH is amended by adding in numerical order a new entry for 63.6(e)(3)(ix) to read as follows:

Table 10 to Subpart HHHHH of Part 63—Applicability of General Provisions to Subpart HHHHH

* * * * *

Citation	Subject	Explanation
* * * * * * *		
§ 63.6(e)(3)(ix)	Title V permit	Yes.
* * * * * * *		

Subpart IIIII—[Amended]

■ 126. Section 63.8226 is amended by revising paragraph (b) to read as follows:

§ 63.8226 What are my general requirements for complying with this subpart?

* * * * *

(b) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

■ 127. Section 63.8248 is amended by removing introductory text in paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.8248 What other requirements must I meet?

* * * * *

(b) *Startups, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

Subpart JJJJJ—[Amended]

■ 128. Section 63.8420 is amended by revising paragraph (c) to read as follows:

§ 63.8420 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

* * * * *

■ 129. Section 63.8470 is amended by:

■ a. Removing and reserving paragraph (d); and

■ b. Revising the first sentence in paragraph (e) to read as follows:

§ 63.8470 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(d) [Reserved]

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1) and your OM&M plan. * * *

* * * * *

Subpart KKKKK—[Amended]

■ 130. Section 63.8570 is amended by revising paragraph (c) to read as follows:

§ 63.8570 What are my general requirements for complying with this subpart?

* * * * *

(c) For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

* * * * *

■ 131. Section 63.8620 is amended by:

■ a. Removing and reserving paragraph (d); and

■ b. Revising the first sentence in paragraph (e) to read as follows:

§ 63.8620 How do I demonstrate continuous compliance with the emission limitations and work practice standards?

* * * * *

(d) [Reserved]

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1) and your OM&M plan. * * *

* * * * *

Subpart LLLLL—[Amended]

■ 132. Section 63.8685 is amended by revising paragraph (c) to read as follows:

§ 63.8685 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

* * * * *

■ 133. Section 63.8691 is amended by:

■ a. Removing and reserving paragraph (c); and

■ b. Revising the first sentence in paragraph (d) to read as follows:

§ 63.8691 How do I demonstrate continuous compliance with the operating limits?

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

■ 134. Table 7 to subpart LLLLL of part 63 is amended by revising the citation to § 63.8(c)(1)(i) to read as follows:

Table 7 to Subpart LLLLL of Part 63—Applicability of General Provisions to Subpart LLLLL

Citation	Subject	Brief description	Applies to subpart LLLLL
* * * * * * *			
§ 63.8(c)(1)(i)	Routine and predictable CMS malfunction.	1. Keep parts for routine repairs readily available. 2. Reporting requirements for CMS malfunction when action is described in SSM plan.	Yes.
* * * * * * *			

Subpart MMMMM—[Amended]

■ 135. Section 63.8794 is amended by revising paragraph (e) to read as follows:

§ 63.8794 What are my general requirements for complying with this subpart?

* * * * *

(e) For each new or reconstructed flame lamination affected source, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

* * * * *

■ 136. Section 63.8812 is amended by:

■ a. Removing and reserving paragraph (c); and

■ b. Revising the first sentence in paragraph (d) to read as follows:

§ 63.8812 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(c) [Reserved]

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur at a new or reconstructed flame lamination affected source during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

* * * * *

Subpart NNNNN—[Amended]

■ 137. Section 63.9005 is amended by revising paragraph (c) to read as follows:

§ 63.9005 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

* * * * *

■ 138. Section 63.9040 is amended by:

■ a. Removing and reserving paragraph (d); and

■ b. Revising the first sentence in paragraph (e) to read as follows:

§ 63.9040 How do I demonstrate continuous compliance with the emission limitations and work practice standards?

* * * * *

(d) [Reserved]

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

Subpart PPPPP—[Amended]

■ 139. Section 63.9305 is amended by revising the first sentence in paragraph (c) to read as follows:

§ 63.9305 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written SSM plan (SSMP) for emission control devices and associated monitoring equipment according to the provisions in § 63.6(e)(3). * * *

■ 140. Section 63.9340 is amended by removing introductory text in paragraph (c) and revising paragraph (c)(1) to read as follows:

§ 63.9340 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(c) *Startups, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of SSM of control devices and associated monitoring equipment are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

■ 141. Section 63.9375 is amended by revising the first sentence in the definition of malfunction to read as follows:

§ 63.9375 What definitions apply to this subpart?

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 142. Table 7 to subpart PPPPP of part 63 is amended by revising the citation to § 63.8(c)(1)(i) to read as follows:

Table 7 to Subpart PPPPP of Part 63—Applicability of General Provisions to Subpart PPPPP

* * * * *

Citation	Subject	Brief description	Applies to subpart PPPPP
*	*	*	*
§ 63.8(c)(1)(i)	Routine and predictable CMS malfunctions.	1. Keep parts for routine repairs of CMS readily available. 2. Reporting requirements for SSM when action is described in SSMP.	Yes.
*	*	*	*

Subpart QQQQQ—[Amended]

■ 143. Section 63.9505 is amended by revising paragraph (c) to read as follows:

§ 63.9505 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 144. Section 63.9530 is amended by:

■ a. Removing and reserving paragraph (d); and

■ b. Revising the first sentence in paragraph (e) to read as follows:

§ 63.9530 How do I demonstrate continuous compliance with the emission limitation that applies to me?

* * * * *

(d) [Reserved]

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). * * *

Subpart RRRRR—[Amended]

■ 145. Section 63.9610 is amended by revising paragraph (c) to read as follows:

§ 63.9610 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 146. Section 63.9637 is amended by removing introductory text in paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.9637 What other requirements must I meet to demonstrate continuous compliance?

* * * * *

(b) *Startups, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

Subpart SSSSS—[Amended]

■ 147. Section 63.9792 is amended by revising paragraph (c) to read as follows:

§ 63.9792 What are my general requirements for complying with this subpart?

* * * * *

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

* * * * *

■ 148. Section 63.9810 is amended by removing and reserving paragraph (e)(1) and revising the first sentence in paragraph (e)(2) to read as follows:

§ 63.9810 How do I demonstrate continuous compliance with the emission limits, operating limits, and work practice standards?

* * * * *

(e) * * *

(1) [Reserved]

(2) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1) and your OM&M plan. * * *

Subpart TTTTT—[Amended]

■ 149. Section 63.9910 is amended by revising paragraph (b) to read as follows:

§ 63.9910 What are my general requirements for complying with this subpart?

* * * * *

(b) You must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

■ 150. Section 63.9925 is amended by removing introductory text in paragraph (b) and revising paragraph (b)(1) to read as follows:

§ 63.9925 What other requirements must I meet to demonstrate continuous compliance?

* * * * *

(b) *Startups, shutdowns, and malfunctions.* (1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

* * * * *

PART 65—[AMENDED]

■ 151. The authority citation of part 65 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 152. Section 65.2 is amended by revising the first sentence in the definition of *malfunction* to read as follows:

§ 65.2 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, monitoring equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 153. Section 65.3 is amended by
■ a. Revising the second sentence in paragraph (a)(3);
■ b. Revising the first sentence in paragraph (a)(4); and
■ c. Revising paragraph (b)(2)(i) to read as follows:

§ 65.3 Compliance with standards and operation and maintenance requirements.

(a) * * *

(3) * * * The measures to be taken may include, but are not limited to, air pollution control technologies, recovery technologies, work practices, pollution prevention, monitoring, and/or changes in the manner of operation of the regulated source. * * *

(4) Malfunctions shall be corrected as soon as practical after their occurrence. * * *

* * * * *

(b) * * *

(2) * * *

(i) During periods of startup, shutdown, or malfunction (and the source is operated during such periods in accordance with § 65.3(a)(3)), a monitoring parameter is outside its established range or monitoring data cannot be collected; or

* * * * *

■ 154. Section 65.6 is amended by:
■ a. Revising the first and fourth sentences in paragraph (b)(1) introductory text;
■ b. Revising paragraph (b)(2); and
■ c. Revising paragraph (c)(3) to read as follows:

§ 65.6 Startup, shutdown, and malfunction plan and procedures.

* * * * *

(b) *Startup, shutdown, and malfunction plan*—(1) *Description and purpose of plan.* The owner or operator of a regulated source shall develop a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the regulated source during periods of startup, shutdown, and malfunction and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the relevant standard. * * * The requirement to develop this plan shall be incorporated into the source's title V permit. * * *

* * * * *

(2) *Operation of source.* During periods of startup, shutdown, and malfunction, the owner or operator of a regulated source shall operate and maintain such source (including associated air pollution control equipment and CPMS) in accordance with § 65.3(a). The general duty to minimize emissions during a period of startup, shutdown, or malfunction does not require the owner or operator to achieve emission levels that would be required by the applicable standard at other times if this is not consistent with safety and good air pollution control practices, nor does it require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the

Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures (including the startup, shutdown, and malfunction plan required in paragraph (b)(1) of this section), review of operation and maintenance records, and inspection of the source.

* * * * *

(c) * * *

(3) If actions taken by an owner or operator during a startup, shutdown, and malfunction of a regulated source, or of a control device or monitoring system required for compliance (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan, then the owner or operator shall state such information in a startup, shutdown, and malfunction report, and describe the actions taken. Such description can take the form of a checklist; only one checklist is necessary if actions taken are the same for multiple events during the reporting period.

* * * * *

■ 155. Section 65.115 is amended by revising the last sentence in paragraph (b)(1) and the last sentence in paragraph (b)(2) to read as follows:

§ 65.115 Standards: Closed vent systems and control devices; or emissions routed to a fuel gas system or process.

* * * * *

(b) *Compliance standard.* (1) * * * Note that this includes the startup, shutdown, and malfunction provisions of § 65.6.

(2) * * * Note that this includes the startup, shutdown, and malfunction provisions of § 65.6.

■ 156. Section 65.156 is amended by revising paragraphs (d)(3)(i) and (ii) to read as follows:

§ 65.156 General monitoring requirements for control and recovery devices.

* * * * *

(d) * * *

(3) * * *

(i) Excursions which occur during periods of startup, shutdown, and malfunction, when the source is being operated during such periods to minimize emissions in accordance with § 65.3(a)(3).

(ii) Excursions which occur due to failure to collect a valid hour of data during periods of startup, shutdown, and malfunction, when the source is being operated during such periods in accordance with § 65.3(a)(3).

* * * * *

■ 157. Section 65.161 is amended by revising paragraph (e)(2)(iv)(A) to read as follows:

§ 65.161 Continuous records and monitoring data system handling.

* * * * *

(e) * * *

(2) * * *

(iv) * * *

(A) The daily average value during any startup, shutdown, or malfunction shall not be considered an excursion for purposes of this paragraph (e) if the owner or operator operates the source in accordance with § 65.3(a).

* * * * *

■ 158. Section 65.163 is amended by revising paragraph (c)(2) to read as follows:

§ 65.163 Other records.

* * * * *

(c) * * *

(2) For each startup, shutdown, and malfunction during which excess emissions occur, records whether the procedures specified in the source's startup, shutdown, and malfunction plan were followed, and a description of actions taken to minimize emissions. For example, if a startup, shutdown, and malfunction plan includes procedures for routing control device emissions to a backup control device (for example, the incinerator for a halogenated stream could be routed to a flare during periods when the primary control device is out of service), records must be kept of whether the plan was followed. These records may take the form of a checklist or other form of recordkeeping that confirms conformance with the startup, shutdown, and malfunction plan for the event.

