Despite the many reasons offered by commenters opposing our proposal, we continue to believe that our proposed approach is appropriate. As discussed in the proposal (69 FR 21327) and in the previous subsection, although the Phase 1 Replacement and Phase 2 standards provide a high level of protection (i.e., they are generally protective) to human health and the environment, thereby allowing us to nationally defer the RCRA emission requirements to MACT, additional controls may be necessary on an individual source basis to ensure that adequate protection is achieved in accordance with RCRA. Until today, we have relied exclusively upon RCRA § 3005(c)(3) and its associated regulations at § 270.10(k) when conducting or requiring an SSRA. We continue to believe that § 3005(c)(3) and its associated regulations provide the authority to require and perform SSRAs and to write permit conditions based on SSRA results. In fact, as the next subsection will explain, EPA will likely continue to include permit conditions based on the omnibus authority in some circumstances when conducting these activities, and state agencies in states with authorized programs will continue to rely on their own authorized equivalent. However, because SSRAs are likely to continue to be necessary at some facilities, we are finalizing the authority to require them on a case-by-case basis and add conditions to RCRA permits based on SSRA results under the authority of RCRA §§ 3004(a) and (q) and 3005(c). Therefore, we are finalizing §§ 270.10(l) and 270.32(b)(3) with some minor modifications to provide further clarification of the Agency's intent.

D. How Will the New SSRA Regulatory Provisions Work?

The new regulatory provisions are finalized under both base program authority (§ 3004(a) and § 3005(b)) and HSWA authority (§ 3004(q)). That is, changes made to regulations applicable to boilers are promulgated under HSWA authority, whereas changes made to regulations applicable to incinerators are promulgated under non-HSWA authority. Consequently, when it is determined that an SSRA is needed, the applicability of these provisions will vary according to the type of combustion unit (whether it is regulated under 3004(q), or only 3004(a) and 3005(b)), and the authorization status of the state. Depending on the facts, the new authority would be applicable, or the omnibus provision would remain the principal authority for requiring SSRAs and imposing risk-based conditions where appropriate. See 69 FR 21327.

According to the state authorization section of this preamble (see Part Five, Section IV.), EPA does not consider these provisions to be either more or less stringent than the pre-existing federal program, since they simply make explicit an authority that has been and remains available under the omnibus authority and its implementing regulations. Thus, states with authorized equivalents to the federal omnibus authority will not be required to adopt these provisions, so long as they interpret their omnibus authority broadly enough to require risk assessments where necessary.[239]

The provisions of §§ 270.10(l) and 270.32(b)(3) adopted in today's rule are substantially similar to the provisions EPA proposed. Section 270.10(l) continues to explicitly provide that a permit authority has the authority to evaluate, on a case-by-case basis, the need for an SSRA. EPA has also retained its proposed language that explicitly provides that, where an SSRA is determined to be necessary, the permit authority may require a permittee or an applicant to conduct an SSRA, or to provide the regulatory agency with the information necessary to conduct an SSRA on behalf of the permittee/applicant. The final provision also essentially retains the standard laid out in the proposal: that a permit authority may decide that an SSRA is warranted based on a conclusion that additional controls beyond those required pursuant to 40 CFR parts 63, 264, 265, or 266 may be needed to ensure protection of human health and the environment under RCRA. In § 270.32(b)(3), EPA has also explicitly codified the authority for permit authorities to require that the applicant provide information, if needed, to make the decision of whether an SSRA should be required.

However, EPA has adopted some further clarifications to the final provisions in response to comments. In response to comments that the regulatory language EPA had proposed still fails to provide the regulated community with adequate notice that an SSRA might be required, and what that might entail, EPA has included additional language to address those issues. Specifically, EPA has included a sentence stating that the information required under § 270.10(l) can include the information necessary to evaluate the potential risk to human health and/or the environment resulting from both direct and indirect exposure pathways. EPA has also added language to remind permit authorities that the determination that the MACT standards may not be sufficiently protective is to be based only on factors relevant to the potential risk from the hazardous waste combustion unit at the site, and has provided a list of factors to guide the permit authority in making that determination. See subsections E. and F. for further discussion. The applicability language of §§ 270.19, 270.22, 270.62, and 270.66 also has been amended to allow a permit authority that has determined that an SSRA is necessary to continue to apply the relevant requirements of these sections on a case-by-case basis and as they relate to the performance of the SSRA after the source has demonstrated compliance with the MACT standards.

As previously noted, the requirements at 40 CFR Part 124 continue to apply to actions taken to implement § 270.10(l). Thus, if the permitting authority concludes that a risk assessment or additional information is necessary for a particular combustor, the permitting authority must provide the factual and technical basis for its decision in the permit's administrative record and must make it available to the public during the comment period for the draft permit. If the facility or any other party files comments on a draft permit decision objecting to the permitting authority's conclusions regarding the need for an SSRA, the authority must respond fully to the comments. In addition, the SSRA must be included in the administrative record and made available to the public during the comment period. Any additional conditions and limitations determined to be necessary as a result of the SSRA must be documented and supported in the administrative record as well.[240]

[238] See final Response to Comment to the HWC MACT Standards, Volume 5, Miscellaneous.

[239] Authorized states are required to modify their programs only when EPA enacts federal requirements that are more stringent or broader in scope than existing federal requirements. This applies to regulations promulgated under both HSWA and non-HSWA authorities.

[240] Additional clarification on the appropriate use of the SSRA policy and technical guidance is provided in the April 10, 2003 memorandum from Marianne Lamont Horinko entitled "Use of the Site-

E. What Were Commenters' Reactions to EPA's Proposed Decision Not To Provide National Criteria for Determining When an SSRA Is or Is Not Necessary?

In the proposal, we stated that we were not proposing national criteria (e.g., guiding factors) for determining when an SSRA is necessary. Although we had developed a list of qualitative guiding factors for permit authorities to consult when considering the need for an SSRA in the September 1999 final rulemaking (revised from the April 1996 NPRM), we never intended for them to comprise an exclusive list for several reasons. Mainly, we felt that the complexity of multi-pathway risk assessments precluded the conversion of the qualitative guiding factors into more definitive criteria. See 69 FR 21328.

Commenters generally agreed that the risk assessment guidance and policy should not be codified. They agreed in principle that it is important to keep the decision to require an SSRA flexible because factors vary from facility to facility. However, several commenters raised the concern that the proposed language of § 270.10 (l) was too vague. For example, one commenter suggested that any additional guidance clarifying how risk assessments should be performed and that providing standards or goals to be achieved by the operating conditions would be helpful. Another commenter felt that EPA should identify specific factors that the regions and authorized states should consider, and specific criteria that should be met, before requiring an SSRA or additional emission controls or other standards. We agree with commenters that additional guidance would be beneficial and have taken a number of actions in this regard. First, EPA is adopting a more detailed regulatory provision that provides a non-exclusive list of guiding factors for permit authorities to use in determining whether the MACT will be sufficiently protective at an individual site, and consequently, whether an SSRA is warranted. Section 270.10(l) now requires that the permit writer's evaluation of whether compliance with the standards of 40 CFR part 63, Subpart EEE alone is protective of human health or the environment be based on factors relevant to the potential risk from a hazardous waste combustion unit, including, as appropriate, any of the specifically enumerated factors. These factors reflect the eight guiding factors that EPA has discussed in several rule preambles. See 61 FR 17372, 64 FR 52842, and 69 FR 21328. However, EPA has also incorporated a few minor revisions to reflect the standards promulgated today, and to reflect the fact that the factors will be codified.

EPA has revised the language of the factors so that the language is consistent between the provisions. Consistency of phrasing is generally more important in regulations, which are binding, than in guidance. For example, some of the factors listed in the 1999 preamble used the phrase "presence or absence" while other used the phrase "identities and quantities." EPA has adopted the phrase "identities and quantities," on the grounds that it more precisely expresses the concept intended by both phrases. EPA has also made minor revisions to reduce redundant text, and to shorten the provisions, in the interests of clarity. For example, rather than addressing the proximity of receptors in two factors, EPA addresses this issue in a single factor. However, nothing contained in either of the original factors was deleted as part of this revision. None of the revisions described here substantively change the issues to be considered from those contained in the original eight guiding factors.

In addition to these minor technical revisions, EPA has included language to clarify that one potentially relevant factor for consideration is the "identities and quantities of persistent, bioaccumulative or toxic pollutants considering enforceable controls in place to limit those pollutants." This reflects changes made between the proposed and final MACT standards (e.g., the proposed rule called for beyond-the-floor dioxin limits for some sources; those were not promulgated in the final rule).

Another change is the EPA has deleted the factor that listed "concerns raised by the public." The regulation will allow the decision to be based on any one of the listed factors, and public concern, unaccompanied by an identifiable risk, would not provide an adequate basis for determining that an SSRA was warranted.

Finally, as discussed previously in subsection B., EPA has added an additional factor to indicate that a previously conducted risk assessment would be relevant in evaluating changes in conditions that may lead to increased risk. The factor reads as follows: "Adequacy of any previously conducted risk assessment, given any subsequent changes in conditions likely to affect risk." See § 270.10(l)(1).

One commenter raised the concern that the eight guiding factors the Agency specified in its Federal Register notice at 64 FR 52842 (September 30, 1999) did not adequately focus on the central question of whether there are likely to be emissions that would be uncontrolled under the Subpart EEE final rule. They argued that, as an example, under guiding factor #5, if the waste containing highly toxic constituents are being addressed by the Subpart EEE standards, the fact that there might be such wastes should not justify an SSRA. The commenter apparently misunderstands that the factors were not intended to function as stand-alone criteria for requiring an SSRA—i.e., to use their example, the commenter believes that the mere fact that highly toxic constituents are present in the waste would justify an SSRA without consideration of whether the MACT emission standards were sufficiently protective. This is an incorrect reading of EPA's proposed regulation. Rather, the factors were always intended to function as considerations that might be relevant to the determination of whether the MACT was sufficiently protective. However, the regulatory structure EPA has adopted in the final rule makes perfectly clear that the critical determination is that "compliance with the standards of 40 CFR part 63, Subpart EEE alone may not be protective of human health or the environment." Further, the provision states that this determination is to be based only on factors relevant to the potential risk from the hazardous waste combustion unit, including, as appropriate, the listed factors. EPA believes that these provisions make clear that the determination of whether to require an SSRA is to be based on consideration of the conditions at the facility site, including, for example, an evaluation of all enforceable controls in place to limit emissions. Further discussion of EPA's revised provisions can be found in subsection F.

Second, as discussed in more detail below, EPA is issuing a revised risk assessment guidance document that we believe will provide additional insight to help users. While clearly delineating between risk management and risk assessment, the HHRAP explains in great detail a recommended process for performing and reporting on cost-effective, scientifically defensible risk assessments. It includes numerous recommended defaults, while at the same time is flexible enough to incorporate site-specific values. Although the HHRAP provides numerous recommendations, it remains merely guidance and consequently leaves the final decisions up to the permitting authority. We believe that

Specific Risk Assessment Policy and Guidance for Hazardous Waste Combustion Facilities." (See Docket # OAR–2004–0022–0083).

the revised HHRAP guidance will provide further assistance to permit writers, risk assessors and facilities in determining whether or not to conduct an SSRA and what and how much information is required for the SSRA.

F. What Are EPA's Responses to the Cement Kiln Recycling Coalition's Comments on the Proposal and What is EPA's Final Decision on CKRC's Petition?

In the proposal, we provided a lengthy discussion in response to CKRC's petition for rulemaking (69 FR 21325–21331). In its petition, CKRC presented two requests with respect to SSRAs: (1) That EPA repeal the existing SSRA policy and technical guidance because CKRC believes that the policy and guidance "are regulations issued without appropriate notice and comment rulemaking procedures"; and (2) after EPA repeals the policy and guidance, "should EPA believe it can establish the need to require SSRAs in certain situations, CKRC urges EPA undertake an appropriate notice and comment rulemaking process seeking to promulgate regulations establishing such requirements." Additionally, CKRC stated that it does "not believe that these SSRAs are in any event necessary or appropriate" and that they disagree with EPA's use of the RCRA omnibus provision as the authority to conduct SSRAs. Finally, CKRC raised three general concerns: (1) Whether an SSRA is needed for hazardous waste combustors that will be receiving a RCRA permit when the combustor is in full compliance with the RCRA boiler and industrial furnace regulations and/or with the MACT regulations; (2) how an SSRA should be conducted; and (3) what is the threshold level for a "yes" or "no" decision that additional risk-based permit conditions are necessary. We believe our tentative decision in the proposal addressed each request and concern presented in their petition. However, in its comments, CKRC has restated many of the same issues with new emphasis. Thus, we believe it is appropriate to address their major comments in the following paragraphs.[240a]

1. Whether SSRAs Are Necessary for Facilities in Full Compliance With BIF or MACT Regulations

In its comments, CKRC continues to question the need for any SSRAs at facilities that are in full compliance with the MACT EEE standards. CKRC also states that "[our] Petition challenged EPA to explain why, if there is any need for SSRAs at all under RCRA, there is a rational basis for why it has limited the entire SSRA program to hazardous waste combustors." They argue that, "The point is that if the "omnibus" words in RCRA mean what EPA says they mean for hazardous waste combustors, why do they not mean the same thing for all of the other TSD facilities that also pose the same kind of "what-if" hypotheticals that EPA throws out in its preamble?"

As discussed above in subsection B., and in greater detail below, EPA believes that risk assessments will continue to be necessary at some facilities. For example, based on the inconclusive results from the national risk assessment conducted for the 1999 final rule and the comparative risk analysis conducted for today's rule, EPA is not able to conclude that all MACT standards will be sufficiently protective for every facility (e.g., non-dioxin PICs not previously modeled, no numerical dioxin/furan emission standard for solid fuel-fired boilers, liquid fuel-fired boilers with wet or no APCDs, and hydrochloric acid production furnaces, etc.). EPA also provided examples of site-specific factors that might lead risk assessors to decide that the MACT standards may not be sufficiently protective, and therefore an SSRA may be necessary (e.g., if a source's emissions are comprised of persistent bioaccumulative or toxic contaminants). EPA also discussed this issue at length in both the 2004 proposal, and the 1999 rule preamble. See 69 FR 21326 and 64 FR 52842. Given these uncertainties, the SSRA provides significant support for the Agency's 1006(b) determination supporting the elimination of separate RCRA emission standards for MACT EEE facilities.

We disagree that our discussion of standards (and site-specific factors) that may warrant a risk evaluation at certain types of facilities are mere "what-if" hypotheticals. The examples that we discussed in both the earlier preambles and above were based on the 1999 national risk assessment and a comparative risk analysis, which concluded that either there was not enough information to make a definitive protectiveness determination or that uncertainty in cancer and other health effects levels of dioxin and furans, for instance, make it difficult to draw conclusions about potential risks. Furthermore, the discussions with respect to the protectiveness of certain standards (i.e., some are less stringent today than the 1999 standards) in subsection B., present a reasonable basis for permitting authorities to consider whether or not risk should be evaluated. In support of our position that the examples we have provided in the 1999 final rule preamble, the 2004 proposed rule preamble, and this final rule, are more than "what-if" hypotheticals, we have placed copies of completed risk assessments where risk-based limits were found to be necessary in the docket for today's final rule (see OAR–2004–0022).

The CKRC fails to acknowledge that there are many aspects of hazardous waste combustors and the combustion process itself, which make this category of TSD facilities different from others, and which factor heavily into our SSRA policy. Consider that many combustion facilities feed a wide array of waste streams comprised of many hazardous constituents. The combustion of these constituents results in complex chemical processes (which are difficult to predict) occurring throughout the combustion unit. The end product is stack emissions comprised of a variety of compounds different from those that enter the process, and thus are difficult to predict because they can vary greatly based on the many variables of the individual combustion unit, making them difficult to address (*i.e.*, there are no specific emissions standards to limit certain compounds such as products of incomplete combustion). For example, in attempting to maximize the destruction of organic compounds, products of incomplete combustion are often generated as a consequence. Further, due to stack dispersion, hazardous waste combustors have the potential to affect several square miles. Other types of TSD facilities' operations typically do not encompass such complex processes or have the potential to adversely affect receptors for several square miles.

It should be noted that hazardous waste combustors are not the only type of TSD subjected to site-specific evaluations of risk. We take a site-specific approach to regulating miscellaneous units under Part 264, subpart X. Because it is not possible to develop performance standards and emission limits for each type of treatment unit that may fall under this broad category, we rely on general environmental performance standards to meet our mandate under §§ 3004 (a) and (q) that standards governing the operation of hazardous waste facilities be protective of human health and the environment. For example, § 264.601(c) requires "Prevention of any release that may have adverse effects on human

[240a] CKRC provided numerous comments organized by subtitles. Rather than relying on this format in the preamble, we have organized the comments and responses according to the concerns initially raised in the petition, and consistent with the discussion presented in the proposal.

health or the environment due to migration of waste constituents in the air, considering: * * * (6) the potential for health risks caused by human exposure to waste constituents; and * * *" For all intents and purposes, subparts X units are subject to SSRAs as well.

In addition, the question of whether an SSRA continues to be necessary is partly a function of the fact that EPA is seeking to rely on CAA MACT standards in order to eliminate RCRA emissions standards for these facilities. As noted above, because the MACT is technology-based, and because of uncertainties in our national risk assessments, permit writers' ability to conduct an SSRA in individual cases provides important support for our deferral.

RCRA §§ 3004(a) and (q) mandate that standards governing the operation of hazardous waste combustion facilities be protective of human health and the environment. To meet this mandate, we originally developed national combustion standards under RCRA, taking into account the potential risk posed by direct inhalation of the emissions from these sources. With advancements in risk assessment science since promulgation of the original national standards (*i.e.*, 1981 for incinerators and 1991 for boilers and industrial furnaces), it became apparent that the risk posed by indirect exposure (*e.g.*, ingestion of contaminants in the food chain) to long-term deposition of metals, dioxins/furans and other organic compounds onto soils and surface waters should be assessed in addition to the risk posed by direct inhalation exposure to these contaminants. We also recognized that the national assessments performed in support of the original hazardous waste combustor standards did not take into account unique and site-specific considerations which might influence the risk posed by a particular source. Therefore, until EPA was able to revise its regulations, to ensure the RCRA mandate was met on a facility-specific level for all hazardous waste combustors, we strongly recommended that site-specific risk assessments (SSRAs), including evaluations of risk resulting from both direct and indirect exposure pathways, be conducted as part of the RCRA permitting process. In those situations where the results of an SSRA showed that a facility's operations could pose an unacceptable risk (even after compliance with the RCRA national regulatory standards), additional risk based, site-specific permit conditions could be imposed pursuant to RCRA's omnibus authority, § 3005(c)(3).

Rather than establish separate emission standards under RCRA, EPA decided to coordinate its revisions to the RCRA emissions standards for hazardous waste combustors with the adoption of the MACT standards pursuant to § 112(d) of the CAA. See 64 FR 52832. In the rulemaking establishing the MACT standards for incinerators, cement kilns and lightweight aggregate kilns (Phase 1 sources), relying on RCRA § 1006(b), EPA determined that in most cases, the MACT standards would be sufficiently protective that separate RCRA emission standards and operating conditions would not need to be included in the facility's RCRA permit. However, for a variety of reasons, EPA lacked sufficient factual basis to conclude that a complete deferral of RCRA requirements could be supported for all facilities.

Section 1006(b) conditions EPA's authority to reduce or eliminate RCRA requirements on the Agency's ability to demonstrate that the integration meets RCRA's protectiveness mandate (42 U.S.C. 6005(b)(1)). See *Chemical Waste Management* v. *EPA*, 976 F.2d 2, 23, 25 (D.C. Cir. 1992). To support its RCRA § 1006(b) determination, EPA conducted a national evaluation of both direct and indirect human health and ecological risks to determine if the MACT standards would satisfy the RCRA mandate to protect human health and the environment. That evaluation, however, did not quantitatively assess the proposed standards with respect to mercury and nondioxin products of incomplete combustion. This was due to a lack of adequate information regarding the behavior of mercury in the environment and a lack of sufficient emissions data and parameter values (*e.g.*, bioaccumulation values) for nondioxin products of incomplete combustion. Since it was not possible to suitably evaluate the proposed standards for the potential risk posed by mercury and nondioxin products of incomplete combustion, in order to support our 1006(b) determination, we continued to recommend that SSRAs be conducted for some facilities as part of the permitting process until we could conduct a further assessment once final MACT standards were promulgated and implemented. Specifically, we recommended that for hazardous waste combustors subject to the Phase 1 MACT standards—hazardous waste burning incinerators, cement kilns and light-weight aggregate kilns—permitting authorities should evaluate the need for an SSRA on a case-by-case basis. We further stated that while SSRAs are not anticipated to be necessary for every facility, they should be conducted where there is some reason to believe that operation in accordance with the MACT standards alone may not be protective of human health and the environment. For hazardous waste combustors not subject to the Phase 1 standards, we continued to recommend that SSRAs be conducted as part of the RCRA permitting process. See 64 FR 52841. As discussed in subsection B., EPA believes that SSRAs may continue to be necessary for some Phase 1 facilities. For the Phase 2 sources, our comparative risk analysis generally indicates that, although the MACT standards for Phase 2 sources are appreciably more stringent than the current RCRA BIF standards, an SSRA may be necessary to confirm that a facility will operate in a way that is protective of human health and the environment.

Thus, for both Phase 1 and Phase 2 sources, we continue to believe that SSRAs may be necessary for some facilities.[241] We generally believe the MACT standards will be protective; in most cases they are substantially more protective than the existing RCRA part 264, 265, and 266 requirements. However, because HWCs manage hazardous waste and process it by burning and emitting the by-products into the air, a multitude of potential exposure pathways exist. These exposure pathways can also vary substantially based on site-specific factors associated with an individual combustion unit and the surrounding site. Such factors make it difficult for the Agency to conclude that a single, national risk assessment provides adequate factual support for its determination that the technology-based MACT standards will be sufficiently protective. This is further complicated by the fact that, for certain parameters, the Agency lacked sufficient information to quantitatively assess the risk, but is relying on a combination of quantitative and qualitative assessments of the MACT standards' protectiveness.

Nonetheless, EPA does not believe that the uncertainty is so great that it would preclude a deferral under 1006(b) for the affected categories of facilities; nor does EPA believe that these uncertainties necessarily support requiring a risk assessment for all such facilities. Conditions at the facility

[241] As discussed in section B., we expect that facilities that have previously conducted an SSRA will not need to conduct another in consideration of today's final standards. Only those facilities newly subject to the RCRA permitting requirements, or existing sources where changes in conditions could lead to increased risk, may need to conduct or modify an existing SSRA.

might confirm that the MACT standards are sufficiently protective, without the need for a facility-wide risk assessment. For example, if the results of the MACT testing demonstrated that the facility's dioxin emissions fall below the levels estimated in the database EPA used for its comparative risk assessment, the uncertainties in EPA's comparative risk assessment would not, by itself, support a decision to require an SSRA. Such decisions require an evaluation of the conditions at the site, and EPA believes it important to retain the flexibility for permit authorities to take these conditions into account. Accordingly, EPA believes that the regulatory structure adopted in today's rule strikes the appropriate balance between these competing factors.

In response to EPA's statement in the proposal that non-HAP emissions, which were beyond the direct scope of MACT, may pose risk which could necessitate an SSRA (69 FR 21326), CKRC pointed out that the same could be said for other types of TSDs, such as landfills, land treatment systems, etcetera, and EPA has not addressed this point in its preamble. As previously noted, combustion units are distinct from other types of TSDs due to the wide array of waste streams being fed to the unit, the complex chemical processes throughout the combustion unit, stack emissions comprised of a wide variety of compounds that are difficult to address, and the potential to impact receptors for several square miles due to stack dispersion. A further distinction is that EPA is seeking to rely on the MACT standards to eliminate national RCRA stack emissions standards under § 1006(b). Unless EPA can affirmatively demonstrate that RCRA's protectiveness standards are met, the Agency cannot eliminate RCRA requirements. A number of uncertainties remain concerning the protectiveness of the MACT standards based on the uncertainties remaining in the supporting national risk assessment and comparative analysis, and the variability of site-specific factors from one facility to another. Permitting authorities' ability to resolve these uncertainties through the use of the SSRA, where appropriate, provides important support for the Agency's 1006(b) finding. Furthermore, as we have noted, under omnibus, to the extent permitting authorities believe there are problems with other types of TSDs, they can impose requirements and request additional information, including an SSRA in accordance with § 270.10(k). Also as previously noted, Part 264, subpart X specifically incorporates site-specific consideration of risk into its regulatory framework.

Next, CKRC comments that EPA has a non-discretionary duty under CAA § 112(f) to address and take care of any "residual risk" from MACT facilities in the future in any event. We discussed why we do not believe that the residual risk process should or can take the place of an SSRA under RCRA in subsection C. of this SSRA preamble, as well as in the 1999 rule preamble (64 FR 52843). In short, because the residual risk standards have not yet been established, permit writers cannot rely on this process in reaching current permitting decisions or in acting on currently pending permit applications.

2. Codification of EPA's Technical Guidance

In response to our explanation in the proposal that risk assessment guidelines should be flexible and reflect current science, CKRC gave three comments: (1) Not a word of the current SSRA guidelines has been changed in 3 years; (2) it is easy to write regulations that have provisions that might be applied differently in different situations, and at least many basic, fundamental points can go in regulations, while some details can be in guidance—EPA writes regulations accompanied by "fill in the small details" guidance all the time; and (3) EPA seems to have no real problems with regulatory fixes anyway. In addition, CKRC provides several comments related to the previous three throughout their comment document, which are addressed below.

None of these comments address the specific issue EPA raised, which is that, while it certainly is possible to codify our risk assessment guidance, for a variety of reasons, we disagree that it would be appropriate to issue these technical recommendations as a regulation. As we previously explained, risk assessment—especially multi-pathway, indirect exposure assessment—is a highly technical and evolving field. Any regulatory approach EPA might codify in this area is likely to become outdated, or at least artificially constraining, shortly after promulgation in ways that EPA cannot anticipate now. In support of this, we noted specific examples of problems we experienced in implementing the BIF regulations. See 69 FR 21330. Further, we explained that at the time of codification, BIF risk assessments were not intended to address indirect routes of exposure, thus making the parameters easier to implement. Today, however, risk assessments are more complex due to the necessary inclusion of multi-pathway and indirect exposure routes. Given the complexity of multi-pathway and indirect exposure assessments and the fact that risk science is continuously evolving, it would be difficult and again, overly constraining, to codify risk parameters today. We note as well, in this regard, that several commenters agreed that codification of EPA's risk assessment guidance would be too constraining for both the agency and the regulated community.

We also believe that a guidance approach is consistent with the fact that permit authorities must make site-specific decisions whether to do risk assessments at all. We think that it makes little sense to allow this kind of flexibility regarding whether to do a risk assessment and for what purposes, while prescribing how one must be conducted if one is required. In fact, permitting authorities, in some cases, have developed their own guidance methodologies responsive to the specific needs associated with their facilities. For example, North Carolina, Texas, and New York have each developed their own risk assessment methodologies. Further, facilities that choose to conduct SSRAs themselves can choose alternative approaches in applying methodologies as well. We think this flexibility employed in the field supports our judgment that risk assessment methodologies should not be codified. CKRC's comments failed to address any of these issues.

Turning to the remainder of CKRC's specific points—CKRC's assertion that the technical guidance has not been amended in the past three years is inaccurate. A revised HHRAP guidance, that has been amended to take into account the technical recommendations from both the public comments and peer review, is published in conjunction with this rule. In addition, as noted above, in some cases, permitting authorities have developed their own methodologies responsive to the specific needs associated with their facilities.

With respect to CKRC's third point, the regulatory corrections made to the MACT rules were necessary either to fix an error or omission or to resolve potential legal issues. To codify technical tools and chemical information pertinent to the risk process simply is not prudent, as this information is continually changing and would almost always be out of date. Granted, when this information is presented in guidance, it can just as easily become outdated, however, facilities and risk assessors are free to use the most up-to-date air modeling tools and toxicity values available (i.e., they would not be bound to regulations requiring the use of obsolete tools and

information). We continue to believe that publishing our technical recommendations as regulation would remove much of the flexibility that is important in evaluating risk on a site-specific basis.

CKRC discounts EPA's statement that codification of risk assessment is the exception arguing that "Neither TSCA or CERCLA, however, specifically commands EPA to define the type of information necessary for a permit application through the rulemaking process as RCRA does. Moreover, the TSCA and CERCLA examples EPA cites are not analogous to the situation where a permit applicant can be denied a permit—or at least strung through months or years of tortuous and costly submissions, revision, and resubmission—to obtain a permit."

Even if TSCA and CERCLA were not considered to be analogous, that does not change EPA's fundamental rationale that codification of highly technical risk assessment guidance is not appropriate. EPA does not believe that RCRA § 3005(b) requires EPA to codify an exhaustive list of every possible piece of information that might be required in a permit. To some extent, that is the reason for having a permit process—to allow site specific conditions to be taken into account. Nevertheless, EPA has revised part 270, pursuant to RCRA § 3004(a) and § 3005(b) to specifically provide that a risk assessment may be necessary, where there is reason to believe that the MACT standards may not be sufficiently protective. This was done wholly to address the petitioner's concern that the current regulations do not adequately provide notice that an SSRA might be necessary as part of a permit application. This provision, while it does not provide as much detail as the petitioner wishes, clearly "defines the type of information necessary for a permit application."

CKRC complains that the Agency did not address in its proposed response the petitioner's discussion of the "strong case law compelling the conclusion that 'guidance' documents EPA has issued for conducting SSRAs must be subjected to notice-and-comment rulemaking." EPA has chosen not to respond to CKRC's legal interpretation because we believe that it is clear that the guidance documents do not impose mandatory requirements, and therefore need not be issued by notice and comment rulemaking. Nevertheless, EPA notes that in the proposal, the Agency explained that we were in the process of reviewing the guidance documents, and, to the extent we found language that could be construed as limiting discretion, we committed to revise the documents to make clear that they are non-binding. See 69 FR 21329. We specifically noted that CKRC indicated in its petition that, in its view, the documents contain language that could be construed as mandatory. While EPA does not necessarily agree, and believes that, in context, it is clear that the recommendations in the documents are discretionary, EPA nonetheless reviewed the documents to ensure that they are carefully drafted. Consequently, under the standards articulated in *Appalachian Power Co.* v. *EPA*, 208 F.3d 1015 (D.C. Cir. 2000) and subsequent case law, the final HHRAP guidance is truly guidance and does not require notice-and-comment rulemaking. The HHRAP explains in great detail an acceptable process for performing and reporting on cost-effective, scientifically defensible risk assessments. It includes numerous recommended defaults, while at the same time provides the risk assessor or facility full opportunity to incorporate site-specific values in place of the defaults. The HHRAP offers numerous recommendations, but requires nothing. EPA has placed a copy of the final guidance document in the docket for today's action (see OAR–2004–0022).

CKRC believes that EPA's technical guidance imposes information requirements upon the RCRA permit applicant that are not contained in any regulations and in fact exceed by orders of magnitude any information requirements contained in the part 270 regulations. We disagree that anything contained in HHRAP is "required" in any way. Moreover, to the extent any individual facility believes the information requested is inappropriate or unnecessary, they can challenge that as part of the permitting process.

Lastly, CKRC argues that "The procedures EPA has been using to issue and revise the SSRA guidance do not by any measure comply with the full panoply of procedures and protections offered by the APA process. Most critically, when EPA merely solicits comments on draft guidance documents, it has no duty to respond to comments and provide a rational basis and justification in defense of its choices in the face of comments. EPA is essentially running its entire SSRA program on the basis of "draft" guidance versions for which EPA has never to this day prepared any response to comments." As previously noted, EPA believes the final HHRAP is merely guidance and therefore, EPA is not required to proceed through notice and comment rulemaking pursuant to § 553 of the APA. However, because we want the HHRAP guidance to be useful and clear, we have solicited public review and comment. As a result, it has been improved over the years by including revisions to the guidance based upon feedback from users of the guidance and from experience in the field. A response to comments document has been prepared and released along with the final HHRAP and final MACT rules, even though the Agency was not required to do so. More to the point, because it is only guidance, sources will have the opportunity to raise questions or comments on anything in the guidance as part of the permitting process and the permitting authority will be required to respond to those comments as part of the permitting process. See 40 CFR part 124. Sources will also have the right to challenge the responses or use of the guidance as part of the permitting process.

3. Codification of Criteria for Determining That Additional Risk-Based Permit Conditions or an SSRA Is Necessary

CKRC argues that EPA's proposed regulatory changes should not be considered as a partial grant because EPA has not codified specific criteria in the proposed regulations for permit authorities to use to decide whether to require an SSRA; to set the risk levels that are deemed protective; or to otherwise provide any further definition as to what it means to protect human health and the environment.

In its petition, CKRC requested that after we repeal the policy and guidance (per the first request), "should EPA believe it can establish the need to require SSRAs in certain situations, CKRC urges EPA to undertake an appropriate notice and comment rulemaking process seeking to promulgate regulations establishing such requirements." As discussed at length in both the proposal (69 FR 21325–21327) and the preceding paragraphs, we believe that we have established certain circumstances where the MACT standards may not be protective and that an SSRA may be warranted, based on relevant site-specific factors associated with an individual combustion unit. Consequently, we are finalizing regulations that explicitly authorize permitting authorities to conduct or require an SSRA on a site-specific basis. This, in our view, grants the second of CKRC's requests. Our response directly addresses a number of CKRC's concerns: (1) Through a notice and comment rulemaking process, EPA has established circumstances in which an SSRA may be necessary; and (2) EPA's regulations will now explicitly

acknowledge that an SSRA might be necessary as part of the permitting process, thereby addressing the petitioner's concern that EPA's past approach of relying on RCRA's omnibus authority to implement this policy violates the requirements of RCRA § 3005(b). And as discussed further below, EPA has codified criteria for permit authorities to use to determine whether to require an SSRA.

While it does not provide exactly what CKRC requested, the regulated community has had a full opportunity to comment on the need for an SSRA both as part of the 1999 rulemaking and, again, as part of this rulemaking to adopt the provisions of § 270.10(l), which contain an explicit reference to the potential need for an SSRA as part of the permitting process pursuant to RCRA § 3004(a) and § 3005(b). As previously explained, § 270.10(k) does not explicitly mention the potential for an SSRA to be required. Although the rule does not identify a priori that an SSRA will be required in an individual circumstance, but defers that determination to the permitting process, the final rule reflects EPA's findings that an SSRA is not anticipated to be necessary in every circumstance—only where site-specific conditions give the permit authority reason to believe that additional controls beyond those required pursuant to 40 CFR parts 63, 264, 265, or 266 may be necessary to protect human health and the environment.

CKRC argues that EPA's decision not to codify national criteria renders the regulation impermissibly vague, and therefore, "in their view totally deficient as a legal matter." The petitioner argues that the rule is essentially "a bootstrap attempt to avoid rulemaking requirements by establishing 'rules' that give no more guidance or direction than general terms in the statute and in no way channel the decision maker's discretion or put the public on notice of anything." According to CKRC, this unbridled discretion is manifest in three ways: (1) No criteria explain how a permit writer is to decide whether to require an SSRA; need merely to conclude "reason to believe"; (2) there are absolutely no limits on what type of information or assessments the permit writer may demand and the proposed reg. does not even hint at what type of information or assessments might be demanded; and (3) there is not a word of guidance or specification as to what it means to "ensure protection of human health and the environment." The petitioner argues that as a consequence, the proposed § 270.10(l) would be struck down as a "standardless regulation."

EPA disagrees that the provisions at § 270.10(l) are impermissibly vague, or otherwise inconsistent with the cases the petitioner cites. In the cited cases the courts found that the regulated entity bore the entire burden of determining how to comply with the challenged regulation in the complete absence of a government-generated standard or guidance. See *Maryland* v. *EPA*, 530 F.2d 215, 220 (4th Cir. 1975); *South Terminal Corp* v. *EPA*, 504 F.2d 646, 670 (1st Cir. 1974). This is entirely distinct from the regulations codified at § 270.10(l).

In § 270.10(l) EPA identified the standard for when a risk assessment may be necessary: where the regulatory authority identifies factors or conditions at the facility that indicate that the MACT standards may not be sufficiently protective, and defers the articulation of the more precise requirement to the permitting process, where the onus falls on the permitting authority to identify the basis for its determination. Until the permitting authority provides this further guidance, the regulated entity incurs no obligation. The mere fact that specific factors or facility conditions that form the basis for the determination that an SSRA is warranted will be subsequently identified through the permitting process does not invalidate the regulation. See *Ethyl Corp* v. *EPA*, 306 F.3d 1144, 1149–1150 (D.C. Cir. 2002).

The regulation also identifies the categories of information that might be required for MACT EEE facilities: The information must be necessary to determine whether additional controls are needed to ensure protection of human health and the environment; it can include the information necessary to evaluate the potential risk from both direct and indirect exposure pathways; or it can include the information necessary to determine whether such an assessment is necessary. Here as well, EPA's reliance on the permitting process to provide further specification of the required information is not improper.

Moreover, as discussed above in subsection C., in response to commenters' concerns, EPA has revised § 270.10(l) to provide more detail, both with respect to the basis for the determination that an SSRA is necessary, and with respect to the type of information the permit authority might need. EPA has added language to remind permit authorities that the determination that the MACT standards may not be sufficiently protective is to be based only on factors relevant to the potential risk from the hazardous waste combustion unit at the site. EPA has also added language to § 270.10(l) to identify guiding factors for permitting authorities to consult in determining whether the MACT will be sufficiently protective at an individual site. Although the list of guiding factors is not all-inclusive, they offer a structure for risk managers (as well as the regulated community) to use to frame the evaluation of whether a combustor's potential risk may or may not be acceptable.

Finally, we note that, unlike the circumstances in the cited cases, § 270.10 is promulgated in the context of an existing permitting regime. The regulatory standards at 40 CFR part 124 provide further structure for both the regulated community and the permit authority. For similar reasons, EPA disagrees that the cited cases compel the Agency to establish risk levels that are deemed protective, or to otherwise provide any further definition as to what it means to protect human health and the environment. We discussed at length throughout the proposal the reasons we believe it would not be appropriate to codify either an exclusive set of national criteria for determining that an SSRA (or additional risk-based permit conditions) would be necessary, or a uniform risk level. The decision to require an SSRA is inherently site specific, thus permitting authorities need to have the flexibility to evaluate a range of factors that can vary from facility to facility. See 69 FR 21328–21331. CKRC has neither presented new factual or policy reasons that would cause the Agency to reconsider the tentative decisions presented in the proposal, nor specifically addressed the issues underlying EPA's decision. Instead, the petitioner has merely reiterated the concerns presented in its petition and its general disagreement with EPA's decision.

EPA also disagrees that its new regulatory structure grants permit writers unbridled discretion for many of the same reasons that EPA does not believe that § 270.10(l) is impermissibly vague. As EPA has previously explained, the requirements at Part 124 continue to apply to actions taken to implement § 270.10(l). Moreover, the language of § 270.10(l) makes clear that the onus initially falls on the permitting authority to identify the basis for its conclusion that the MACT standards may not be sufficiently protective. As both part 124 et. seq., and EPA's preamble discussions make clear, facilities will continue to have the opportunity to comment on and challenge the determination. See §§ 124.10, 124.11, and 124.19. The

regulatory structure adopted in § 270.10(l) mirrors the structure Congress established in sections 3004 and 3005; although 3004 directs EPA to establish national standards, section 3005 recognizes that those standards will be applied on a case-by-case basis through the permitting process, to allow site-specific conditions to be taken into account, and to supplement those standards as necessary.

EPA has also provided recommendations through guidance on how an SSRA can be conducted. Although the recommendations are not binding, they provide risk managers (as well as the facility) with a starting point from which to determine whether a combustor's potential risk may or may not be acceptable.

CKRC argues that it appears that rather than following the statutory authorities and requirements to review and amend regulations every 3 years as necessary (RCRA § 2002(b)), EPA decided to take the easy way out and impose, through non-rulemaking "guidance", massive, costly, and confusing requirements leaving unbridled discretion to its permit writers.

We disagree that the Agency has attempted to avoid rulemaking in this context. EPA has conducted several rulemakings to amend our regulations. The first was in 1999, when we adopted revised emission standards under the authority of both § 112(d) of the CAA and RCRA to more rigorously control toxic emissions from burning hazardous waste in incinerators, cement kilns, and lightweight aggregate kilns. See 64 FR 52828. At the time, we noted that "today's rule fulfills our 1993 and 1994 public commitments to upgrade emission standards for hazardous waste combustors." We have continued to revise our regulations consistent with and based on the facts before the Agency, taking into account the arguments presented in CKRC's petition. As explained above, we believe that the facts do not support granting all of CKRC's requests. Rather we believe that the MACT standards will generally be protective, and that permit authorities should reach the decision to require an SSRA based on a variety of factors and concerns specific to their sites. In addition, as previously addressed, we believe that our risk assessment guidance should remain as guidance. Several other commenters agree that the guidance should not be codified.

The petitioner argues that the regulation EPA has proposed to adopt is so vague, that it is essentially not a regulation, and that consequently, even if finalized, it would not be sufficient to comply with the requirement in RCRA § 3005(b) to specify in regulations, the information necessary to obtain a permit. They compare the level of detail in § 270.10(l) to the lengthy regulations (codified in 40 CFR part 270) specifying in great detail the information required when one is submitting a RCRA permit application, arguing that "these regulations cover 75 pages of fine print in Code of Federal Regulations," to demonstrate that this regulation would be insufficient under RCRA § 3005(b). In further support of this argument, CKRC cites *Ethyl Corporation* v. *EPA*, 306 F.3d 1144 (D.C. Cir. 2002).

EPA disagrees that its regulations are in any way inconsistent with the decision in *Ethyl Corp.* At issue in that case was a regulation issued pursuant to section 206(d) of the CAA. Section 206(d) provides that EPA "shall, by regulation, establish methods and procedures for making tests under this section." 42 U.S.C. 7525(d). The court found that "with CAP 2000, [the challenged regulation] the EPA does not claim to have itself articulated even a vague durability test. Rather CAP 2000 requires that 'the manufacturer shall propose a durability program' for EPA approval. 40 CFR 86.182301(a). It thus falls on the forbidden side of the line." *Ethyl Corp.*, 306 F.3d at 323–324. The Court distinguished the challenged regulation from the situation in which an agency issues a "vague" regulation, and relies on subsequent proceedings to flesh out the specific details. And as the court explained, where "Congress had not specified the level of specificity expected of the agency, we held that the agency was entitled to broad deference in picking the suitable level." 306 F.3d at 323 (citing *American Trucking Associations* v. *DOT*, 166 F.3d 374 (D.C. Cir. 1999) and *New Mexico* v. *EPA*, 114 F.3d 290 (D.C. Cir. 1997).

In § 270.10(l) EPA has articulated the standard for when a risk assessment may be necessary: where the regulatory authority has identified factors or conditions at the facility that indicate that the MACT standards may not be sufficiently protective. EPA has also adopted a list of factors on which permit writers are to rely in reaching this determination. EPA has also identified the categories of information that might be required for MACT EEE facilities: The information must be necessary to determine whether additional controls are needed to ensure protection of human health and the environment; it can include the information necessary to evaluate the potential risk from both direct and indirect exposure pathways; or it can include the information necessary to determine whether such an assessment is necessary. While it does not provide as much detail as the petitioner wishes, this provision unquestionably "defines the type of information necessary for a permit application."

Thus, the issue turns on the level of specificity that RCRA § 3005(b) requires, and EPA does not believe that RCRA § 3005(b) requires EPA to publish a list of every possible piece of information that might be required in a permit. Section 3005(b) merely establishes a broad directive that "each application for a permit under this section shall contain such information as may be required under regulations promulgated by the Administrator," and that it shall include the information contained in subsections (1) and (2), leaving to EPA's discretion to determine the level of specificity at which to promulgate regulations. To some extent, this reflects the reason for having a permit process—to allow site specific conditions to be taken into account. The regulatory structure adopted in § 270.10 mirrors the structure Congress established in RCRA § 3004 and § 3005. Despite the petitioner's comparison to the length of part 270, the length of these provisions are not indicative of any determination of the precise level of detail that § 3005(b) requires, but reflects the fact that EPA has adopted requirements specific to individual types of units. Moreover, notwithstanding the petitioner's characterization, the language at § 270.10(l) is comparable to many other provisions in 40 CFR part 270. See, for example: §§ 270.14(b)(8); 270.16(h)(1)–(2); 270.22(a)(6)(i)(C); 270.22(c).

Lastly, CKRC argues that the proposed regulation is particularly problematic, because it extends beyond "information" that may already exist. CKRC says that it is one thing to demand that a party go out and gather existing information, but another thing to demand that an applicant conduct "assessments." Moreover, nothing in the regulations prohibits a permit authority from demanding revised assessments, and even more revised assessments. We agree that permit authorities have the authority to require facilities to provide additional information beyond that which already exists. However, based on feedback from EPA Regional permit writers, SSRAs generally represent a one-time cost. We do not expect that facilities that have conducted risk assessments will have to repeat them. As discussed in the 1999 final rule preamble, changes to comply with the MACT standards should not cause an increase in risk for the vast majority of facilities given that the changes, in all

probability, will be the addition of pollution control equipment or a reduction in the hazardous waste being burned (see 64 FR 52842). Instances where a facility may need to repeat a risk assessment would be related to changes in conditions that would likely lead to increased risk.[242] In such situations, we would anticipate that the risk assessment would not have to be entirely redone. It may be as limited as collecting relevant new data for comparison purposes, leading to a decision not to repeat any portion of a risk assessment. Or, it may be more inclusive such that modifications would be made to specific inputs to or aspects of the risk assessment using data from a previous risk assessment, risk burn or comprehensive performance test. As discussed in subsection B., we have added a new regulatory provision to indicate a previously conducted risk assessment would be relevant in evaluating changes in conditions that may lead to increased risk. The factor reads as follows: "Adequacy of any previously conducted risk assessment, given any subsequent changes in conditions likely to affect risk."

4. EPA's Cost Estimates for SSRAs

CKRC raised several objections to our cost estimates for conducting an SSRA, and provided higher cost estimates ($200K to $1M, with upper bound of $1.3M). We suggested in the proposal, that the higher cost figures provided by CKRC were likely incurred prior to the 1998 release of the Human Health Risk Assessment Protocol (HHRAP) guidance document. We believe our lower cost estimates can be attributed to the fact that we based them on the conduct of future SSRAs that will benefit from substantially better guidance and commercially available software.

Multiple issues regarding the cost information we provided in the proposal are raised by CKRC. The first of five issues is that CKRC believes that EPA's methods for calculating costs associated with future SSRAs do not include data gathering costs, QA/QC, third party consultants in addition to risk assessors and plant personnel time to coordinate and review SSRA efforts and collect facility data. We disagree with this statement in part; the estimates developed by the Agency do include data gathering costs, QA/QC, and third-party consultants. (Refer to the proposed rule's support document entitled: Preliminary Cost Assessment for Site Specific Risk Assessment, November 2003, Docket # OAR–2004–0022; and the Assessment of the Potential Costs, Benefits, and Other Impacts of the Hazardous Waste Combustion MACT Replacement Standards—Final Rule, October 12, 2005, for a description of how the estimates were arrived at.) However, we agree with CKRC that the method used to develop SSRA costs does not capture facility time associated with data collection and management related to the SSRA. Consequently, we have adjusted our SSRA cost estimates to account for these activities by incorporating costs associated with time needed for facility data collection and management efforts associated with the SSRA, and will assume that engineering staff are required to perform these tasks.

The second issue concerns the extent to which cement kiln SSRAs are consistent with EPA's "normal" assumptions. We do not question the accuracy of the costs submitted by CKRC. However, it is not clear that the costs submitted by CKRC represent typical future costs for SSRA implementation at all facilities in the universe. Certain of the CKRC cost estimates (e.g., those submitted by Ash Grove and Holcim) reflect implementation of SSRAs over a number of years in the 1990s, while SSRA implementation was in its early stages. In other cases (e.g., estimates provided by Solite) costs appear to be consistent with EPA estimates. While we do not dispute the accuracy of these costs, earlier costs are likely to reflect the deliberative process common with early SSRAs.

For the third issue, CKRC's points out that EPA's estimate of 20 percent additional cost for adding a risk burn during a trial burn may be low; CKRC asserts that additional test costs can add up to 40 percent depending on the circumstances. We agree with this and have adjusted the range of total SSRA costs as necessary to assure that a range of additional test costs for separate risk burns (20 to 40 percent incremental cost) are included. For revised figures, see background document, Assessment of the Potential Costs, Benefits, and Other Impacts of the Hazardous Waste Combustion MACT Replacement Standards—Final Rule, October 12, 2005.

CKRC's fourth issue is that EPA does not appear to include more than evaluations of stack emissions in its estimates of SSRA costs. We disagree with this comment. The estimates of SSRA costs developed by the Agency reflect total contractor costs for performing an SSRA at a facility under different sets of conditions, and are not limited to stack emissions.

In the fifth cost-related issue, CKRC asserts that EPA's average estimates might be reasonable if the SSRA process were limited to the submission and acceptance of one SSRA effort. CKRC contends, however, that its members' experiences with SSRAs have involved coordination with state and regional offices and multiple revisions and submissions. Again, we do not question the experiences and costs of specific facilities. However, we anticipate that the 2003 Memorandum, Use of the Site-Specific Risk Assessment Policy and Guidance for Hazardous Waste Combustion Facilities, and the Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities guidance, which is finalized and released in conjunction with today's rule, will provide facilities and regulators with a clearer understanding of SSRA policy and guidance and will support a more efficient SSRA process. EPA's future SSRA cost estimates are based on current or recent cost data from multiple practitioners, and likely reflect a more efficient process than that experienced by some CKRC members in the 1990s.

X. Permitting

As discussed in the proposal, we believe that the permitting approach we adopted in the 1999 final rule is still the most appropriate means to avoid duplication to the extent practicable and to streamline requirements. Thus, both Phase 1 and Phase 2 sources will comply with their RCRA emission limits and operating requirements until they demonstrate compliance with the MACT standards by conducting a comprehensive performance test (CPT), submitting a Notification of Compliance (NOC) documenting compliance to the Administrator or delegated state, and then requesting to have their RCRA permits modified to remove the duplicative RCRA requirements (unless a sunset clause had been added previously that inactivates specified requirements upon compliance with MACT).[243] Ultimately, the MACT air emissions and related operating requirements will reside in the CAA Title V permit, while all other aspects

[242] For example, hazardous waste burning cement kilns that previously monitored hydrocarbons in the main stack may elect to install a mid-kiln sampling port for carbon monoxide or hydrocarbon monitoring to avoid restrictions on hydrocarbon levels in the main stack. Thus, their hydrocarbon emissions may increase. (64 FR 52843, footnote 29.) Another example would be if the only change at a facility relates to the exposed population; what was acceptable in a previous risk assessment may not be any longer.

[243] Although we expect that the vast majority of Phase 1 sources will have had their RCRA permits modified by the time this rule is promulgated, we acknowledge that there may be a few permits yet to be modified.

of the combustion unit and the facility (*e.g.*, corrective action, general facility standards, other combustor specific concerns such as material handling, risk-based emission limits and operating requirements, and other hazardous waste management units) will remain in the RCRA permit. A new pictorial timeline has been provided to highlight milestones of the MACT compliance process. See figure 1 at the end of this section.

A. What is the Statutory Authority for the RCRA Requirements Discussed in this Section?

EPA is finalizing amendments to modify RCRA permits in today's rule pursuant to sections 1006(b), 2002, 3004, 3005 and 7004(b) of RCRA. 42 U.S.C. §§ 6905(b), 6912, 6924, 6905, and 6074. Our approach is likewise consistent with section 112(n)(7) of the Clean Air Act which indicates that EPA should strive to harmonize requirements under section 112 and RCRA requirements for hazardous waste combustion sources. With respect to the regulatory framework that is discussed in this section, we are finalizing the process to eliminate the existing RCRA stack emissions national standards for hazardous air pollutant for Phase 2 sources as we had done for Phase 1 sources in the 1999 final rule. That is, after submittal of the NOC established by today's rule and, where applicable, once RCRA permit modifications are completed at individual facilities, RCRA national stack emission standards will no longer apply to these hazardous waste combustors (unless risk-based permit conditions are determined necessary).

We originally issued emission standards under the authority of section 3004(a) and (q) of RCRA, which calls for EPA to promulgate standards "as may be necessary to protect human health and the environment." We believe that the final MACT standards are generally protective of human health and the environment, and that separate RCRA emission standards are not needed to protect human health and the environment. See Part Seven, How Does the Final Rule Meet the RCRA Protectiveness Mandate? for a discussion of this topic. RCRA section 1006(b) directs EPA to integrate the provisions of RCRA for purposes of administration and enforcement and to avoid duplication, to the maximum extent practicable, with the appropriate provisions of the Clean Air Act (and other federal statutes). This integration must be done in a way that is consistent with the goals and policies of these statutes. Therefore, based on its findings regarding the protectiveness of the MACT standards, and pursuant to section 1006(b), EPA is generally eliminating the existing RCRA stack emission standards to avoid duplication with the new MACT standards. The amendments made today to allow new combustion units to comply with the MACT standards upon start-up, versus the RCRA stack emissions national standards, are based on the principle of avoiding duplication between programs.

We are not stating that RCRA permit conditions to control emissions from these sources will never be necessary, only that the national RCRA standards appear to be unnecessary. Under the authority of RCRA's "omnibus" clause section 3005(c)(3); (see §§ 270.32(b)(2) and (b)(3)), RCRA permit authorities may impose additional terms and conditions on a site-specific basis as may be necessary to protect human health and the environment. Thus, if MACT standards are not protective in an individual instance, RCRA permit writers will establish permit limits that are protective.

In RCRA, Congress gave EPA broad authority to provide for public participation in the RCRA permitting process. Section 7004(b) of RCRA requires EPA to provide for, encourage and assist public participation in the development, revision, implementation, and enforcement of any regulation, guideline, information, or program under the Act.

B. Did Commenters Express any Concerns Regarding the Current Permitting Requirements?

Generally speaking, commenters favor maintaining the permitting approach and requirements referred to above. This approach was finalized in the 1999 rule and has been implemented, and in a few cases is currently being implemented, for Phase 1 sources complying with the Interim Standards Rule. However, several commenters raised similar concerns regarding certain aspects of the transition process from RCRA to MACT and Title V permitting.

1. Removal of Duplicative RCRA Permit Conditions

One comment is in regard to Phase 1 sources that have been fully transitioned (i.e., have had duplicative RCRA permit conditions and requirements removed or that have been "sunsetted") to compliance with the Interim Standards that may need to make upgrades to comply with the revised Phase 1 MACT Standards. The concern is that Phase 1 sources needing to make upgrades for MACT should be able to do so without a RCRA permit modification (unless risk-based conditions are present). We agree with the commenters that as long as the technology upgrades (e.g., equipment changes to upgrade air pollution control equipment) do not affect any remaining conditions in the RCRA permit, the regulations do not require a permit modification. For those Phase 1 sources that need to make upgrades to comply with the revised standards, they should address the specific upgrades in their draft Notification of Intent to Comply (NIC) and during the informal NIC public meeting so that the regulatory authority and public are aware of the source's activities and plans for compliance. We encourage early communication between the source and the RCRA permit writer to ensure a common understanding of whether a RCRA permit modification will be needed.

Additionally, Phase 1 sources must comply with the provisions of § 63.1206(b)(5) for changes in facility design. We do not anticipate that upgrades made to comply with the Replacement Standards will adversely affect a source's compliance with the Interim Standards. Therefore, consistent with § 63.1206(b)(5)(ii), sources must document the change in their operating record, revise their NOC and resubmit it to the permitting authority (per § 63.9(h)), and, as necessary, revise their start-up, shutdown, and malfunction plan.[244]

Several commenters felt that we should re-emphasize the importance of removing duplicative RCRA permit conditions and requirements. We agree with the commenters that this is an important action for regulatory agencies. In addition to comments received, we also have learned through the implementation process for the Interim Standards, that some state agencies are not removing duplicative requirements from the RCRA permit. We have clearly stated in several preambles and guidance documents that we believe it is appropriate to retain only the RCRA risk-based conditions that are more stringent than the applicable MACT limits (i.e., if the RCRA condition has been determined to limit risk to an acceptable level and is necessary to protect human health and the environment) in the RCRA permit after

[244] The requirements in § 63.1206(b)(5)(ii) call for sources to revise (as necessary) the performance test plan, DOC, NOC, and start-up, shutdown, and malfunction plan. For sources complying with the Interim Standards, it is not necessary to revise the performance test plan or the DOC, since they were developed in preparation for compliance with the Interim Standards.

compliance with MACT.[245] However, we also acknowledge that in certain cases it may not be clear which compliance requirement is more stringent. For example, standards under MACT are expressed as concentration based limits (micrograms/dry standard cubic meter) while certain RCRA standards are expressed as mass emission rate limits (grams/second). Also, averaging times between the two programs differ: MACT requires hourly rolling averages whereas RCRA requires instantaneous values. This is an unfortunate consequence of moving compliance from a risk-based program to a technology-based program. Because we cannot definitively say when a RCRA requirement is more stringent than a MACT requirement and consistently apply it to all sources, we are relying on sources and permitting agencies to work together to determine which requirement is more stringent. If the MACT requirement is determined to be more stringent, the permitting agency can remove the requirement from the RCRA permit.

In adopting a permitting approach to place the MACT air emissions and related operating requirements in the CAA Title V permit and to keep all other aspects of the combustion unit and the facility in the RCRA permit, our intent was and still is, to minimize duplication to the extent practicable and to eliminate the potential for dual enforcement. We view it as an unnecessary duplication of effort between programs as well as an unnecessary expenditure of resources and costs for both facilities and regulatory authorities to maintain a RCRA permit and a Title V permit that contain duplicative requirements, when there are viable mechanisms (i.e., Class 1 modification procedure at 270.42 Appendix I, section A.8, or Class 2 or 3 if a state has not adopted the Class 1 procedure) in place to avoid doing so.

Nevertheless, we believe that states should have the flexibility to decide how they will allocate their resources, which is why we did not include a single transition approach for implementing agencies to follow in the 1999 rule or in today's rule. So, in such cases where a state agency chooses not to adopt the transition language (i.e. the Class 1 modification procedure at 270.42 Appendix I, section A.8) into their state requirements (e.g., because the state's procedures are broader in scope or more stringent than the federal requirements) or is unable to reach an agreement between its RCRA and air programs regarding which standards are more stringent, the Title V permitting authority should document these issues, including any continuing RCRA permit requirements, in the title V permit's statement of basis (40 CFR §§ 70.7(a)(5) and 71.7(a)(5)). This will help to ensure that the source is clear regarding its compliance obligations, which is a main goal of the Title V program. Further, for purposes of clarification and as a matter of courtesy, we urge regulatory authorities that choose to impose dual compliance requirements, to also provide a written justification to the source explaining the reasons for their decisions.

2. Transition of Interim Status Phase 2 Units From RCRA to CAA Permits

In response to our discussion in the proposal regarding RCRA permitting for interim status Phase 2 units (69 FR 21324), two commenters suggest that EPA establish policy and/or regulation that discourage further RCRA permitting work for interim status Phase 2 sources. Their comments are directed our statement in the proposal that the RCRA combustion permitting procedures in 40 CFR part 270 also continue to apply until you demonstrate compliance. As noted in this statement, we intended for Phase 2 sources to continue to be subject to RCRA permitting requirements for air emissions standards and related operating parameters, including trial burn planning and testing, until they have demonstrated compliance with the MACT standards by conducting a comprehensive performance test and submitting an NOC to the Agency. However, we also provided several factors that should be taken into consideration when determining whether to proceed with the RCRA permit process such as: the facility's permit status at the time the MACT rule becomes final, the facility's anticipated schedule for MACT compliance, the priorities and schedule of the regulatory agency, and the level of environmental concern at a given site (69 FR 21324).

To support their position, the commenters noted that time and resources would be conserved and duplicative and overlapping activities could be minimized if Phase 2 sources were permitted solely via Title V. Also, they argued that it would avoid expending resources to modify the RCRA permit once the source has demonstrated compliance with MACT. We agree with commenters that every effort should be made to conserve resources and avoid duplication to the extent possible. However, we do not believe it is appropriate to establish policy or regulation that permitting authorities must suspend the RCRA permit process (whether it pertains to interim status or renewals), especially in cases where considerable time and effort has been invested and the permit is close to final issuance. As before, we strongly encourage sources and regulatory authorities to work together to establish an approach that will provide for the most practical transition. For example, we strongly recommend that sunset provisions be included in a permit that will be issued well in advance of compliance with MACT to avoid duplication and a later modification to remove the duplicative RCRA conditions. Also, it would make more sense to transition a source to MACT compliance prior to issuing the RCRA permit if it will comply with MACT early.

3. Transition From Compliance With the Interim Standards to the Replacement Standards

A specific question that has been raised relates to the applicable standards and operating parameters that the source must comply with during the period between the rule's effective date for the Phase 1 Replacement Standards and submission of their new NOC. Upon the publication date of the rule, the Replacement Standards (and Phase 2 Standards) will become effective and sources will have 3 years to come into compliance. During this 3-year period, Phase I sources' existing title V permits will either be reopened to include the Replacement Standards, or the permitting authority will have incorporated the Replacement Standards during permit renewal. In this example, a Phase 1 source's Title V permit has been reopened, revised, or renewed and includes the Replacement Standards, the compliance date has not yet passed, no new documentation of compliance (DOC) for the replacement standards has been included in the operating record, and the source has not yet conducted a comprehensive performance test and submitted a new NOC (therefore it still has an NOC containing the operating parameters for compliance with the Interim Standards).

In the above scenario, the question asked is whether the source should comply with the Interim Standards in the current NOC or the Replacement Standards in the Title V permit. The

[245] As an example, a RCRA permit could specify a higher minimum operating temperature than what is necessary for the facility to achieve compliance with MACT. The lower minimum operating temperature under MACT may be sufficient, unless the RCRA permit authority determines that the higher RCRA temperature is necessary to limit risk to an acceptable level for that facility. There should be a connection between the RCRA limit and protection of human health and the environment when retaining a RCRA limit.

source should comply with the Interim Standards until the compliance date of the Replacement Standards. Although the Title V permit now includes the Replacement Standards, the permit will also include the Replacement Standards' future compliance date. With regard to the transition from the Interim Standards NOC to the Replacement Standards DOC, we are revising the regulations at § 63.1211(c) to render the NOC, which documented compliance with the Interim Standards, inapplicable upon inclusion of the DOC for the Replacement Standards in the operating record by the compliance date. Thus, the source will not be placed in a situation where it must continue to ensure compliance with the operating parameters established in the NOC for the Interim Standards, while seeking to comply with the Replacement Standards and operating parameters in its DOC. Although it can be assumed that the source would still be able to comply with its Interim Standard-based NOC because the Replacement Standards are the same as or more stringent than the Interim Standards, we believe that the revision to render the previous NOC inapplicable provides a clearer and more sensible approach.

4. Changes to Title V Permits

Both the Replacement Standards and the Phase 2 Standards will necessitate permit reopenings or revisions to some existing title V permits; other permits will incorporate the requirements upon renewal. 40 CFR §§ 70.7 and 71.7 include the requirements for Title V permit revisions, reopenings, and renewals. Also, approved Title V permitting authorities may have additional requirements. Please refer to the appropriate permitting authority and its individual Title V permits program to determine the necessary requirements and procedures.

With respect to incorporating minor revisions into the Title V permit, one commenter had asked, for example, whether revisions made to the NOC to reflect minor operating changes could be incorporated into the permit by reference rather than through the reopening procedures. Determining the appropriate Title V permit reopening or revision requirements is based on the nature of the change and the source specific permit terms and conditions, and is therefore difficult to generalize. We recommend that sources work with their Title V permit authorities to determine the appropriate requirements and procedures that are applicable to any specific situation. However, we would like to note that, when incorporating requirements by reference into the Title V permit is appropriate, this does not necessarily obviate the need for permit revisions if the material incorporated by reference is subsequently revised. For more information on incorporation by reference, please refer to the Office of Air Quality Planning and Standards' "White Paper Number 2 for Improved Implementation of the Part 70 Operating Permits Program" (March 5, 1996), Section II.E.2.c. This paper can be found at: *http://www.epa.gov/ttn/oarpg/t5/memoranda/wtppr-2.pdf.*

C. Are There Any Changes to the Proposed Class 1 Permit Modification Procedure?

In the NPRM, we proposed a new Class 1, with prior Agency approval, permit modification procedure to help further minimize potential conflicts between the RCRA permit requirements and MACT requirements. See 69 FR 21384 and proposed § 270.42(k). During implementation of the Interim Standards for Phase 1 sources, it became evident that there are two significant instances where RCRA permit limits may overlap with MACT requirements: during initial (and future) performance testing and during the period between placement of the documentation of compliance (DOC) in the operating record and the final modification of the RCRA permit after receipt of the NOC. We discussed several existing approaches (e.g., a class 2 or 3 modification, request for approval submitted via the RCRA trial burn plan or coordinated MACT/RCRA test plan, or through a temporary authorization) for addressing these instances, noting that none provided an optimal solution.

All commenters agreed that the new Class 1 modification procedure is the appropriate and most efficient method to enable specific RCRA permit conditions to be waived during instances of overlap referred to above. However, a few commenters were concerned with the requirements in proposed § 270.42(k)(2)(ii) and (k)(3), that require sources to submit their permit modification request upon approval of the test plan and the requirement for the Director to approve or deny the request within 30 days, or within 60 days with an extension. This timeframe is feasible only for those sources that have received approval of their test plans at least 60 days prior to their scheduled date for commencing their performance test. We acknowledged the potential impracticality of this requirement in the proposal, but at the time believed that few sources, if any, would conduct their performance tests without an approved test plan. While this still may be true, we have learned that sources who received extensions for testing (so that they would have an approved plan), typically commenced their test shortly after approval. Consequently, this still would not allow enough time to review and approve the permit modification before the test begins. Thus, the new Class 1 modification would be of no benefit to facilities that conduct their tests without an approved test plan, or to facilities that received extensions and need to begin their tests upon or shortly after approval of the test plan. Also, we found one other circumstance where the timeframes could be problematic: If a permitting agency has allowed sources to begin pretesting/testing upon approval of the test plan. Again, a source would not be able to have RCRA permit requirements waived in time to begin its test.