* * * * *

[FR Doc. 06-3312 Filed 4-19-06; 8:45 am]

BILLING CODE 6560-50-P

entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*).

EPA has determined that this final action does not include a Federal mandate that may result in estimated costs of $100 million or more to either state, local, or tribal governments in the aggregate, or to the private sector. This action will require the state of Missouri to revise laws and regulations to meet the NAAQS for lead. This requirement would not result in aggregate costs over $100 million to either the state or local districts. It is unclear whether a requirement to submit a SIP revision would constitute a Federal mandate. The obligation for a state to revise its SIP that arises out of sections 110(a) and 110(k)(5) of the CAA is not legally enforceable by a court of law, and at most is a condition for continued receipt of highway funds. Therefore, it is possible to view an action requiring such a submittal as not creating any enforceable duty within the meaning of section 421(5)(9a)(I) of the Unfunded Mandates Reform Act (UMRA) (2 U.S.C. 658(a)(I)). Even if it did, the duty could be viewed as falling within the exception for a condition of Federal assistance under section 421(5)(a)(i)(I) of UMRA (2 U.S.C. 658(5)(a)(i)(I)).

This final action also does not have tribal implications because it will not have a substantial direct effect on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes, as specified by Executive Order 13175 (65 FR 67249, November 9, 2000).

This action also does not have Federalism implications because it does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999), because it is in keeping with the relationship and the distribution of power and responsibilities between EPA and the states as established by the CAA. This SIP call is required by the CAA because the current SIP is inadequate to attain the lead NAAQS. Missouri's direct compliance costs will not be substantial because the SIP call requires Missouri to submit only those revisions necessary to address the SIP deficiency and applicable CAA requirements.

Executive Order 13045: "Protection of Children from Environmental health Risks and Safety Risks" (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency. EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Order has the potential to influence the regulation. This rule is not subject to Executive Order 13045 because it requires attainment of a previously promulgated health-based Federal standard. In addition, it is not economically significant.

Section 12 of the National Technology Transfer and Advancement Act of 1995 requires Federal agencies to evaluate existing technical standards when developing a new regulation. To comply with the National Technology Transfer and Advancement Act, EPA must consider and use "voluntary consensus standards" (VCS) if available and applicable when developing programs and policies unless doing so would be inconsistent with applicable law or otherwise impractical. In making a finding of a SIP deficiency, EPA's role is to review existing information against previously established standards (in this case, what constitutes a violation of the lead standard). In this context, there is no opportunity to use VCS. Thus, the requirements of section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) do not apply.

This final action does not impose an information collection burden under the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*).

National Emission Standards for Hazardous Air Pollutants for Refractory Products Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Withdrawal of direct final rule.

SUMMARY: Because EPA received adverse comment, we are withdrawing the direct final rule amendments to the national emission standards for hazardous air pollutants (NESHAP) for Refractory Products Manufacturing, published in the **Federal Register** on February 13, 2006. We stated in the direct final rule amendments that if we received adverse comment by March 15, 2006, we would publish a timely notice of withdrawal in the **Federal Register**. We subsequently received adverse comment on the direct final rule amendments. We will address those comments in a subsequent final action based on the parallel proposal also published on February 13, 2006. As stated in the parallel proposal, we will not institute a second comment period on this action.

DATES: As of April 14, 2006, EPA withdraws the direct final rule amendments published on February 13, 2006 (71 FR 7415).

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0088. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the NESHAP for Refractory Products Manufacturing Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Refractory Products

Manufacturing Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Susan Fairchild, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Metals and Minerals Group (D–243–02), Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5167; fax number: (919) 541–5600; e-mail address: *fairchild.susan@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

Categories and entities potentially affected by this action include those which manufacture refractory products. Regulated categories and entities include:

Category	NAICS code[1]	Examples of regulated entities
Industry	327124 327125	Clay refractory manufacturing plants and nonclay refractory manufacturing plants.
Federal government		Not affected.
State/local/tribal government		Not affected.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. This table lists the types of entities that EPA is now aware could be affected by this action. Other types of entities not listed in the table could also be affected. To determine whether your facility is affected by this action, you should carefully examine the applicability criteria in 40 CFR 63.9782 of subpart SSSSS (NESHAP for Refractory Products Manufacturing). If you have questions regarding the applicability of this action to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13 of subpart A (General Provisions).

II. Background Information

On February 13, 2006, we published a direct final rule (71 FR 7415) and parallel proposal (71 FR 7494) amending the NESHAP for Refractory Products Manufacturing. The amendments would have clarified the testing and monitoring requirements of the NESHAP, made the NESHAP consistent with recent changes to the General Provisions (40 CFR part 63, subpart A), and made certain technical corrections to the rule. The amendments would have clarified that sources complying with the total hydrocarbon (THC) percent reduction emission limit could choose to meet the alternative concentration emission limit if they turn back the control device after it is no longer needed (*i.e.*, after the concentration of THC in the exhaust gas is at or below the THC concentration emissions limit).

The preamble to the direct final rule amendments stated that if we received adverse comment by March 15, 2006, we would publish a timely notice of withdrawal in the Federal Register. EPA received adverse comment on the direct final rule amendments. Accordingly, we are withdrawing the direct final rule amendments as of April 14, 2006. EPA will take final action on the parallel proposal after considering the comments received. As stated in the parallel proposal, EPA will not institute a second comment period on this action.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: April 7, 2006.

William L. Wehrum,

Acting Assistant Administrator for Air and Radiation.

PART 63—[AMENDED]

■ Accordingly, the amendments to the rule published in the Federal Register on February 13, 2006 (71 FR 7415) on pages 7415–7441 are withdrawn as of April 14, 2006.

Sodium Metasilicate; Amendment to an Exemption From the Requirement of a Tolerance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes an amendment to an exemption from the requirement of a tolerance for residues of sodium metasilicate on all food commodities when applied/used as an insecticide or fungicide to control or suppress leafhoppers and powdery mildew in accordance with approved label rates and good agricultural practice. A petition was submitted to EPA on behalf of Environmentally Safe Systems, Inc. under the Federal Food, Drug, and Cosmetic Act (FFDCA), as amended by the Food Quality Protection Act of 1996 (FQPA), requesting an exemption from the requirement of a tolerance. This regulation eliminates the need to establish a maximum permissible level for residues of sodium metasilicate.

DATES: This regulation is effective April 14, 2006. Objections and requests for hearings must be received on or before June 13, 2006.

ADDRESSES: To submit a written objection or hearing request follow the detailed instructions as provided in Unit IX. of the **SUPPLEMENTARY INFORMATION.** EPA has established a docket for this action under Docket identification (ID) number EPA–HQ–OPP–2002–0241. All documents are listed on the www.regulations.gov web site. (EDOCKET, EPA's electronic public docket and comment system was replaced on November 25, 2005, by an enhanced federal-wide electronic docket management and comment system located at *http://www.regulations.gov/.* Follow the on-line instructions.) Although listed in the index, some information is not publicly available, i.e., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at the Public Information and Records Integrity Branch (PIRIB), Rm. 119, Crystal Mall #2, 1801 S. Bell St., Arlington, VA. This docket facility is open from 8:30 a.m. to 4 p.m., Monday through Friday, excluding legal holidays. The docket telephone number is (703) 305–5805.

and by adding a new paragraph (h) to read as follows:

§ 51.373 Implementation deadlines.

* * * * *

(b) For areas newly required to implement basic I/M as a result of designation under the 8-hour ozone standard, the required program shall be fully implemented no later than 4 years after the effective date of designation and classification under the 8-hour ozone standard.

* * * * *

(d) For areas newly required to implement enhanced I/M as a result of designation under the 8-hour ozone standard, the required program shall be fully implemented no later than 4 years after the effective date of designation and classification under the 8-hour ozone standard.

(e) [Reserved]

* * * * *

(h) For areas newly required to implement either a basic or enhanced I/M program as a result of being designated and classified under the 8-hour ozone standard, such programs shall begin OBD testing on subject OBD-equipped vehicles coincident with program start-up.

Ethylene Oxide Emissions Standards for Sterilization Facilities

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final decision.

SUMMARY: This action finalizes our decision not to revise the Ethylene Oxide Emission Standards for Sterilization Facilities, originally promulgated on December 6, 1994. Within 8 years of promulgating these standards, the Clean Air Act directs us to assess the risk and to promulgate more stringent standards if necessary to protect public health with an ample margin of safety and to prevent adverse environmental effects. Also, within 8 years of promulgating the national emission standards, the Clean Air Act requires us to review and revise the standards as necessary, taking into account developments in practices, processes, and control technologies. Today's action reflects our findings that after conducting these risk and technology reviews, no additional control requirements are warranted.

DATES: *Effective Date:* April 7, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2003–0197. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the Air and Radiation Docket, EPA/DC, EPA West, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: *General and Technical Information.* Mr. David Markwordt, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Coatings and Chemicals Group (E–143–01), Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone (919) 541–0837, facsimile number (919) 685–3195, electronic mail (e-mail) address: *markwordt.david@epa.gov.*

[a] North American Industry Classification System.
[b] Standard Industrial Classification.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by the national emission standards. To determine whether your facility would be affected by the national emission standards, you should examine the applicability criteria in 40 CFR 63.360. If you have any questions regarding the applicability of the national emission standards to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's final decision will also be available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of the final decision will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg/.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final decision is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by June 6, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to a rule or procedure raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final decision may not be challenged separately in civil or criminal proceedings brought to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Outline. The information presented in this preamble is organized as follows:

I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Statutory Authority for These Actions?

Section 112 of the CAA establishes a comprehensive regulatory process to address hazardous air pollutants (HAP) from stationary sources. In implementing this process, we have identified categories of sources emitting one or more of the HAP listed in the CAA, and ethylene oxide sterilization facilities are identified as both major and area source categories. Section 112(d) requires us to promulgate national technology-based emission standards for sources within those categories that emit or have the potential to emit any single HAP at a rate of 10 tons or more per year or any combination of HAP at a rate of 25 tons or more per year (known as major sources), as well as for certain area sources emitting less than those amounts. These technology-based national emission standards for HAP (NESHAP) must reflect the maximum reductions of HAP achievable (after considering cost, energy requirements, and nonair health and environmental impacts) and are commonly referred to as maximum achievable control technology (MACT) standards. We promulgated the National Emission Standards for Ethylene Oxide Commercial Sterilization and Fumigation Operations Facilities at 59 FR 62585 on December 6, 1994 (Ethylene Oxide Sterilization NESHAP). As for area sources, we established MACT standards for certain emission points pursuant to section 112(d)(2) and generally available control technology (GACT) standards for other emission points pursuant to section 112(d)(5).

In what is referred to as the technology review, we are required under section 112(d)(6) of the CAA to review these technology-based standards no less frequently than every 8 years. Further, if we conclude that a revision is necessary, we have the authority to revise these standards, taking into account "developments in practices, processes, and control technologies."

The residual risk review is described in section 112(f) of the CAA. Section 112(f)(2) requires us to determine for each section 112(d) source category, except area source categories for which we issued a GACT standard, whether the NESHAP protects public health with an ample margin of safety (AMOS). If the NESHAP for HAP "classified as a known, probable, or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million," we must decide whether additional reductions are necessary to provide an ample margin of safety. As part of this decision, we may consider costs, technological feasibility, uncertainties, or other relevant factors. We must determine whether more stringent standards are necessary to prevent adverse environmental effect (defined in section 112(a)(7)) as "any significant and widespread adverse effect, which may reasonably be anticipated to wildlife, aquatic life, or other natural resources, including adverse impacts on populations of endangered or threatened species or significant degradation of environmental quality over broad areas," but in making this decision we must consider cost, energy, safety, and other relevant factors.