We agree with commenters that the proposed requirements in 270.42(k)(2)(ii) and (iii) do not provide any flexibility to waive RCRA permit limits for sources that (1) do not have an approved test plan but choose to conduct their test; (2) are granted an extension to their test date because they do not yet have an approved test plan; and (3) may begin testing upon approval of their test plans. Our original intent to require prior Agency approval for the new Class 1 permit modification procedure was to ensure that the proposed test conditions would be sufficiently protective when specific RCRA requirements are waived and that a source has met the regulatory requirements for performance test plans. We still believe that review and approval is an important step; however, we also believe it should not be a barrier and therefore, should occur in advance of a source commencing its performance test. As a result, we have revised the proposed regulatory language in 270.42(k)(2)(i) to specify that sources submit their permit modification requests with their test plans, to allow potentially up to one year for approval (*i.e.*, the performance test plan is due one year before the test is to begin). Also, so that approval does not impede the commencement of the performance test, we have revised the proposed language in 270.42(k)(2)(ii) so that the Director can choose whether to issue approval of the permit modification request contingent upon approval of the performance test plan.[246] In that respect,

[246] In all likelihood, we anticipate that the RCRA permit authority will have reviewed the modification request along with the test plans, worked with its Air counterparts and the source to resolve any concerns, and have prepared the permit

Continued

the RCRA permit authority would continue to have an extra measure of assurance in circumstances that may demand it.

D. What Permitting Approach Is EPA Finalizing for New Units?

1. Why Did EPA Propose a Separate Permitting Approach?

As discussed in the proposal, the current RCRA regulations at §§ 264.340, 265.340, 266.100, 270.19, 270.22, 270.62, and 270.66 do not address how or when new combustion units will comply with the MACT standards. Consequently, the part 270 regulations imply that a new unit must obtain a complete RCRA permit before it can demonstrate compliance with the MACT standards. It was never our intent for new units to develop a trial burn plan and provide suggested conditions for the various phases of operation in the RCRA permit application, given that these conditions will become inactive or need to be removed from their permits upon demonstrating compliance with MACT. To rectify our previous omission, we suggested several options that would allow units newly entering the RCRA permit process [247] (and that will comply with the Subpart EEE requirement upon start-up) to forego certain RCRA permit requirements and performance standards. In developing the options that would enable new units to forego certain RCRA requirements, we noted the importance of public participation opportunities under the MACT/CAA framework equivalent to those provided under the RCRA framework. Thus, each option was constructed in such a way that would streamline the RCRA requirements, but continue to provide early and frequent public participation commensurate with the requirements of the RCRA Expanded Public Participation Rule (60 FR 63417, December 11, 1995).

2. What Options Did EPA Propose for Permitting New Units?

In our preferred approach, we proposed that new units not be required to develop a trial burn plan and provide suggested conditions for the various phases of operation in their RCRA permit application. Instead, new units would only be required to address the remaining RCRA activities at the facility in their permit application (or modification request) including corrective action, general facility standards, other combustor specific concerns such as materials handling, risk-based emission limits and operating requirements, and other hazardous waste management units. While this approach appears to be ideal from the standpoint of reducing the regulatory burden to sources and RCRA permit authorities, we noted that even though a new unit will be required to meet the RCRA public participation requirements as part of the permit application process, the operations and emission information specific to the combustor would no longer be provided. Thus, we focused on certain compliance activities under the MACT/CAA framework (i.e., the Notification of Intent to Comply requirements) that would allow for combustor-specific information to be made available to the public as it would have been under the full RCRA permit process.

Regarding the three additional approaches or "options", each considered a different point in the RCRA permit process where a new unit could "transition" to compliance with the MACT standards (see 69 FR 21319). Under the first option, a new unit could transition to MACT compliance after it had submitted its RCRA Part B application. The Part B however, would not include the trial burn plan information. The new unit would only be required to discuss the compliance activities related to the combustor as part of the RCRA informal public meeting. In the second option, we proposed that a new unit would transition after its RCRA permit has been issued. Here, the new unit would be required to develop a trial burn plan which provided its proposed operations and emissions information and to discuss its compliance activities via the RCRA informal public meeting. Then, a permit would be issued, but it would not contain operating and emissions requirements in order to avoid a future modification to remove them. For the third option, the transition point would have been after the new unit places the DOC in its operating record, which is the compliance point for MACT. This option is more inclusive than the second because it requires the new unit to have a draft permit that covers the construction and shakedown period.

3. Which Option Is EPA Finalizing?

For today's final rule, we are adopting our preferred, proposed approach: new units will not be required to follow the full RCRA permitting process for establishing combustor operations and emissions. Thus, new units are not subject to the combustor-specific RCRA permit requirements and performance standards (i.e., to develop a trial burn plan, provide suggested conditions for the various phases of operation in their permit application, and subsequently operate under those conditions). However, because these units remain hazardous waste treatment units, they are still required to obtain a RCRA permit, or to modify an existing RCRA permit to include a new unit, prior to construction. They need only address the remaining hazardous waste management activities at the facility in their permit application (or modification request) including corrective action, general facility standards, other combustor specific concerns such as materials handling, risk-based emission limits and operating requirements, and other hazardous waste management units. As we noted in the previous section and will discuss again more thoroughly in the next section, we are relying on the NIC process to provide the public with the combustor-specific information that previously would have been provided under the full RCRA permit process.

Almost all commenters supported our preferred approach to not require that new units complete the full RCRA permit process and to rely on the NIC requirements and the MACT/CAA framework to provide a level of public participation that is commensurate with the requirements under RCRA. Commenters generally agreed that our preferred approach achieves this goal while streamlining the RCRA permit process for new units. One commenter felt that the Title V and New Source Review programs (NSR) provide sufficient requirements to regulate new combustion units. We disagree that either or both of those programs fully address the hazardous waste and public participation components commensurate with that provided by the approach we are finalizing today. For instance, a unit may be constructed and operating before a Title V permit is issued, which directly conflicts with RCRA's early public participation requirements. Also, in some instances, public participation may not be a required component of state issued NSR permits (see footnote regarding public participation and SIPs below). However, we do believe that the NSR program will play an important role regarding the exchange of information, as we will discuss in the section below. With respect to the remaining three options presented in the proposal (69 FR 21319–

modification approval prior to issuance of the test plan approval.

[247] Units "newly" entering the RCRA permit process refers to a newly constructed facility, thus newly constructed hazardous waste combustion unit; an existing facility that constructs a new unit; or an existing facility that converts a non-hazardous fuel combustion unit to a hazardous waste fuel combustion unit.

21320) that suggested a transitional approach (i.e., each option explored progressive points in the RCRA permit process where facilities could transfer over to MACT without fully completing the RCRA process), nearly all commenters were in agreement that they would require more work to implement than is necessary and consequently oppose them.

4. How Will Permitting for New Units Work?

In the proposed rule, we created an approach that utilizes the NIC requirements and the MACT/CAA framework with the intent of ensuring that the requirements of the RCRA Expanded Public Participation Rule would continue to be fulfilled. The four requirements for public participation as they relate to hazardous waste combustion units are: (1) Permit applicants must hold an informal public meeting before applying for a permit; (2) permit agencies must announce the submission of a permit application which will tell community members where they can view the application while the agency reviews it; (3) permitting agencies may require a facility to set up an information repository at any point during the permitting process if warranted; and (4) permitting agencies must notify the public prior to a trial (or test) burn.

As discussed in the preamble to the proposal (69 FR 21318), we believe that the NIC process addresses the first two RCRA public participation requirements. The NIC process requires a source to make its draft NIC, which discusses the source's plan for coming into compliance with the MACT standards, available for public review and to hold an informal public meeting to discuss the activities contained in the NIC. While the NIC process gives the public an early opportunity to participate in the unit's compliance planning process early on, a few components are still missing before we can consider the first 2 RCRA public participation requirements to be fulfilled under the MACT framework. One component is that there is no permit action associated with the NIC requirements. However, the NSR program can provide a permit mechanism that will determine whether or not a source may be constructed.[248] The steps associated with obtaining an NSR permit, or a "pre-construction" permit, are similar, but not necessarily identical to that required under RCRA. They are: (1) Preparation of the permit application (sources must provide the location, design, construction, and operation information) and participation in pre-application meetings; (2) issuance of permit application completeness determination by the State; (3) development and negotiation of draft permit; (4) opportunity for public notice and comment on the draft permit; (5) response of permitting authority to public comments; (6) possible administrative and judicial appeals; and (7) permit issuance/denial.[249]

A second component is that the NIC does not provide the information on the proposed combustor operations or emissions information that would normally be available as part of the RCRA process. To address these gaps between RCRA and MACT, we are requiring an approach similar to that which was proposed. New sources must: (1) Prepare a draft NIC and make it available to the public at the same time as their RCRA pre-application meeting notice; (2) provide a draft of their comprehensive performance test (CPT) plan (to the public) to coincide with the draft NIC and RCRA pre-application meeting notices; and (3) hold their NIC public meeting with their RCRA informal public meeting. The first two requirements ensure that the public is provided with most of the same information that would have been available via the RCRA trial burn plan prior to the source burning hazardous waste. Other information not required by the NIC or CPT plan, such as the combustion unit's design specifications will, in most cases, be available to the public through the NSR permit application. We recommend that sources submit a copy of their NSR permit application to the RCRA permit authority so that this information is readily available for development of the RCRA permit. The third requirement allows the public to inquire and comment on both the new unit's proposed activities and operations. By requiring new sources to develop, notice, and hold a combined public meeting that encompasses the NIC, draft CPT plan, and RCRA pre-application notice information, the public will be provided with all information related to the combustor's compliance plans as well as its operating plans and emissions estimates prior to burning hazardous waste. See new requirements in § 63.1212.

With respect to the requirements we are finalizing today, we received only one comment that expressed concern. The concern is that the requirement to submit the CPT plan is too early in the compliance process. For example, the RCRA application is submitted approximately 2–3 years before start-up whereas the CPT plan is required 1.5 years after the final NIC is due.[250] The commenter feels that the facility would not have enough time to learn about the "detailed nuances of the system". However, the commenter does note that it is possible to submit the CPT plan, but it will not be as complete or refined as it would be if it was submitted according to the deadline for existing units. We agree with the commenter that a considerable amount of planning is required of the source to be able to draft the CPT plan at such an early stage, but we are only requiring that a draft of the CPT plan be made available, with the final CPT plan due 6 months prior to the source's compliance date. Moreover, at this early stage, we liken the development of the draft CPT plan to the development of the trial burn plan. Even though it may not be as complete or refined as it will be when the final CPT plan is due, we believe that it will still be of benefit to the public and the regulatory authority, but also to the source in terms of advance planning for the design of the unit through start-up of the unit.

The components thus far, have satisfied the first (2) two RCRA public participation requirements. The third RCRA public participation requirement enables a regulatory authority to evaluate the need for and require a facility to establish and maintain an information repository. The establishment of an information repository is typically required only when there are concerns or unique information needs of a community. The purpose of the information repository is to make information regarding the facility (and combustion unit) available to the public during the permit issuance process and during the life of the permit. In the preamble, we noted that

[248] We believe that the majority of new units will be classified as major sources for NSR permitting (requiring either prevention of significant deterioration or nonattainment permits), however, those that do not, will likely be required to obtain a minor NSR permit. In few cases, new sources (e.g., newly constructed as opposed to modified) may not be required to obtain an NSR permit if its potential to emit does not exceed the NSR threshold level.

[249] With respect to numbers 4 and 5, many States omitted the public participation steps in their federally approved SIPs. This was the reason why Sierra Club had been opposed to our efforts to simply rely on NSR permitting to provide public participation opportunities that would have been otherwise provided under the traditional RCRA permit process for new units. Today, however, many SIPs have been revised to address public participation requirements.

[250] Comprehensive performance test plans are required to be submitted one year in advance of the scheduled test. The submittal date would be as late as 2.5 years after the effective date of the rule assuming no extensions are granted.

although the Title V permit process contains a provision that any materials relevant to the permit decision be made available to interested persons (see § 70.7(h)(2) and § 71.11(d)), the information may not be made available until well after the combustor is constructed and operating. Consequently, we have chosen to adopt additional provisions under the NIC requirements that parallel the requirements of § 124.33.

We had proposed two options that would allow a regulatory authority to require, on a case-by-case basis, a source to establish an information repository specific to the combustor. The first option was to place such a provision in the NIC regulations and the second option was to amend the applicability language in § 124.33 to include combustion sources that will comply with Part 63, subpart EEE upon start-up. Two commenters felt that the second option would create problems as far as organization (i.e., by modifying the RCRA regulations to include a provision solely for new units complying with MACT). We agree that the second option could be confusing and that it would be more appropriate to keep all new requirements for new units in one set of regulations. Therefore, we are finalizing a provision that will allow for an information repository to be established specific to the combustor (recall that a repository established pursuant to the RCRA permit will include documents relevant to the facility only), if deemed appropriate, under the NIC regulations. See new § 63.1212(c). Under the NIC regulations, the repository could include the NIC, test plans, draft Title V permit and application, reports, et cetera.

The fourth and final RCRA public participation requirement to be fulfilled is for the regulatory authority to notify the public of an impending trial burn or test burn. As discussed in the RCRA Expanded Public Participation Rule, the RCRA permit authority will typically provide the notice at least 30 days in advance of the test (60 FR 63426, December 11, 1995). Similarly, the MACT regulations require an existing or new unit to provide notice to the public that the CPT plan (and the continuous monitoring system performance evaluation test plan) is available for review. The regulations in § 63.1207(e)(2) fulfill this requirement. Although the CPT plan may not be approved before the public is notified, the intent is to provide notice to the public of a future test. We believe that the MACT regulations provide public notice of the test plans that are commensurate with the RCRA regulations and thus, no additional regulatory revisions or amendments are needed.

4.a. Process for New Units Seeking an Initial RCRA Permit

We anticipate that the process for new units seeking an initial permit will work as follows. Any new unit would begin the process by developing and compiling the information necessary for the RCRA draft permit (e.g., information required for the part A application at § 270.13, the relevant general information for the part B application according to Part 270) and the applicable NSR permit.[251] The information needed to compile the draft NIC and draft CPT plan would be gathered simultaneously, as if the source were developing the trial burn plan. When the source has compiled its RCRA permit application, draft NIC and draft CPT plan, it would submit a RCRA pre-application meeting notice at least 30 days prior to the date scheduled for the RCRA informal public meeting according to §§ 124.31(b) and (d). At the time of the RCRA pre-application meeting notice, the source would also issue notice of the NIC public meeting (at least 30 days prior to the NIC meeting) according to § 63.1210(c)(3), so that the two meetings can occur at the same time. In order for the public to be able to view all information relevant to the combustor before the combined RCRA pre-application and NIC public meeting, the source would make the draft NIC and draft CPT plan available to the public for review at the same time the notices for the meetings are issued. To aid the RCRA permit authority in its development of the draft RCRA permit (*i.e.*, mainly for purposes of evaluating risk), we strongly recommend that the source also provide copies of the draft NIC, draft CPT plan, and NSR application (if applicable) to the RCRA permit authority. It is our hope that the availability of information will expedite the development of the draft permit. All notices should be presented to the public in sufficient time to allow for a combined RCRA informal public meeting and NIC public meeting.

Following the combined public meeting, the source will submit its RCRA permit application and the RCRA regulatory authority will prepare and issue a draft permit. The public will then have an opportunity to comment on the draft permit and request a public hearing. Upon resolution of any issues surrounding the draft permit, a final RCRA permit will be issued. The RCRA process is the same as before, but should be reasonably shorter. Finally, the new unit may begin burning hazardous waste when it can assure it will operate in compliance with the MACT standards (*i.e.*, by placing a documentation of compliance in its operating record on the day it begins burning hazardous waste). See new regulatory language at § 63.1212(c). To aid readers in understanding the above process, we have included a pictorial timeline. Please see figure 2.

Finally, it may also be feasible to combine an NSR pre-application meeting and public notice of the draft NSR permit with the process described above. Thus, we recommend that sources work closely with their Air and RCRA permit agencies so that the NSR public notices and meetings may be coordinated with the RCRA and NIC notices and meetings so time and resources are efficiently utilized.

4.b. Process for New Units Modifying an Existing RCRA Permit

The process of adding a new unit to an existing permit is accomplished through a Class 3 permit modification (see § 270.42 (c) for requirements). The requirements governing public notices of the draft NIC, draft CPT plan, and holding a combined public meeting are essentially the same as new units seeking an initial permit. The process is as follows. The source prepares and submits its RCRA permit modification request (and if applicable, NSR application). It must then publish a notice of the modification request seven days later, followed by a public meeting no earlier than 15 days after publication of the notice for the modification request, and no later than 15 days before the close of the 60-day comment period. As with new units that are submitting an initial RCRA permit application, it is also important for sources seeking to modify their permit to coordinate their NIC public meeting with their RCRA permit modification public meeting. This is made possible due to the flexibility of the NIC public meeting; it can be held any time prior to the 10 month deadline. After the combined public meeting and the close of the comment period, the permit authority will either grant or deny the modification request. If approved, the source may then begin construction or modification of the unit. To aid readers in understanding the timing of the

[251] Because the information required for NSR permit is less comprehensive than a RCRA permit, it allows for a much shorter time period for issuance. The average time for issuing a PSD permit, for example, after receiving an application is slightly more than 7 months, but varies depending upon public involvement and negotiation of the application content. USEPA. Docket A–2001–19, Document II–A–01. *NSR 90-Day Review Background Paper*, June 22, 2001.

above process, we have included a pictorial timeline. Please see figure 2.

Again, it may be feasible to combine an NSR pre-application meeting and public notice of the draft NSR permit with the process described above. Thus, we recommend that sources work closely with their Air and RCRA permit agencies so that the NSR public notices and meetings may be coordinated with the RCRA and NIC notices and meetings so time and resources are efficiently utilized.

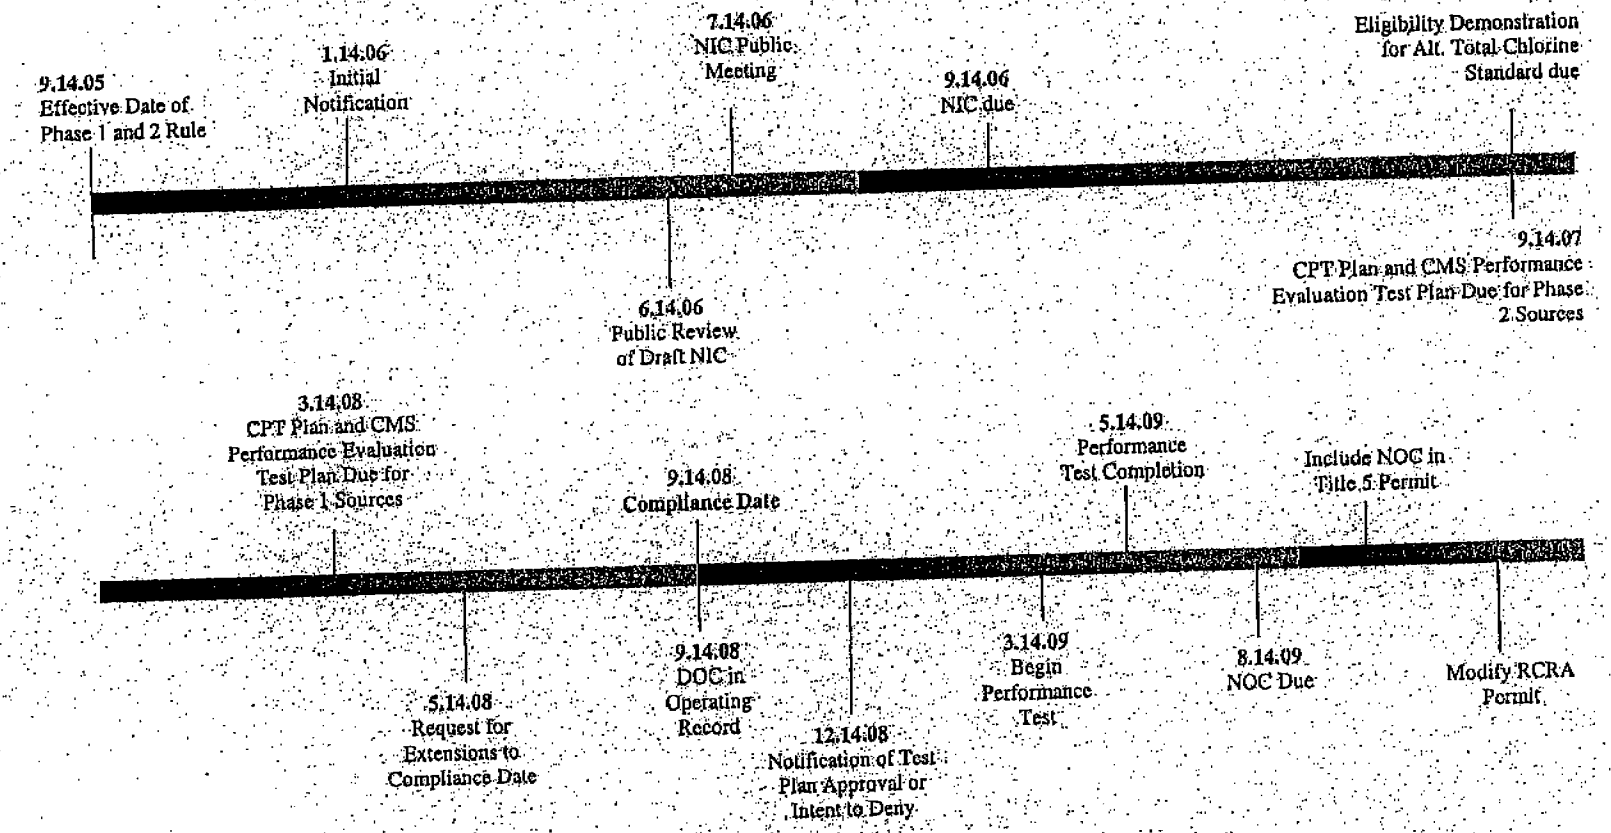
E. What Other Permitting Requirements Were Discussed in the Proposal?

At proposal, we discussed where most Phase 1 sources would be in terms of their transition from their RCRA permit requirements to compliance with the MACT Interim Standards (see 69 FR 21321). The transition process was discussed with respect to both the RCRA permit and the Title V permit. However, when we discussed the Title V permit requirements in the proposal, we did not elaborate on the transition between the Interim Standards and Replacement Standards. Because we believe that such a discussion would be helpful to readers, we have included general information describing how the transition process would work for most sources in Section B. Did Commenters Express any Concerns Regarding the Current Permitting Requirements?, subsections 3 and 4.

For Phase 2 sources, we proposed the same permitting approach as we did for Phase 1 sources. Today, we are finalizing as proposed, the following for Phase 2 sources: (1) the new Phase 2 emissions standards will be placed only in the CAA regulations at 40 CFR part 63, subpart EEE, and be implemented through the air program; (2) with few exceptions, the analogous standards in the RCRA regulations no longer apply once a facility demonstrates compliance with the MACT standards in subpart EEE and any duplicative requirements have been removed from the RCRA permit; and (3) the new standards will be incorporated into operating permits issued under Title V of the CAA rather than be incorporated into RCRA permits. Consequently, we are finalizing the proposed changes to §§ 270.22 and 270.66 to implement the above. Also applicable to Phase 2 sources via today's final rule are the changes and additions we finalized in the 1999 final rule for Phase 1 sources. These include a streamlined RCRA permit modification procedure to allow sources to make upgrades to comply with MACT (§§ 270.42(j) and 270.42 appendix I, section L.9), a second streamlined RCRA permit modification procedure to remove conditions from a permit that are no longer applicable (§ 270.42 appendix I, section A.8), an addition to § 270.235 to specify conditions for start-up, shutdown, and malfunction plan and integrate them with the CAA program, and an amendment to the interim status regulations at § 270.72 to exempt interim status facilities from the reconstruction limitation when making upgrades to comply with MACT.

Also, we are finalizing three new permitting changes that are applicable to both Phase 1 and 2 sources. Two have been discussed previously in this section and are: (1) A new streamlined RCRA permit modification procedure designed to reduce overlap during the transition from RCRA to MACT (§§ 270.42(k) and 270.42, appendix I, L.10); and (2) regulatory provisions stating that new units are no longer subject to the full array of RCRA combustion permitting requirements. The third change is discussed above in Section IX. Site-Specific Risk Assessment Under RCRA and finalizes our response to a petition for rulemaking with respect to site-specific risk assessments (SSRAs). As part of this change we have decided to adopt regulatory language that specifically provides clarification of authority for RCRA permit writers to evaluate the need for and, where appropriate, require SSRAs and to add conditions to RCRA permits that they determine, based on the results of an SSRA, are necessary to protect human health and the environment.

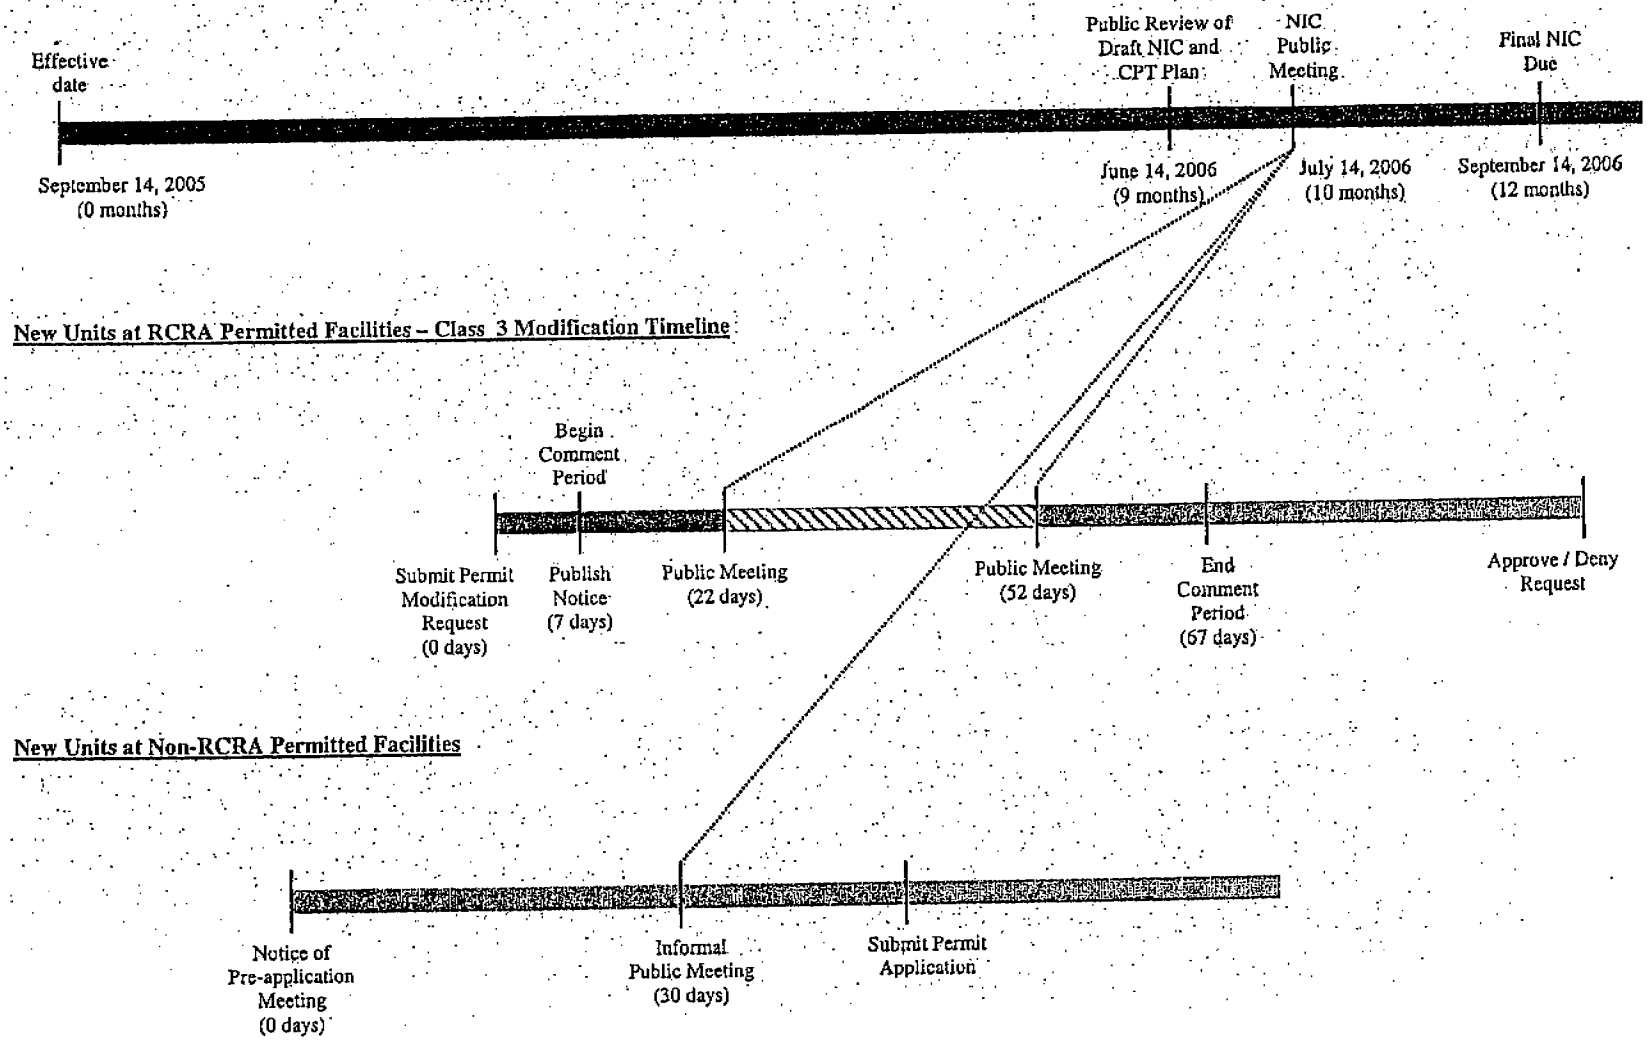
Last, as explained in part four section II.A, we are finalizing our decision to regulate emissions of dioxin/furans, mercury, polycyclic organic matter, and polychlorinated biphenyls from Phase 2 area sources under section 112(d).[252] This means that Phase 2 area sources are subject to MACT standards only for these hazardous air pollutants (HAP) in the final rule. To reiterate, they are: Dioxin/furans, mercury, and polycyclic organic matter (controlled by the surrogates DRE and carbon monoxide/hydrocarbon). For the remaining HAP (hydrogen chloride and chlorine gas and metals other than mercury), Phase 2 area sources may either comply with the MACT standards for Phase 2 major sources or continue complying with the RCRA standards and requirements of their RCRA permit.



In the 2004 proposal, we stated that we were not making a positive area source finding for Phase 2 area sources as we have for Phase 1 area sources (69 FR 21212 and 21325). Regardless of this, however, the Phase 2 area sources are still subject to the requirement to obtain a Title V permit because they are subject to section 112 standards under this subpart. See § 502(a) of the CAA and 40 CFR §§ 70.3(b)(2) and 71.3(b)(2).

It is important to note that the Title V applications for the Phase 2 area sources will need to contain emissions information relative to all regulated air pollutants (to determine applicable requirements, fees, etc.) that are being emitted from the units subject to the MACT standards, not just the specific HAP pollutants regulated by the MACT standards (see §§ 70.5(c)(3)(i) and 71.5(c)(3)(i)). Although, the permit itself would contain standards only for the HAP subject to MACT standards (the § 112(c)(6) HAP). A Phase 2 area source which chooses to control hydrogen chloride, chlorine gas, and metals other than mercury by continuing to comply with the relevant RCRA standards and the requirements of its RCRA permit should note this choice in its Title V application and cite to the relevant requirements of this subpart. This will help ensure that the permitting authority is aware that these requirements apply in lieu of the MACT standards for Phase 2 major sources. The permitting authority should also document this choice in the statement of basis for the source's Title V permit. See §§ 70.7(a)(5) and 71.7(a)(5). Finally, for the units at a source which are subject to the subpart EEE MACT standards, all CAA applicable requirements to which these units are subject, *e.g.*, State Implementation Plan requirements, not just the relevant Subpart EEE requirements, must be included in the Title V permits issued to these sources. See §§ 70.3(c)(2) and 71.3(c)(2). For more information regarding § 112(c)(6) and how it relates to Phase 2 area sources, see Part Four, Section II.A., "Area Source Boilers and Hydrochloric Acid Production Furnaces".

BILLING CODE 6560-50-P



[252] As explained in the Comment Response Document vol. V, although § 502(a) allows EPA to exempt area sources from title V permitting requirements if EPA finds that those requirements would be (among other things) "unnecessarily burdensome", we believe that Title V requirements remain appropriate for these sources given the highly toxic nature of the HAP and the importance of affording opportunity for public participation as provided for in the Title V permit issuance process.

Figure 1. Time Line for Phase 1 Replacement Standards and Phase 2 Standards[253]

[253] Because of the variability of the Title V program requirements, most Title V permit actions (application due dates, revisions, reopenings, etc.) are not included in this timeline. Please refer to the particular source's current Title V permit status, the Title V regulations, and the individual permitting authority's Title V program requirements.

Figure 2. NIC and CPT Plan Time Line for New Units

Part Five: What Are the CAA Delegation Clarifications and RCRA State Authorization Requirements?

I. Authority for This Rule

Today's rule amends the promulgated standards located at 40 CFR part 63, subpart EEE. It amends the standards for the Phase 1 source categories—incinerators, cement kilns, and lightweight aggregate kilns that burn hazardous waste, and it also amends subpart EEE to establish MACT standards for the Phase 2 source categories—boilers and hydrochloric acid production furnaces that burn hazardous waste. Additionally, this rule amends several RCRA regulations located in 40 CFR part 270 to reflect changes in applicability, addition of a new permit modification procedure, and additions related to site-specific assessments and permitting.

II. CAA Delegation Authority

Before discussing the clarifications being finalized today, it is important to first highlight a few key aspects of delegation authority. Recall from the proposal that a state, local, or tribal (S/L/T) agency must be delegated authority under CAA section 112(l) before it can exercise the delegable provisions' authorities. The delegable authorities can be found in 40 CFR 63.91(g)(1)(i), also known as Category I Authorities. A S/L/T agency that has applied for and received delegation authority can approve: test plans, requests for minor and in most cases, intermediate changes to monitoring and test methods, performance test waivers, and several other Category I Authorities. Please note that even though a S/L/T agency may have an approved Title V permit program, it cannot exercise delegable authorities or be the primary enforcement authority if it has not received delegation authority under CAA section 112(l). Moreover, when a S/L/T agency has not taken delegation of a section 112 standard, the agency can only incorporate the section 112 standard's requirements into its Title V permits, (and then implement and enforce these requirements through its title V permits) when it has adequate authority under State, local, or tribal law which allows it to conduct the above actions without delegation. See, *e.g.*, the proposed Federal Plan for Commercial and Industrial Solid Waste Incinerators, November 25, 2002 (67 FR 70640, 70652). Please also refer to 69 FR 21335 of the proposal and the fact sheet entitled, Clean Air Act Delegation for the HWC NESHAP at: *http://www.epa.gov/epaoswer/hazwaste/combust/toolkit/factshts.htm* to learn more about the advantages of receiving delegation authority.

Also, we would like to point out that there are several delegation options that S/L/T agencies can receive. Regardless, many S/L/T agencies choose the "straight delegation" option when applying for delegation approval. Straight delegation means that these agencies have agreed to implement and enforce federal MACT standards as they have been written in the promulgated requirements. As a result, many EPA Regions and states have established memoranda of agreement that essentially provide automatic delegation of each future MACT, as opposed to the state applying for delegation of each future MACT, which requires a rulemaking to implement. For more information related to the delegation options and procedures, please refer to the fact sheet, Clean Air Act Delegation for the HWC NESHAP at: *http://www.epa.gov/epaoswer/hazwaste/combust/toolkit/factshts.htm* and EPA's delegation website at: *http://www.epa.gov/ttnatw01/112(l)/112-lpg.html*.

III. Clarifications to CAA Delegation Provisions for Subpart EEE

In the proposal, we discussed the need to provide additional clarification for the delegable and non-delegable authorities within Subpart EEE based upon our implementation experience with the Phase 1 Interim Standards and the Clarifications to Existing National Emissions Standards for Hazardous Air Pollutants Delegation' Provisions final rule published on June 23, 2003 (68 FR 37334). Although the June 23, 2003 final rule provided clarification and streamlined the delegable provisions for each existing NESHAP, it overlooked several non-delegable and delegable authorities within Subpart EEE. It provided clarification on the non-delegable authorities of Subpart EEE as they relate to major alternatives to the standards themselves and to test methods, monitoring, or recordkeeping and reporting under the General Provisions.[254] However, it omitted major alternatives specific to Subpart EEE such as: test methods under §§ 63.1208(b) and 63.1209(a)(1); monitoring under § 63.1209(a)(5) and; recordkeeping and reporting under § 63.1211(a) through (d). Therefore, the following paragraphs will explain which authorities in Subpart EEE are delegable and are not delegable to S/L/T agencies that have been delegated authority and will provide some examples of or references to alternative requests associated with each delegable or non-delegable provisions authority.

To review, the regulations at 40 CFR 63.90 define three types of alternative requests. Alternative requests or "changes" to a particular delegable or non-delegable provision are classified as major, intermediate, or minor depending upon the degree (*i.e.*, potential to be nationally significance, potential to reduce the stringency of the standard, etc.) of change being requested. An alternative request that qualifies as a major change is not delegable to S/L/T agencies, even when they have delegation authority. These requests must be sent to the EPA Region or, if it concerns a test method under §§ 63.7(e)(2)(ii) and (f), 63.1208(b) and 63.1209(a)(1) or a standard under §§ 63.1200, 63.1206(a), or 63.1216–63.1221, then it must be sent to our Office of Air Quality Planning and Standards (OAPQS).[255] An alternative request that qualifies as an intermediate or minor change is delegable. However, the EPA Region may choose whether or not they will delegate authority to S/L/T agencies to approve intermediate and, even some minor changes during the delegation approval process. In addition to the regulations, the guidance document entitled, How to Review and Issue Clean Air Act Applicability Determinations and Alternative Monitoring (EPA 305–B–99–004, February 1999) provides a listing of delegable and non-delegable authorities in Tables 1 and 2, as well as descriptions and examples of major, intermediate, and minor changes in Attachment 1.

A. Alternatives to Requirements

Any change to a promulgated standard is considered a major change and as noted above, must be sent to OAQPS (see contact information in footnote). The reason why a change to a standard must be sent to EPA Headquarters is because the change must be established through national rulemaking, regardless of the degree of change sought. Thus, only OAQPS can approve alternative requests for changes to standards. Additionally, any change to applicability requirements and compliance dates (*e.g.*, requirements that ensure that the standards are achieved as EPA intended) are also

[254] For example, the final rule included approval of alternatives to requirements in §§ 63.1200, 63.1203, through 63.1205, and 63.1206(a); approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f); approval of major alternatives to monitoring under § 63.8(f) and; approval of major alternatives to recordkeeping and reporting under § 63.10(f).

[255] For contact information, please visit *www.epa.gov/ttn/emc/staffdir.html*.

considered major and also must be sent to OAQPS for approval. Specific to Subpart EEE, alternative requirement requests including those pursuant to §§ 63.1200, 63.1206(a), or 63.1216–63.1221 are considered major changes and consequently are non-delegable. The regulations at § 63.1214(c) correctly identified the requirements in Subpart EEE, however we have revised them today (as we proposed) to reflect the new sections that house the Phase 1 Replacement Standards and Phase 2 Standards.

There are a few exceptions to the above, however. Subpart EEE incorporates specific provisions for sources to request alternative standards which are delegable because they have been established through rulemaking. In fact, several alternative standards are self-implementing meaning that the source only need specify in their DOC which standard it will comply with. The alternative to the particulate matter standard in § 63.1206(b)(14) and the emissions averaging standards for cement kilns with in line kiln raw mills and preheater or preheater/precalciner kilns with dual stacks in § 63.1204(d) and (e) are three examples. There are also alternative standards that sources may petition to comply with. They include: Alternatives to the standards for existing and new LWAKs at § 63.1206(9) and cement kilns at § 63.1206(b)(10) and the alternative risk-based standard for total chlorine at § 63.1215. Sources choosing to comply with these alternative standards must receive approval from their delegated S/L/T agency prior to implementing them.[256] With respect to changes to compliance dates, requests under § 63.1213 specifically allow sources to request an extension to the compliance date for the installation of pollution prevention or waste minimization controls. Again, because this provision has been specified in subpart EEE, it is not considered a major change and is delegable.

B. Alternatives to Test Methods

With respect to test methods, we noted above that the final delegations rule stated that major alternatives to the test methods at §§ 63.7(e)(2)(ii) and (f) were not delegable. Therefore, as we proposed, it is necessary to add major alternatives to 63.1208(b), which specifies the test methods sources must use to determine compliance with subpart EEE. Also, we are adding the CEMS monitoring requirement under § 63.1209(a)(1). It is regarded as a test method because it serves as a benchmark method for demonstrating compliance with the emission standards. Both sections are delegable to S/L/T agencies as long as they have been delegated authority and as long as the alternative requests comprise minor or intermediate changes. However, a major change to either of these test method sections must be sent to OAQPS for approval.[257] Only OAQPS can approve major changes to test methods because they are designated in the standard as the means for determining compliance with an emission standard. The proposed revisions to § 63.1214 are finalized today to include major alternatives to test methods under §§ 63.1208(b) and 63.1209(a)(1) as non-delegable authorities.

C. Alternatives to Monitoring

For monitoring, the final delegations rule stated that major alternatives to monitoring at § 63.8(f) were not delegable, but did not reference monitoring specific to subpart EEE. In subpart EEE, the monitoring requirements are located in § 63.1209. This section also includes two provisions specific to alternative monitoring, thus removing some of the "guesswork" when trying to discern whether a request for change is minor, intermediate, or major. One is located at § 63.1209(a)(5), Petitions to use CEMS for other standards and the other is located at § 63.1209(g)(1), Alternative monitoring requirements other than continuous emissions monitoring systems. Each is discussed in the following paragraphs.

In the proposal, we explained that a request to use other monitoring in lieu of a CEMS is always considered a major change due to CEMS generally being considered a more accurate measure of compliance. However, if a source requests to use a CEMS in lieu of a required operating parameter, it may be considered an intermediate change. Since publication of the proposal, performance specifications have been promulgated for PM CEMS (and mercury CEMS).[258] Consequently, today we view requests per § 63.1209(a)(5) to use PM CEMS as intermediate changes to monitoring. Although the implementation of PM CEMS according to PS–11 (69 FR 1786 and 40 CFR part 60, Appendix B; January 12, 2004) and Procedure 2 (see also 40 CFR part 60, Appendix F) is largely "self-implementing," sources wishing to apply to use of PM CEMS should develop and submit QA/QC plans specifying audit frequencies to account for site-specific stack conditions. We believe that other site-specific issues that may need to be addressed prior to use of the CEMS, such as a source's request to deviate from PS–11 or a source's selection of the correct correlation curve(s), are properly addressed under EPA's established policies and procedures for alternative method requests. We believe that a petition to use PM CEMS under § 63.8(f) is still the appropriate mechanism, but that sources can submit their petitions to their delegated S/L/T agency for review and approval, and we recommend that EPA Regional offices work with these agencies to monitor implementation. Thus, with the exception of petitions to use PM CEMS in lieu of an operating parameter which is considered an intermediate change, we are finalizing our proposed revision to § 63.1214(c) to include major alternatives to monitoring under § 63.1209(a)(5) as a non-delegable authority.

Section 63.1209(g)(1), Alternative monitoring requirements other than continuous emissions monitoring systems, contains the other alternative monitoring provision. This provision allows sources to request alternative monitoring methods to monitor compliance, except for those standards that must be monitored with a CEMS (e.g., those in § 63.1209(a)(1)), and to request a waiver of an operating parameter limit. We provided several examples of alternative parameter monitoring for which a request may be submitted under this section in the proposal at 69 FR 21337. They include use of: a different detector, different monitoring location, a different method as recommended by the manufacturer, or a different averaging period that is more stringent than the applicable standard. In the proposal, we stated that we believe the majority of requests submitted pursuant to § 63.1209(g)(1) are not major and discussed in the preamble amending the language in § 63.1209(g)(1) so that these types of changes could be reviewed and approved by the delegated S/L/T agency. However, when we added

[256] The alternative risk-based standard for total chlorine at § 63.1215 requires sources to submit their eligibility demonstration to both the delegated S/L/T agency and to the Risk and Exposure Assessment Group in Research Triangle Park, NC for review, even though the delegated S/L/T agency can grant or deny approval.

[257] For contact information, please visit *www.epa.gov/ttn/emc/staffdir.html*.

[258] Although performance specifications have been promulgated for mercury CEMS, there has not been as much experience in implementing these devices for hazardous waste combustion sources (or similar sources) as there has been for PM CEMS at this time. Therefore, we believe it appropriate to continue sending requests to use mercury CEMS in lieu of an operating parameter to the appropriate EPA Region for review and approval.

language to § 63.1209(g)(1) to allow for the above, we inadvertently referred to an approved Title V program instead of a S/L/T agency which has taken delegation of subpart EEE. We have corrected and finalized the proposed language. Therefore, whether minor or intermediate, requests under § 63.1209(g)(1) may be sent to your delegated S/L/T agency for review and approval.

Please note that 63.1209(g)(1) cannot be used when requesting major changes to the monitoring required by the standard. Such changes typically involve new unproven monitoring methods. Unproven monitoring methods refer to those where the technology or procedures are not generally accepted by the scientific community (§ 63.90(a)). If you are uncertain whether your request constitutes a new unproven monitoring method, which is considered a major change, you should submit your request to your EPA Region. The regulatory language in 63.1209(g)(1) has been revised to reflect this clarification.

D. Alternatives to Recordkeeping and Reporting.

As with the others, the final delegation provisions' rule only cited the waiver of recordkeeping and reporting requirements of § 63.10(f) as a non-delegable provision. Thus, it is necessary to add the relevant subpart EEE recordkeeping and reporting requirements of § 63.1211. Section 63.1211 is delegable in its entirety to S/L/T agencies unless an alternative request is determined to be a major change. An alternative request that is a major change, such as decreases in record retention for all records, must be sent to your EPA Region for review and approval. Similar to the monitoring section, § 63.1211 contains a specific alternative provision. Section 63.1211(d) Data Compression, allows sources to request to use data compression techniques to record data from CMS and CEMS on a frequency less than that required by § 63.1209. We view the alternative request to be a minor change because available guidance provides criteria for defining fluctuation and data compression limits. See 64 FR 52961 and 52962, September 30, 1999. Therefore, requests submitted under 63.1211(d) can be consistently evaluated by delegated S/L/T agencies. Section 63.1214(c) has been revised to specify that major alternatives to 63.1211(a)—(c) are non-delegable authorities.

E. Other Delegation Provisions

Although not discussed in the proposal, it is important to note that issuing applicability determinations is another delegable authority. The EPA document How to Review and Issue Clean Air Act Applicability Determinations and Alternative Monitoring (EPA 305–B–99–004, February 1999) provides guidance regarding who has the lead for issuing applicability determinations. In general, Regions may delegate the authority to issue applicability determinations to S/L/T agencies when the determinations are routine in nature. However, delegation of authority for certain applicability determinations should be retained by the Regions. These include applicability determinations that: (1) Are unusually controversial or complex; (2) have bearing on more than one state or district (are multi-Regional); (3) appear to create conflict with previous policy or determinations; (4) are a legal issue which has not previously been considered (a matter of first impression); or (5) raise new policy questions. It is recommended that Regional offices require notification when S/L/T agencies issue applicability determinations.

IV. RCRA State Authorization and Amendments to the RCRA Regulations

Under section 3006 of RCRA, EPA may authorize qualified states to administer their own hazardous waste programs in lieu of the federal program within the state. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized states have primary enforcement responsibility. The standards and requirements for state authorization are found at 40 CFR Part 271.

Prior to enactment of the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final RCRA authorization administered its hazardous waste program entirely in lieu of EPA administering the federal program in that state. The federal requirements no longer applied in the authorized state, and EPA could not issue permits for any facilities in that state, since only the state was authorized to issue RCRA permits. When new, more stringent federal requirements were promulgated, the state was obligated to enact equivalent authorities within specified time frames. However, the new federal requirements did not take effect in an authorized state until the state adopted the federal requirements as state law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), which was added by HSWA, new requirements and prohibitions imposed under HSWA authority take effect in authorized states at the same time that they take effect in unauthorized states. EPA is directed by the statute to implement these requirements and prohibitions in authorized states, including the issuance of permits, until the state is granted authorization to do so. While states must still adopt HSWA related provisions as state law to retain final authorization, EPA implements the HSWA provisions in authorized states until the states do so.

Authorized states are required to modify their programs only when EPA enacts federal requirements that are more stringent or broader in scope than existing federal requirements. RCRA section 3009 allows the states to impose standards more stringent than those in the federal program (see also 40 CFR 271.1). Therefore, authorized states may, but are not required to, adopt federal regulations, both HSWA and non-HSWA, that are considered less stringent than previous federal regulations.

We discussed in the proposal which RCRA regulations we intended to amend and their impact on state authorization procedures. Today, we are finalizing those amendments in §§ 270.10, 270.22, 270.32, 270.42, 27062, 270.66, and 270.235. In addition, we are amending the regulations in §§ 264.340 and 266.100 to reflect changes that have been made based upon comments. Today's amendments fall under both HSWA and non-HSWA authorities. That is, changes made to regulations applicable to boilers and industrial furnaces are promulgated under HSWA authority, whereas changes made to regulations applicable to incinerators are promulgated under non-HSWA authority. [259] All of the amendments made today are considered to be either less stringent or equivalent to the existing Federal program, which means that states are not required to adopt and seek authorization for these provisions regardless of whether they are finalized under non-HSWA or HSWA authorities. Nevertheless, we strongly encourage states to become authorized for today's amendments.

[259] When new requirements and prohibitions (that are more stringent than the previous federal regulations) are imposed under non-HSWA authority, the new federal requirements do not take effect in an authorized state until the state adopts the federal requirements as law. Conversely, when imposed under HSWA authority, the new federal requirements are federally enforceable in an authorized state until the necessary changes to a state's authorization are approved by EPA.

Experience has shown that when states have been authorized for previous amendments (i.e., those finalized in the 1999 rule) that were intended to facilitate the transition from the RCRA program to MACT and the CAA Title V program, the process has proven to be less cumbersome. For a more detailed discussion of non-HSWA and HSWA authorities with respect to how and when they take effect, please refer to the proposal's preamble discussion at 69 FR 21338.

Several RCRA sections that have been enacted as part of HSWA apply to today's rule: 3004(o), 3004(q), and 3005(c)(3). Thus, if a state is not authorized for the boiler and industrial furnace regulations, these provisions are federally enforceable in an authorized state until the necessary changes to a state's authorization are approved by us. See RCRA section 3006, 42 U.S.C. 6926. We are adding today's requirements to Table 1 in 271.1(j) where rulemakings promulgated pursuant to HSWA authority are identified.

Part Six: Impacts of the Final Rule

I. What Are the Air Impacts?

Table 1 below shows the emissions reductions achieved by the final rule for all existing hazardous waste combustors. For Phase I sources—incinerators, cement kilns, and lightweight aggregate kilns—the emission reductions represent the difference in emissions between sources controlled to today's standards and estimated emissions when complying with the interim MACT standards promulgated on February 13, 2002. Thus, the significant emissions reductions already achieved by the interim standards are not reflected in the estimates shown in Table 1.[260] For Phase II sources—solid fuel boilers, liquid fuel boilers, and hydrochloric acid production furnaces—the reductions represent the difference in emissions between today's standards and the current baseline of control provided by 40 CFR part 266, subpart H.

Nationwide baseline HAP and particulate matter emissions from hazardous waste combustors are estimated to be approximately 12,650 tons per year at the current baseline level of control. Depending on the number of facilities demonstrating compliance with health-based compliance alternatives for total chlorine, the total reduction of HAP and particulate matter for existing sources could be between approximately 2,260 and 3,380 tons per year. A discussion of the emission estimates methodology and results are presented in "Technical Support Document for HWC MACT Replacement Standards, Volume V: Emission Estimates and Engineering Costs" that is available in the docket.

TABLE 1.—NATIONWIDE ANNUAL EMISSIONS REDUCTIONS OF HAP AND OTHER POLLUTANTS

Pollutant	Estimated emission reductions (tons per year)
Dioxin/furans[1]	0.20
All HAP metals	19.5
Mercury	0.21
Semivolatile metals (Cd, Pb)	2.9
Low volatile metals (As, Be, Cr)	6.5
Other metals (Co, Mn, Ni, Sb, Se)	9.9
HCl and chlorine gas[2]	1220
Particulate matter	2,140

[1] Dioxin/furan emission reductions are expressed as grams TEQ per year.

[2] We are promulgating health-based compliance alternatives for total chlorine for hazardous waste combustors other than hydrochloric acid production furnaces in lieu of the MACT technology-based emission standards (see Part Four, Section VII of the preamble for details). Given that a number of sources may elect to comply with the health-based compliance alternatives, the estimated reductions of total chlorine represent an upper bound estimate.

II. What Are the Water and Solid Waste Impacts?

We estimate that water usage for existing sources will increase between 400 million and 1.6 billion gallons per year as a result of today's rule. The upper range estimate represents the water usage assuming no sources elect to comply with the health-based compliance alternatives for total chlorine, while the lower range estimate represents water usage assuming all sources elect the alternative. Water usage increases are estimated for reducing combustion gas temperatures with evaporated spray coolers for dioxin/furan control as well as for new particulate matter and acid gas air pollution control equipment. The increased water usage will also result in an increase in wastewater generation. Depending on the number of sources that elect to comply with the health-based compliance alternatives for total chlorine, we also estimate that up to 775 million gallons of wastewater may be generated.

We estimate that the generation of solid waste will increase between approximately 8,700 tons and 12,200 tons per year depending on the number of sources that elect to comply with the health-based compliance alternatives for total chlorine. Of these totals, approximately 250 tons per year will be classified as hazardous waste subject to RCRA Subtitle C regulations. We estimate the remainder—between 8,450 and 11,950 tons per year—will be classified and managed as a non-hazardous industrial waste subject to Subtitle D of RCRA. The costs associated with these disposal and water requirements are accounted for in the annualized compliance cost estimates. A discussion of the methodology used to estimate impacts is presented in "Technical Support Document for HWC MACT Replacement Standards, Volume V: Emission Estimates and Engineering Costs" that is available in the docket. We note that the nonair quality health and environmental impacts effects for both floor and beyond-the-floor options are discussed in the technical support document and are part of our consideration of such factors under section 112(d)(2).

III. What Are the Energy Impacts?

We estimate that the national annual energy usage as a result of this rule will increase between approximately 73 million and 85 million kilowatt hours (kWh) depending on the number of sources that elect to comply with the health-based compliance alternatives for total chlorine. The increase results from the electricity required to operate air pollution control equipment installed to meet the standards. The increase energy usage costs are accounted for in the annualized compliance cost estimates. A discussion of the methodology used to estimate impacts is presented in "Technical Support Document for HWC MACT Replacement Standards, Volume V: Emission Estimates and Engineering Costs." We note that the energy effects for both floor and beyond-the-floor options are discussed in the technical support document and are part of our consideration of such factors under section 112(d)(2).

IV. What Are the Control Costs?

Control costs, as presented in this section, refer only to engineering, operation, and maintenance costs associated with unit/system upgrades necessary to meet the final standards. These costs do not incorporate any market-based adjustments. All costs presented in this section are annualized estimates in 2002 dollars.

[260] USEPA, "Final Technical Support Document for HWC MACT Standards, Volume V: Emission Estimates and Engineering Costs," Section 3, July 1999.

We estimate there are a total of 267 sources [261] that may be subject to requirements of this final rule. Of this total, there are 116 boilers (104 liquid fuel boilers plus 12 solid fuel boilers), 92 on-site incinerators, 25 cement kilns, 15 commercial incinerators, nine (or seven) lightweight aggregate kilns, and ten hydrochloric acid (HCl) production furnaces.

Total national private sector engineering costs for the final standards are estimated at $40.2 million per year.[262] This estimate reflects total non market adjusted upgrade costs (engineering, plus administrative and permitting), excluding chlorine control costs.[263] All Phase II sources combined (liquid fuel boilers, coal fired boilers, and HCl production furnaces) represent 86 percent of this total. The average private sector engineering cost, *excluding* permitting and administrative, is projected to be highest for liquid fuel boilers, at $256,300 per source. Coal fired boilers are second at approximately $170,246 per source. Total engineering costs to cement kilns and HCl production furnaces are estimated to average $113,600, and $16,645 per source, respectively. Commercial incinerators are projected to experience engineering costs averaging $12,300 per source. On-site incinerators and LWAKs will face the lowest engineering costs at $10,200 and $3,330, respectively.

For all Phase I sources (141 sources; commercial incinerators, on-site incinerators, cement kilns, and lightweight aggregate kilns), total average annualized non market-adjusted compliance costs (*including* permitting and administrative [264]) are estimated at $39,700 per source. The combined Phase II sources (126 sources; solid and liquid fuel-fired boilers and hydrochloric acid production furnaces) have total average annualized non market-adjusted compliance costs of approximately $274,500 per source. Across all sectors covered by today's rule (Phase I and Phase II sources), total annualized compliance costs were found to average $150,500 per source.

Private sector engineering costs (control) costs have also been assessed on a per ton (U.S.) basis. Captive energy recovery sources (solid and liquid fuel-fired boilers, and hydrochloric acid production furnaces) burned a total of 944,667 tons of hazardous waste in 2003. These facilities are projected to experience the highest average incremental control costs, at approximately $37 per ton of waste burned. Commercial energy recovery sources (cement kilns and LWAKs), burning an estimated 999,076 tons in 2003, are projected to experience average incremental control costs of approximately of $3.00 per ton. Captive (on-site) and commercial incinerators burn an estimated 925,828 tons and 447,524 tons per year, respectively. These sources are estimated to experience average incremental engineering costs of $2.15 per ton and $0.80 per ton, respectively.

The aggregate control costs presented in this section do not reflect the anticipated real world cost burden on the economy. Any market disruption, such as the requirements in this final rule, will cause a short-term disequilibrium in the hazardous waste burning market, resulting in a natural economic process designed to reach the new market equilibrium. Actual cost impacts to society are more accurately measured by taking into account market adjustments in the targeted industry, plus secondary (societal) costs. Total market-adjusted costs plus secondary costs are commonly termed Social Costs, and are generally less than total engineering costs due to efficiencies implemented during the market adjustment process. Social Costs theoretically represent the total real world costs of all goods and services society must give up in order to gain the added protection to human health and the environment. Social Costs are presented in Part VI of this Section.[265]

V. What Are the Economic Impacts?

Economic impacts may be measured through several factors. This section presents estimated economic impacts relative to market exits, waste reallocations, and employment impacts. Economic impacts presented in this section are distinct from social costs, which correspond only to the estimated monetary value of market disturbances.

A. Market Exit Estimates

The hazardous waste combustion industry operates in a dynamic market, with systems entering and exiting the market on a routine basis. Our analysis defines "market exit" as ceasing to burn hazardous waste. We have projected post-rule hazardous waste combustion system market exits based on economic feasibility only. Social, liability, and informational issues are not incorporated into our market exit analysis.

Market exit estimates are derived from a breakeven analysis designed to determine system viability. This analysis is subject to several assumptions, including: Cost assumptions concerning the per sector baseline cost of hazardous waste burning, cost estimates for necessary pollution control devices (including operation and maintenance), prices for combustion services, and estimated waste quantities burned at these facilities. It is important to note that, for most sectors, exiting the hazardous waste combustion market is not equivalent to closing a plant. (Actual plant closure may occur only in the case of a commercial incinerator closing all systems.)

We estimate that 39 systems, representing about 15 percent of the total affected universe, may stop burning hazardous waste in response to the final standards. Approximately 59,000 tons of hazardous waste may be diverted from these closed systems.

These estimates assume no chlorine controls are put in place as a direct result of the rule.[266] Of the estimated 39 market exits, 26 are projected to be on-site incinerators and 8 are liquid fuel boilers. Three commercial incinerator systems may exit the market in response to the final rule. However, these systems are considered economically marginal in the baseline. Two coal-fired boiler systems are also projected to exit the market. No cement kilns, lightweight aggregate kilns, or HCl production furnaces are projected to exit the market as a result of the final rule. Market exit estimates were found to be identical

[261] For purposes of this discussion, a source is defined as the air pollution control system associated with one or more hazardous waste combustion unit(s). A facility may operate one or more sources. Note that this total includes two LWAK units limited by system burn constraints. Exclusion of these two units results in a total of 265 independent sources.

[262] Not included here are total annual government costs. These costs, with or without chlorine control, are approximately $0.5 million/year.

[263] We are finalizing the incorporation of section 112(d)(4) of the Clean Air Act to establish risk-based standards for total chlorine for hazardous waste combustors (except for hydrochloric acid production furnaces). The low-end of this cost range assumes all facilities emit total chlorine levels below risk-based levels of concern. Under this scenario, no total chlorine controls are assumed to be necessary. The total engineering cost with chlorine control is estimated at $46.7 million/year.]

[264] See Exhibit 4–3 in the economic assessment background document.

[265] Beyond-the-Floor standards were assessed for all floors. These findings are available in Appendix F and G of the engineering background document: See: Final Technical Support Document for HWC MACT Standards, Volume V—Emissions Estimates and Engineering Costs.

[266] Even though we are allowing sources (except hydrochloric acid production furnaces) to invoke § 112(d)(4) in lieu of MACT chlorine control requirements, we have not attempted to estimate the following: (1) The total number of sources that may elect to implement this provision, and, (2) what level of control may be necessary following a § 112(d)(4) risk-based determination, since this would vary on a site-by-site basis.

when the cost of chlorine control is included in the model.

B. Waste Reallocations

Some on-site combustion systems (sources) may no longer be able to cover their hazardous waste burning costs as a result of final rule requirements. These sources are projected to divert or reroute their wastes to different hazardous waste combustion sources (usually some type of commercial unit).[267] For multiple system facilities, this diversion may include on-site (non-commercial) waste consolidation among fewer systems at the same facility. Under current market conditions, non-combustion alternatives are generally not economically feasible, and in any case, would normally be unable to achieve the RCRA Land Disposal Restriction Treatment standards, which are based on the performance of combustion technology (which optimizes destruction of organic HAP).

As mentioned above, our economic model indicates that approximately 59,000 tons (U.S.) of hazardous waste may be reallocated. This figure represents approximately 1.8 percent of the total 2003 quantity of hazardous waste burned at all sources. On-site consolidations account for nearly 24 percent (13,915 tons) of all diverted waste. Commercial incinerators are projected to receive the vast majority (42,722 tons, or 73 percent) of all off-site waste reallocations. Cement kilns and LWAKs are projected to receive the remaining reallocation (2,289 tons). Currently, there is more than adequate capacity to accommodate all off-site hazardous waste diversions.

C. Employment Impacts

Today's rule is projected to induce employment shifts across all affected sectors. These shifts may occur as specific combustion facilities find it no longer economically feasible to keep all of their systems running, or to stay in the hazardous waste market at all. When this occurs, workers at these locations may lose their jobs or experience forced relocations. At the same time, the rule is projected to result in positive employment impacts, as new purchases of pollution control equipment stimulate additional hiring in the pollution control manufacturing sector, and as additional staff are required at selected combustion facilities to accommodate reallocated waste and/or various compliance activities.

1. Employment Impacts—Dislocations (Losses)

Employment dislocations in the combustion industry are projected to occur when facilities consolidate waste into fewer systems, or when a facility exits the hazardous waste combustion market altogether. Operation and maintenance labor hours are expected to be reduced for each system that stops burning hazardous waste. For each facility that completely exits the market, employment dislocations may also include supervisory and/or administrative personnel.

Total employment dislocations resulting from implementation of the final standards are estimated at 310 full-time-equivalent (FTE) jobs. On-site incinerators account for about 62 percent of this total, followed by commercial incinerators (about 24 percent), and liquid-fuel boilers (about 12 percent). The large number of on-site incinerators drives the impacts within this sector.

2. Employment Impacts—Positive

In addition to employment dislocations, our analysis indicates that today's rule may also result in positive employment impacts. These positive impacts are projected to occur to both the air pollution control industry and to combustion firms as they hire personnel to accommodate reallocated waste and/or comply with the various requirements of the rule. Hazardous waste combustion sources are projected to need additional operation and maintenance personnel for the new pollution control equipment and other compliance activities, such as new reporting and record keeping requirements.

The total annual positive employment impact associated with the final standards is estimated at 323 FTEs. Positive employment impacts to the air pollution control industry[268] are projected at 93 FTEs, or about 29 percent of this total. At 183 jobs, liquid-fuel boilers are projected to experience the greatest positive employment impact among all combustors.

While it may appear that our analysis suggests overall net positive employment impacts, such a conclusion would be inappropriate. Because the positive employment impacts and employment dislocations occur in different sectors of the economy, they should not be added together. Doing so would mask important distributional effects of the rule. In addition, these employment estimates reflect within sector impacts only and therefore do not account for potential displacements across sectors. This may occur if investment funds are diverted from other areas of the larger economy.

VI. What Are the Social Costs and Benefits of the Final Rule?

The value of any regulatory action is traditionally measured by the net change in social welfare that it generates. Our economic assessment conducted in support of today's final rule evaluated compliance (control) costs, and economic impacts, as discussed above. The Assessment also analyzed social costs, benefits, small entity impacts, and other impacts (e.g., children's health, unfunded mandates). To conduct this analysis, we examined the current combustion market and practices, developed and implemented a methodology for examining compliance and social costs, applied an economic model to analyze industry economic impacts (discussed above), examined benefits, and followed appropriate guidelines and procedures for examining equity considerations, children's health, and other impacts. The data applied in this analysis were the most recently available at the time of the analysis. Because our data were limited, the findings from these analyses should be more accurately viewed as national estimates.

A. Combustion Market Overview

The hazardous waste industry consists of three key segments: hazardous waste generators, fuel blenders/intermediaries, and hazardous waste burners. Hazardous waste is combusted at four main types of facilities: commercial incinerators, on-site incinerators, waste burning kilns (cement kilns and lightweight aggregate kilns), and industrial boilers. Commercial incinerators are generally larger in size and designed to manage virtually all types of solids, as well as liquid wastes. On-site incinerators are more often designed as liquid-injection systems that handle liquids and pumpable solids. Waste burning kilns and boilers generally burn hazardous wastes to generate heat and power for their manufacturing processes.