B. What Did We Propose?

We promulgated the Ethylene Oxide Sterilization NESHAP in 1994. On October 24, 2005 (70 FR 61406), we proposed not to revise the Ethylene Oxide Sterilization NESHAP and requested public comments on the residual risk and technology review for the Ethylene Oxide Sterilization NESHAP.

II. Risk and Technology Review Final Decision

In our proposal, we presented the analysis and conclusions on residual risk and technology review, concluding that the maximum individual cancer risk for this source category already meets the level we generally consider acceptable, and that further control requirements would achieve, at best, minimal emission and risk reductions at a very high cost from emission vents controlled with MACT at both major and area sources. Further, the analyses showed that both the chronic noncancer and acute risks from this source category are below their respective relevant health thresholds, and that there are no adverse impacts to the environment (i.e., ecological risks). As a result, we concluded that no additional control should be required because an ample margin of safety (considering cost, technical feasibility, and other factors) has been achieved by the NESHAP MACT requirements for the

ethylene oxide major and area source categories.

In the technology review, we concluded that additional controls at existing sources would achieve, at best, minimal emission and risk reductions at a very high cost. Additionally, we did not identify any significant developments in practices, processes, or control technologies since promulgation of the original standards in 1994 which represent the best controls that can be implemented nationally. Thus, we proposed no additional controls under the technology review under CAA section 112(d)(6).

We conclude in this rulemaking, as proposed, that there is not a need to revise the Ethylene Oxide Sterilization NESHAP under the provisions of CAA section 112(f) or 112(d)(6).

III. Summary of Comments and Responses

The proposal provided a 45-day comment period ending December 8, 2005. We received comments from eight commenters. Commenters included three State agencies, one State and local agency association, three industry trade associations, and one coalition of trade associations. We have considered the public comments as discussed below and did not find that the comments changed any of our determinations.

1. Source Category Risk Approach

Comment: One commenter disagreed that EPA can utilize approaches different from that specified in the Benzene NESHAP. The commenter believes that EPA misinterpreted the CAA legislative history stating that EPA could read section 112(f)(2)(B) as directing it to use the interpretation set out in the Benzene NESHAP or use approaches affording the same level of protection. According to the commenter, EPA must use only the Benzene NESHAP approach and cannot use any other approach by relying on a Senate manager's statement that EPA should interpret the section 112(f)(2)(B) requirement to establish standards reflecting an ample margin of safety in a manner no less protective of the most exposed individual than the policy set forth in the Benzene NESHAP.

Response: In the proposed rule, EPA followed the approach set out in National Emission Standards for Hazardous Air Pollutants (NESAHP): Benzene Emissions from Maleic Anhydride Plants, Ethylbenzene/Styrene Plants, Benzene Storage Vessels, Benzene Equipment Leaks, and Coke By-Product Recovery Plants, 54 FR 38044 (September 14, 1989). EPA used the two-step decision process of first determining a level of acceptable risk followed by finding an ample margin of safety. As the commenter concedes EPA's approach is fully consistent with the Benzene NESHAP approach and therefore acceptable. Since, in this instance, EPA did not use any other approach, the comment is not applicable to this particular rulemaking.

Comment: One commenter stated that Congress was clear in requiring EPA to evaluate only the risks from an individual source category or subcategory in establishing residual risk standards. The commenter stated EPA should not include the risk from area sources in determining whether risks from the major source category exceeds the one-in-a-million risk trigger under section 112(f)(2) or in making judgments on acceptable risk and ample margin of safety for major sources.

Response: We listed separate source categories for major and area commercial sterilization facilities under section 112(c) of the CAA, and we agree with the commenter that a separate determination of acceptable risk and ample margin of safety should be made for each source category under section 112(f) of the CAA. Our risk assessment for commercial sterilization facilities includes risk estimates for all known sources, including mostly major sources and the area sources with the highest emissions. Only two area sources have estimated cancer risk greater than 1 in 1 million (highest is 20 in 1 million), and no area sources have modeled ethylene oxide concentrations near the reference concentration. For additional information on our risk assessment of area sources see section III.2.

In the preamble to the proposed rule, we stated that risks were acceptable considering all known sources (major and area sources) and that an ample margin of safety was achieved without control requirements beyond those in the current standards. Although the preamble to the proposed rule does not discuss separate determinations of acceptability and ample margin of safety for major and areas source categories, our conclusions would not have changed whether we had considered all sources together, or separately for major sources and area sources.

Comment: One commenter stated that EPA did not comprehensively consider the plants' impacts because it did not consider all HAP emissions or all source categories at the facilities. The commenter stated that in considering only a portion of the facilities' emissions, the determination of low-risk is based on a distorted and unrealistic view of their impact. The commenter included an example of a facility that uses and emits methyl bromide from its sterilization operations.

Response: In general, there is much less co-location of commercial sterilization operations with other industrial processes than there is for the typical source category. Many facilities are contract sterilizers with no co-location. In some cases, there is co-location of commercial sterilizers with other processes, such as pharmaceuticals production. We do not have sufficiently detailed information to analyze the possibility of controls on the various specific sources within a facility but outside the commercial sterilizer source category. As a result, we could not evaluate the existing levels of control or the potential for applying additional controls at the facilities where HAP emissions from other sources contribute to the risk. Therefore, we did not consider emissions from co-located sources in our decision to require no additional controls because we did not have the control cost and feasibility data necessary to do so. Our position on the potential consideration of co-located source categories is fully discussed in the coke oven final rule (70 FR 19995–19998).

Regarding emissions of methyl bromide, we searched the 1999 National Emissions Inventory (NEI) for the 76 identified ethylene oxide sterilization facilities to determine which emit both ethylene oxide and methyl bromide. According to the NEI data base, only two of the facilities emit both HAP. One of the facilities emits so little methyl bromide that the risk estimates would not be significantly different if methyl bromide were considered. The other facility emits more methyl bromide than ethylene oxide (about 2 to 3 times as much). However, because there is no cancer unit risk estimate for methyl bromide, the emissions of methyl bromide would not affect our cancer risk estimate (3 in 1 million). Considering effects other than cancer, the reference concentration for chronic inhalation exposures to methyl bromide is approximately six times lower than that of ethylene oxide. Consequently, the methyl bromide emissions could result in an increase in our estimate of the hazard index for the facility by as much as a factor of 20 (assuming similar source release parameters like stack height, etc.). This is not a concern because our current estimate of the hazard index is 0.001, and a factor greater than 1000 would be necessary before a hazard index of 1 would be exceeded. Therefore, even considering these emissions would not change our regulatory decision.

Comment: One commenter stated EPA should not conduct a separate technology review for ethylene oxide sources under section 112(d)(6). The commenter believes that once EPA has made a residual risk determination under section 112(f), emissions from the category are "safe," and the Agency must find a revision of the MACT standard under section 112(d)(6) is unnecessary. Another commenter urges EPA to avoid expenditure of resources by conducting further analysis geared to tightening control requirements when an AMOS has already been provided by a protective standard.

Response: As discussed in the preamble to the proposed rule, we performed a separate technology review for both the area and major source categories under section 112(d)(6), but recommended no changes to the NESHAP. It is possible that future advances in control technologies for this source category could allow for meaningful emission reductions at a reasonable cost. We believe that the technology review required under section 112(d)(6) was appropriate here.

Comment: One commenter believes that there is no mechanism to revisit section 112(f) assessments and, therefore, that the risk assessment should be corrected to account for reasonably foreseeable changes that could result in increased risk, such as new residences being built closer to the facility, or increases in actual emissions within the current permit limitations.

Response: We disagree with the commenter's assertion that there is no mechanism to revisit risks from the source category, and that, therefore, the risk assessment must include consideration of foreseeable changes that may occur in the future. We have the authority to revisit (and revise, if necessary) any rulemaking if there is sufficient evidence that changes within the affected industry or significant improvements to science suggests the public is exposed to significant increases in risk as compared to the risk assessment prepared for the rulemaking (e.g., CAA section 301).

2. Area Source Category—MACT and GACT

Comment: One commenter stated that EPA has discretion to not regulate MACT or GACT area sources under section 112(f). One commenter stated that EPA has the discretion under section 112(f)(5) of the CAA to avoid residual risk analysis for area sources subject to GACT, regardless of whether such sources are subject to both MACT and GACT under section 112(d). The commenter reasoned that since the CAA does not require residual risk analysis of area sources subject to GACT only, area sources subject to more stringent requirements under both MACT and GACT should also not require analysis. Two commenters stated that EPA should not omit sources subject to GACT from the residual risk analysis because it could result in serious underestimation of the health risks from area sources. One commenter believes that both section 112(d) and 112(f) of the CAA were satisfied when area sources were addressed under section 112(d)(5); since GACT controls alone would have been sufficient for EPA to avoid a residual risk review, clearly requiring both MACT and GACT controls obviates the need for any further Agency review of these area sources under both 112(d) and 112(f).

Response: For area source ethylene oxide sterilizers, EPA issued MACT standards under section 112(d)(2) for sterilizer vents and chamber exhaust vents and GACT standards for aeration room vents. EPA undertook a section 112(f)(2) analysis for area source emissions standards that were issued as MACT standards and exercised its discretion under section 112(f)(5) to not do an 112(f)(2) analysis for those emission points for which GACT standards were established. EPA appreciates the responses to its question regarding the range of discretion that the Agency has under section 112(f)(5) and will consider the points made by commenters in developing future relevant proposals. However, for purposes of this rulemaking, EPA believes that it exercised its discretion appropriately by conducting a 112(f)(2) analysis for those emission points subject to MACT standards.

3. Risk Analysis Assumptions

Comment: Two commenters stated that EPA must use the best available science to establish a cancer unit risk estimate for ethylene oxide, and that it is scientifically indefensible for EPA to use the California Environmental Protection Agency cancer unit risk factor in risk assessments when more recent epidemiological data exist. One commenter states that the basis for the California unit risk factor (mononuclear leukemia in female rats) is not relevant to humans. One commenter states that a sound scientific estimate of the cancer unit risk for ethylene oxide has been derived by Kirman, *et al.*[1] based partly on two epidemiological studies[2,3] that include exposure estimates for more than 20,000 workers. Two commenters stated that EPA should plan to reevaluate the risks associated with this source category whenever the new cancer risk estimate is made final, regardless of whether or not the final rule has been published.

Response: In estimating potential excess cancer risk associated with ethylene oxide sterilizers, EPA has considered all available, credible, and relevant information. In 1985, the EPA health assessment for ethylene oxide[4] concluded, based on the information available at that time, that ethylene oxide is "probably carcinogenic to humans," and derived a cancer unit risk estimate. California EPA subsequently relied on the EPA assessment in developing their cancer unit risk estimate using the same rat study as basis.[5,6] The California EPA assessment received concurrence from their Scientific Review Panel.[7] In 1994, the International Agency for Research on Cancer categorized ethylene oxide in their Group 1 (Carcinogenic to Humans). In 2000, the United States Department of Health and Human Services revised its listing for ethylene oxide to "known to be a human carcinogen" in the Ninth Report on Carcinogens.[8] Support for this listing includes epidemiological evidence from studies of workers exposed to ethylene oxide and animal studies. Cancer in both human and animal studies has included multiple sites, including reported associations with leukemia.[9]

EPA is currently developing an updated cancer assessment for ethylene oxide (*http://cfpub.epa.gov/iristrac/index.cfm?fuseaction=viewChemical.showChemical&iris&_sub_id=897*). EPA's updated cancer assessment for ethylene oxide will consider all relevant literature and studies including the Kirman, *et al.* paper and the epidemiological studies referred to in the comment. However, until completion of that assessment and given the peer review status of the work done by the State of California, the California EPA unit risk estimate must be considered to be the best-available science and has therefore been used in assessing cancer risk for this rulemaking.