As discussed above, we have identified a total of 267 hazardous waste burning sources (systems) currently in operation in the United States. Liquid fuel-boilers account for 104 sources, followed by on-site incinerators at 92 sources. Cement kilns, hydrochloric acid production furnaces, and commercial incinerators account for 25, 10, and 15 sources, respectively. Solid

[267] This analysis includes the cost of waste transport to alternative combustion sources, burning fees, and purchase of alternative fuels (if appropriate).

[268] Manufacturers and distributors of air pollution control devices are projected to increase sales as a result of this action.

fuel boilers and lightweight aggregate kilns make up the remainder, at 12 and nine systems, respectively. These 267 sources are operated at a total of 145 different facilities. A single facility may have one or more combustion systems. Facilities with multiple systems may have different types of hazardous waste burning units. Combustion systems operating at chemical manufacturing facilities (NAICS 325) were found to account for about 70 percent of the total number of facilities and manage about 58 percent of all hazardous waste burned in 2003.

The EPA Biennial Reporting System (BRS) reports a total demand for all combusted hazardous waste, across all facilities, at 3.32 million tons (U.S. ton) in 2003. Commercial energy recovery (cement kilns and lightweight aggregate kilns) burned about 30 percent of this total. Hazardous waste destruction at on-site incinerators and commercial incinerators accounted for 28 percent and 13 percent, respectively. Captive energy recovery accounted for the remainder, at 29 percent of the total.

About 65 percent of all hazardous waste burned in 2003 was organic liquids. This is followed by solids (14 percent), inorganic liquids (11 percent), and sludges (10 percent). Hazardous gases were found to represent a negligible portion, at about 0.08 percent of the total quantity burned in 2003. In terms of hazardous waste generating sources, the Basic Organic Chemical Manufacturing e sector (NAICS 325) generated approximately 32 percent of all hazardous waste burned in 2001, followed by pesticides and agricultural chemicals, business services, organic fibers, medicinal chemicals, pharmaceuticals, plastics materials and resins, petroleum, and miscellaneous.

Companies that generate large quantities of uniform hazardous wastes generally find it more economical and efficient to combust these wastes on-site using their own noncommercial systems. Commercial incineration facilities manage a wide range of hazardous waste streams generated in small to medium quantities by diverse industries. Cement kilns, lightweight aggregate kilns, and boilers derive heat and energy by burning high-Btu (solvents and organics) liquid hazardous wastes.[269] Sometimes these wastes are blended with fossil fuels where system operators choose to not derive all of their energy input from hazardous waste.

Regulatory requirements, liability concerns, and economics influence the demand for hazardous waste combustion services. Regulatory forces influence the demand for combustion by mandating certain hazardous waste treatment standards (land disposal restriction requirements, etc.). Liability concerns of waste generators affect combustion demand because combustion, by destroying organic wastes, greatly reduces the risk of future environmental problems. Finally, if alternative waste management options are more expensive, hazardous waste generators will likely choose to send their wastes to combustion facilities in order to increase overall profitability.

Throughout much of the 1980s, hazardous waste combustors enjoyed a strong competitive position and generally maintained a high level of profitability. During this period, EPA regulations helped stimulate a greatly expanded market. In addition, federal permitting requirements, as well as powerful local opposition to siting of new incinerators, constrained the entry of new combustion systems. As a result, combustion prices rose steadily, ultimately reaching record levels in 1987. The high profits of the late 1980s induced many firms to enter the market, in spite of the difficulties and delays anticipated in the permitting and siting process.

Hazardous waste markets have changed significantly since the late 1980s. In the early 1990s, substantial overcapacity resulted in fierce competition, declining prices, poor financial performance, numerous project cancellations, system consolidations, and facility closures. Since the mid 1990s, several additional combustion facilities have closed, while many of those that have remained open have consolidated their operations. Available (prior to this final rule) excess commercial capacity is currently estimated at about 21 percent of the total 2003 quantity combusted.

B. Baseline Specification

Proper and consistent baseline specification is vital to the accurate assessment of incremental costs, benefits, and other economic impacts associated with today's rule. The baseline essentially describes the world absent the rule. The incremental impacts of today's rule are evaluated by predicting post MACT compliance responses with respect to the baseline. The baseline, as applied in this analysis, is the point at which today's rule is promulgated. Thus, incremental cost and economic impacts are projected beyond the standards established in the February 13, 2002 Interim Standards Final Rule.

C. Analytical Methodology and Findings—Social Cost Analysis

Total social costs include the value of resources used to comply with the standards by the private sector, the value of resources used to administer the regulation by the government, and the value of output lost due to shifts of resources away from the current market equilibrium. To evaluate these shifts in resources and changes in output requires predicting changes in behavior by all affected parties in response to the regulation, including responses of directly-affected entities, as well as indirectly-affected private parties.

For this analysis, social costs are grouped into two categories: Economic welfare (changes in consumer and producer surplus), and government administrative costs. The economic welfare analysis conducted for today's rule uses a simplified partial equilibrium approach. In this analysis, changes in economic welfare are measured by summing the changes in consumer and producer surplus. This simplified approach bounds potential economic welfare losses associated with the rule by considering two scenarios: Compliance costs assuming no market adjustments, and market adjusted compliance costs.

The annualized private sector compliance (engineering) costs of $40.2 million, as presented in Section IV, assume no market adjustments. Our best estimate of total social costs incorporates rational market adjustments and all government costs. Under this scenario, increased compliance (engineering) costs are examined in the context of likely incentives hazardous waste combustion facilities have to continue burning, and the competitive balance in the market.

Total annualized market-adjusted net private-sector costs are estimated at $22.1 million.[270] In addition to the net private sector costs, total annual government costs are approximately $0.50 million. Thus, our best estimate of total social costs of this final rule is $22.6 million per year.

The $22.1 million figure incorporates a net gain to selected Phase I sources and an estimated $3.6 million cost

[269] Many cement kilns are also able to burn a certain level of non liquid waste.

[270] We are finalizing alternative risk-based total chlorine standards for hazardous waste combustors (except for hydrochloric acid production furnaces). The net private sector costs of $22.1 million/year may be considered a lower-bound estimate that assumes facilities emit total chlorine (TCI) below risk-based levels of concern (i.e., no TCI controls are assumed to be necessary). Total net private sector market-adjusted costs would increase to approximately $28.1 million per year if we were to assume all sources were to comply with technology-based TCI standards (as opposed to the risk-based standards).

(price) increase to pre-existing customers of commercial hazardous waste combustion facilities. On-site incinerators are projected to experience total market-adjusted cost increases of approximately $1.5 million/year. All phase II sources account for approximately $31.9 million in increased costs. Our economic model indicates that, of the Phase I source categories, commercial incinerators, cement kilns, and LWAKs would experience net gains following all market adjustments. The total net gain for these three source categories is estimated at $14.8 million per year. Commercial incinerators would receive about 98 percent of the total gain ($14.5 million/year). Gains to commercial facilities occur due to marginally higher prices, increased waste receipts, and relatively low upgrade costs, when compared to the other sources.

D. Analytical Methodology and Findings—Benefits Assessment

This section discusses the monetized and non monetized benefits to human health and the environment potentially associated with today's final rule. Monetized human health benefits are derived from reductions in particulate matter (PM) and dioxin/furan exposure, and are based on a Value of Statistical Life (VSL) estimate of $6.2 million.[271] Non monetized benefits are associated with human health, ecological, and waste minimization factors.

1. Monetized Benefits

Total monetized human health benefits for the final standards are estimated to range from $5.61 million/year to $6.31 million/year. This estimate includes human health benefits associated with avoided PM and dioxin/furans exposure. The range is driven by alternative discount rate assumptions (no discount rate, 3 percent, or 7 percent) for mortality valuation. PM benefits represent 99 percent of the total monetized human health benefits.

Particulate Matter

Results from our risk assessment extrapolation procedure[272] are used to evaluate incremental human health benefits potentially associated with particulate matter emission reductions from hazardous waste combustion facilities. This analysis applied avoided human health benefits factors from the March 2004 Assessment document,[273] combined with more recent emissions estimates for particulate matter.

Reduced PM emissions are estimated to result in monetized human health benefits of approximately $6.29 million per year. This is an undiscounted figure. Avoided PM morbidity cases account for $3.42 million of this total, and include: respiratory illness, cardiovascular disease, chronic bronchitis, work loss days, and minor restricted activity. Chronic bronchitis accounts for approximately 89 percent of the total value of avoided PM morbidity cases. All morbidity cases are assumed to be avoided within the first year following reduced PM emissions and are not discounted under any scenario.

Avoided premature deaths (mortality) are valued at $2.87 million per year, undiscounted. Assuming a discount rate of three and seven percent, PM mortality benefits would be $2.52 million and $2.19 million, respectively. Our discounted analysis of PM mortality benefits assumes that 30 percent of premature mortalities occur during the first year, 50 percent occur evenly from the second through the fifth years, and the remaining 20 percent occur evenly from the sixth through the twentieth years.[274] Due to limitations in the risk analysis, this assessment of PM benefits does not consider corresponding health benefits associated with the reduction of HAP metals carried by the PM.

Dioxin/furan—Dioxin/furan emissions are projected to be reduced by a total of 0.2 grams per year under the final standards. In the July 23, 1999 Addendum to the Assessment, cancer risk reductions linked to consumption of dioxin-contaminated agricultural products accounted for the vast majority of the 0.36 cancer cases per year that were expected to be avoided due to the 1999 standards. Cancer risk reductions associated with the final standards are expected to be less than 0.36 cases per year, but greater than zero.

At this time, the Agency is still using a cancer risk slope factor of 1.56×10^5 [mg/kg/day]$^{-1}$ for dioxin. This cancer slope factor is derived from the Agency's 1985 health assessment document for polychlorinated dibenzo-p-dioxins[275] and represents an upper bound 95th percentile confidence limit of the excess cancer risk from a lifetime exposure. For the past several years the Agency has been conducting a reassessment of the human health risks associated with dioxin and dioxin-like compounds. In October of 2004 this reassessment[276] was delivered to the National Academy of Sciences (NAS) for review.

Evidence compiled from this draft reassessment indicates that the carcinogenic effects of dioxin/furans may be six times as great as believed in 1985, reflecting an upper bound cancer risk slope factor of 1×10^6 [mg/kg/day]$^{-1}$ for some individuals. Agency scientists' more likely (central tendency) estimates (derived from the ED_{01} rather than the LED_{01}) result in slope factors and risk estimates that are within 2–3 times of the upper bound estimates (i.e., between 3×10^5 [mg/kg/day]$^{-1}$ and 5×10^5 [mg/kg/day]$^{-1}$) based on the available epidemiological and animal cancer data. However, risks could be as low as zero for some individuals. Use of the alternative upper bound cancer risk slope factor could result in a higher human health monetized health benefit associated with premature cancer deaths avoided in response to the final standard for dioxin/furans. The assessment of upper bound cancer risk using this alternative slope factor should not be considered current Agency policy. The standards for dioxin in today's final rule were not based on this draft reassessment.

Total non-discounted human health benefits associated with projected dioxin reductions are estimated at $0.02 million/year. These benefits may range from $0.01 million/year to nearly zero, applying a discount rate of 3 percent and 7 percent, respectively. Our discounted estimates incorporate an assumed latency period of 21 and 34 years from exposure to death.

2. Non-Monetized Benefits

We examined, but did not monetize human health benefits potentially associated with reduced exposure to lead, mercury, and total chlorine. Non monetized ecological benefits

[271] Monetized benefits associated with avoided premature mortality reflect a VSL range of $1.1 million to $11.4 million, with a central VSL estimate of $6.2 million. These values are derived from willingness-to-pay based VSL estimates presented in U.S. EPA, Regulatory Impact Analysis for the Final Clean Air Interstate Rule, March 2005.

[Note: Toxicity risk factors presented in this document should not be considered EPA's official estimate of dioxin toxicity, but rather reflect EPA's ongoing effort to reevaluate dioxin toxicity].

potentially associated with reductions in dioxin/furan; selected metals, total chlorine, and particulate matter were also examined. Finally, waste minimization is examined as a non-monetized benefit.

Lead—The final standards are expected to reduce lead emissions by approximately 2.5 tons per year. In comparison, the 1999 standards were expected to reduce lead emissions by 89 tons per year, and were expected to reduce cumulative lead exposures for two children, ages zero to five, to less than 10 μg/dL. The lead benefits associated with these final standards are therefore expected to be modest. The final standards will also result in reduced lead levels for children of sub-populations with especially high levels of exposure. Children of subsistence fishermen, commercial beef farmers, and commercial dairy farmers who face the greatest levels of cumulative lead exposure may also experience comparable reductions in overall exposure as a result of the MACT standards.

Mercury—The HWC MACT final standards are expected to reduce mercury emissions by approximately 0.21 tons per year, approximately 93 percent less than the four-ton reduction expected under the 1999 Standards. We do not attempt to quantify the mercury-related benefits associated with today's final standards. However, because the reduction in mercury emissions represents a fraction of the reduction expected under the 1999 Standards, the mercury-related benefits of the final standards are likely to be less than the corresponding benefits under the 1999 Standards.

To characterize the benefits associated with reduced mercury emissions, the 1999 Assessment measured changes in hazard quotients for populations living near hazardous waste combustion facilities. For any given population, the hazard quotient is the ratio of the actual level of exposure to a safe level of exposure. A hazard quotient greater than one implies that a population is potentially at risk. The exposure quotient analysis in the 1999 Assessment found that the measurable benefits of reduced mercury emissions under the 1999 Standards were likely to be small because baseline exposures were relatively low. In addition, many of the studies examining the adverse health effects of mercury are inconclusive. Over the past several years, however, scientists have conducted three large-scale studies of individuals in the Faroe Islands, New Zealand, and the Seychelles Islands examining the relationship between mercury exposure in women and the neuro-development of their unborn children.[277] The New Zealand and Faroe Islands studies both found a statistically significant relationship between maternal methylmercury exposure and IQ decrements in the unborn children of these women. In its 2000 report on the toxicological effects of methylmercury, the National Research Council suggested that integrating the results of all three studies could be useful for risk assessment purposes.[278] Such an integrative risk assessment, later published by Ryan et al. in 2005, served as the basis of the Agency's health effects analysis for the Clean Air Mercury Rule (CAMR).[279] The regulatory impact analysis for CAMR summarizes several of the adverse health effects that may be linked to mercury and reviews the epidemiological literature examining the link between these effects and exposure to mercury.[280]

Total Chlorine—We were not able to quantify the benefits associated with reductions in total chlorine emissions. Total chlorine is a combination of hydrogen chloride and chlorine gas. The final standards are projected to reduce total annual chlorine emissions by about 107 tons per year[281] (HCl production furnaces only). Hydrogen chloride is corrosive to the eyes, skin, and mucous membranes. Acute inhalation can cause eye, nose, and respiratory tract irritation and inflammation, and pulmonary edema. Chronic occupational inhalation has been reported to cause gastritis, bronchitis, and dermatitis in workers. Long term exposure can also cause dental discoloration and erosion. Chlorine gas inhalation can cause bronchitis, asthma and swelling of the lungs, headaches, heart disease, and meningitis. Acute exposure causes more severe respiratory and lung effects, and can result in fatalities in extreme cases. The exposure levels established under 112(d)(4) are expected to reduce chlorine exposure for people in close proximity to hazardous waste combustion facilities, and are therefore likely to reduce the risk of all associated health effects.

Ecological Benefits—We examined ecological benefits through a comparison of the 1999 Assessment and today's final standards. Ecological benefits in the 1999 Assessment were based on reductions of approximately 100 tons per year in dioxin/furans and selected metals. Lead was the only pollutant of concern for aquatic ecosystems, while mercury appeared to be of greatest concern for terrestrial ecosystems. Dioxin/furan and lead emission reductions also provided some potential benefits for terrestrial ecosystems. The final standards are expected to reduce dioxin/furan and selected metal emissions by about 12 percent to 13 percent of the 1999 estimate, resulting in fewer incremental benefits than those estimated for the 1999 Assessment (and later, for the 2002 Interim Standards). However, the 1999 Assessment did not estimate the ecological benefits of MACT standards for hazardous waste burning industrial boilers and HCl production furnaces. These systems were excluded from the universe in 1999 but are part of the universe addressed by today's final standards. As a result, while the total ecological benefits of the final rule are likely to be modest, areas near facilities with boilers may enjoy more significant ecological benefits under the final standards than areas near facilities that have already complied with the 2002 Interim standards.

Mercury, lead, and chlorides are among the HAPs that can cause damage to the health and visual appearance of

[281] This is a lower bound estimate that assumes all other sources will implement 112(d)(4) and will not move to reduce TCl emissions from current baseline levels.

plants.[282] While the total value of forest health is difficult to estimate, visible deterioration in the health of forests and plants can cause a measurable change in recreation behavior. Several studies that measure the change in outdoor recreation behavior according to forest health have attempted to place a value on aesthetic degradation of forests.[283] Although these studies are available, additional research is needed to fully understand the effects of these Haps on the forest ecosystem. Thus, these benefits are not quantified in this analysis.

Emissions that are sufficient to cause structural and aesthetic damage to vegetation are likely to affect growth as well. Little research has been done on the effects of compounds such as chlorine, heavy metals (as air pollutants), and PM on agricultural productivity.[284] Even though the potential for visible damage and production decline from metals and other pollutants suggests the final standards could increase agricultural productivity, we have not monetized the benefits of these changes.

3. Waste Minimization Benefits

Facilities that burn hazardous waste and remain in operation following implementation of the final standards are expected to experience marginally increased costs as a result of these standards. This will result in an incentive to pass these increased costs on to their customers in the form of higher combustion prices. In the 1999 Assessment we conducted a waste minimization analysis to inform the expected price change. The analysis concluded that the demand for hazardous waste combustion is relatively inelastic. While a variety of waste minimization alternatives are available for managing hazardous waste streams that are currently combusted, the costs of these alternatives generally exceed the cost of combustion. When the additional costs of compliance with the MACT standards are taken into account, waste minimization alternatives still tend to exceed the higher combustion costs. This relative inelasticity suggests that, in the short term, large reductions in the amount of hazardous waste requiring combustion are not likely to occur. However, over the longer term (*i.e.* as production systems are updated), companies may continue to seek alternatives to expensive hazardous waste-management. This may include process adjustments that result, to some degree in source reduction of hazardous waste and the increased generation of non hazardous waste. To the extent that increases in combustion prices provide additional incentive to adopt more efficient processes, the final standards may contribute to longer term process-based hazardous waste minimization efforts.

No hazardous waste minimization impacts are captured in our quantitative analysis of costs and benefits.[285] A quantitative assessment of the benefits associated with waste minimization may result in double-counting of some of the benefits described earlier. For example, waste minimization may reduce emissions of hazardous air pollutants and therefore have a positive effect on public health. Furthermore, emission reductions beyond those necessary for compliance with the final standards are not addressed in the benefits assessment. In addition, waste minimization is likely to result in specific types of benefits not captured in this Assessment. For example, waste generators that engage in waste minimization may experience a reduction in their waste handling costs and could also reduce the risk related to waste spills and waste management. Finally, waste minimization procedures potentially stimulated by today's action may result in additional costs to facilities that implement these technologies. These factors have not been assessed in our analysis but are likely to at least partially offset corresponding benefits.

4. Conclusion

Total non-discounted monetized human health benefits associated with the final standards are estimated at $6.31 million/year. Annualized discounted benefits were found to range from $5.61 million to $5.95 million/year. The range reflects an alternative discount rate of 3 percent and 7 percent for mortality benefits.

It is important to emphasize that monetized benefits represent only a portion of the total benefits associated with this rule. A significant portion of the benefits are not monetized, as discussed above, due to data and analytical limitations. Specifically, ecological benefits, and human health benefits associated with reductions in chlorine, mercury, and lead are not quantified or monetized. In some regions these benefits may be significant. In addition, specific sub-populations near combustion facilities, including children and minority populations, may be disproportionately affected by environmental risks and may therefore enjoy more significant benefits. Visibility benefits associated with reduced PM are also expected from this final rule. For a complete discussion of the methodology, data, findings, and limitations associated with our benefits analysis the reader is encouraged to review the Assessment document,[286] and the Addendum to the Assessment.

Part Seven: How Does the Final Rule Meet the RCRA Protectiveness Mandate?

As discussed in more detail below, we believe today's final standards are generally protective of human health and the environment. We therefore finalize and apply these standards, in most instances, in lieu of the RCRA air emission standards applicable to these sources.

I. Background

Section 3004(a) of RCRA requires the Agency to promulgate standards for hazardous waste treatment, storage, and disposal facilities as necessary to protect human health and the environment. The standards for hazardous waste incinerators generally rest on this authority. In addition, § 3004(q) requires the Agency to promulgate standards for emissions from facilities that burn

[282] Although the primary pollutants which are detrimental to vegetation aesthetics and growth are tropospheric ozone, sulfur dioxide, and hydrogen fluoride (three pollutants which are not regulated in the MACT standards), some literature exists on the relationship between metal deposition and vegetation health. (Mercury Study Report to Congress Volume VI, 1997) (Several studies are cited in this report.)

[283] See, for example, Brown, T.C. et al. 1989. Scenic Beauty and Recreation Value: Assessing the Relationship, In J. Vining, ed., *Social Science and Natural Resources Recreation Management*, Westview Press, Boulder, Colorado; this work studies the relationship between forest characteristics and the value of recreational participation. Also see Peterson, D.G. et al. 1987, Improving Accuracy and Reducing Cost of Environmental Benefit Assessments. Draft Report to the U.S. EPA, by Energy and Resource Consultants, Boulder, Colorado; Walsh et al. 1990, Estimating the public benefits of protecting forest quality, Journal of Forest Management, 30:175–189., and Homes et al. 1992, Economic Valuation of Spruce-Fir Decline in the Southern Appalachian Mountains: A comparison of Value Elicitation Methods. Presented at the Forestry and the Environment: Economic Perspectives Conference, March 1, 1992 Jasper, Alberta, Canada for estimates of the WTP of visitors and residents to avoid forest damage.

[284] MacKenzie, James J., and Mohamed T. El-Ashry, *Air Pollution's Toll on Forests and Crops* (New Haven, Yale University Press, 1989).

[285] Note that this rule does, in fact, consider hazardous waste feed control. Feed control can be implemented by each source through waste minimization procedures. See: Final Technical Support Document for HWC MACT Standards, Volume V–Emissions Estimates and Engineering Costs.

[286] Assessment of the Potential Costs, Benefits, and Other Impacts of the Hazardous Waste Combustion MACT Final Rule Standards. September 2005.

hazardous waste fuels (e.g., cement and lightweight aggregate kilns, boilers, and hydrochloric acid production furnaces) as necessary to protect human health and the environment. Using RCRA authority, the Agency has established emission (and other) standards for hazardous waste combustors that are either entirely risk-based (e.g., site-specific standards for metals under the Boiler and Industrial Furnace rule), or are technology-based but determined by a generic risk assessment to be protective (e.g., the DRE standard for incinerators and BIFs).

The MACT standards finalized today implement the technology-based regime of CAA § 112(d). There is, however, a residual risk component to air toxics standards. Section 112(f) of the Clean Air Act requires the Agency to impose, within eight years after promulgation of the technology-based standards promulgated under § 112(d) (i.e., the authority for today's final standards), additional controls if needed to protect public health with an ample margin of safety or to prevent adverse environmental effect.

RCRA § 1006(b) directs that EPA "integrate all provisions of [RCRA] for purposes of administration and enforcement and * * * avoid duplication, to the maximum extent possible, with the appropriate provisions of the Clean Air Act * * *" Thus, although considerations of risk are not ordinarily part of the MACT process, in order to avoid duplicative standards where possible, we have evaluated the protectiveness of the standards finalized today.

As noted above, under RCRA, EPA must promulgate standards "as may be necessary to protect human health and the environment." RCRA § 3004(a) and (q). Technology-based standards developed under CAA § 112 do not automatically satisfy this requirement, but may do so in fact. See 59 FR at 29776 (June 6, 1994) and 60 FR at 32593 (June 23, 1995) (RCRA regulation of secondary lead smelter emissions unnecessary at this time given stringency of technology-based standard and pendency of § 112(f) determination). If the MACT standards, as a factual matter, are sufficiently protective to also satisfy the RCRA mandate, then no independent RCRA standards are required. Conversely, if MACT standards are inadequate, the RCRA authorities would have to be used to fill the gap.

II. Evaluation of Protectiveness

For the purpose of satisfying the RCRA statutory mandates, the Agency has conducted an evaluation of the degree of protection afforded by the MACT standards being finalized today. We have not conducted a comprehensive risk assessment for this rulemaking as was done for incinerators, cement kilns, and lightweight aggregate kilns in the 1999 MACT rule where we concluded that the promulgated standards were generally protective and therefore, the RCRA standards need not be retained. However, we noted that in certain instances, permit authorities may invoke the omnibus authority (RCRA § 3005(c)(3) and its implementing regulations at § 270.10(k)) if there is some reason to believe that additional controls beyond those required pursuant to 40 CFR parts 63, 264, 265, and 266 may be needed to ensure protection of human health and the environment under RCRA.

For this final rule, we instead compared the risk-related characteristics of the sources covered by the 1999 rule to the sources covered by today's rule (e.g., estimated emissions, stack characteristics, meteorology, and population). For a description of the methodology and technical discussion of its application, see "Inferential Risk Analysis in Support of Standards for Emissions of Hazardous Air Pollutants from Hazardous Waste Combustors," in the docket for today's rule. We performed a large array of statistical comparisons and from these we attempted to make inferences about whether risks would be expected to be about the same, less than, or greater than the risks estimated for 1999 rule. We think the comparative analysis lends additional support to our view that today's final standards are generally protective. We received no comments either in support of or in opposition to our use of the comparative analysis to evaluate the protectiveness of the standards being finalized today or our view that the standards are generally protective.

While we regard the final standards as generally protective, the comparative analysis suggests some concern for solid fuel-fired boilers (SFBs) with regard to the particulate matter standard (and certain metals such as antimony and thallium), mercury, and total chlorine standards (other than the alternative risk-based chlorine standards). The analysis also suggests some concern for hydrochloric acid (HCl) production furnaces with regard to the dioxin/furan standard, where carbon monoxide and total hydrocarbon serve as surrogate control. However, because both SFBs and HCl production furnaces comprise such small source categories (4 SFB facilities and 8 HCl production facilities), it is difficult to reach firm conclusions. For example, for SFBs it was not possible to conduct hypothesis tests that could be considered valid involving correlations among variables for a number of variables in the analysis because of the small number of data points and the power of the tests to detect differences for those that were conducted was very low, which greatly diminishes the value of the results. (Indeed, no differences in correlations were found for SFBs at the 0.1 significance level—the level of significance that was used in the analysis.) Similarly, for HCl production furnaces the power of the tests to detect differences in correlations was quite low. It must be noted that the comparative analysis methodology was not intended for comparisons that involve relatively few facilities because it is grounded in tests of hypotheses and levels of statistical significance which generally require substantial amounts of data to produce firm conclusions. Nevertheless, in consideration of the indications of possible risks for the aforementioned standards, permit authorities may want to consider site-specific factors in determining whether or not the MACT standards are sufficiently protective for facilities that fall into these categories.

The comparative analysis may also raise possible concerns for lightweight aggregate kilns (LWAKs) and liquid fuel-fired boilers (LFBs) with dry APCDs with regard to the dioxin/furan standards, in view of the ongoing uncertainty in cancer and other health effects levels for chlorinated dioxins and furans. In particular, some recent estimates of the carcinogenicity of these compounds that consider both human and animal data, are higher than earlier estimates derived from animal data alone. However, like SFBs and HCl production furnaces, LWAKs and LFBs with dry APCDs both comprise small source categories (3 LWAK facilities and 7 dry APCD LFB facilities). This makes it very difficult to reach firm conclusions and suggests the need to consider site-specific factors in determining whether the MACT standards are sufficiently protective in these instances.

Except as noted, we believe today's final standards provide a substantial degree of protection to human health and the environment. We therefore do not believe that we need to retain the existing RCRA standards for boilers and hydrochloric acid production furnaces (just as we found that existing RCRA standards for incinerators, cement kilns, and lightweight aggregate kilns were no longer needed after the 1999 rule). However, as previously discussed in

more detail in Part Four, Section IX, site-specific risk assessments may be warranted on an individual source basis to ensure that the MACT standards provide adequate protection in accordance with RCRA.

Part Eight: Statutory and Executive Order Reviews

I. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 [58 FR 51735 (October 4, 1993)] the Agency, in conjunction with OMB's Office of Information and Regulatory Affairs (OIRA), must determine whether a regulatory action is "significant" and therefore subject to OMB review and the full requirements of the Executive Order. The Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that this rule is a "significant regulatory action" because this action may raise novel legal or policy issues due to the methodology applied in development of the final standards. As such, this action was submitted to OMB for review. Changes made in response to OMB suggestions or recommendations are documented in the public record.

The total social costs for this rule are estimated at $22.6 million per year[287]. This figure is significantly below the $100 million threshold established under point number one above. Thus, this rule is not considered to be an economically significant action. However, in an effort to comply with the spirit of the Order, we have prepared an economic assessment in support of today's final rule. This document is entitled: Assessment of the Potential Costs, Benefits, and Other Impacts of the Hazardous Waste Combustion MACT Final Rule Standards, September 2005. We have also prepared an Addendum to this Assessment entitled: Addendum to the Assessment of the Potential Costs, Benefits, and Other Impacts of the Hazardous Waste Combustion MACT Final Rule Standards, September 2005. This Addendum captures changes made to the rulemaking following completion of the full Assessment document. The Assessment and Addendum were designed to adhere to analytical requirements established under Executive Order 12866, and corresponding Agency and OMB guidance; subject to data, analytical, and resource limitations. Findings presented under Part Six of this Preamble were developed in accordance with this guidance. The RCRA docket established for today's rulemaking maintains a copy of the Assessment and Addendum for public review. Interested persons are encouraged to read both documents to gain a full understanding of the analytical methodology, findings, and limitations associated with this report.

[287] This figure includes approximately $0.5 million/year in total government costs. Total social costs would increase to approximately $28.6 million per year if we were to assume all sources were to comply with technology-based TC1 standards.

II. Paperwork Reduction Act

We have prepared an Information Collection Request (ICR) document (ICR No. 1773.08) listing the information collection requirements of this final rule, and have submitted it for approval to the Office of Management and Budget (OMB) under the provisions of the Paperwork Reduction Act, U.S.C. 3501 *et seq.* OMB has assigned a control number 2050–0171 for this ICR. This ICR is available for public viewing in the EPA Docket Center, Room B102, 1301 Constitution Avenue NW., Washington, DC. Copy may also be obtained from the EDOCKET on the EPA Web site, or by calling (202) 566–1744. The information collection requirements are not enforceable until OMB approves them.

The public burden associated with this final rule is projected to affect 238 HWC units and is estimated to average 211 hours per respondent annually. The reporting and recordkeeping cost burden is estimated to average $5,640 per respondent annually.

Burden means total time, effort, or financial resources expended by persons to generate, maintain, retain, disclose, or provide information to or for a Federal agency. That includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9. When this ICR is approved by OMB, the Agency will publish a technical amendment to 40 CFR part 9 in the **Federal Register** to display the OMB control number for the approved information collection requirements contained in this final rule.

The EPA requested comments (see 70 FR 20748, Apr. 21, 2005) on the need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including through the use of automated collection techniques.

III. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), 5 U.S.C. 601 et seq., generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act, or any other statute. This analysis must be completed unless the agency is able to certify that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small not-for-profit enterprises, and small governmental jurisdictions.

The RFA provides default definitions for each type of small entity. Small entities are defined as: (1) A small business as defined by the Small Business Administration's (SBA) regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, I certify that this action will not

have a significant economic impact on a substantial number of small entities. We have determined that hazardous waste combustion facilities are not owned by small governmental jurisdiction or nonprofit organizations. Therefore, only small businesses were analyzed for small entity impacts. For the purposes of the impact analyses, small entity is defined either by the number of employees or by the dollar amount of sales. The level at which a business is considered small is determined for each North American Industrial Classification System (NAICS) code by the Small Business Administration.

Affected individual waste combustors (incinerators, cement kilns, lightweight aggregate kilns, solid and liquid fuel-boilers, and hydrochloric acid production furnaces) will bear the impacts of today's rule. These units will incur direct economic impacts (positive or negative) as a result of today's rule. Few of the hazardous waste combustion facilities affected by this rule were found to be owned by small businesses, as defined by the Small Business Administration (SBA). From our universe of 145 facilities, we identified eight facilities that are currently owned by small businesses. Four of these facilities are liquid boilers, two are on-site incinerators, one is a cement kiln, and one is a lightweight aggregate kiln (LWAK). Our analysis indicates that none of these facilities are likely to incur annualized compliance costs greater than one percent of gross annual corporate revenues. Cost impacts of the final standards were found to range from less than 0.01 percent to 0.46 percent of annual gross corporate revenues.

The reader is encouraged to review our regulatory flexibility screening analysis prepared in support of this determination. This analysis is incorporated as Appendix H of the *Assessment* document, and updated in the *Addendum*.

IV. Unfunded Mandates Reform Act of 1995

Signed into law on March 22, 1995, the Unfunded Mandates Reform Act (UMRA) calls on all federal agencies to provide a statement supporting the need to issue any regulation containing an unfunded federal mandate and describing prior consultation with representatives of affected state, local, and tribal governments.

Today's final rule is not subject to the requirements of sections 202, 204 and 205 of UMRA. In general, a rule is subject to the requirements of these sections if it contains "Federal mandates" that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. Today's final rule does not result in $100 million or more in expenditures for any of these categories. The aggregate annualized social cost for today's rule is estimated at $22.6 million.

V. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

Under Executive Order 13132, EPA may not issue a regulation that has federalism implications, that imposes substantial direct compliance costs, and that is not required by statute, unless the Federal government provides the funds necessary to pay the direct compliance costs incurred by State and local governments, or EPA consults with State and local officials early in the process of developing the regulation.

This final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in the Order. The rule focuses on requirements for facilities burning hazardous waste, without affecting the relationships between Federal and State governments. Thus, Executive Order 13132 does not apply to this rule. Although section 6 of Executive Order 13132 does not apply to this rule, EPA did include various State representatives on our Agency workgroup. These representatives participated in the development of this rule.

VI. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175: Consultation and Coordination with Indian Tribal Governments (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." Our Agency workgroup for this rule included Tribal representation. We have determined that this final rule does not have tribal implications, as specified in the Order. No Tribal governments are known to own or operate hazardous waste combustors subject to the requirements of this final rule. Furthermore, this rule focuses on requirements for all regulated sources without affecting the relationships between tribal governments in its implementation, and applies to all regulated sources, without distinction of the surrounding populations affected. Thus, Executive Order 13175 does not apply to this rule.

VII. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045: "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR. 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under E.O. 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency. Today's final rule is not subject to the Executive Order because it is not economically significant as defined under point one of the Order, and because the Agency does not have reason to believe the environmental health or safety risks addressed by this action present a disproportionate risk to children.

VIII. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This rule is not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 Fed. Reg. 28355 (May 22, 2001)). This rule, as finalized, will not seriously disrupt energy supply, distribution patterns, prices, imports or exports. Furthermore, this rule is not an economically significant action under Executive Order 12866.

IX. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 ("NTTAA"), Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards.

This rulemaking involves environmental monitoring or measurement. Both Performance Based Measurement System (PBMS) and specific measurement methods are finalized under this rule. The PBMS approach is intended to be more flexible and cost-effective for the regulated community; it is also intended to encourage innovation in analytical technology and improved data quality. Where allowed, EPA is not precluding the use of any method, whether it constitutes a voluntary consensus standard or not, as long as it meets the performance criteria specified.

X. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations' (February 11, 1994) requires us to complete an analysis of today's rule with regard to equity considerations. The Order is designed to address the environmental and human health conditions of minority and low-income populations. This section briefly discusses potential impacts (direct or disproportional) today's rule may have in the area of environmental justice.

We have recently analyzed demographic data from the U.S. Census, and have previously examined data from two other reports: "Race, Ethnicity, and Poverty Status of the Populations Living Near Cement Plants in the United States" (EPA, August 1994) and "Race, Ethnicity, and Poverty Status of the Populations Living Near Hazardous Waste Incinerators in the United States" (EPA, October 1994). These reports examine the number of low-income and minority individuals living near a relatively large sample of cement kilns and hazardous waste incinerators and provide county, state, and national population percentages for various sub-populations. The demographic data in these reports provide several important findings when examined in conjunction with the risk reductions projected from today's rule.

We find that combustion facilities, in general, are not located in areas with disproportionately high minority and low-income populations. However, there is evidence that hazardous waste burning cement kilns are somewhat more likely to be located in areas that have relatively higher low-income populations. Furthermore, there are a small number of commercial hazardous waste incinerators located in highly urbanized areas where there is a disproportionately high concentration of minorities and low-income populations within one and five mile radii. The reduced emissions at these facilities due to today's rule could represent meaningful environmental and health improvements for these populations. Overall, today's rule should not result in any adverse or disproportional health or safety effects on minority or low-income populations. Any impacts on these populations are likely to be positive due to the reduction in emissions from combustion facilities near minority and low-income population groups. The Assessment document available in the RCRA docket established for today's rule discusses our Environmental Justice analysis.

XI. Congressional Review

The Congressional Review Act (CRA), 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. Prior to publication of the final rule in the Federal Register, we will submit all necessary information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States. Under the CRA, a major rule cannot take effect until 60 days after it is published in the Federal Register. This action is not a "major rule" as defined by 5 U.S.C. 804(2).

Environmental protection, Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements.

40 CFR Part 266

Environmental protection, Energy, Hazardous waste, Recycling, Reporting and recordkeeping requirements.

40 CFR Part 270

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: September 14, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 9—OMB APPROVALS UNDER THE PAPERWORK REDUCTION ACT

■ 1. The authority citation for part 9 continues to read as follows:

Authority: 7 U.S.C. 135 *et seq.*, 136–136y; 15 U.S.C. 2001, 2003, 2005, 2006, 2601–2671 21 U.S.C. 331j, 346a, 348; 31 U.S.C. 9701; 33 U.S.C. 1251 *et seq.*, 1311, 1313d, 1314, 1318, 1321, 1326, 1330, 1342, 1344, 1345 (d) and (e), 1361; E.O. 11735, 38 FR 21243, 3 CFR, 1971–1975 Comp. p. 973; 42 U.S.C. 241, 242b, 243, 246, 300f, 300g, 300g–1, 300g–2,

300g–3, 300g–4, 300g–5, 300g–6, 300j–1, 300j–2, 300j–3, 300j–4, 300j–9, 1857 *et seq.*, 6901–6992k, 7401–7671q, 7542, 9601–9657, 11023, 11048.

■ 2. Section 9.1 is amended in the table under center heading "National Emission Standards for Hazardous Air Pollutants for Source Categories" by adding entry "63.1200–63.1221" in numerical order to read as follows:

§ 9.1 OMB approvals under the Paperwork Reduction Act.

* * * * *

40 CFR citation	OMB control No.
* * * * * * *	
National Emission Standards for Hazardous Air Pollutants for Source Categories [3]	
* * * * * * *	
63.1200–63.1221	2050–0171

[3] The ICRs referenced in this section of the table encompass the applicable general provisions contained in 40 CFR part 63, subpart A, which are not independent information collection requirements.

* * * * *

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

■ 2. Section 63.14 is amended by:

■ a. Removing paragraphs (i)(1) and (i)(2).

■ b. Redesignating paragraph (i)(3) as (i)(1).

■ c. Adding and reserving new paragraph (i)(2).

■ d. Revising paragraph (k).

The revisions and additions read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(i) * * *

(2) [Reserved]

* * * * *

(k) The following materials are available for purchase from the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 605–6000 or (800) 553–6847; or for purchase from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 512–1800:

(1) The following methods as published in the test methods compendium known as "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW–846, Third Edition. A suffix of "A" in the method number indicates revision one (the method has been revised once). A suffix of "B" in the method number indicates revision two (the method has been revised twice).

(i) Method 0023A, "Sampling Method for Polychlorinated Dibenzo-*p*-Dioxins and Polychlorinated Dibenzofuran Emissions from Stationary Sources," dated December 1996 and in Update III, IBR approved for § 63.1208(b)(1) of Subpart EEE of this part.

(ii) Method 9071B, "n-Hexane Extractable Material (HEM) for Sludge, Sediment, and Solid Samples," dated April 1998 and in Update IIIA, IBR approved for § 63.7824(e) of Subpart FFFFF of this part.

(iii) Method 9095A, "Paint Filter Liquids Test," dated December 1996 and in Update III, IBR approved for §§ 63.7700(b) and 63.7765 of Subpart EEEEE of this part.

(2) [Reserved]

■ 3. Section 63.1200 is amended by:

■ a. Revising the introductory text.

■ b. Revising paragraph (a)(2).

■ c. Adding entry (4) in Table 1 in paragraph (b).

The revisions and additions read as follows:

§ 63.1200 Who is subject to these regulations?

The provisions of this subpart apply to all hazardous waste combustors: hazardous waste incinerators, hazardous waste cement kilns, hazardous waste lightweight aggregate kilns, hazardous waste solid fuel boilers, hazardous waste liquid fuel boilers, and hazardous waste hydrochloric acid production furnaces. Hazardous waste combustors are also subject to applicable requirements under parts 260 through 270 of this chapter.

(a) * * *

(2) Both area sources and major sources subject to this subpart, but not previously subject to title V, are immediately subject to the requirement to apply for and obtain a title V permit in all States, and in areas covered by part 71 of this chapter.

(b) * * *

TABLE 1 TO § 63.1200.—HAZARDOUS WASTE COMBUSTORS EXEMPT FROM SUBPART EEE

If	And If	Then
* * * * * * *		
(4) You meet the definition of a small quantity burner under § 266.108 of this chapter		You are not subject to the requirements of this subpart (Subpart EEE).

* * * * *

■ 4. Section 63.1201 is amended in paragraph (a) by revising the definitions of "Hazardous waste combustor", "New source", and "TEQ", and adding definitions for "Btu", "Hazardous waste hydrochloric acid production furnace", "Hazardous waste liquid fuel boiler", "Hazardous waste solid fuel boiler", and "System removal efficiency" in alphabetical order to read as follows:

§ 63.1201 Definitions and acronyms used in this subpart.

(a) * * *

Btu means British Thermal Units.

* * * * *

Hazardous waste combustor means a hazardous waste incinerator, hazardous waste burning cement kiln, hazardous waste burning lightweight aggregate kiln, hazardous waste liquid fuel boiler, hazardous waste solid fuel boiler, or hazardous waste hydrochloric acid production furnace.

* * * * *

Hazardous waste hydrochloric acid production furnace and *Hazardous Waste HCl production furnace* mean a halogen acid furnace defined under § 260.10 of this chapter that produces aqueous hydrochloric acid (HCl) product and that burns hazardous waste at any time.

* * * * *

Hazardous waste liquid fuel boiler means a boiler defined under § 260.10 of this chapter that does not burn solid fuels and that burns hazardous waste at any time. Liquid fuel boiler includes boilers that only burn gaseous fuel.

* * * * *

Hazardous waste solid fuel boiler means a boiler defined under § 260.10 of this chapter that burns a solid fuel and that burns hazardous waste at any time.

* * * * *

New source means any affected source the construction or reconstruction of which is commenced after the dates specified under §§ 63.1206(a)(1)(i)(B), (a)(1)(ii)(B), and (a)(2)(ii).

* * * * *

System removal efficiency means [1 − Emission Rate (mass/time) / Feedrate (mass/time)] X 100.

* * * * *

TEQ means the international method of expressing toxicity equivalents for dioxins and furans as defined in U.S. EPA, Interim Procedures for Estimating Risks Associated with Exposures to Mixtures of Chlorinated Dibenzo-p-dioxins and -dibenzofurans (CDDs and CDFs) and 1989 Update, March 1989.

* * * * *

■ 5. Section 63.1203 is amended by:

■ a. Revising an undesignated center heading above the section heading.

■ b. Revising the section heading.

■ c. Revising paragraph (c)(3)(2).

The revisions and additions read as follows:

Interim Emissions Standards and Operating Limits For Incinerators, Cement Kilns, and Lightweight Aggregate Kilns

§ 63.1203 What are the standards for hazardous waste incinerators that are effective until compliance with the standards under § 63.1219?

* * * * *

(c) * * *

(3) * * *

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

* * * * *

■ 6. The section heading to § 63.1204 and paragraph (c)(3)(ii) are revised to read as follows:

§ 63.1204 What are the standards for hazardous waste burning cement kilns that are effective until compliance with the standards under § 63.1220?

* * * * *

(c) * * *

(3) * * *

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

* * * * *

■ 7. The section heading to § 63.1205 and paragraph (c)(3)(ii) are revised to read as follows:

§ 63.1205 What are the standards for hazardous waste burning lightweight aggregate kilns that are effective until compliance with the standards under § 63.1221?

* * * * *

(c) * * *

(3) * * *

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

* * * * *

■ 8. Section 63.1206 is amended by:

■ a. Revising paragraph (a).

■ b. Revising paragraphs (b)(1)(ii), (b)(6) introductory text, (b)(7)(i)(A), (b)(7)(ii), (b)(9)(i) introductory text, (b)(9)(i)(A), (b)(9)(iv)(A), (b)(9)(vi), (b)(9)(vii) introductory text, (b)(9)(viii)(D), (b)(9)(ix)(D), (b)(10)(i) introductory text, (b)(10)(i)(A), (b)(10)(vi), (b)(10)(vii) introductory text, (b)(10)(viii)(D), (b)(10)(ix)(D), (b)(11), (b)(13)(i) introductory text, (b)(13)(ii), and (b)(14).

■ c. Adding paragraph (b)(16).

■ d. Revising paragraphs (c)(1)(i) introductory text, (c)(3)(iv), (c)(6)(iii)(B) introductory text, (c)(6)(iv) introductory text, and (c)(7).

■ e. Adding paragraphs (c)(8) and (c)(9).

The revisions and additions read as follows:

§ 63.1206 When and how must you comply with the standards and operating requirements?

(a) *Compliance dates.* (1) *Compliance dates for incinerators, cement kilns, and lightweight aggregate kilns that burn hazardous waste.* (i) *Compliance date for standards under §§ 63.1203, 63.1204, and 63.1205.* (A) *Compliance dates for existing sources.* You must comply with the emission standards under §§ 63.1203, 63.1204, and 63.1205 and the other requirements of this subpart no later than the compliance date, September 30, 2003, unless the Administrator grants you an extension of time under § 63.6(i) or § 63.1213.

(B) *New or reconstructed sources.* (*1*) If you commenced construction or reconstruction of your hazardous waste combustor after April 19, 1996, you must comply with the emission standards under §§ 63.1203, 63.1204, and 63.1205 and the other requirements of this subpart by the later of September 30, 1999 or the date the source starts operations, except as provided by paragraph (a)(1)(i)(B)(*2*) of this section. The costs of retrofitting and replacement of equipment that is installed specifically to comply with this subpart, between April 19, 1996 and a source's compliance date, are not considered to be reconstruction costs.

(*2*) For a standard under §§ 63.1203, 63.1204, and 63.1205 that is more stringent than the standard proposed on April 19, 1996, you may achieve compliance no later than September 30, 2003 if you comply with the standard proposed on April 19, 1996 after September 30, 1999. This exception does not apply, however, to new or

reconstructed area source hazardous waste combustors that become major sources after September 30, 1999. As provided by § 63.6(b)(7), such sources must comply with the standards under §§ 63.1203, 63.1204, and 63.1205 at startup.

(ii) *Compliance date for standards under §§ 63.1219, 63.1220, and 63.1221.* (A) *Compliance dates for existing sources.* You must comply with the emission standards under §§ 63.1219, 63.1220, and 63.1221 and the other requirements of this subpart no later than the compliance date, October 14, 2008, unless the Administrator grants you an extension of time under § 63.6(i) or § 63.1213.

(B) *New or reconstructed sources.* (*1*) If you commenced construction or reconstruction of your hazardous waste combustor after April 20, 2004, you must comply with the new source emission standards under §§ 63.1219, 63.1220, and 63.1221 and the other requirements of this subpart by the later of October 12, 2005 or the date the source starts operations, except as provided by paragraph (a)(1)(ii)(B)(*2*) of this section. The costs of retrofitting and replacement of equipment that is installed specifically to comply with this subpart, between April 20, 2004, and a source's compliance date, are not considered to be reconstruction costs.

(*2*) For a standard under §§ 63.1219, 63.1220, and 63.1221 that is more stringent than the standard proposed on April 20, 2004, you may achieve compliance no later than October 14, 2008, if you comply with the standard proposed on April 20, 2004, after October 12, 2005. This exception does not apply, however, to new or reconstructed area source hazardous waste combustors that become major sources after October 14, 2008. As provided by § 63.6(b)(7), such sources must comply with the standards under §§ 63.1219, 63.1220, and 63.1221 at startup.

(2) *Compliance dates for solid fuel boilers, liquid fuel boilers, and hydrogen chloride production furnaces that burn hazardous waste for standards under §§ 63.1216, 63.1217, and 63.1218.* (i) *Compliance date for existing sources.* You must comply with the standards of this subpart no later than the compliance date, October 14, 2008, unless the Administrator grants you an extension of time under § 63.6(i) or § 63.1213.

(ii) *New or reconstructed sources.* (A) If you commenced construction or reconstruction of your hazardous waste combustor after October 12, 2005, you must comply with the new source emission standards of this subpart by the later of October 12, 2005, or the date the source starts operations, except as provided by paragraph (a)(2)(ii)(B) of this section. The costs of retrofitting and replacement of equipment that is installed specifically to comply with this subpart, between April 20, 2004, and a source's compliance date, are not considered to be reconstruction costs.

(B) For a standard in the subpart that is more stringent than the standard proposed on April 20, 2004, you may achieve compliance no later than October 14, 2008, if you comply with the standard proposed on April 20, 2004, after October 12, 2005. This exception does not apply, however, to new or reconstructed area source hazardous waste combustors that become major sources after October 14, 2008. As provided by § 63.6(b)(7), such sources must comply with this subpart at startup.

(3) *Early compliance.* If you choose to comply with the emission standards of this subpart prior to the dates specified in paragraphs (a)(1) and (a)(2) of this section, your compliance date is the earlier of the date you postmark the Notification of Compliance under § 63.1207(j)(1) or the dates specified in paragraphs (a)(1) and (a)(2) of this section.

(b) * * *

(1) * * *

(ii) When hazardous waste is not in the combustion chamber (i.e., the hazardous waste feed to the combustor has been cut off for a period of time not less than the hazardous waste residence time) and you have documented in the operating record that you are complying with all otherwise applicable requirements and standards promulgated under authority of sections 112 (e.g., 40 CFR part 63, subparts LLL, DDDDD, and NNNNN) or 129 of the Clean Air Act in lieu of the emission standards under §§ 63.1203, 63.1204, 63.1205, 63.1215, 63.1216, 63.1217, 63.1218, 63.1219, 63.1220, and 63.1221; the monitoring and compliance standards of this section and §§ 63.1207 through 63.1209, except the modes of operation requirements of § 63.1209(q); and the notification, reporting, and recordkeeping requirements of §§ 63.1210 through 63.1212.

* * * * *

(6) *Compliance with the carbon monoxide and hydrocarbon emission standards.* This paragraph applies to sources that elect to comply with the carbon monoxide and hydrocarbon emissions standards of this subpart by documenting continuous compliance with the carbon monoxide standard using a continuous emissions monitoring system and documenting compliance with the hydrocarbon standard during the destruction and removal efficiency (DRE) performance test or its equivalent.

* * * * *

(7) * * * (i) * * *

(A) You must document compliance with the Destruction and Removal Efficiency (DRE) standard under this subpart only once provided that you do not modify the source after the DRE test in a manner that could affect the ability of the source to achieve the DRE standard.

* * * * *

(ii) *Sources that feed hazardous waste at locations other than the normal flame zone.* (A) Except as provided by paragraph (b)(7)(ii)(B) of this section, if you feed hazardous waste at a location in the combustion system other than the normal flame zone, then you must demonstrate compliance with the DRE standard during each comprehensive performance test;

(B)(*1*) A cement kiln that feeds hazardous waste at a location other than the normal flame zone need only demonstrate compliance with the DRE standard during three consecutive comprehensive performance tests provided that:

(*i*) All three tests achieve the DRE standard in this subpart; and

(*ii*) The design, operation, and maintenance features of each of the three tests are similar;

(*iii*) The data in lieu restriction of § 63.1207(c)(2)(iv) does not apply when complying with the provisions of paragraph (b)(7)(ii)(B) of this section;

(*2*) If at any time you change your design, operation, and maintenance features in a manner that could reasonably be expected to affect your ability to meet the DRE standard, then you must comply with the requirements of paragraph (b)(7)(ii)(A) of this section.

* * * * *

(9) * * * (i) You may petition the Administrator to request alternative standards to the mercury or hydrogen chloride/chlorine gas emission standards of this subpart, to the semivolatile metals emission standards under §§ 63.1205, 63.1221(a)(3)(ii), or 63.1221(b)(3)(ii), or to the low volatile metals emissions standards under §§ 63.1205, 63.1221(a)(4)(ii), or 63.1221(b)(4)(ii) if:

(A) You cannot achieve one or more of these standards while using maximum achievable control technology (MACT) because of raw material contributions to emissions of mercury, semivolatile metals, low

volatile metals, or hydrogen chloride/chlorine gas; or

* * * * *

(iv) * * * (A) The alternative standard petition you submit under paragraph (b)(9)(i)(A) of this section must include data or information documenting that raw material contributions to emissions prevent you from complying with the emission standard even though the source is using MACT, as defined under paragraphs (b)(9)(viii) and (ix) of this section, for the standard for which you are seeking relief.

* * * * *

(vi) You must include data or information with semivolatile metals, low volatile metals, and hydrogen chloride/chlorine gas alternative standard petitions that you submit under paragraph (b)(9)(i)(A) of this section documenting that semivolatile metals, low volatile metals, and hydrogen chloride/chlorine gas emissions attributable to the hazardous waste only will not exceed the emission standards of this subpart.

(vii) You must not operate pursuant to your recommended alternative standards in lieu of emission standards specified in this subpart:

* * * * *

(viii) * * *

(D) For hydrogen chloride/chlorine gas, a hazardous waste chlorine feedrate corresponding to an MTEC of 2,000,000 µg/dscm or less, and use of an air pollution control device with a hydrogen chloride/chlorine gas removal efficiency of 85 percent or greater.

(ix) * * *

(D) For hydrogen chloride/chlorine gas, a hazardous waste chlorine feedrate corresponding to an MTEC of 14,000,000 µg/dscm or less, and use of an air pollution control device with a hydrogen chloride/chlorine gas removal efficiency of 99.6 percent or greater.

(10) * * * (i) You may petition the Administrator to request alternative standards to the mercury or hydrogen chloride/chlorine gas emission standards of this subpart, to the semivolatile metals emission standards under §§ 63.1204, 63.1220(a)(3)(ii), or 63.1220(b)(3)(ii), or to the low volatile metals emissions standards under §§ 63.1204, 63.1220(a)(4)(ii), or 63.1220(b)(4)(ii) if:

(A) You cannot achieve one or more of these standards while using maximum achievable control technology (MACT) because of raw material contributions to emissions of mercury, semivolatile metals, low volatile metals, or hydrogen chloride/chlorine gas; or

* * * * *

(vi) You must include data or information with semivolatile metals, low volatile metals, and hydrogen chloride/chlorine gas alternative standard petitions that you submit under paragraph (b)(10)(i)(A) of this section documenting that emissions of the regulated metals and hydrogen chloride/chlorine gas attributable to the hazardous waste only will not exceed the emission standards in this subpart.

(vii) You must not operate pursuant to your recommended alternative standards in lieu of emission standards specified in this subpart:

* * * * *

(viii) * * *

(D) For hydrogen chloride/chlorine gas, a hazardous waste chlorine feedrate corresponding to an MTEC of 720,000 µg/dscm or less.

(ix) * * *

(D) For hydrogen chloride/chlorine gas, a hazardous waste chlorine feedrate corresponding to an MTEC of 420,000 µg/dscm or less.

(11) *Calculation of hazardous waste residence time.* You must calculate the hazardous waste residence time and include the calculation in the performance test plan under § 63.1207(f) and the operating record. You must also provide the hazardous waste residence time in the Documentation of Compliance under § 63.1211(c) and the Notification of Compliance under §§ 63.1207(j) and 63.1210(d).

* * * * *

(13) * * *

(i) Cement kilns that feed hazardous waste at a location other than the end where products are normally discharged and where fuels are normally fired must comply with the carbon monoxide and hydrocarbon standards of this subpart as follows:

* * * * *

(ii) Lightweight aggregate kilns that feed hazardous waste at a location other than the end where products are normally discharged and where fuels are normally fired must comply with the hydrocarbon standards of this subpart as follows:

(A) Existing sources must comply with the 20 parts per million by volume hydrocarbon standard of this subpart;

(B) New sources must comply with the 20 parts per million by volume hydrocarbon standard of this subpart.

(14) *Alternative to the particulate matter standard for incinerators.* (i). *General.* In lieu of complying with the particulate matter standards under § 63.1203, you may elect to comply with the following alternative metal emission control requirements:

(ii) *Alternative metal emission control requirements for existing incinerators.* (A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 240 µg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(B) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 97 µg/dscm, combined emissions, corrected to 7 percent oxygen.

(iii) *Alternative metal emission control requirements for new incinerators.* (A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 24 µg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(B) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 97 µg/dscm, combined emissions, corrected to 7 percent oxygen.

(iv) *Operating limits.* Semivolatile and low volatile metal operating parameter limits must be established to ensure compliance with the alternative emission limitations described in paragraphs (e)(2) and (e)(3) of this section pursuant to § 63.1209(n), except that semivolatile metal feedrate limits apply to lead, cadmium, and selenium, combined, and low volatile metal feedrate limits apply to arsenic, beryllium, chromium, antimony, cobalt, manganese, and nickel, combined.

* * * * *

(16) *Compliance with subcategory standards for liquid fuel boilers.* You must comply with the mercury, semivolatile, low volatile metal, and total chlorine standards for liquid fuel boilers under § 63.1217 as follows:

(i) You must determine the as-fired heating value of each batch of hazardous waste fired by each firing system of the boiler so that you know the mass-weighted heating value of the hazardous waste fired at all times.

(ii) If the as-fired heating value of the hazardous waste is 10,000 Btu per pound or greater, you are subject to the thermal emission concentration standards (lb/million Btu) under § 63.1217.

(iii) If the as-fired heating value of the hazardous waste is less than 10,000 Btu/lb, you are subject to the mass or volume emission concentration

standards (μg/dscm or ppmv) under § 63.1217.

(iv) If the as-fired heating value of hazardous wastes varies above and below 10,000 Btu/lb over time, you are subject to the thermal concentration standards when the heating value is 10,000 Btu/lb or greater and the mass concentration standards when the heating value is less than 10,000 Btu/lb. You may elect to comply at all times with the more stringent operating requirements that ensure compliance with both the thermal emission concentration standards and the mass or volume emission concentration standards.

* * * * *

(c) * * * (1) * * * (i) You must operate only under the operating requirements specified in the Documentation of Compliance under § 63.1211(c) or the Notification of Compliance under §§ 63.1207(j) and 63.1210(d), except:

* * * * *

(3) * * *

(iv) *Failure of the AWFCO system.* If the AWFCO system fails to automatically and immediately cutoff the flow of hazardous waste upon exceedance of a parameter required to be interlocked with the AWFCO system under paragraph (c)(3)(i) of this section, you have failed to comply with the AWFCO requirements of paragraph (c)(3) of this section. If an equipment or other failure prevents immediate and automatic cutoff of the hazardous waste feed, however, you must cease feeding hazardous waste as quickly as possible.

* * * * *

(6) * * *

(iii) * * *

(B) Be trained under the requirements of, and certified under, one of the following American Society of Mechanical Engineers (ASME) standards: QHO–1–1994, QHO–1a–1996, or QHO–1–2004 (Standard for the Qualification and Certification of Hazardous Waste Incinerator Operators). If you elect to use the ASME program:

* * * * *

(iv) Control room operators of cement kilns, lightweight aggregate kilns, solid fuel boilers, liquid fuel boilers, and hydrochloric acid production furnaces must be trained and certified under:

* * * * *

(7) *Operation and maintenance plan*—(i) You must prepare and at all times operate according to an operation and maintenance plan that describes in detail procedures for operation, inspection, maintenance, and corrective measures for all components of the combustor, including associated pollution control equipment, that could affect emissions of regulated hazardous air pollutants.

(ii) The plan must prescribe how you will operate and maintain the combustor in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels achieved during the comprehensive performance test.

(iii) This plan ensures compliance with the operation and maintenance requirements of § 63.6(e) and minimizes emissions of pollutants, automatic waste feed cutoffs, and malfunctions.

(iv) You must record the plan in the operating record.

(8) *Bag leak detection system requirements.* (i) If your combustor is equipped with a baghouse (fabric filter), you must continuously operate either:

(A) A bag leak detection system that meets the specifications and requirements of paragraph (c)(8)(ii) of this section and you must comply with the corrective measures and notification requirements of paragraphs (c)(8)(iii) and (iv) of this section; or

(B) A particulate matter detection system under paragraph (c)(9) of this section.

(ii) *Bag leak detection system specification and requirements.* (A) The bag leak detection system must be certified by the manufacturer to be capable of continuously detecting and recording particulate matter emissions at concentrations of 1.0 milligrams per actual cubic meter unless you demonstrate, under § 63.1209(g)(1), that a higher detection limit would routinely detect particulate matter loadings during normal operations;

(B) The bag leak detection system shall provide output of relative or absolute particulate matter loadings;

(C) The bag leak detection system shall be equipped with an alarm system that will sound an audible alarm when an increase in relative particulate loadings is detected over a preset level;

(D) The bag leak detection system shall be installed and operated in a manner consistent with available written guidance from the U.S. Environmental Protection Agency or, in the absence of such written guidance, the manufacturer's written specifications and recommendations for installation, operation, and adjustment of the system;

(E) The initial adjustment of the system shall, at a minimum, consist of establishing the baseline output by adjusting the sensitivity (range) and the averaging period of the device, and establishing the alarm set points and the alarm delay time;

(F) Following initial adjustment, you must not adjust the sensitivity or range, averaging period, alarm set points, or alarm delay time, except as detailed in the operation and maintenance plan required under paragraph (c)(7) of this section. You must not increase the sensitivity by more than 100 percent or decrease the sensitivity by more than 50 percent over a 365 day period unless such adjustment follows a complete baghouse inspection which demonstrates the baghouse is in good operating condition;

(G) For negative pressure or induced air baghouses, and positive pressure baghouses that are discharged to the atmosphere through a stack, the bag leak detector shall be installed downstream of the baghouse and upstream of any wet acid gas scrubber; and

(H) Where multiple detectors are required, the system's instrumentation and alarm system may be shared among the detectors.

(iii) *Bag leak detection system corrective measures requirements.* The operating and maintenance plan required by paragraph (c)(7) of this section must include a corrective measures plan that specifies the procedures you will follow in the case of a bag leak detection system alarm. The corrective measures plan must include, at a minimum, the procedures used to determine and record the time and cause of the alarm as well as the corrective measures taken to correct the control device malfunction or minimize emissions as specified below. Failure to initiate the corrective measures required by this paragraph is failure to ensure compliance with the emission standards in this subpart.

(A) You must initiate the procedures used to determine the cause of the alarm within 30 minutes of the time the alarm first sounds; and

(B) You must alleviate the cause of the alarm by taking the necessary corrective measure(s) which may include, but are not to be limited to, the following:

(*1*) Inspecting the baghouse for air leaks, torn or broken filter elements, or any other malfunction that may cause an increase in emissions;

(*2*) Sealing off defective bags or filter media;

(*3*) Replacing defective bags or filter media, or otherwise repairing the control device;

(*4*) Sealing off a defective baghouse compartment;

(*5*) Cleaning the bag leak detection system probe, or otherwise repairing the bag leak detection system; or

(*6*) Shutting down the combustor.

(iv) *Excessive exceedances notification.* If you operate the

combustor when the detector response exceeds the alarm set-point more than 5 percent of the time during any 6-month block time period, you must submit a notification to the Administrator within 30 days of the end of the 6-month block time period that describes the causes of the exceedances and the revisions to the design, operation, or maintenance of the combustor or baghouse you are taking to minimize exceedances. To document compliance with this requirement:

(A) You must keep records of the date, time, and duration of each alarm, the time corrective action was initiated and completed, and a brief description of the cause of the alarm and the corrective action taken;

(B) You must record the percent of the operating time during each 6-month period that the alarm sounds;

(C) In calculating the operating time percentage, if inspection of the fabric filter demonstrates that no corrective action is required, no alarm time is counted; and

(D) If corrective action is required, each alarm shall be counted as a minimum of 1 hour.

(9) *Particulate matter detection system requirements for electrostatic precipitators and ionizing wet scrubbers.* If your combustor is equipped with an electrostatic precipitator or ionizing wet scrubber, and you elect not to establish under § 63.1209(m)(1)(iv) site-specific control device operating parameter limits that are linked to the automatic waste feed cutoff system under paragraph (c)(3) of this section, you must continuously operate a particulate matter detection system that meets the specifications and requirements of paragraph (c)(9)(i) through (iii) of this section and you must comply with the corrective measures and notification requirements of paragraphs (c)(9)(iv) through (v) of this section.

(i) *Particulate matter detection system requirements.*—(A) The particulate matter detection system must be certified by the manufacturer to be capable of continuously detecting and recording particulate matter emissions at concentrations of 1.0 milligrams per actual cubic meter unless you demonstrate, under § 63.1209(g)(1), that a higher detection limit would routinely detect particulate matter loadings during normal operations;

(B) The particulate matter detector shall provide output of relative or absolute particulate matter loadings;

(C) The particulate matter detection system shall be equipped with an alarm system that will sound an audible alarm when an increase in relative or absolute particulate loadings is detected over the set-point

(D) You must install, operate, and maintain the particulate matter detection system in a manner consistent with the provisions of paragraph (c)(9) of this section and available written guidance from the U.S. Environmental Protection Agency or, in the absence of such written guidance, the manufacturer's written specifications and recommendations for installation, operation, maintenance and quality assurance of the system;

(E) You must include procedures for installation, operation, maintenance, and quality assurance of the particulate matter detection system in the site-specific continuous monitoring system test plan required under § 63.8(e)(3) of this chapter.