The EPA cancer assessment will not receive external peer review until mid-2006, which is after the promulgation date of the residual risk rule for this source category. Our authority to revisit any rulemaking is addressed in Section III.1.

Comment: Several commenters stated that Acute Exposure Guideline Levels (AEGL), Emergency Response Planning Guidelines (ERPG), and Immediately Dangerous to Life or Health (IDLH) values should not be used in assessing the risk from acute exposures to ethylene oxide because these values were developed for accidental release planning and are not appropriate for assessing daily human exposure scenarios. One commenter stated that EPA's acute assessment discounted the use of the National Institute of Occupational Safety and Health (NIOSH) 10-minute ceiling value of 5 parts per million (ppm) (9 mg/m^3), and noted that EPA's maximum acute exposure estimate for this source category (23 mg/m^3) exceeds the NIOSH value. Two of the commenters stated that EPA's new acute reference concentration value for ethylene oxide should be used when it becomes available.

Response: We are continuing to evaluate the role of acute health effects in our section 112(f) analysis. In any event, we have concluded that this source category does not present acute health risks that warrant further regulation. Our authority to revisit any rulemaking is addressed in Section III.1.

Comment: Three commenters stated that EPA should consider the risks from chronic exposure at facility property boundaries instead of at the geographic centroids of census blocks. The commenters state that census blocks can be large and that the point of maximum impact can be far from the census block centroid.

Response: We believe that, in a national-scale assessment of lifetime inhalation exposures and health risks from a category of facilities, it is appropriate to identify exposure locations where an individual may reasonably be expected to spend a majority of his or her lifetime. Further, we believe that it is appropriate to use census block information on where people actually reside, rather than points on a fence-line, to locate the estimation of exposures and risks to individuals living near such facilities.

Census blocks are the finest resolution available for the nationwide population data set (as developed by the U.S. Census Bureau); each is typically comprised of approximately 40 people or about 10 households. In our risk assessments, we use the geographic centroid of each census block containing at least one person to represent the location where all the people in that census block live. The census block centroid with the highest estimated exposure then becomes the location of maximum exposure, and the entire population of that census block experiences the maximum individual risk. In some cases, since actual residence locations may be closer to or farther from facility emission points, this may result in an overestimate or underestimate of the actual chronic risks. However, given the relatively small dimensions of census blocks in densely-populated areas and the relatively large number of sources being assessed for any given source category, we believe that these uncertainties are small and do not bias our estimates of maximum individual risks for a source category.

Comment: One commenter stated that the risk assessment for ethylene oxide sterilization facilities lacks a reliable facility-specific inventory of emissions. The commenter stated that EPA did not acquire the ethylene oxide usage records and emissions data needed to perform the residual risk assessment, but instead relied on industry-supplied data from the Toxics Release Inventory (TRI) and the National Emissions Inventory (NEI). The commenter implied that EPA should have requested data from facilities under its authority under section 114 of the CAA. The commenter strongly recommend that the EPA re-conduct this residual risk assessment by requiring the sources subject to this proposed rulemaking to report five years of usage data and/or throughput data. The EPA should then select the maximum usage value to calculate emissions for each facility in the residual risk assessment based on the current percent control requirement prescribed by the NESHAP. One commenter stated that EPA's risk assessment considered only actual reported emissions instead of potential emissions. The commenter stated that since facility emissions (and associated impacts) could increase over time for a variety of reasons EPA should have considered the risks based on potential emissions. Two commenters stated residual risk assessments must be performed on allowable emissions to fully understand the potential public health implications for a source category.

Response: Our position on the use of allowable emissions is fully discussed in the final Coke Oven Batteries NESHAP (70 FR 19998–19999).

We used reported emissions (from the National Emissions Inventory database and company reports) for the ethylene oxide source category risk analysis. The reported emissions are a mix of actual, allowable, and potential emissions, but we do not have the necessary information to distinguish between the types of data reported. While we generally recognize that most facilities over comply with the MACT requirements (thus, actual emissions are lower than allowable), we do not have data to determine the degree of over compliance that facilities are achieving or reporting. For example, chamber exhaust emissions in some cases may be lower because they are controlled by some States although not by EPA because of the safety issue discussed in the proposal. The removal of chamber exhaust vent controls by the States would likely result in a significant increase in risk. However, as discussed in section III.3, we have no basis to change conclusions presented in the proposal and will not impose controls on chamber exhaust emissions for either new or existing facilities.

The commenter also recommended we use the authority under section 114 of the CAA to gather data rather than use data bases like the TRI or data submitted by the facility but not under authority of the CAA. Since the data ultimately is supplied by the facility we believe the data is comparable to data gathered under section 114. The commenter also recommended we base rule-making on 5 years of data. The commenter provided no basis which demonstrates modeled results based on the previous 5 years are any more representative of risks than those based on the most recent emission estimates.

4. Additional Issues

Comment: One commenter stated EPA concludes that "further controls would not meaningfully reduce emissions from emission vents" but indicates that the Agency is aware that the State of California's requirement for the main sterilizer vent is 99.9 percent as contrasted with the 99 percent MACT requirement. The Agency therefore requests further data from the public in the form of five questions dealing primarily with technology and costs. (70 FR 61408) EPA does not clearly set out what decision criteria will be applied to the information that the public is being asked to supply. The commenter also stated that EPA does not explicitly state the decision criteria used in making ample margin of safety decisions under the residual risk program. Specifically, the commenter stated that for ethylene oxide sterilization facilities, the EPA did not explicitly state that incremental emission control costs were compared to incremental risk reductions in making the ample margin of safety decision, as it has in past rulemakings such as the Benzene NESHAP and radionuclide standards. The commenter also stated that the public would better understand and accept EPA's ample margin of safety decisions if EPA were to better educate the public regarding its estimated risk estimates and the contribution of stationary sources to the overall risk. One commenter stated EPA indicates that the agency had considered increasing the emission reduction limit to 99.9 percent in the national emission standards but that "we do not have data to confirm that facilities are capable of achieving 99.9 percent on a continuous basis" (70 FR 61409). The commenter encouraged EPA to review state data on this source category, including information from New York and New Jersey, indicating that such levels are achievable. Another commenter stated that EPA needs to re-evaluate the control technologies and exemptions from the current NESHAP. The emissions of ethylene oxide from the largest fugitive sources evaluated in the residual risk assessment equates to over 28 tons per year. The EPA should assess the risk reductions associated with the additional control percentages on the sterilizer chamber vent and aeration room vents for sources which use between 1 and less than 10 tons and 10 tons or greater per year of ethylene oxide.

Response: EPA stated in the proposal, "we considered the estimate of health risk and other health information along with additional factors relating to the appropriate level of control, including costs and economic impacts of controls, technological feasibility, uncertainties, and other relevant factors." We used the same decision criteria today to address the data submitted in response to the proposal. The EPA does not have definitive criteria such as a specific cost effectiveness value which dictates the final outcome.

We solicited comments concerning both the control effectiveness and costs associated with increasing the performance limit to 99.9 percent. The summary test data submitted by the commenters lend support to the technical feasibility of complying with a higher limit for the main sterilizer vent. Commenters did not supply data supporting continuous compliance with a higher limit.

Many of the outlet concentrations are reported at the detection limit. This implies the measurement devices were showing zero concentration of ethylene oxide in the outlet stream. Because both the 1990s and 2000s data show no ethylene oxide in the outlet stream, we believe there isn't a measurable difference in the control efficiencies of the tested devices.

We did not receive comments addressing the safe control of emissions from the chamber exhaust vent. As we stated in the "Memorandum: Technology Review and Residual Risk Data Development for the Ethylene Oxide Commercial Sterilization NESHAP" (Docket # EPA–HQ–OAQ–2003–0197–0027): "Many, if not all, source facilities utilize a chamber exhaust fan while personnel are removing product from the sterilization chamber. This fan removes ethylene oxide off-gassing from the product. The Ethylene Oxide Commercial Sterilization and Fumigation NESHAP promulgated in 1994 (59 FR 62585) required control of the chamber exhaust vent. In 1997 there were a series of explosions associated with control of the chamber exhaust vent (62 FR 64736). We subsequently reassessed the control requirements and removed the requirement to control the chamber exhaust in November 2001 (66 FR 55577); the Agency continues to believe that the action taken in 2001 is reasonable and we have found no safe way to impose controls on the chamber exhaust vents. Approximately 1 percent of the ethylene oxide used in the process is emitted through the chamber exhaust vent."

Therefore, we have no basis to change conclusions presented in the proposal and will not impose controls on chamber exhaust emissions for either new or existing facilities.

To assess the risk reduction associated with increasing the stringency of the standard for the main sterilizer vent from 99 to 99.9 percent emission reduction, we looked at the five facilities with the highest estimated cancer risk (ETO 4, 5, 8, 18, 19, and 27). Only one commenter provided cost estimates to retrofit existing facilities to comply with a higher standard. This commenter estimated the retrofit costs to be approximately one million dollars per facility. Emissions from these five facilities range from approximately 0.3 to 4.5 tons per year and total 18 tons per year (Docket item EPA–HQ–OAR–2003–0197—0003, Table 2). Approximately 12 of the 18 tons are fugitive emissions from the chamber exhaust. Residual emissions i.e., emissions after the application of emission control devices from the main chamber and aeration vents for the five facilities with the highest estimated cancer risk (ETO 4, 5, 8, 18, 19, and 27) range from approximately 0 to 1.6 tons per year, and are 4 tons per year in total (Docket item EPA–HQ–OAR–2003–0197—0003 Table 2). Based on a $1 million capital investment per facility, a 7 percent discount rate, and a 10-year capital recovery period, the average cost per ton of emissions reduced for the five facilities is approximately $35,000. These estimates assume facilities complying with the 99 percent limit do not in practice achieve a higher efficiency than 99 percent and there are zero emissions from control devices complying with the 99.9 percent limit.

To test the commenter's assertion that more stringent controls on the main and aeration vents would reduce risk levels, we remodeled the five facilities with the highest estimated cancer risk (ETO 4, 5, 8, 18, 19, and 27) with the assumption that main vent and aeration vent emissions are essentially zero after a 99.9 percent reduction and we compared the results to the baseline risks estimates. The risks (estimated to one significant figure) changed for only one facility, for which the maximum individual risk was reduced from 90 in 1 million to 80 in 1 million. Although we did not remodel all facilities, similar results would be expected for the other facilities because of the high chamber exhaust emissions relative to the emissions from the main vent and aeration vent after 99 percent control. Therefore, for existing major sources we conclude in our ample margin of safety decision that further controls would achieve minimal emission and risk reductions at a very high cost.

For existing sources under the 8 year review, in the proposal we stated, "Because the three vents associated

with these facilities (i.e., the main sterilization, aeration room, and chamber exhaust emission vents) are the same for both major and area sources, the conclusions concerning technology apply to both source categories. We found that additional controls for emission vents controlled with either MACT or GACT would achieve at best, minimal emission and risk reductions at a very high cost. In our review, we did not identify any significant developments in practices, processes, or control technologies since promulgation of the national emission standards in 1994." The analysis presented above for the five facilities with the highest risk support the conclusion presented in the proposal.

As stated above we believe for new main sterilizer vent and aeration control, increasing the stringency of the control limit from 99 to 99.9 percent achieves only a minimal reduction in risk. Therefore, EPA does not find it necessary to increase the control limit for new facilities.

Comment: One commenter stated EPA appropriately concluded that changes to the standard are not required to satisfy section 112(f) of the CAA. However, the commenter stated EPA did not provide sufficient data in the preamble to the document on the AMOS analysis that led to this conclusion, including its cost versus risk-reduction benefit analysis for a possible increase in the EO reduction requirements from 99 percent to 99.9 percent.

Response: As we stated in the proposal, we did not find any new technology or alternative controls for any vents for commercial EO sterilizers. We also found no data to support the addition of down stream control devices to existing controls as a way of further reducing emissions. We, therefore, concluded that further controls would achieve minimal reductions at a high cost. While we were aware of more stringent control limits at the State level, we stated in the proposal that we did not have data to confirm that all facilities are capable of meeting a more stringent level and solicited both control and cost data. Based on the data received from commenters we performed a risk assessment which confirmed our earlier qualitative conclusion.

Comment: One commenter stated EPA's language suggests that the decision criterion is whether further reductions would "meaningfully reduce emissions or risks." (70 FR 61408) The commenter stated that introducing the term "meaningfully reduce" without further explaining it is potentially misleading to the public. They were further troubled by the continued insertion of the word "emissions" in this formulation of the decision criteria as reinforced by the specific questions asked in this Federal Register notice.

Response: EPA presented, in the proposal, its analysis and conclusions on residual risk and technology review. Under section 112(d)(6), EPA is required to review the MACT standards and revise them as necessary taking into account developments in practices, processes and control technologies, no less frequently than every 8 years. Section 112(f)(2) requires us to determine for each source category whether the NESHAP protect public health with an ample margin of safety and prevent an adverse environmental effect. After reviewing and analyzing data under both these sections, EPA concluded that further controls would not meaningfully reduce emissions or risks. EPA reached this conclusion because the maximum individual cancer risk for this source category is already at the level we generally consider acceptable and that further controls would achieve minimal risk reduction at a very high cost. In addition, our conclusion referred to both emissions and risk because EPA's analysis included both the technology review and a residual risk determination.

Comment: One commenter stated EPA's CAA section 112(d)(6) review of the source category correctly concluded that the NESHAP standards did not need to be revised. However, the commenter stated that EPA reached this conclusion after conducting an independent technology review instead of basing it on the conclusions of EPA's CAA section 112(f)(2) analysis, which showed that the source category achieves an AMOS that is not limited by cost or technological feasibility concerns. The commenter believes that EPA should have based its determination that further controls under 112(d)(6) are not required through the 112(f) AMOS determination. According to the commenter, EPA did not need to conduct a separate technology review because it considered the need for additional controls in its AMOS analysis. The commenter goes on to state that where the AMOS is based in large part on cost or technical feasibility concerns, which according to the commenter was not the case with EO sterilizer facilities, then further future review under CAA section 112(d)(6) may remain viable and additional controls may not be precluded if feasible control measures are identified. Further, the commenter states that in evaluating whether action is necessary under CAA section 112(d)(6), EPA should not apply a "bright line" 1 in 1 million standard for cancer risks, nor a similar "bright line" standard for non-cancer risks.

Response: Section 112(d)(6) of the CAA requires EPA to review, and revise as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under section 112 no less often than every 8 years. We disagree, therefore, that the Agency did not need to conduct a separate technology review because it considered, among other factors, the need for additional controls under its 112(f) analysis. As we noted in the preamble to the Coke Ovens residual risk rule, the findings that underlie a section 112(f) determination should be key factors in making any subsequent section 112(d)(6) determinations. However, as the word "subsequent" indicates, we believe that we are obligated to perform the initial section 112(d)(6) analysis. Because the timing for the initial section 112(d)(6) analysis coincides with those of the residual risk analysis, it is appropriate for the Agency to conduct both analyses at the same time and for the results of the risk analysis to impact future section 112(d)(6) technology reviews. However, we agree with the commenters that a revision is not necessarily required under section 112(d)(6) even if cancer risks are greater than or equal to 1 in 1 million. For example, it may be the case that a technology review is performed, but no change in the standard results from that review. In the preamble to the residual risk rule for Coke Ovens, we have applied a similar logic to the need for subsequent technology revisions under section 112(d)(6). As we stated in the Coke Ovens rule, if the ample margin of safety analysis for a section 112(f) standard shows that the remaining risk for non-threshold pollutants falls below 1 in 1 million and for threshold pollutants falls below a similar threshold of safety, then further revision should not be needed because an ample margin of safety has already been assured.

We generally agree that where an AMOS is based on cost or technical feasibility future review under § 112(d)(6) may require additional controls if feasible control measures are identified. If the availability and/or costs of technology are part of the rationale for the ample margin of safety determination, it is reasonable to conclude that changes in those costs or in the availability of technology could alter our conclusions regarding the ample margin of safety. For this reason, we agree that revisions may be

appropriate if the ample margin of safety established by the residual risk process considers cost or technical feasibility. In the EO proposal, we noted that while some states required the facilities to meet a more stringent standard, we believed that the costs and feasibility concerns for implementing such a standard did not make adopting this standard a reasonable alternative. In addition, we noted in the preamble to the EO proposal that EPA had evaluated new technologies and alternatives during our investigation of the safety issue regarding chamber exhaust vents and concluded that controls on those vents were not technologically feasible and additional controls on these vents were limited because of the safety issues. [For a full discussion of the safety issues, see 66 FR Notice 55577.]

IV. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), we must determine whether a regulation is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal government communities;

(2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) raise novel or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, OMB has notified us that it considers this a "significant regulatory action" within the meaning of the Executive Order. We have submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. However, OMB has previously approved the information collection requirements for the national emissions standards under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* and has assigned OMB control number 2060–0283, EPA ICR number 1666.06. A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, Collection Strategies Division; U.S. Environmental Protection Agency (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for our regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

We have established a public docket for this action, which includes the ICR, under Docket ID number EPA–HQ–OAR–2003–0197, which can be found in *http://www.regulations.gov*. Today's final decision will not change the burden estimates from those developed and approved in 1994 for the national emission standards.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administrations' regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final decision on small entities, we have concluded that this action will not have a significant economic impact on a substantial number of small entities. We are taking no further action at this time to revise the national emission standards. Thus, the final decision will not impose any requirements on small entities. Today's final decision on the residual risk assessment and technology review for the national emission standards imposes no additional burden on facilities impacted by the national emission standards.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, we generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows us to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation of why that alternative was not adopted.

Before we establish any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, we must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small

governments to have meaningful and timely input in the development of regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

We have determined that today's final decision does not contain a Federal mandate that may result in expenditures of $100 million or more to State, local, and tribal governments in the aggregate, or to the private sector in any 1 year. Therefore, today's final decision is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, today's final decision does not significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, today's final decision is not subject to section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires us to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

Today's final decision does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. Thus, the requirements of the Executive Order do not apply to today's final decision.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires us to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" is defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and the Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

Today's final decision does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to today's final decision.

G. Executive Order 13045: Protection of Children From Environmental Health & Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that we have reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, we must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

Today's final decision is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866, and because, as explained earlier, the Agency does not have reason to believe the environmental health or safety risk addressed by this action present a disproportionate risk to children.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

Today's final decision is not an "economically significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that today's final decision is not likely to have any adverse energy impacts.

I. National Technology Transfer and Advancement Act

Under section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law No. 104–113, all Federal agencies are required to use voluntary consensus standards (VCS) in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA requires Federal agencies to provide Congress, through annual reports to OMB, with explanations when the agency does not use available and applicable VCS.

Today's final decision does not involve technical standards. Therefore, the requirements of the NTTAA are not applicable.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. We will submit a report containing this final decision and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final decision in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final decision becomes effective on April 7, 2006.

National Emission Standards for Magnetic Tape Manufacturing Operations

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final action.

governments to have meaningful and timely input in the development of regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

We have determined that today's final decision does not contain a Federal mandate that may result in expenditures of $100 million or more to State, local, and tribal governments in the aggregate, or to the private sector in any 1 year. Therefore, today's final decision is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, today's final decision does not significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, today's final decision is not subject to section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires us to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

Today's final decision does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. Thus, the requirements of the Executive Order do not apply to today's final decision.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires us to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" is defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and the Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

Today's final decision does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to today's final decision.

G. Executive Order 13045: Protection of Children From Environmental Health & Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that we have reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, we must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

Today's final decision is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866, and because, as explained earlier, the Agency does not have reason to believe the environmental health or safety risk addressed by this action present a disproportionate risk to children.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

Today's final decision is not an "economically significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that today's final decision is not likely to have any adverse energy impacts.

I. National Technology Transfer and Advancement Act

Under section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law No. 104–113, all Federal agencies are required to use voluntary consensus standards (VCS) in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA requires Federal agencies to provide Congress, through annual reports to OMB, with explanations when the agency does not use available and applicable VCS.

Today's final decision does not involve technical standards. Therefore, the requirements of the NTTAA are not applicable.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. We will submit a report containing this final decision and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final decision in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final decision becomes effective on April 7, 2006.

National Emission Standards for Magnetic Tape Manufacturing Operations

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final action.

SUMMARY: On December 15, 1994, we promulgated national emission standards for hazardous air pollutants for Magnetic Tape Manufacturing Operations. The standards limit and control emissions of hazardous air pollutants that are known or suspected to cause cancer or have other serious health or environmental effect.

Section 112(f)(2) of the Clean Air Act directs EPA to assess the risk remaining (residual risk) after the application of national emission standards for hazardous air pollutants controls and to promulgate more stringent standards, if necessary, to protect public health with an ample margin of safety and to prevent adverse environmental effects. Also, section 112(d)(6) of the Clean Air Act requires EPA to review and revise the national emission standard for hazardous air pollutants, as necessary, taking into account developments in practices, processes, and control technologies. On October 24, 2005, based on the findings from our residual risk and technology review, we proposed no further action to revise the national emission standards for hazardous air pollutants and requested public comment. Today's final action responds to public comments received on the proposed action and announces EPA's final decision not to revise the standards.

DATES: This final action is effective on April 7, 2006.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2003–0161. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, i.e., confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the HQ EPA Docket Center, Docket ID No. EPA–HQ–OAR–2003–0161, EPA West Building, Room B102, 1301 Constitution Avenue, NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the HQ EPA Docket Center is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

FOR FURTHER INFORMATION CONTACT: For questions about the final action, contact Mr. H. Lynn Dail, U.S. EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Natural Resources and Commerce Group (C539–03), Research Triangle Park, North Carolina 27711; telephone number: (919) 541–2363; fax number: (919) 541–5689; e-mail address: *dail.lynn@epa.gov*. For questions on the residual risk analysis, contact Ms. Maria Pimentel, U.S. EPA, Office of Air Quality Planning and Standards, Health and Environmental Impacts Division, Sector Based Assessment Group (C404–01), Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5280; fax number: (919) 541–0840; e-mail address: *pimentel.maria@epa.gov*.