(F) Where multiple detectors are required to monitor multiple control devices, the system's instrumentation and alarm system may be shared among the detectors.

(G) You must establish the alarm set-point as provided by either paragraph (c)(9)(ii) or paragraph (c)(9)(iii) of this section.

(ii) *Establishing the alarm set-point without extrapolation.* (A) The alarm set-point is the average of the test run averages of the detector response achieved during the comprehensive performance test demonstrating compliance with the particulate matter emission standard.

(B) During the comprehensive performance test, you may simulate emission concentrations at the upper end of the range of normal operations by means including feeding high levels of ash and detuning the emission control equipment.

(C) You must comply with the alarm set-point on a 6-hour rolling average, updated each hour with a one-hour block average that is the average of the detector responses over each 15-minute block;

(iii) *Establishing the alarm set-point with extrapolation.* You may extrapolate the average of the test run averages of the detector response achieved during the comprehensive performance test as provided by paragraph (c)(9)(iii)(A) of this section to establish an alarm level after you approximate the correlation of the detector response to particulate matter concentration as prescribed by paragraph (c)(9)(iii)(B) of this section. You must comply with the extrapolated alarm set-point on a 6-hour rolling average, updated each hour with a one-hour block average that is the average of the detector responses over each 15-minute block.

(A) You may extrapolate the detector response up to a particulate matter concentration that is 50% of the particulate matter emission standard or 125% of the highest particulate matter concentration used to develop the correlation under paragraph (c)(9)(iii)(B) of this section, whichever is greater. The extrapolated emission concentration must not exceed the particulate matter emission standard.

(B) To establish an approximate correlation of the detector response to particulate matter emission concentrations, you should use as guidance Performance Specification-11 for PM CEMS (40 CFR Part 60, Appendix B), except that you need only conduct 5 runs to establish the initial correlation under Section 8.6 of Performance Specification 11.

(C) For quality assurance, you should use as guidance Procedure 2 of Appendix F to Part 60 of this chapter and the detector manufacturer's recommended procedures for periodic quality assurance checks and tests, except that:

(*1*) You must conduct annual Relative Response Audits as prescribed by Procedure 2 of Appendix F to Part 60 of this chapter (Section 10.3(6));

(*2*) You need only conduct Relative Response Audits on a 3-year interval after passing two sequential annual Relative Response Audits.

(D) An exceedance of the particulate matter emission standard by a particulate matter detection system for which particulate emission concentrations have been approximately correlated with the detector response under paragraph (c)(9)(iii) of this section is not evidence that the standard has been exceeded. The approximate correlation is used for compliance assurance to determine when corrective measures must be taken rather than for compliance monitoring.

(iv) *Particulate matter detection system corrective measures requirements.* The operating and maintenance plan required by paragraph (c)(7) of this section must include a corrective measures plan that specifies the procedures you will follow in the case of a particulate matter detection system alarm. The corrective measures plan must include, at a minimum, the procedures used to determine and record the time and cause of the alarm as well as the corrective measures taken to correct the control device malfunction or minimize emissions as specified below. Failure to initiate the corrective measures required by this paragraph is failure to ensure compliance with the emission standard in this subpart.

(A) You must initiate the procedures used to determine the cause of the alarm within 30 minutes of the time the alarm first sounds; and

(B) You must alleviate the cause of the alarm by taking the necessary corrective measure(s) which may include shutting down the combustor.

(v) *Excessive exceedances notification.* If you operate the combustor when the detector response exceeds the alarm set-point more than 5 percent of the time during any 6-month block time period, you must submit a notification to the Administrator within 30 days of the end of the 6-month block time period that describes the causes of the exceedances and the revisions to the design, operation, or maintenance of the combustor or emission control device you are taking to minimize exceedances. To document compliance with this requirement:

(A) You must keep records of the date, time, and duration of each alarm, the time corrective action was initiated and completed, and a brief description of the cause of the alarm and the corrective action taken;

(B) You must record the percent of the operating time during each 6-month period that the alarm sounds;

(C) In calculating the operating time percentage, if inspection of the emission control device demonstrates that no corrective action is required, no alarm time is counted; and

(D) If corrective action is required, each alarm shall be counted as a minimum of 1 hour.

■ 9. Section 63.1207 is amended by:
■ a. Revising paragraph (b)(1).
■ b. Adding paragraph (b)(3).
■ c. Revising paragraphs (c)(1) and (c)(2)(iii).
■ d. Adding paragraph (c)(3).
■ e. Revising paragraph (d)(4)(i).
■ f. Revising paragraphs (e)(2) and (e)(3)(iv).
■ g. Revising paragraphs (f)(1)(ii)(D), (f)(1)(x) introductory text, (f)(1)(xiii), (f)(1)(xiv), (f)(1)(xvi), and (f)(1)(xxv).
■ h. Adding paragraph (f)(1)(xv).
■ i. Revising paragraph (h)(2)(i).
■ j. Revising paragraph (j)(3).
■ k. Revising paragraph (l)(1) introductory text.
■ l. Revising paragraph (m)(2) introductory text.

The revisions and additions read as follows:

§ 63.1207 What are the performance testing requirements?

* * * * *

(b) * * *

(1) *Comprehensive performance test.* You must conduct comprehensive performance tests to demonstrate compliance with the emission standards provided by this subpart, establish limits for the operating parameters provided by § 63.1209, and demonstrate compliance with the performance specifications for continuous monitoring systems.

* * * * *

(3) *One-Time Dioxin/Furan Test for Sources Not Subject to a Numerical Dioxin/Furan Standard.* For solid fuel boilers and hydrochloric acid production furnaces, for lightweight aggregate kilns that are not subject to a numerical dioxin/furan emission standard under § 63.1221, and liquid fuel boilers that are not subject to a numerical dioxin/furan emission standard under § 63.1217, you must conduct a one-time emission test for dioxin/furan under feed and operating conditions that are most likely to reflect daily maximum operating variability, similar to a dioxin/furan comprehensive performance test.

(i) You must conduct the dioxin/furan emissions test no later than the deadline for conducting the initial comprehensive performance test.

(ii) You may use dioxin/furan emissions data from previous testing to meet this requirement, provided that:

(A) The testing was conducted under feed and operating conditions that are most likely to reflect daily maximum operating variability, similar to a dioxin/furan compliance test;

(B) You have not changed the design or operation of the source in a manner that could significantly affect stack gas dioxin/furan emission concentrations; and

(C) The data meet quality assurance objectives that may be determined on a site-specific basis.

(iii) You may use dioxin/furan emissions data from a source to represent emissions from another on-site source in lieu of testing (i.e., data in lieu of testing) if the design and operation, including hazardous waste feed and other feedstreams, of the sources are identical.

(iv) You must include the results of the one-time dioxin/furan emissions test with the results of the initial comprehensive performance test in the Notification of Compliance.

(v) You must repeat the dioxin/furan emissions test if you change the design or operation of the source in a manner that may increase dioxin/furan emissions.

(c) * * * (1) *Test date.* Except as provided by paragraphs (c)(2) and (c)(3) of this section, you must commence the initial comprehensive performance test not later than six months after the compliance date.

(2) * * * (iii) The data in lieu test age restriction provided in paragraph (c)(2)(i)(A) of this section does not apply for the duration of the interim standards (i.e., the standards published in the Federal Register on February 13, 2002, 67 FR 6792). See 40 CFR parts 63, 264, 265, 266, 270, and 271 revised as of July 1, 2002. Paragraph (c)(2)(i)(A) of this section does not apply until EPA promulgates permanent replacement standards pursuant to the Settlement Agreement noticed in the Federal Register on November 16, 2001 (66 FR 57715).

* * * * *

(3) For incinerators, cement kilns, and lightweight aggregate kilns, you must commence the initial comprehensive performance test to demonstrate compliance with the standards under §§ 63.1219, 63.1220, and 63.1221 not later than 12 months after the compliance date.

(d) * * *

(4) * * * (i) *Waiver of periodic comprehensive performance tests.* Except as provided in paragraph (c)(2) of this section, you must conduct only an initial comprehensive performance test under the interim standards (i.e., the standards published in the Federal Register on February 13, 2002); all subsequent comprehensive performance testing requirements are waived under the interim standards. The provisions in the introductory text to paragraph (d) and in paragraph (d)(1) of this section do not apply until EPA promulgates permanent replacement standards pursuant to the Settlement Agreement noticed in the Federal Register on November 16, 2001.

* * * * *

(e) * * *

(2) You must make your site-specific test plan and CMS performance evaluation test plan available to the public for review no later than 60 calendar days before initiation of the test. You must issue a public notice to all persons on your facility/public mailing list (developed pursuant to 40 CFR 70.7(h), 71.11(d)(3)(i)(E) and 124.10(c)(1)(ix)) announcing the availability of the test plans and the location where the test plans are available for review. The test plans must be accessible to the public for 60 calendar days, beginning on the date that you issue your public notice. The location must be unrestricted and provide access to the public during reasonable hours and provide a means for the public to obtain copies. The notification must include the following information at a minimum:

(i) The name and telephone number of the source's contact person;

(ii) The name and telephone number of the regulatory agency's contact person;

(iii) The location where the test plans and any necessary supporting documentation can be reviewed and copied;

(iv) The time period for which the test plans will be available for public review; and

(v) An expected time period for commencement and completion of the performance test and CMS performance evaluation test.

(3) * * *

(iv) *Public notice.* At the same time that you submit your petition to the Administrator, you must notify the public (e.g., distribute a notice to the facility/public mailing list developed pursuant to 40 CFR 70.7(h), 71.11(d)(3)(i)(E) and 124.10(c)(1)(ix)) of your petition to waive a performance test. The notification must include all of the following information at a minimum:

(A) The name and telephone number of the source's contact person;

(B) The name and telephone number of the regulatory agency's contact person;

(C) The date the source submitted its site-specific performance test plan and CMS performance evaluation test plans; and

(D) The length of time requested for the waiver.

(f) * * *

(1) * * *

(ii) * * *

(D) The Administrator may approve on a case-by-case basis a hazardous waste feedstream analysis for organic hazardous air pollutants in lieu of the analysis required under paragraph (f)(1)(ii)(A) of this section if the reduced analysis is sufficient to ensure that the POHCs used to demonstrate compliance with the applicable DRE standards of this subpart continue to be representative of the most difficult to destroy organic compounds in your hazardous waste feedstreams;

* * * * *

(x) If you are requesting to extrapolate metal feedrate limits from comprehensive performance test levels under §§ 63.1209(l)(1)(v) or 63.1209(n)(2)(vii):

* * * * *

(xiii) For cement kilns with in-line raw mills, if you elect to use the emissions averaging provision of this subpart, you must notify the Administrator of your intent in the initial (and subsequent) comprehensive performance test plan, and provide the information required by the emission averaging provision;

(xiv) For preheater or preheater/precalciner cement kilns with dual stacks, if you elect to use the emissions averaging provision of this subpart, you must notify the Administrator of your intent in the initial (and subsequent) comprehensive performance test plan, and provide the information required by the emission averaging provision;

(xv) If you request to use Method 23 for dioxin/furan you must provide the information required under § 63.1208(b)(1)(i)(B);

(xvi) If you are not required to conduct performance testing to document compliance with the mercury, semivolatile metals, low volatile metals, or hydrogen chloride/chlorine gas emission standards under paragraph (m) of this section, you must include with the comprehensive performance test plan documentation of compliance with the provisions of that section.

* * * * *

(xxv) If your source is equipped with a dry scrubber to control hydrogen chloride and chlorine gas, you must document in the comprehensive performance test plan key parameters that affect adsorption, and the limits you establish for those parameters based on the sorbent used during the performance test, if you elect not to specify and use the brand and type of sorbent used during the comprehensive performance test, as required by § 63.1209(o)(4)(iii)(A); and

* * * * *

(h) * * *

(2) * * *

(i) Operations when stack emissions testing for dioxin/furan, mercury, semivolatile metals, low volatile metals, particulate matter, or hydrogen chloride/chlorine gas is being performed; and

* * * * *

(j) * * *

(3) See §§ 63.7(g), 63.9(h), and 63.1210(d) for additional requirements pertaining to the Notification of Compliance (*e.g.*, you must include results of performance tests in the Notification of Compliance).

* * * * *

(l) *Failure of performance test*—(1) *Comprehensive performance test.* The provisions of this paragraph do not apply to the initial comprehensive performance test if you conduct the test prior to your compliance date.

* * * * *

(m) * * *

(2) You are not required to conduct performance tests to document compliance with the mercury, semivolatile metals, low volatile metals, or hydrogen chloride/chlorine gas emission standards under the conditions specified in this paragraph (m)(2). You are deemed to be in compliance with an emission standard if the twelve-hour rolling average maximum theoretical emission concentration (MTEC) does not exceed the emission standard:

* * * * *

■ 10. Section 63.1208 is amended by removing and reserving paragraph (a) and revising paragraphs (b)(1)(i) and (b)(5) to read as follows:

§ 63.1208 What are the test methods?

(a) [Reserved]

(b) * * *

(1) * * * (i) To determine compliance with the emission standard for dioxins and furans, you must use:

(A) Method 0023A, Sampling Method for Polychlorinated Dibenzo-*p*-Dioxins and Polychlorinated Dibenzofurans emissions from Stationary Sources, EPA Publication SW–846 (incorporated by reference— see § 63.14); or

(B) Method 23, provided in appendix A, part 60 of this chapter, after approval by the Administrator.

(*1*) You may request approval to use Method 23 in the performance test plan required under § 63.1207(e)(i) and (ii).

(*2*) In determining whether to grant approval to use Method 23, the Administrator may consider factors including whether dioxin/furan were detected at levels substantially below the emission standard in previous testing, and whether previous Method 0023 analyses detected low levels of dioxin/furan in the front half of the sampling train.

(*3*) Sources that emit carbonaceous particulate matter, such as coal-fired boilers, and sources equipped with activated carbon injection, will be deemed not suitable for use of Method 23 unless you document that there would not be a significant improvement in quality assurance with Method 0023A.

* * * * *

(5) *Hydrogen chloride and chlorine gas*—(i) *Compliance with MACT standards.* To determine compliance with the emission standard for hydrogen chloride and chlorine gas (combined), you must use:

(A) Method 26/26A as provided in appendix A, part 60 of this chapter; or

(B) Methods 320 or 321 as provided in appendix A, part 63 of this chapter, or

(C) ASTM D 6735–01, Standard Test Method for Measurement of Gaseous Chlorides and Fluorides from Mineral Calcining Exhaust Sources—Impinger Method to measure emissions of hydrogen chloride, and Method 26/26A to measure emissions of chlorine gas, provided that you follow the provisions in paragraphs (b)(5)(C)(*1*) through (*6*) of this section. ASTM D 6735–01 is available for purchase from at least one of the following addresses: American Society for Testing and Materials (ASTM), 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428–2959; or ProQuest, 300 North Zeeb Road, Ann Arbor, MI 48106.

(*1*) A test must include three or more runs in which a pair of samples is obtained simultaneously for each run according to section 11.2.6 of ASTM Method D6735–01.

(*2*) You must calculate the test run standard deviation of each set of paired samples to quantify data precision, according to Equation 1 of this section:

$$RSD_a = (100)\,AbsoluteValue\left[\frac{C1_a - C2_a}{C1_a + C2_a}\right] \qquad \text{(Eq. 1)}$$

Where:

RSD_a = The test run relative standard deviation of sample pair a, percent.

$C1_a$ and $C2_a$ = The HCl concentrations, milligram/dry standard cubic meter (mg/dscm), from the paired samples.

(*3*) You must calculate the test average relative standard deviation according to Equation 2 of this section:

$$RSD_{TA} = \frac{\sum_{a=1}^{p} RSD_a}{p} \qquad \text{(Eq. 2)}$$

Where:

RSD_{TA} = The test average relative standard deviation, percent.

RSD_a = The test run relative standard deviation for sample pair a.

p = The number of test runs, ≥3.

(*4*) If RSDTA is greater than 20 percent, the data are invalid and the test must be repeated.

(*5*) The post-test analyte spike procedure of section 11.2.7 of ASTM Method D6735–01 is conducted, and the percent recovery is calculated according to section 12.6 of ASTM Method D6735–01.

(*6*) If the percent recovery is between 70 percent and 130 percent, inclusive, the test is valid. If the percent recovery is outside of this range, the data are considered invalid, and the test must be repeated.

(ii) *Compliance with risk-based limits under § 63.1215.* To demonstrate compliance with emission limits established under § 63.1215, you must use Method 26/26A as provided in appendix A, part 60 of this chapter, Method 320 as provided in appendix A, part 63 of this chapter, Method 321 as provided in appendix A, part 63 of this chapter, or ASTM D 6735–01, Standard Test Method for Measurement of Gaseous Chlorides and Fluorides from Mineral Calcining Exhaust Sources—Impinger Method (following the provisions of paragraphs (b)(5)(C)(*1*) through (*6*) of this section), except:

(A) For cement kilns and sources equipped with a dry acid gas scrubber, you must use Methods 320 or 321 as provided in appendix A, part 63 of this chapter, or ASTM D 6735–01 to measure hydrogen chloride, and the back-half, caustic impingers of Method 26/26A as provided in appendix A, part 60 of this chapter to measure chlorine gas; and

(B) For incinerators, boilers, and lightweight aggregate kilns, you must use Methods 320 or 321 as provided in appendix A, part 63 of this chapter, or ASTM D 6735–01 to measure hydrogen chloride, and Method 26/26A as provided in appendix A, part 60 of this chapter to measure total chlorine, and calculate chlorine gas by difference if:

(*1*) The bromine/chlorine ratio in feedstreams is greater than 5 percent; or

(*2*) The sulfur/chlorine ratio in feedstreams is greater than 50 percent.

* * * * *

■ 11. Section 63.1209 is amended by:
■ a. Revising paragraphs (a)(1)(ii), (a)(1)(iv)(D), (a)(1)(v)(D), and (a)(5).
■ b. Revising paragraph (b)(2)(ii).
■ c. Revising the heading of paragraph (g)(1) introductory text and paragraph (g)(1)(i).
■ d. Adding paragraph (g)(1)(iv).
■ e. Revising paragraphs (k)(1)(i) and (k)(2)(i).
■ f. Revising paragraph (l)(1).
■ g. Revising paragraphs (m)(1)(iv) introductory text and (m)(3).
■ h. Revising paragraph (n)(2).
■ i. Revising the heading of paragraph (o) introductory text and paragraph (o)(1).
■ j. Adding paragraph (r).

The revisions read as follows:

§ 63.1209 What are the monitoring requirements?

(a) * * *

(1) * * *

(ii) (A) *Cement kilns under § 63.1204*—Except as provided by paragraphs (a)(1)(iv) and (a)(1)(v) of the section, you must use a COMS to demonstrate and monitor compliance with the opacity standard under §§ 63.1204(a)(7) and (b)(7) at each point where emissions are vented from these affected sources including the bypass stack of a preheater or preheater/precalciner kiln with dual stacks.

(B) *Cement kilns under § 63.1220*—Except as provided by paragraphs (a)(1)(iv) and (a)(1)(v) of the section and unless your source is equipped with a bag leak detection system under § 63.1206(c)(8) or a particulate matter detection system under § 63.1206(c)(9), you must use a COMS to demonstrate and monitor compliance with the opacity standard under §§ 63.1220(a)(7) and (b)(7) at each point where emissions are vented from these affected sources including the bypass stack of a preheater or preheater/precalciner kiln with dual stacks.

(C) You must maintain and operate each COMS in accordance with the requirements of § 63.8(c) except for the requirements under § 63.8(c)(3). The requirements of § 63.1211(c) shall be complied with instead of § 63.8(c)(3); and

(D) Compliance is based on a six-minute block average.

* * * * *

(iv) * * *

(D) To remain in compliance, all six-minute block averages must not exceed the opacity standard.

(v) * * *

(D) To remain in compliance, all six-minute block averages must not exceed the opacity standard.

* * * * *

(5) *Petitions to use CEMS for other standards.* You may petition the Administrator to use CEMS for compliance monitoring for particulate matter, mercury, semivolatile metals, low volatile metals, and hydrogen chloride and chlorine gas under § 63.8(f) in lieu of compliance with the corresponding operating parameter limits under this section.

* * * * *

(b) * * *

(2) * * *

(ii) *Accuracy and calibration of weight measurement devices for activated carbon injection systems.* If you operate a carbon injection system, the accuracy of the weight measurement device must be ± 1 percent of the weight being measured. The calibration of the device must be verified at least once each calendar quarter at a frequency of approximately 120 days.

* * * * *

(g) * * *

(1) *Requests to use alternatives to operating parameter monitoring requirements.* (i) You may submit an application to the Administrator under this paragraph for approval of alternative operating parameter monitoring requirements to document compliance with the emission standards of this subpart. For requests to use additional CEMS, however, you must use paragraph (a)(5) of this section and § 63.8(f). Alternative requests to operating parameter monitoring requirements that include unproven monitoring methods may not be made under this paragraph and must be made under § 63.8(f).

* * * * *

(iv) *Dual Standards that incorporate the Interim Standards for HAP metals.* (A) *Semivolatile and Low Volatile Metals.* You may petition the Administrator to waive a feedrate operating parameter limit under paragraph (n)(2) of this section for either the emission standards expressed in a thermal emissions format or the interim standards based on documentation that the feedrate operating parameter limit is not needed to ensure compliance with the relevant standard on a continuous basis.

(B) *Mercury.* You may petition the Administrator to waive a feedrate operating parameter limit under paragraph (l)(1) of this section for either the feed concentration standard under §§ 63.1220(a)(2)(i) and (b)(2)(i) or the interim standards based on documentation that the feedrate operating parameter limit is not needed to ensure compliance with the relevant standard on a continuous basis.

* * * * *

(k) * * *

(1) * * * (i) For sources other than a lightweight aggregate kiln, if the combustor is equipped with an electrostatic precipitator, baghouse (fabric filter), or other dry emissions control device where particulate matter is suspended in contact with combustion gas, you must establish a limit on the maximum temperature of the gas at the inlet to the device on an hourly rolling average. You must establish the hourly rolling average limit as the average of the test run averages.

* * * * *

(2) * * * (i) For sources other than cement kilns, you must measure the temperature of each combustion chamber at a location that best represents, as practicable, the bulk gas temperature in the combustion zone. You must document the temperature measurement location in the test plan you submit under §§ 63.1207(e) and (f);

* * * * *

(l) *Mercury.* * * *

(1) *Feedrate of mercury.* (i) For incinerators and solid fuel boilers, when complying with the mercury emission standards under §§ 63.1203, 63.1216 and 63.1219, you must establish a 12-hour rolling average limit for the total feedrate of mercury in all feedstreams as the average of the test run averages.

(ii) For liquid fuel boilers, when complying with the mercury emission standards of § 63.1217, you must establish a rolling average limit for the mercury feedrate as follows on an averaging period not to exceed an annual rolling average:

(A) You must calculate a mercury system removal efficiency for each test run and calculate the average system removal efficiency of the test run averages. If emissions exceed the mercury emission standard during the comprehensive performance test, it is not a violation because the averaging period for the mercury emission standard is (not-to-exceed) one year and compliance is based on compliance with the mercury feedrate limit with an averaging period not-to-exceed one year.

(B) If you burn hazardous waste with a heating value of 10,000 Btu/lb or greater, you must calculate the mercury feedrate limit as follows:

(*1*) The mercury feedrate limit is the emission standard divided by [1 − system removal efficiency].

(*2*) The mercury feedrate limit is a hazardous waste thermal concentration limit expressed as pounds of mercury in hazardous waste feedstreams per million Btu of hazardous waste fired.

(*3*) You must comply with the hazardous waste mercury thermal concentration limit by determining the feedrate of mercury in all hazardous waste feedstreams (lb/hr) at least once a minute and the hazardous waste thermal feedrate (MM Btu/hr) at least once a minute to calculate a 60-minute average thermal emission concentration as [hazardous waste mercury feedrate (lb/hr) / hazardous waste thermal feedrate (MM Btu/hr)].

(*4*) You must calculate a rolling average hazardous waste mercury thermal concentration that is updated each hour.

(*5*) If you select an averaging period for the feedrate limit that is greater than a 12-hour rolling average, you must calculate the initial rolling average as though you had selected a 12-hour rolling average, as provided by paragraph (b)(5)(i) of this section. You must calculate rolling averages thereafter as the average of the available one-minute values until enough one-minute values are available to calculate the rolling average period you select. At that time and thereafter, you update the rolling average feedrate each hour with a 60-minute average feedrate.

(C) If you burn hazardous waste with a heating value of less than 10,000 Btu/lb, you must calculate the mercury feedrate limit as follows:

(*1*) You must calculate the mercury feedrate limit as the mercury emission standard divided by [1 − System Removal Efficiency].

(*2*) The feedrate limit is expressed as a mass concentration per unit volume of stack gas (μg/dscm) and is converted to a mass feedrate (lb/hr) by multiplying it by the average stack gas flowrate of the test run averages.

(*3*) You must comply with the feedrate limit by determining the mercury feedrate (lb/hr) at least once a minute to calculate a 60-minute average feedrate.

(*4*) You must update the rolling average feedrate each hour with this 60-minute feedrate measurement.

(*5*) If you select an averaging period for the feedrate limit that is greater than a 12-hour rolling average, you must calculate the initial rolling average as though you had selected a 12-hour rolling average, as provided by paragraph (b)(5)(i) of this section. You must calculate rolling averages thereafter as the average of the available one-minute values until enough one-minute values are available to calculate the rolling average period you select. At that time and thereafter, you update the rolling average feedrate each hour with a 60-minute average feedrate.

(D) If your boiler is equipped with a wet scrubber, you must comply with the following unless you document in the performance test plan that you do not feed chlorine at rates that may substantially affect the system removal efficiency of mercury for purposes of establishing a mercury feedrate limit based on the system removal efficiency during the test:

(*1*) Scrubber blowdown must be minimized during a pretest conditioning period and during the performance test:

(*2*) Scrubber water must be preconditioned so that mercury in the

water is at equilibrium with stack gas at the mercury feedrate level of the performance test; and

(3) You must establish an operating limit on minimum pH of scrubber water as the average of the test run averages and comply with the limit on an hourly rolling average.

(iii) For cement kilns:

(A) When complying with the emission standards under §§ 63.1220(a)(2)(i) and (b)(2)(i), you must:

(1) Comply with the mercury hazardous waste feed concentration operating requirement on a twelve-hour rolling average;

(2) Monitor and record in the operating record the as-fired mercury concentration in the hazardous waste (or the weighted-average mercury concentration for multiple hazardous waste feedstreams);

(3) Initiate an automatic waste feed cutoff that immediately and automatically cuts off the hazardous waste feed when the as-fired mercury concentration operating requirement is exceeded;

(B) When complying with the emission standards under §§ 63.1204, 63.1220(a)(2)(ii) and (b)(2)(ii), you must establish a 12-hour rolling average limit for the total feedrate of mercury in all feedstreams as the average of the test run averages;

(C) Except as provided by paragraph (l)(1)(iii)(D) of this section, when complying with the hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) under §§ 63.1220(a)(2)(iii) and (b)(2)(iii), you must:

(1) Comply with the MTEC operating requirement on a twelve-hour rolling average;

(2) Monitor and record the feedrate of mercury for each hazardous waste feedstream according to § 63.1209(c);

(3) Monitor with a CMS and record in the operating record the gas flowrate (either directly or by monitoring a surrogate parameter that you have correlated to gas flowrate);

(4) Continuously calculate and record in the operating record a MTEC assuming mercury from all hazardous waste feedstreams is emitted;

(5) Initiate an automatic waste feed cutoff that immediately and automatically cuts off the hazardous waste feed when the MTEC operating requirement is exceeded;

(D) In lieu of complying with paragraph (l)(1)(iii)(C) of this section, you may:

(1) Identify in the Notification of Compliance a minimum gas flowrate limit and a maximum feedrate limit of mercury from all hazardous waste feedstreams that ensures the MTEC calculated in paragraph (l)(1)(iii)(B)(4) of this section is below the operating requirement under paragraphs §§ 63.1220(a)(2)(iii) and (b)(2)(iii); and

(2) Initiate an automatic waste feed cutoff that immediately and automatically cuts off the hazardous waste feed when either the gas flowrate or mercury feedrate exceeds the limits identified in paragraph (l)(1)(iv)(D)(1) of this section.

(iv) For lightweight aggregate kilns:

(A) When complying with the emission standards under §§ 63.1205, 63.1221(a)(2)(i) and (b)(2)(i), you must establish a 12-hour rolling average limit for the total feedrate of mercury in all feedstreams as the average of the test run averages;

(B) Except as provided by paragraph (l)(1)(iv)(C) of this section, when complying with the hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) under §§ 63.1221(a)(2)(ii) and (b)(2)(ii), you must:

(1) Comply with the MTEC operating requirement on a twelve-hour rolling average;

(2) Monitor and record the feedrate of mercury for each hazardous waste feedstream according to § 63.1209(c);

(3) Monitor with a CMS and record in the operating record the gas flowrate (either directly or by monitoring a surrogate parameter that you have correlated to gas flowrate);

(4) Continuously calculate and record in the operating record a MTEC assuming mercury from all hazardous waste feedstreams is emitted;

(5) Initiate an automatic waste feed cutoff that immediately and automatically cuts off the hazardous waste feed when the MTEC operating requirement is exceeded;

(C) In lieu of complying with paragraph (l)(1)(iv)(B) of this section, you may:

(1) Identify in the Notification of Compliance a minimum gas flowrate limit and a maximum feedrate limit of mercury from all hazardous waste feedstreams that ensures the MTEC calculated in paragraph (l)(1)(iv)(B)(4) of this section is below the operating requirement under paragraphs §§ 63.1221(a)(2)(ii) and (b)(2)(ii); and

(2) Initiate an automatic waste feed cutoff that immediately and automatically cuts off the hazardous waste feed when either the gas flowrate or mercury feedrate exceeds the limits identified in paragraph (l)(1)(iv)(C)(1) of this section.

(v) *Extrapolation of feedrate levels.* In lieu of establishing mercury feedrate limits as specified in paragraphs (l)(1)(i) through (iv) of this section, you may request as part of the performance test plan under §§ 63.7(b) and (c) and §§ 63.1207 (e) and (f) to use the mercury feedrates and associated emission rates during the comprehensive performance test to extrapolate to higher allowable feedrate limits and emission rates. The extrapolation methodology will be reviewed and approved, as warranted, by the Administrator. The review will consider in particular whether:

(A) Performance test metal feedrates are appropriate (*i.e.*, whether feedrates are at least at normal levels; depending on the heterogeneity of the waste, whether some level of spiking would be appropriate; and whether the physical form and species of spiked material is appropriate); and

(B) Whether the extrapolated feedrates you request are warranted considering historical metal feedrate data.

* * * * *

(m) * * *

(1) * * *

(iv) *Other particulate matter control devices.* For each particulate matter control device that is not a fabric filter or high energy wet scrubber, or is not an electrostatic precipitator or ionizing wet scrubber for which you elect to monitor particulate matter loadings under § 63.1206(c)(9) of this chapter for process control, you must ensure that the control device is properly operated and maintained as required by § 63.1206(c)(7) and by monitoring the operation of the control device as follows:

* * * * *

(3) *Maximum ash feedrate.* Owners and operators of hazardous waste incinerators, solid fuel boilers, and liquid fuel boilers must establish a maximum ash feedrate limit as a 12-hour rolling average based on the average of the test run averages. This requirement is waived, however, if you comply with the particulate matter detection system requirements under § 63.1206(c)(9).

(n) * * *

(2) *Maximum feedrate of semivolatile and low volatile metals.* (i) *General.* You must establish feedrate limits for semivolatile metals (cadmium and lead) and low volatile metals (arsenic, beryllium, and chromium) as follows, except as provided by paragraph (n)(2)(vii) of this section.

(ii) For incinerators, cement kilns, and lightweight aggregate kilns, when complying with the emission standards under §§ 63.1203, 63.1204, 63.1205, and 63.1219, and for solid fuel boilers when complying with the emission standards

under §63.1216, you must establish 12-hour rolling average limits for the total feedrate of semivolatile and low volatile metals in all feedstreams as the average of the test run averages.

(iii) *Cement kilns under § 63.1220*—(A) When complying with the emission standards under §§ 63.1220(a)(3)(i), (a)(4)(i), (b)(3)(i), and (b)(4)(i), you must establish 12-hour rolling average feedrate limits for semivolatile and low volatile metals as the thermal concentration of semivolatile metals or low volatile metals in all hazardous waste feedstreams. You must calculate hazardous waste thermal concentrations for semivolatile metals and low volatile metals for each run as the total mass feedrate of semivolatile metals or low volatile metals for all hazardous waste feedstreams divided by the total heat input rate for all hazardous waste feedstreams. The 12-hour rolling average feedrate limits for semivolatile metals and low volatile metals are the average of the hazardous waste thermal concentrations for the runs.

(B) When complying with the emission standards under §§ 63.1220(a)(3)(ii), (a)(4)(ii), (b)(3)(ii), and (b)(4)(ii), you must establish 12-hour rolling average limits for the total feedrate of semivolatile and low volatile metals in all feedstreams as the average of the test run averages.