SUPPLEMENTARY INFORMATION:

Regulated Entities. The regulated categories and entities affected by the national emission standards for hazardous air pollutants (NESHAP) include:

Category	NAICS[a] code	Examples of regulated entities
Industry	334613 322222 325992	Operations at major sources that are engaged in the surface coating of magnetic tape.
Federal government		Not affected.
State, local, tribal government		Not affected.

[a] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by the Magnetic Tape NESHAP. To determine whether your facility would be affected by the Magnetic Tape NESHAP, you should examine the applicability criteria in 40 CFR part 63.701(a) of subpart EE (NESHAP for Magnetic Tape Manufacturing Operations). If you have any questions regarding the applicability of the Magnetic Tape NESHAP to a particular entity, contact Mr. Leonard Lazarus, U.S. EPA, Office of Enforcement and Compliance Assurance, Office of Compliance, Air Compliance Branch (2223A), Ariel Rios Building, 1200 Pennsylvania Avenue, NW., Washington, DC 20460; telephone number: (202) 564–6369; fax number: (202) 564–0050; e-mail address: *lazarus.leonard@epa.gov*.

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of today's final action will also be available on the World Wide Web through the Technology Transfer Network (TTN). Following signature, a copy of the final action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of this final decision is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by June 6, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to a rule or procedure raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final decision may not be challenged separately in civil or criminal proceedings brought to enforce these requirements.

Section 307(d)(7)(B) of the CAA further provides that "only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "if the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for

Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20004.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Statutory Authority for This Action?
B. What Did the Magnetic Tape NESHAP Accomplish?

I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Statutory Authority for This Action?

Section 112 of the Clean Air Act (CAA) establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In the first stage, after EPA has identified categories of sources emitting one or more of the HAP listed in the CAA, section 112(d) calls for us to promulgate national technology-based emission standards for sources within those categories that emit or have the potential to emit any single HAP at a rate of 10 tons or more per year or any combination of HAP at a rate of 25 tons or more per year (known as "major sources"), as well as for certain "area sources" emitting less than those amounts. These technology-based standards must reflect the maximum reductions of HAP achievable (after considering cost, energy requirements, and non-air health and environmental impacts) and are commonly referred to as maximum achievable control technology (MACT) standards. For area sources, CAA section 112(d)(5) provides that, in lieu of MACT, the Administrator may elect to promulgate standards or requirements which provide for the use of generally available control technologies or management practices, and such standards are commonly referred to as generally available control technology (GACT) standards.

The EPA is then required to review these technology-based standards and to revise them "as necessary, taking into account developments in practices, processes and control technologies," no less frequently than every 8 years.

The second stage in standard-setting is described in section 112(f) of the CAA. This provision requires that EPA prepare a Report to Congress describing, among other things, methods of estimating risks posed by sources after implementation of the MACT standards, the public health significance of those risks, the means and costs of controlling them, actual health risks to persons in proximity to emitting sources, and recommendations as to legislation regarding such remaining risk. The EPA prepared and submitted this report ("Residual Risk Report to Congress," EPA–453/R–99–001) in March 1999. The Congress did not act on any of the recommendations in the report, triggering the second stage of the standard-setting process, the residual risk stage. Section 112(f)(2) requires us to determine for each section 112(d) source category, except area source categories for which we issued a generally available control technology standard, whether the NESHAP protects public health with an ample margin of safety. If the NESHAP for HAP "classified as a known, probable, or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million," we must decide whether additional reductions are necessary to provide an ample margin of safety. As a part of this decision, we may consider costs, technological feasibility, uncertainties, or other relevant factors. We must determine whether more stringent standards are necessary to prevent an adverse environmental effect (defined in section 112(a)(7) as "any significant and widespread adverse effect, which may reasonably be anticipated to wildlife, aquatic life, or other natural resources, including adverse impacts on populations of endangered or threatened species or significant degradation of environmental quality over broad areas"), but in making this decision we must consider cost, energy, safety, and other relevant factors.

B. What Did the Magnetic Tape NESHAP Accomplish?

On December 15, 1994, we promulgated the NESHAP for Magnetic Tape Manufacturing Operations (59 FR 64580) and required existing sources to comply with the NESHAP by December 15, 1996.

The Magnetic Tape NESHAP covers HAP emissions from surface coatings used in the manufacture of magnetic and optical recording media used in audio, video, computer and magnetic stripe tape and disks. The emission units regulated by the Magnetic Tape NESHAP are storage tanks, mix preparation equipment, coating operations, waste handling devices, condenser vents in solvent recovery, particulate transfer operations, wash sinks for cleaning removable parts, equipment for flushing fixed lines, and wastewater treatment operations. The Magnetic Tape NESHAP regulates only those sources located at major sources. During the development of the NESHAP, we identified 25 existing magnetic recording media and magnetic stripe facilities, of which 14 were considered major and, therefore, subject to the NESHAP. Currently, there are only six magnetic tape manufacturing facilities remaining in the United States, all of which are major.

In general, the current NESHAP requires an overall HAP control efficiency of at least 95 percent for emissions from each solvent storage tank, piece of mix preparation equipment, coating operation, waste handling device, or condenser vent in solvent recovery. If an incinerator is used to control these emissions points, an outlet HAP concentration of no greater than 20 parts per million by volume by compound may be met, instead of achieving 95 percent control, as long as the efficiency of the capture system is 100 percent. If a coating with a HAP content no greater than 0.18 kilograms per liter (1.5 pounds per gallon) of coatings solids is used, that coating operation does not require further control.

Several solvents and particulate HAP are used in the magnetic tape manufacturing industry. Currently, the solvents used to the greatest extent are methyl ethyl ketone (MEK) and the HAP toluene, and the particulate HAP are

cobalt and cobalt compounds. At the time of promulgation of the NESHAP, however, the solvents in use included MEK, cyclohexanone, acetone, and isopropyl alcohol and the HAP toluene, methyl isobutyl ketone, toluene diisocyanate, ethylene glycol, methanol, xylenes, ethyl benzene, and acetaldehyde; and the particulate HAP included chromium, cobalt, and their respective compounds. Several of these compounds are no longer used in the industry. The compound MEK and the HAP toluene are used at all facilities. At the time of promulgation of the magnetic tape NESHAP, MEK was a listed HAP, and we estimated that HAP emissions, including MEK and toluene, would be reduced by 2,080 megagrams per year (Mg/yr) (2,300 tons per year (tpy)) from a baseline of 4,060 Mg/yr (4,470 tpy). Methyl ethyl ketone was later delisted by EPA in 70 FR 75047, December 19, 2005.

C. What Were the Conclusions of the Residual Risk Assessment?

As required by section 112(f)(2) of the CAA, we prepared a risk assessment to determine the residual risk posed by magnetic tape manufacturing operations after implementation of the NESHAP. We compiled a list of the six magnetic tape manufacturing facilities still in operation in the United States based on inventory information we gathered from a number of manufacturing facilities and State environmental program offices (e.g., whether these facilities were still operating and manufacturing magnetic tape).

The major compounds emitted by the magnetic tape manufacturing source category are MEK and the HAP toluene, which comprise 97 percent, by tpy, of all emissions in the source category. The six magnetic tape manufacturing facilities have MEK and HAP emissions ranging from 3.9 to 214 Mg/yr (4.3 to 236 tpy). At the time of proposal, MEK was a listed HAP, and the nationwide annual HAP emissions, including MEK and toluene, were estimated to be 468 Mg/yr (516 tpy). Methyl ethyl ketone has since been delisted.

Using these data, we modeled exposure concentrations surrounding the six facilities, calculated the risk of possible chronic cancer and noncancer health effects, evaluated whether acute exposures might exceed relevant health thresholds, and investigated human health multipathway and ecological risks.

The emissions data used in the residual risk assessment represent actual levels of emissions for the base year. We have no reason to believe that there is a substantial amount of over control compared to what is allowed under the MACT standard. Therefore, the results of the risk assessment represent our approximation of the maximum risks which would be allowed under compliance with the NESHAP.

Consistent with the tiered modeling approach described in the Residual Risk Report to Congress of March 1999 (EPA–453/R–99–001), the risk assessment for this source category started with a simple assessment, which used health-protective assumptions in lieu of site-specific data. The results demonstrated negligible risks for potential chronic cancer, chronic noncancer, and acute noncancer health endpoints. Also, no significant human health multipathway or ecological risks were identified. Had the resulting risks been determined to be non-negligible, a more refined analysis with site-specific data would have been necessary.

The assessment is described in detail in the memorandum "Residual Risk Assessment for the Magnetic Tape Manufacturing Source Category," available in the docket. Since our assessment shows that sources subject to the Magnetic Tape Manufacturing NESHAP pose maximum lifetime excess cancer risks which are significantly less than 1 in 1 million, EPA concluded that public health is protected with an ample margin of safety, and since noncancer health risks and ecological risks were also found to be insignificant for this source category, EPA is not obligated to adopt standards under section 112(f) of the CAA. Because risks contributed by MEK are a negligible part of the overall risk, the delisting of MEK has essentially no effect on the risk assessment performed for the proposed rule.

D. What Were the Conclusions of the Technology Review?

Section 112(d)(6) of the CAA requires EPA to review, and revise as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under section 112 no less often than every 8 years. As we stated in the preamble to the Coke Ovens residual risk rule (70 FR 20009), and as discussed below, the facts underlying a section 112(f) determination should be key factors in making any subsequent section 112(d)(6) determinations. For this and several other source categories, we were under consent decree deadlines to complete both the section 112(d)(6) technology review and the section 112(f)(2) residual risk analysis by the same date. As a result, we conducted the two reviews concurrently and did not have the results of the section 112(f)(2) analysis before we began the section 112(d)(6) technology review.

We reviewed available information about the industry, talked with industry representatives, and contacted several facilities in the industry to investigate available emission control technologies and the potential for additional emission reductions. We did not identify any additional control technologies beyond those that are already in widespread use within the source category (e.g., carbon adsorbers, condensers). The only developments identified involve improvements in the performance of existing technologies or increased frequency of inspections and testing, which would achieve only small incremental emission reductions. However, we did discover that new product developments (optical recording media and solid state recording media) may eventually supplant magnetic tape, but these media are not considered magnetic tape and would not be covered under the Magnetic Tape NESHAP. Therefore, our investigation did not identify any significant developments in practices, processes, or control technologies in the magnetic tape manufacturing industry since promulgation of the original standards in 1994. We undertook the technology assessment for this source category consistent with our policy in the Coke Ovens residual risk rule (70 FR 20008–20009).

E. What Was the Proposed Action?

On October 24, 2005, based on the findings from our residual risk and technology review, we proposed no further action to revise the NESHAP (70 FR 61417) and requested public comment.

II. Today's Action

A. What Is Today's Final Action?

Today's final action responds to public comments received on the proposed action and announces our final decision not to revise the standards.

B. What Comments Were Received on the Proposed Action?

In the proposed action, we requested public comment on our residual risk review and our technology review and on issues of delisting the source category and conducting future technology reviews. By the end of the public comment period, comments from five entities had been received. A summary of these comments and EPA's responses are provided in the sections below.

1. Residual Risk Determination

Comment: Three commenters supported EPA's decisions for the magnetic tape source category. The commenters supported EPA's conclusion that no changes to the existing NESHAP for magnetic tape manufacturing were required to satisfy the requirements of section 112(f). The commenters noted that EPA correctly reviewed the magnetic tape sources, followed the tiered risk assessment approach described in its Residual Risk Report to Congress, and, using a conservative methodology, determined that no source in the category had a maximum individual cancer risk exceeding the 1-in-1-million level for triggering promulgation of a residual risk standard under section 112(f).

Two of the commenters stated that EPA was correct to focus its section 112(f) residual risk analysis on the sources in the magnetic tape source category subject to section 112(d) requirements, and not consider risk from outside that source category. According to the commenters, the statutory language and construction of section 112(f) shows that Congress was directing EPA to perform residual risk analyses for individual source categories.

Response: We acknowledge the commenters' support for our health-protective methodology and our conclusions in the proposed notice. However, we do not agree that our section 112(f) residual risk analyses must always focus only on the sources in the category subject to section 112(d) requirements or that Congress intended to limit all residual risk analyses to the individual source categories in question. As we stated in the preamble to the Coke Ovens residual risk rule, "EPA disagrees that section 112(f) precludes EPA from considering emissions other than those from the source category or subcategory entirely." Rather, we have concluded that, when the statutory risk trigger is exceeded, the two-step approach set forward in the Benzene NESHAP remains the approach that we should follow in determinations under section 112(f). At the first step, when determining "acceptable risk," we will consider risks that result from emissions from the source category only. However, during the second step, we must determine whether additional reductions should be required to protect public health with "an ample margin of safety." One of the factors that we can consider in this second step is environmental levels of HAP due to emissions from sources outside the source category being assessed. This could include ambient background concentrations of HAP, as well as co-location of other emission sources that augment the identified risks from the source category.

2. Delisting the Source Category

At proposal, we requested comment on whether it would be appropriate to delist the magnetic tape source category under section 112(c)(9) based on the possibility that HAP emissions from the source category would be sufficiently low even in the absence of MACT standards.

Comment: One commenter opposed delisting the magnetic tape source category, stating that if the source category was delisted, there would be nothing to prevent sources from increasing their HAP emissions substantially or changing their processes to emit new HAP, resulting in HAP levels unacceptable to public health and the environment. The commenter indicated that such an approach ignores the possibility that HAP emissions were reduced to an acceptable level because of the MACT requirements and that emissions could increase again without the MACT standard in place. Furthermore, the commenter believed that Congress did not intend for the residual risk review to result in delisting of regulated source categories; if Congress had wanted to make delistings dependent on or linked to the outcome of the residual risk process, it would have specifically mandated this in the CAA, which it did not.

Two commenters argued that delisting a source category does not affect the applicability of an existing NESHAP and cited the delisting action following the Asbestos NESHAP as support for their argument. They also noted that EPA said in its proposal that no further section 112(d)(6) reviews are required unless there is a significant change to the source category. Consequently, the commenters saw no benefit in delisting the magnetic tape source category. However, they were not opposed to such an action.

One commenter supported delisting the magnetic tape source category under the authority of section 112(c)(9) based on EPA's finding of negligible risks (0.01 in 1 million). The commenter stated that EPA's request for comment implied that it interpreted the CAA to allow delisting on the basis of low risk only before a MACT standard is issued; however, section 112(c)(9) provides EPA with the authority to delist a source category whenever the Administrator makes a determination that the risks are below the risk criteria in the CAA and does not limit this authority to sources not yet subject to a MACT or GACT standard. According to the commenter, limiting EPA's discretion to delist source categories prior to issuing MACT or GACT standards also conflicts with the required sequence of duties under section 112, which does not require EPA to conduct a risk analysis until a residual risk evaluation is required 8 years after MACT standards are issued; consequently, EPA is unlikely to have sufficient data on which to base a delisting decision until many years after MACT standards have been promulgated. Furthermore, the commenter stated it is possible that source categories found to be low-risk after MACT standards were imposed may have been low-risk before the standards were imposed, especially magnetic tape facilities, where the risk assessment showed risks two orders of magnitude below the statutory criteria for delisting under section 112(c)(9). Finally, the commenter noted that if EPA was concerned that the source category would exceed risk levels if MACT controls were not applicable, it could use section 112(c)(9) to keep in place those MACT requirements needed to sustain the low-risk determination and delisting. According to the commenter, those requirements could be established as part of the delisting decision and maintained in the title V permit, as was done in the NESHAP for Plywood and Composite Wood Products.

Response: Based on our risk assessment of the magnetic tape source category, we have concluded that these sources are low-risk and, therefore, that no further standards are required to protect public health with an ample margin of safety or to protect the environment. However, we agree with the commenter who argues that this conclusion is based, at least in part, on the fact that the MACT requirements for these sources limit HAP emissions. Further, we disagree with the comment that delisting will not affect the viability of the existing NESHAP. The commenter cited the delisting action following the Asbestos NESHAP as support for their argument, noting that the applicability of that rule was not affected by delisting. However, the Asbestos NESHAP was established under part 61, which is not directly relevant in this situation since the Magnetic Tape NESHAP is a part 63 rule. If we delist this source category, it is our conclusion that existing magnetic tape sources would no longer be subject to the NESHAP and, thus, HAP emissions would no longer be limited by this rule. If sources begin emitting

HAP at levels exceeding those allowed under the NESHAP, risks could increase, and the basis for our finding that the source category is low-risk could be compromised. We have already documented that emissions from magnetic tape manufacturing operations were substantially higher at promulgation, compared to more recent emissions estimates (after the standards were implemented). As noted in the October 24, 2005 proposal (70 FR 61419) and previously in this action, HAP emissions at promulgation were estimated to be 4,060 Mg/yr (4,470 tpy), while HAP emissions in 2000 were estimated to be 468 Mg/yr (516 tpy)—a difference of almost 90 percent, some of which is due to compliance with the MACT standard and some of which is due to 19 plant closures since 1994. These HAP emissions estimates include MEK, which has since been delisted as a HAP. More recent information suggests that the delisting of MEK may result in one plant reducing its emissions to below the major source levels. If the potential-to-emit limit for this facility is below the major source threshold due to the delisting of MEK, it would become an area source and as such would no longer be subject to the magnetic tape manufacturing NESHAP. Nonetheless, since compliance with the MACT standard is part of the basis for our low-risk determination, we believe that our policy objectives are best served if we do not delist the magnetic tape source category.

Contrary to one commenter's contention, we did not intend to imply through our request for comments that we interpret section 112(c)(9) of the CAA to apply only before a MACT standard has been promulgated. We were simply seeking comment on the use of section 112(c)(9) after the MACT standard. However, for the reasons presented above, we have decided not to use section 112(c)(9) to delist the magnetic tape source category.

The Agency would like to remove the burden of the repetitive review of Section 112 standards for low risk source categories. At the same time, we think it is appropriate to maintain the MACT controls, in this case. We plan to further investigate approaches for removing low-risk source categories from the Section 112 universe while maintaining MACT-level controls. An example of a similar approach is found in the Plywood and Composite Wood Products MACT where we allow a subcategory of facilities to reduce emissions to acceptable risk levels through Title 5 permits and remove them from the MACT universe.

3. Future Technology Reviews

At proposal, we requested comment on "the notion that, barring any unforeseeable circumstances which might substantially change this source category or its emissions, we would have no obligations to conduct future technology reviews under CAA section 112(d)(6)." We suggested this approach because of the low-risk finding for this source category under section 112(f).

Comment: One commenter disagreed that low risk from a source category at this time should absolve EPA of its obligation to conduct future technology reviews. The commenter stated that, without periodic reviews of source categories and technology in the future reviews, EPA would not be aware of any technologies that have been developed or any "unforeseeable circumstances" related to the source category to which EPA refers in the notice. Furthermore, the commenter believed that Congress did not intend for the residual risk review to result in the removal of EPA's obligation to conduct future technology reviews under section 112(d)(6); if Congress had wanted to make technology reviews dependent on or linked to the outcome of the residual risk process, it would have specifically mandated this in the CAA, which it did not.

Three commenters stated that EPA has no obligation to conduct a technology review in the case of Magnetic Tape. According to the commenters, because the residual risk provisions of the CAA were not triggered by the magnetic tape source category's remaining low risk, even an initial technology review was unnecessary. The commenters noted that EPA only used the results of the section 112(f)(2) residual risk analysis to conclude that future section 112(d)(6) technology reviews would not be required. The commenters stated that EPA's use of a formal technology review as the basis for its conclusion under section 112(d)(6) that the NESHAP did not need to be revised was inconsistent with EPA's prior stated position in the Coke Ovens residual risk rule (70 FR 20009) on determining the need for a technology review under section 112(d)(6). One commenter stated that if the Coke Ovens criteria for when a technology review is not "necessary" under the CAA are sound for subsequent technology reviews, then they are also sound for initial reviews, as in the case of Magnetic Tape. Another commenter stated that, where the ample margin of safety set in the residual risk rule is largely based on cost or technical feasibility, then further future review under section 112(d)(6) may remain viable, and additional controls may not be precluded if feasible, cost-effective control measures are identified in the future.

Response: We stated in the preamble to the Coke Ovens residual risk rule that if the ample margin of safety analysis for the section 112(f) standard is not based at all on the availability or cost of particular control technologies, then advances in air pollution control technology should not justify revising the MACT standard pursuant to section 112(d)(6) because the section 112(f) standard would continue to assure an adequate level of safety. We agree that a technology review is required every 8 years. However, if the ample margin of safety analysis for a section 112(f) standard shows that remaining risk for non-threshold pollutants falls below 1 in 1 million and for threshold pollutants falls below a similar threshold of safety, then further revision should not be needed because an ample margin of safety has already been assured. In these situations, it is difficult to conceive of a case where the development of new technology, or of inexpensive control strategies, would cause us to require additional requirements for a source category. If the availability and/or costs of technology are part of the rationale for the ample margin of safety determination, it is reasonable to conclude that changes in those costs or in the availability of technology could alter our conclusions regarding the ample margin of safety. For this reason, we agree with the comment that subsequent technology reviews would be appropriate and revisions may also be appropriate if the ample margin of safety established by the residual risk process considers cost or technical feasibility.

We disagree with the comment that we should not have conducted an initial technology review under section 112(d)(6) for the magnetic tape source category. As we noted in the preamble to the Coke Ovens residual risk rule, we believe that the findings that underlie a section 112(f) determination should be key factors in making any subsequent section 112(d)(6) determinations. As indicated by the inclusion of the word "subsequent" in this rationale, we believe that we are obligated to perform the initial section 112(d)(6) analysis. The timing requirements for the initial section 112(d)(6) analysis coincide with those for the residual risk analysis. Thus, it is appropriate for us to conduct both analyses at the same time and for the results of the risk analysis to impact future section 112(d)(6) technology reviews, even though these results do

not negate either the need to perform the initial review or the need to perform subsequent reviews under section 112(d)(6).

4. General Approach to Technology Reviews

Comment: Three commenters stated that action is not necessarily required under section 112(d)(6) even if a residual risk rule does not reduce cancer risks for all persons to a level below 1 in 1 million. Two of the commenters noted that EPA had already rejected such a "bright line" approach under section 112(f) in the Coke Ovens residual risk rule; instead, it serves as a trigger point to evaluate whether additional reductions are necessary to provide an ample margin of safety. The third commenter cited the legislative history of the 1990 amendments to the CAA as support that Congress had rejected provisions requiring sources to meet a 1-in-1-million standard. According to this commenter, EPA's proposed interpretation of section 112(d)(6) of requiring successive reviews unless sources achieve this risk level implies that sources must meet a 1-in-1-million standard to avoid future regulation, and if Congress had intended this "technology-based" downward revision of the standard, there would have been no need for section 112(f).

Noting that EPA's risk estimates are upper bound estimates that likely overstate risks, the first two commenters stated that a "bright line" approach should not be employed under section 112(d)(6) any more than it should be employed under section 112(f); instead, they stated that EPA should make determinations of whether a technology review is necessary on a case-by-case basis for each category.

The third commenter stated that section 112(d)(6) should be more appropriately viewed as a regulatory backstop authority, similar to the case-by-case "MACT hammer" provisions of section 112(j), to ensure that available advances in technology will be applied in the event EPA fails to issue residual risk standards under section 112(f). The commenter stated that once EPA has established a residual risk standard under section 112(f) that is "acceptable" or "safe" and protective with an "ample margin of safety," then it must find that a separate revision of the MACT standard under section 112(d)(6) is not necessary.

Response: We agree with the commenters who indicated that it would be sufficient not to revise MACT standards citing section 112(d)(6) even if cancer risks are greater than or equal to 1 in 1 million. For example, it may be the case that a technology review is performed, but no change in the standard results from that review. In the preamble to the residual risk rule for Coke Ovens, we have applied a similar logic to the need for subsequent technology revisions under section 112(d)(6). As we stated in the Coke Ovens rule, if the ample margin of safety analysis for a section 112(f) standard shows that the remaining risk for non-threshold pollutants falls below 1 in 1 million and for threshold pollutants falls below a similar threshold of safety, then further revision would not be needed because an ample margin of safety has already been assured.

5. Context of the Residual Risk Program

Comment: One commenter strongly recommended that EPA carefully lay out the context and framework of the residual risk program in the determination for each source category. The commenter stated that this was especially important because of the unique nature of the program compared to other EPA programs with which the public is familiar.

The commenter specifically recommended that EPA mention the two-stage regulatory process (MACT and residual risk) used to control HAP emissions from major stationary sources and to determine whether the MACT technology controls provide an ample margin of safety. The commenter noted that the residual risk program is different from other EPA programs, in that additional controls will be necessary for only some of the listed categories of sources, because in some cases, the cancer risk will be less than the 1-in-1-million trigger, or, if it is greater, EPA may determine that the current emission level provides the public with an ample margin of safety.

The commenter also recommended that EPA put into the proper context the relatively small contribution of major stationary sources to the risks from air toxics—about 11 percent in 1999 and expected to be even smaller as sources come into compliance with the latest MACT rules.

Finally, the commenter recommended that EPA present the risks from air toxics in context with the risks from ambient (criteria) air pollutants to make clear to the public how the air toxics risk estimates are much more conservative and to avoid any misperceptions by the public that the risk estimates for ambient air pollutants are comparable to the risk estimates for air toxics. Without a program of public education on this issue, the commenter indicated the public may incorrectly believe that the ample margin of safety decisions in the residual risk rules are less stringent than EPA knows them to be, resulting in public lawsuits against EPA's decisions or overregulation by EPA to compensate for the gap in public knowledge. The commenter recommended that EPA include preamble language in future EPA decisions describing the criteria it used to determine the ample margin of safety and presenting the incremental risk/incremental cost approach in the fuller context for the residual risk program.

Response: We agree that it is important to provide context for any residual risk rule. In the preamble of the current rule, we describe the MACT program and its impact on the magnetic tape source category. We also describe our statutory authority and our obligations to assess risks to human health and the environment under section 112(f) of the CAA, as well as the requirement to further regulate categories of sources if any of the estimated individual cancer risks exceed the statutory trigger level of 1 in 1 million.

We agree that our risk assessment for the magnetic tape source category appropriately contains a number of health-protective assumptions, resulting in a screening assessment that is designed to overestimate, rather than underestimate, risks. The results demonstrate negligible risks for potential chronic cancer, chronic noncancer, and acute noncancer health endpoints. Also, no significant human health multipathway or ecological risks were identified. Had the resulting risks been determined to be non-negligible, a more refined analysis with site-specific data would have been conducted. Such an assessment would be more data-intensive; however, it would also present a more accurate estimate of risks which could then be used as the basis for regulatory action. However, since the findings of the screening risk assessment for the magnetic tape source category were negative (i.e., the statutory cancer risk trigger level was not exceeded), it was not necessary to conduct a more refined risk assessment using more site-specific data. Since these activities were not relevant to this action, a complete discussion of them in the context of a full discussion of the residual risk program was not deemed necessary or appropriate. The details of our risk assessment can be found in the docket in the memo titled, "Residual Risk Assessment for the Magnetic Tape Manufacturing Source Category."

6. IRIS Data for Acrylonitrile

Comment: According to one commenter, EPA should not have relied

on the outdated unit cancer risk value for acrylonitrile contained in EPA's Integrated Risk Information System (IRIS) in conducting its residual risk assessment of the magnetic tape manufacturing industry. Although EPA concluded that there were no issues to be addressed regarding acrylonitrile because the facility emitting acrylonitrile presented a potential cancer risk of only 1 in 100 million, the commenter stated that it was inappropriate for EPA to use the acrylonitrile value in IRIS in its assessment because EPA was already aware the value was severely out-of-date. According to the commenter, the IRIS profile itself indicates that there are one or more significant new studies based on a screening-level review of the more recent toxicology literature. The commenter also noted that EPA was aware that numerous new studies had been conducted on assessing the cancer risk from acrylonitrile because its staff were briefed on an assessment of those new studies, received copies of the assessment report, and attended a peer review meeting on the report. The commenter also noted that a summary of the cancer assessment was published in October 2005.

Response: We agree that our IRIS assessment for acrylonitrile does not consider studies published after 1991, and we are currently developing an assessment that includes newer information. Our staff reviewed the assessment referenced by the commenter and determined that it has several weaknesses. First, the assessment concludes that the mode of action (MOA) is nonlinear, but does not provide evidence or analysis sufficient to demonstrate nonlinearity or to identify a nonlinear MOA. The independent peer panel that reviewed this assessment noted that the data do not allow unequivocal determination of acrylonitrile's MOA(s), and could not rule out a genotoxic MOA. Given the negligible contribution of the acrolitrile risk estimates in this assessment, we determined that it was reasonable and protective to continue to use linear low-dose extrapolation. Second, the assessment provides a supplemental linear unit risk value but bases it upon animal data rather than human data, despite the fact that adequate human data were available. Using these human data would have produced a higher inhalation unit risk estimate (i.e., closer to the current IRIS assessment value). Third, the linear unit risk value came from a reanalysis of animal data already considered in EPA's 1991 IRIS assessment for inhalation carcinogenicity, and rejected because better human data were available even then. For these reasons we concluded that the commentor's study should not be used in lieu of the current IRIS assessment.

III. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether a regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, OMB has notified EPA that it considers this a "significant regulatory action" within the meaning of the Executive Order. The EPA has submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

B. Paperwork Reduction Act

This action does not impose any information collection burden. It will not change the burden estimates from those previously developed and approved for the existing NESHAP. However, OMB has previously approved the information collection requirements contained in the existing regulation (59 FR 64580, December 15, 1994) under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501, *et seq.*) and has assigned OMB control number 2060–0326 (EPA ICR No. 1678.05). A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, by mail at the Office of Environmental Information, Collection Strategies Division, U.S. EPA (2822T), 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. Include the ICR or OMB number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impact of today's final action on small entities, a small entity is defined as: (1) A small business whose parent company has fewer than 500 to 1,000 employees, depending on the size definition for the affected NAICS code (as defined by Small Business Administration size standards); (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impact of today's final action on small entities, EPA has concluded that this final action will not have a significant economic impact on a substantial number of small entities. The final action will not impose any requirements on small entities. We are taking no further action at this time to revise the NESHAP.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law No. 104–4, establishes requirements for Federal agencies to assess the effect of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation of why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final action does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments in the aggregate, or for the private sector in any 1 year. The rule imposes no enforceable duty on State, local, or tribal governments, or the private sector. Thus, today's final action is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the final action contains no regulatory requirements that might significantly or uniquely affect small governments, because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, the final action is not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government." Today's final action does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State or local governments. Thus, Executive Order 13132 does not apply to the final action.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final action does not have tribal implications as specified in Executive Order 13175. It will not have substantial direct effect on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to today's final action.

G. Executive Order 13045, Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866 and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

The final action is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866, and because EPA does not have reason to believe the environmental health or safety risks addressed by this action present a disproportionate risk to children.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final action is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not an economically significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

Under section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law No. 104–113, § 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities, unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when EPA does not use available and applicable VCS.

The final action does not involve technical standards. Therefore, EPA is not considering the use of any voluntary consensus standards.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a

copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final action and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final action in the Federal Register. The final action is not a "major rule" as defined by 5 U.S.C. 804(2). The effective date of this final action is April 7, 2006.

National Emission Standards for Hazardous Air Pollutants for Industrial Process Cooling Towers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: On September 8, 1994, we promulgated national emission standards for hazardous air pollutants for industrial process cooling towers. The rule prohibits the use of chromium-based water treatment chemicals that are known or suspected to cause cancer or have a serious health or environmental effect.

Section 112(f)(2) of the Clean Air Act directs us to assess the risk remaining (residual risk) after the application of national emission standards for hazardous air pollutants and to promulgate more stringent standards, if warranted, to provide an ample margin of safety to protect public health or prevent adverse environmental effect. Also, section 112(d)(6) of the Clean Air Act requires us to review and revise the standards, as necessary at least every 8 years, taking into account developments in practices, processes, and control technologies. On October 24, 2005, based on the findings from our residual risk and technology review, we proposed no further action to revise the standards and requested public comment. Today's final action amends the applicability section of the rule in response to public comments received on the proposed action. The final amendment provides that sources that are operated with chromium-based water treatment chemicals are subject to this standard; other industrial process cooling towers are not covered.

DATES: *Effective Date:* April 7, 2006.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2004–0004. All documents in the docket are listed on the *http://www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, i.e., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *http://www.regulations.gov* or in hard copy at the national emission standards for hazardous air pollutants (NESHAP) for Industrial Process Cooling Towers (IPCT)Docket, EPA/DC, Docket ID No. EPA–HQ–OAR–2004–0004, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For questions about the final action, contact Mr. Phil Mulrine, U.S. EPA, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, Metals and Minerals Group (D243–02), Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5289; fax number: (919) 541–5450; e-mail address: *mulrine.phil@epa.gov*. For questions on the residual risk analysis, contact Mr. Scott Jenkins, U.S. EPA, Office of Air Quality Planning and Standards, Health and Environmental Impacts Division, Sector Based Assessment Group (C539–02), Research Triangle Park, North Carolina 27711, telephone number: (919) 541–1167, fax number: (919) 541–0840, e-mail address: *jenkins.scott@epa.gov*.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by the NESHAP. To determine whether your facility would be affected by the NESHAP, you should examine the applicability criteria in 40 CFR 63.400(a) of subpart Q (IPCT NESHAP). If you have any questions regarding the applicability of the NESHAP to a particular entity, contact either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 63.13 of subpart A (General Provisions).

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of today's final action will also be available on the WWW through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the final action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at: *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final action is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by June 6, 2006. Under section 307(d)(7)(B) of the CAA, only an objection to the final action amendment that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final action may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce the requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Statutory Authority for This Action?
B. What Did the IPCT NESHAP Accomplish?
C. What Were the Conclusions of the Residual Risk Assessment?
D. What Were the Conclusions of the Technology Review?
E. What Was the Proposed Action?
II. Today's Action
A. What Is Today's Final Action?
B. What Comments Were Received on the Proposed Action?
III. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Statutory Authority for This Action?