(iv) *Lightweight aggregate kilns under § 63.1221*—(A) When complying with the emission standards under §§ 63.1221(a)(3)(i), (a)(4)(i), (b)(3)(i), and (b)(4)(i), you must establish 12-hour rolling average feedrate limits for semivolatile and low volatile metals as the thermal concentration of semivolatile metals or low volatile metals in all hazardous waste feedstreams as specified in paragraphs (n)(2)(iii)(A) of this section.

(B) When complying with the emission standards under §§ 63.1221(a)(3)(ii), (a)(4)(ii), (b)(3)(ii), and (b)(4)(ii), you must establish 12-hour rolling average limits for the total feedrate of semivolatile and low volatile metals in all feedstreams as the average of the test run averages.

(v) *Liquid fuel boilers under § 63.1217.* (A) *Semivolatile metals.* You must establish a rolling average limit for the semivolatile metal feedrate as follows on an averaging period not to exceed an annual rolling average.

(1) *System removal efficiency.* You must calculate a semivolatile metal system removal efficiency for each test run and calculate the average system removal efficiency of the test run averages. If emissions exceed the semivolatile metal emission standard during the comprehensive performance test, it is not a violation because the averaging period for the semivolatile metal emission standard is one year and compliance is based on compliance with the semivolatile metal feedrate limit that has an averaging period not to exceed an annual rolling average.

(2) *Boilers that feed hazardous waste with a heating value of 10,000 Btu/lb or greater.* You must calculate the semivolatile metal feedrate limit as the semivolatile metal emission standard divided by [1 − System Removal Efficiency].

(*i*) The feedrate limit is a hazardous waste thermal concentration limit expressed as pounds of semivolatile metals in all hazardous waste feedstreams per million Btu of hazardous waste fed to the boiler.

(*ii*) You must comply with the hazardous waste semivolatile metal thermal concentration limit by determining the feedrate of semivolatile metal in all hazardous waste feedstreams (lb/hr) and the hazardous waste thermal feedrate (MM Btu/hr) at least once a minute to calculate a 60-minute average thermal emission concentration as [hazardous waste semivolatile metal feedrate (lb/hr) / hazardous waste thermal feedrate (MM Btu/hr)].

(*iii*) You must calculate a rolling average hazardous waste semivolatile metal thermal concentration that is updated each hour.

(*iv*) If you select an averaging period for the feedrate limit that is greater than a 12-hour rolling average, you must calculate the initial rolling average as though you had selected a 12-hour rolling average, as provided by paragraph (b)(5)(i) of this section. You must calculate rolling averages thereafter as the average of the available one-minute values until enough one-minute values are available to calculate the rolling average period you select. At that time and thereafter, you update the rolling average feedrate each hour with a 60-minute average feedrate.

(3) *Boilers that feed hazardous waste with a heating value less than 10,000 Btu/lb.* (*i*) You must calculate the semivolatile metal feedrate limit as the semivolatile metal emission standard divided by [1 − System Removal Efficiency].

(*ii*) The feedrate limit is expressed as a mass concentration per unit volume of stack gas (μg/dscm) and is converted to a mass feedrate (lb/hr) by multiplying it by the average stack gas flowrate (dscm/hr) of the test run averages.

(*iii*) You must comply with the feedrate limit by determining the semivolatile metal feedrate (lb/hr) at least once a minute to calculate a 60-minute average feedrate.

(*iv*) You must update the rolling average feedrate each hour with this 60-minute feedrate measurement.

(*v*) If you select an averaging period for the feedrate limit that is greater than a 12-hour rolling average, you must calculate the initial rolling average as though you had selected a 12-hour rolling average, as provided by paragraph (b)(5)(i) of this section. You must calculate rolling averages thereafter as the average of the available one-minute values until enough one-minute values are available to calculate the rolling average period you select. At that time and thereafter, you update the rolling average feedrate each hour with a 60-minute average feedrate.

(B) *Chromium.* (1) *Boilers that feed hazardous waste with a heating value of 10,000 Btu/lb or greater.* (*i*) The feedrate limit is a hazardous waste thermal concentration limit expressed as pounds of chromium in all hazardous waste feedstreams per million Btu of hazardous waste fed to the boiler.

(*ii*) You must comply with the hazardous waste chromium thermal concentration limit by determining the feedrate of chromium in all hazardous waste feedstreams (lb/hr) and the hazardous waste thermal feedrate (MM Btu/hr) at least once a minute to calculate a 60-minute average thermal emission concentration as [hazardous waste chromium feedrate (lb/hr) / hazardous waste thermal feedrate (MM Btu/hr)]. You must update the rolling average feedrate each hour with this 60-minute average feedrate measurement.

(2) *Boilers that feed hazardous waste with a heating value less than 10,000 Btu/lb.* You must establish a 12-hour rolling average limit for the total feedrate (lb/hr) of chromium in all feedstreams as the average of the test run averages. You must update the rolling average feedrate each hour with a 60-minute average feedrate measurement.

(vi) *LVM limits for pumpable wastes.* You must establish separate feedrate limits for low volatile metals in pumpable feedstreams using the procedures prescribed above for total low volatile metals. Dual feedrate limits for both pumpable and total feedstreams are not required, however, if you base the total feedrate limit solely on the feedrate of pumpable feedstreams.

(vii) *Extrapolation of feedrate levels.* In lieu of establishing feedrate limits as specified in paragraphs (l)(1)(i) through (iii) of this section, you may request as part of the performance test plan under §§ 63.7(b) and (c) and §§ 63.1207(e) and (f) to use the semivolatile metal and low

volatile metal feedrates and associated emission rates during the comprehensive performance test to extrapolate to higher allowable feedrate limits and emission rates. The extrapolation methodology will be reviewed and approved, as warranted, by the Administrator. The review will consider in particular whether:

(A) Performance test metal feedrates are appropriate (*i.e.*, whether feedrates are at least at normal levels; depending on the heterogeneity of the waste, whether some level of spiking would be appropriate; and whether the physical form and species of spiked material is appropriate); and

(B) Whether the extrapolated feedrates you request are warranted considering historical metal feedrate data.

* * * * *

(o) *Hydrogen chloride and chlorine gas.* * * *

(1) *Feedrate of total chlorine and chloride.* (i) *Incinerators, cement kilns, lightweight aggregate kilns, solid fuel boilers, and hydrochloric acid production furnaces.* You must establish a 12-hour rolling average limit for the total feedrate of chlorine (organic and inorganic) in all feedstreams as the average of the test run averages.

(ii) *Liquid fuel boilers.* (A) *Boilers that feed hazardous waste with a heating value not less than 10,000 Btu/lb.* (*1*) The feedrate limit is a hazardous waste thermal concentration limit expressed as pounds of chlorine (organic and inorganic) in all hazardous waste feedstreams per million Btu of hazardous waste fed to the boiler.

(*2*) You must establish a 12-hour rolling average feedrate limit as the average of the test run averages.

(*3*) You must comply with the feedrate limit by determining the mass feedrate of hazardous waste feedstreams (lb/hr) at least once a minute and by knowing the chlorine (organic and inorganic) content and heating value (million Btu/lb) of hazardous waste feedstreams at all times to calculate a 60-minute average feedrate measurement as [hazardous waste chlorine feedrate (lb/hr) / hazardous waste thermal feedrate (million Btu/hr)]. You must update the rolling average feedrate each hour with this 60-minute average feedrate measurement.

(B) *Boilers that feed hazardous waste with a heating value less than 10,000 Btu/lb.* You must establish a 12-hour rolling average limit for the total feedrate of chlorine (organic and inorganic) in all feedstreams as the average of the test run averages. You must update the rolling average feedrate each hour with a 60-minute average feedrate measurement.

* * * * *

(r) *Averaging periods.* The averaging periods specified in this section for operating parameters are not-to-exceed averaging periods. You may elect to use shorter averaging periods. For example, you may elect to use a 1-hour rolling average rather than the 12-hour rolling average specified in paragraph (l)(1)(i) of this section for mercury.

■ 12. Section 63.1210 is amended by:
■ a. Revising the table in paragraph (a)(1) and the table in paragraph (a)(2).
■ b. Redesignating paragraph (b) as (d).
■ c. Adding new paragraph (b).
■ d. Adding new paragraph (c).

The revisions and additions read as follows:

§ 63.1210 What are the notification requirements?

(a) * * *

(1) * * *

Reference	Notification
63.9(b)	Initial notifications that you are subject to Subpart EEE of this Part.
63.9(d)	Notification that you are subject to special compliance requirements.
63.9(j)	Notification and documentation of any change in information already provided under § 63.9.
63.1206(b)(5)(i)	Notification of changes in design, operation, or maintenance.
63.1206(c)(7)(ii)(C)	Notification of excessive bag leak detection system exceedances.
63.1207(e), 63.9(e) 63.9(g)(1) and (3)	Notification of performance test and continuous monitoring system evaluation, including the performance test plan and CMS performance evaluation plan.[1]
63.1210(b)	Notification of intent to comply.
63.1210(d), 63.1207(j), 63.1207(k), 63.1207(l), 63.9(h), 63.10(d)(2), 63.10(e)(2).	Notification of compliance, including results of performance tests and continuous monitoring system performance evaluations.

[1] You may also be required on a case-by-case basis to submit a feedstream analysis plan under § 63.1209(c)(3).

(2) * * *

Reference	Notification, request, petition, or application 6
63.9(i)	You may request an adjustment to time periods or postmark deadlines for submittal and review of required information.
63.10(e)(3)(ii)	You may request to reduce the frequency of excess emissions and CMS performance reports.
63.10(f)	You may request to waive recordkeeping or reporting requirements.
63.1204(d)(2)(iii), 63.1220(d)(2)(iii)	Notification that you elect to comply with the emission averaging requirements for cement kilns with in-line raw mills.
63.1204(e)(2)(iii), 63.1220(e)(2)(iii)	Notification that you elect to comply with the emission averaging requirements for preheater or preheater/precalciner kilns with dual stacks.
63.1206(b)(4), 63.1213, 63.6(i), 63.9(c)	You may request an extension of the compliance date for up to one year.
63.1206(b)(5)(i)(C)	You may request to burn hazardous waste for more than 720 hours and for purposes other than testing or pretesting after making a change in the design or operation that could affect compliance with emission standards and prior to submitting a revised Notification of Compliance.
63.1206(b)(8)(iii)(B)	If you elect to conduct particulate matter CEMS correlation testing and wish to have federal particulate matter and opacity standards and associated operating limits waived during the testing, you must notify the Administrator by submitting the correlation test plan for review and approval.
63.1206(b)(8)(v)	You may request approval to have the particulate matter and opacity standards and associated operating limits and conditions waived for more than 96 hours for a correlation test.

Reference	Notification, request, petition, or application 6
63.1206(b)(9)	Owners and operators of lightweight aggregate kilns may request approval of alternative emission standards for mercury, semivolatile metal, low volatile metal, and hydrogen chloride/chlorine gas under certain conditions.
63.1206(b)(10)	Owners and operators of cement kilns may request approval of alternative emission standards for mercury, semivolatile metal, low volatile metal, and hydrogen chloride/chlorine gas under certain conditions.
63.1206(b)(14)	Owners and operators of incinerators may elect to comply with an alternative to the particulate matter standard.
63.1206(b)(15)	Owners and operators of cement and lightweight aggregate kilns may request to comply with the alternative to the interim standards for mercury.
63.1206(c)(2)(ii)(C)	You may request to make changes to the startup, shutdown, and malfunction plan.
63.1206(c)(5)(i)(C)	You may request an alternative means of control to provide control of combustion system leaks.
63.1206(c)(5)(i)(D)	You may request other techniques to prevent fugitive emissions without use of instantaneous pressure limits.
63.1207(c)(2)	You may request to base initial compliance on data in lieu of a comprehensive performance test.
63.1207(d)(3)	You may request more than 60 days to complete a performance test if additional time is needed for reasons beyond your control.
63.1207(e)(3), 63.7(h)	You may request a time extension if the Administrator fails to approve or deny your test plan.
63.1207(h)(2)	You may request to waive current operating parameter limits during pretesting for more than 720 hours.
63.1207(f)(1)(ii)(D)	You may request a reduced hazardous waste feedstream analysis for organic hazardous air pollutants if the reduced analysis continues to be representative of organic hazardous air pollutants in your hazardous waste feedstreams.
63.1207(g)(2)(v)	You may request to operate under a wider operating range for a parameter during confirmatory performance testing.
63.1207(i)	You may request up to a one-year time extension for conducting a performance test (other than the initial comprehensive performance test) to consolidate testing with other state or federally-required testing.
63.1207(j)(4)	You may request more than 90 days to submit a Notification of Compliance after completing a performance test if additional time is needed for reasons beyond your control.
63.1207(l)(3)	After failure of a performance test, you may request to burn hazardous waste for more than 720 hours and for purposes other than testing or pretesting.
63.1209(a)(5), 63.8(f)	You may request: (1) Approval of alternative monitoring methods for compliance with standards that are monitored with a CEMS; and (2) approval to use a CEMS in lieu of operating parameter limits.
63.1209(g)(1)	You may request approval of: (1) Alternatives to operating parameter monitoring requirements, except for standards that you must monitor with a continuous emission monitoring system (CEMS) and except for requests to use a CEMS in lieu of operating parameter limits; or (2) a waiver of an operating parameter limit.
63.1209(l)(1)	You may request to extrapolate mercury feedrate limits.
63.1209(n)(2)	You may request to extrapolate semivolatile and low volatile metal feedrate limits.
63.1211(d)	You may request to use data compression techniques to record data on a less frequent basis than required by § 63.1209.

(b) *Notification of intent to comply (NIC).* These procedures apply to sources that have not previously complied with the requirements of paragraph (b) of this section, and to sources that previously complied with the NIC requirements of § 63.1210, which were in effect prior to October 11, 2000, that must make a technology change requiring a Class 1 permit modification to meet the standards of §§ 63.1219, 63.1220, and 63.1221.

(1) You must prepare a Notification of Intent to Comply that includes all of the following information:

(i) General information:

(A) The name and address of the owner/operator and the source;

(B) Whether the source is a major or an area source;

(C) Waste minimization and emission control technique(s) being considered;

(D) Emission monitoring technique(s) you are considering;

(E) Waste minimization and emission control technique(s) effectiveness;

(F) A description of the evaluation criteria used or to be used to select waste minimization and/or emission control technique(s); and

(G) A general description of how you intend to comply with the emission standards of this subpart.

(ii) As applicable to each source, information on key activities and estimated dates for these activities that will bring the source into compliance with emission control requirements of this subpart. You must include all of the following key activities and dates in your NIC:

(A) The dates by which you anticipate you will develop engineering designs for emission control systems or process changes for emissions;

(B) The date by which you anticipate you will commit internal or external resources for installing emission control systems or making process changes for emission control, or the date by which you will issue orders for the purchase of component parts to accomplish emission control or process changes.

(C) The date by which you anticipate you will submit construction applications;

(D) The date by which you anticipate you will initiate on-site construction, installation of emission control equipment, or process change;

(E) The date by which you anticipate you will complete on-site construction, installation of emission control equipment, or process change; and

(F) The date by which you anticipate you will achieve final compliance. The individual dates and milestones listed in paragraphs (b)(1)(ii)(A) through (F) of this section as part of the NIC are not requirements and therefore are not

enforceable deadlines; the requirements of paragraphs (b)(1)(ii)(A) through (F) of this section must be included as part of the NIC only to inform the public of how you intend to comply with the emission standards of this subpart.

(iii) A summary of the public meeting required under paragraph (c) of this section;

(iv) If you intend to cease burning hazardous waste prior to or on the compliance date, the requirements of paragraphs (b)(1)(ii) and (b)(1)(iii) of this section do not apply. You must include in your NIC a schedule of key dates for the steps to be taken to stop hazardous waste activity at your combustion unit. Key dates include the date for submittal of RCRA closure documents required under subpart G, part 264 or subpart G, part 265 of this chapter.

(2) You must make a draft of the NIC available for public review no later than 30 days prior to the public meeting required under paragraph (c)(1) of this section or no later than 9 months after the effective date of the rule if you intend to cease burning hazardous waste prior to or on the compliance date.

(3) You must submit the final NIC to the Administrator no later than one year following the effective date of the emission standards of this subpart.

(c) *NIC public meeting and notice.* (1) Prior to the submission of the NIC to the permitting agency, and no later than 10 months after the effective date of the emission standards of this subpart, you must hold at least one informal meeting with the public to discuss anticipated activities described in the draft NIC for achieving compliance with the emission standards of this subpart. You must post a sign-in sheet or otherwise provide a voluntary opportunity for attendees to provide their names and addresses;

(2) You must submit a summary of the meeting, along with the list of attendees and their addresses developed under paragraph (b)(1) of this section, and copies of any written comments or materials submitted at the meeting, to the Administrator as part of the final NIC, in accordance with paragraph (b)(1)(iii) of this section;

(3) You must provide public notice of the NIC meeting at least 30 days prior to the meeting and you must maintain, and provide to the Administrator upon request, documentation of the notice. You must provide public notice in all of the following forms:

(i) *Newspaper advertisement.* You must publish a notice in a newspaper of general circulation in the county or equivalent jurisdiction of your facility. In addition, you must publish the notice in newspapers of general circulation in adjacent counties or equivalent jurisdiction where such publication would be necessary to inform the affected public. You must publish the notice as a display advertisement.

(ii) *Visible and accessible sign.* You must post a notice on a clearly marked sign at or near the source. If you place the sign on the site of the hazardous waste combustor, the sign must be large enough to be readable from the nearest spot where the public would pass by the site.

(iii) *Broadcast media announcement.* You must broadcast a notice at least once on at least one local radio station or television station.

(iv) *Notice to the facility mailing list.* You must provide a copy of the notice to the facility mailing list in accordance with § 124.10(c)(1)(ix) of this chapter.

(4) You must include all of the following in the notices required under paragraph (c)(3) of this section:

(i) The date, time, and location of the meeting;

(ii) A brief description of the purpose of the meeting;

(iii) A brief description of the source and proposed operations, including the address or a map (e.g., a sketched or copied street map) of the source location;

(iv) A statement encouraging people to contact the source at least 72 hours before the meeting if they need special access to participate in the meeting;

(v) A statement describing how the draft NIC (and final NIC, if requested) can be obtained; and

(vi) The name, address, and telephone number of a contact person for the NIC.

(5) The requirements of this paragraph do not apply to sources that intend to cease burning hazardous waste prior to or on the compliance date.

■ 13. Section 63.1211 is amended by:

■ a. Revising the table in paragraph (b).

■ b. Revising paragraph (c)(1).

The revisions read as follows:

§ 63.1211 What are the recordkeeping and reporting requirements?

* * * * *

(b) * * *

Reference	Document, Data, or Information
63.1200, 63.10(b) and (c)	General. Information required to document and maintain compliance with the regulations of Subpart EEE, including data recorded by continuous monitoring systems (CMS), and copies of all notifications, reports, plans, and other documents submitted to the Administrator.
63.1204(d)(1)(ii), 63.1220(d)(1)(ii)	Documentation of mode of operation changes for cement kilns with in-line raw mills.
63.1204(d)(2)(ii), 63.1220(d)(2)(ii)	Documentation of compliance with the emission averaging requirements for cement kilns with in-line raw mills.
63.1204(e)(2)(ii), 63.1220(e)(2)(ii)	Documentation of compliance with the emission averaging requirements for preheater or preheater/precalciner kilns with dual stacks.
63.1206(b)(1)(ii)	If you elect to comply with all applicable requirements and standards promulgated under authority of the Clean Air Act, including Sections 112 and 129, in lieu of the requirements of Subpart EEE when not burning hazardous waste, you must document in the operating record that you are in compliance with those requirements.
63.1206(b)(5)(ii)	Documentation that a change will not adversely affect compliance with the emission standards or operating requirements.
63.1206(b)(11)	Calculation of hazardous waste residence time.
63.1206(c)(2)	Startup, shutdown, and malfunction plan.
63.1206(c)(2)(v)(A)	Documentation of your investigation and evaluation of excessive exceedances during malfunctions.
63.1206(c)(3)(v)	Corrective measures for any automatic waste feed cutoff that results in an exceedance of an emission standard or operating parameter limit.
63.1206(c)(3)(vii)	Documentation and results of the automatic waste feed cutoff operability testing.
63.1206(c)(4)(ii)	Emergency safety vent operating plan.
63.1206(c)(4)(iii)	Corrective measures for any emergency safety vent opening.
63.1206(c)(5)(ii)	Method used for control of combustion system leaks.
63.1206(c)(6)	Operator training and certification program.
63.1206(c)(7)(i)(D)	Operation and maintenance plan.
63.1209(c)(2)	Feedstream analysis plan.

Reference	Document, Data, or Information
63.1209(k)(6)(iii), 63.1209(k)(7)(ii), 63.1209(k)(9)(ii), 63.1209(o)(4)(iii).	Documentation that a substitute activated carbon, dioxin/furan formation reaction inhibitor, or dry scrubber sorbent will provide the same level of control as the original material.
63.1209(k)(7)(i)(C)	Results of carbon bed performance monitoring.
63.1209(q)	Documentation of changes in modes of operation.
63.1211(c)	Documentation of compliance.

(c) * * *

(1) By the compliance date, you must develop and include in the operating record a Documentation of Compliance. You are not subject to this requirement, however, if you submit a Notification of Compliance under § 63.1207(j) prior to the compliance date. Upon inclusion of the Documentation of Compliance in the operating record, hazardous waste burning incinerators, cement kilns, and lightweight aggregate kilns regulated under the interim standards of §§ 63.1203, 63.1204, and 63.1205 are no longer subject to compliance with the previously applicable Notification of Compliance.

* * * * *

■ 14. Section 63.1212 is added to subpart EEE to read as follows:

§ 63.1212 What are the other requirements pertaining to the NIC?

(a) *Certification of intent to comply.* The Notice of Intent to Comply (NIC) must contain the following certification signed and dated by a responsible official as defined under § 63.2 of this chapter: I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(b) *New units.* Any source that files a RCRA permit application or permit modification request for construction of a hazardous waste combustion unit after October 12, 2005 must:

(1) Prepare a draft NIC according to § 63.1210(b) and make it available to the public upon issuance of the notice of NIC public meeting per § 63.1210(c)(3);

(2) Prepare a draft comprehensive performance test plan pursuant to the requirements of § 63.1207 and make it available for public review upon issuance of the notice of NIC public meeting;

(3) Provide notice to the public of a pre-application meeting pursuant to § 124.30 or notice to the public of a permit modification request pursuant to § 270.42 and;

(4) Hold an informal public meeting 30 days following notice of NIC public meeting and notice of the pre-application meeting or notice of the permit modification request.

(c) *Information Repository specific to new combustion units.* (1) Any source that files a RCRA permit application or modification request for construction of a new hazardous waste combustion unit after October 12, 2005 may be required to establish an information repository if deemed appropriate.

(2) The Administrator may assess the need, on a case-by-case basis for an information repository. When assessing the need for a repository, the Administrator shall consider the level of public interest, the presence of an existing repository, and any information available via the New Source Review and Title V permit processes. If the Administrator determines a need for a repository, then the Administrator shall notify the facility that it must establish and maintain an information repository.

(3) The information repository shall contain all documents, reports, data, and information deemed necessary by the Administrator. The Administrator shall have the discretion to limit the contents of the repository.

(4) The information repository shall be located and maintained at a site chosen by the source. If the Administrator finds the site unsuitable for the purposes and persons for which it was established, due to problems with location, hours of availability, access, or other relevant considerations, then the Administrator shall specify a more appropriate site.

(5) The Administrator shall require the source to provide a written notice about the information repository to all individuals on the source mailing list.

(6) The source shall be responsible for maintaining and updating the repository with appropriate information throughout a period specified by the Administrator. The Administrator may close the repository at his or her discretion based on the considerations in paragraph (c)(2) of this section.

■ 15. Section 63.1214 is amended by revising paragraphs (c)(1), (c)(2), (c)(3), and (c)(4) to read as follows:

§ 63.1214 Implementation and enforcement.

* * * * *

(c) * * *

(1) Approval of alternatives to requirements in §§ 63.1200, 63.1203, 63.1204, 63.1205, 63.1206(a), 63.1215, 63.1216, 63.1217, 63.1218, 63.1219, 63.1220, and 63.1221.

(2) Approval of major alternatives to test methods under §§ 63.7(e)(2)(ii) and (f), 63.1208(b), and 63.1209(a)(1), as defined under § 63.90, and as required in this subpart.

(3) Approval of major alternatives to monitoring under §§ 63.8(f) and 63.1209(a)(5), as defined under § 63.90, and as required in this subpart.

(4) Approval of major alternatives to recordkeeping and reporting under §§ 63.10(f) and 63.1211(a) through (c), as defined under § 63.90, and as required in this subpart.

■ 16. Section § 63.1215 is added to subpart EEE to read as follows:

§ 63.1215 What are the health-based compliance alternatives for total chlorine?

(a) *General.* (1) *Overview.* You may establish and comply with health-based compliance alternatives for total chlorine under the procedures prescribed in this section for your hazardous waste combustors other than hydrochloric acid production furnaces. You may comply with these health-based compliance alternatives in lieu of the emission standards for total chlorine provided under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221. To identify and comply with the limits, you must:

(i) Identify a total chlorine emission concentration (ppmv) expressed as chloride ($Cl^{(-)}$) equivalent for each on-site hazardous waste combustor. You may select total chlorine emission concentrations as you choose to demonstrate eligibility for the risk-based limits under this section, except as provided by paragraph (b)(4) of this section;

(ii) Apportion the total chlorine emission concentration between HCl and Cl_2 according to paragraph (b)(6)(i) of this section, and calculate HCl and Cl_2 emission rates (lb/hr) using the gas flowrate and other parameters from the most recent regulatory compliance test.

(iii) Calculate the annual average HCl-equivalent emission rate as prescribed in paragraph (b)(2) of this section.

(iv) Perform an eligibility demonstration to determine if your HCl-equivalent emission rate meets the national exposure standard and thus is below the annual average HCl-equivalent emission rate limit, as prescribed by paragraph (c) of this section;

(v) Submit your eligibility demonstration for review and approval, as prescribed by paragraph (e) of this section, which must include information to ensure that the 1-hour average HCl-equivalent emission rate limit is not exceeded, as prescribed by paragraph (d) of this section;

(vi) Demonstrate compliance with the annual average HCl-equivalent emission rate limit during the comprehensive performance test, as prescribed by the testing and monitoring requirements under paragraph (e) of this section;

(vii) Comply with compliance monitoring requirements, including establishing feedrate limits on total chlorine and chloride, and operating parameter limits on emission control equipment, as prescribed by paragraph (f) of this section; and

(viii) Comply with the requirements for changes, as prescribed by paragraph (h) of this section.

(2) *Definitions.* In addition to the definitions under § 63.1201, the following definitions apply to this section:

1-Hour Average HCl-Equivalent Emission Rate means the HCl-equivalent emission rate (lb/hr) determined by equating the toxicity of chlorine to HCl using 1-hour RELs as the health risk metric for acute exposure.

1-Hour Average HCl-Equivalent Emission Rate Limit means the HCl-equivalent emission rate (lb/hr) determined by equating the toxicity of chlorine to HCl using 1-hour RELs as the health risk metric for acute exposure and which ensures that maximum 1-hour average ambient concentrations of HCl-equivalents do not exceed a Hazard Index of 1.0, rounded to the nearest tenths decimal place (0.1), at an off-site receptor location.

Acute Reference Exposure Level (aREL) means health thresholds below which there would be no adverse health effects for greater than once in a lifetime exposures of one hour. ARELs are developed by the California Office of Health Hazard Assessment and are available at *http://www.oehha.ca.gov/air/acute_rels/acuterel.html.*

Annual Average HCl-Equivalent Emission Rate means the HCl-equivalent emission rate (lb/hr) determined by equating the toxicity of chlorine to HCl using RfCs as the health risk metric for long-term exposure.

Annual Average HCl-Equivalent Emission Rate Limit means the HCl-equivalent emission rate (lb/hr) determined by equating the toxicity of chlorine to HCl using RfCs as the health risk metric for long-term exposure and which ensures that maximum annual average ambient concentrations of HCl equivalents do not exceed a Hazard Index of 1.0, rounded to the nearest tenths decimal place (0.1), at an off-site receptor location.

Hazard Index (HI) means the sum of more than one Hazard Quotient for multiple substances and/or multiple exposure pathways. In this section, the Hazard Index is the sum of the Hazard Quotients for HCl and chlorine.

Hazard Quotient (HQ) means the ratio of the predicted media concentration of a pollutant to the media concentration at which no adverse effects are expected. For chronic inhalation exposures, the HQ is calculated under this section as the air concentration divided by the RfC. For acute inhalation exposures, the HQ is calculated under this section as the air concentration divided by the aREL.

Look-up table analysis means a risk screening analysis based on comparing the HCl-equivalent emission rate from the affected source to the appropriate HCl-equivalent emission rate limit specified in Tables 1 through 4 of this section.

Reference Concentration (RfC) means an estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. It can be derived from various types of human or animal data, with uncertainty factors generally applied to reflect limitations of the data used.

(b) *HCl-equivalent emission rates.* (1) You must express total chlorine emission rates for each hazardous waste combustor as HCl-equivalent emission rates.

(2) *Annual average rates.* You must calculate annual average toxicity-weighted HCl-equivalent emission rates for each combustor as follows:

$ER_{LTtw} = ER_{HCl} + ER_{Cl2} \times (RfC_{HCl}/RfC_{Cl2})$

Where:

ER_{LTtw} is the annual average HCl toxicity-weighted emission rate (HCl-equivalent emission rate) considering long-term exposures, lb/hr

ER_{HCl} is the emission rate of HCl in lbs/hr

ER_{Cl2} is the emission rate of chlorine in lbs/hr

RfC_{HCl} is the reference concentration of HCl

RfC_{Cl2} is the reference concentration of chlorine

(3) *1-hour average rates.* You must calculate 1-hour average toxicity-weighted HCl-equivalent emission rates for each combustor as follows:

$ER_{STtw} = ER_{HCl} + ER_{Cl2} \times (aREL_{HCl}/aREL_{Cl2})$

Where:

ER_{STtw} is the 1-hour average HCl toxicity-weighted emission rate (HCl-equivalent emission rate) considering 1-hour (short-term) exposures, lb/hr

ER_{HCl} is the emission rate of HCl in lbs/hr

ER_{Cl2} is the emission rate of chlorine in lbs/hr

$aREL_{HCl}$ is the 1-hour Reference Exposure Level of HCl

$aREL_{Cl2}$ is the 1-hour Reference Exposure Level of chlorine

(4) You must use the RfC values for hydrogen chloride and chlorine found at *http://epa.gov/ttn/atw/toxsource/summary.html.*

(5) You must use the aREL values for hydrogen chloride and chlorine found at *http://www.oehha.ca.gov/air/acute_rels/acuterel.html.*

(6) *Cl_2/HCl ratios*—(i) *Ratio for calculating annual average HCl-equivalent emission rates.* (A) To calculate the annual average HCl-equivalent emission rate (lb/hr) for each combustor, you must apportion the total chlorine emission concentration (ppmv chloride ($Cl^{(-)}$) equivalent) between HCl and chlorine according to the historical average Cl_2/HCl volumetric ratio for all regulatory compliance tests.

(B) You must calculate HCl and Cl_2 emission rates (lb/hr) using the apportioned emission concentrations and the gas flowrate and other parameters from the most recent regulatory compliance test.

(C) You must calculate the annual average HCl-equivalent emission rate using these HCl and Cl_2 emission rates and the equation in paragraph (b)(2) of this section.

(ii) *Ratio for calculating 1-hour average HCl-equivalent emission rates.* (A) To calculate the 1-hour average HCl-equivalent emission rate for each combustor as a criterion for you to determine under paragraph (d) of this section if an hourly rolling average feedrate limit on total chlorine and chloride may be waived, you must apportion the total chlorine emission concentration (ppmv chloride ($Cl^{(-)}$) equivalent) between HCl and chlorine

according to the historical highest Cl_2/HCl volumetric ratio for all regulatory compliance tests.

(B) You must calculate HCl and Cl_2 emission rates (lb/hr) using the apportioned emission concentrations and the gas flowrate and other parameters from the most recent regulatory compliance test.

(C) You must calculate the 1-hour average HCl-equivalent emission rate using the se HCl and Cl_2 emission rates and the equation in paragraph (b)(3) of this section.

(iii) *Ratios for new sources.* (A) You must use engineering information to estimate the Cl_2/HCl volumetric ratio for a new source for the initial eligibility demonstration.

(B) You must use the Cl_2/HCl volumetric ratio demonstrated during the initial comprehensive performance test to demonstrate in the Notification of Compliance that your HCl-equivalent emission rate does not exceed your HCl-equivalent emission rate limit.

(C) When approving the test plan for the initial comprehensive performance test, the permitting authority will establish a periodic testing requirement, such as every 3 months for 1 year, to establish a record of representative Cl_2/HCl volumetric ratios.

(*1*) You must revise your HCl-equivalent emission rates and HCl-equivalent emission rate limits after each such test using the procedures prescribed in paragraphs (b)(6)(i) and (ii) of this section.

(*2*) If you no longer are eligible for the health-based compliance alternative, you must notify the permitting authority immediately and either:

(*i*) Submit a revised eligibility demonstration requesting lower HCl-equivalent emission rate limits, establishing lower HCl-equivalent emission rates, and establishing by downward extrapolation lower feedrate limits for total chlorine and chloride; or

(*ii*) Request a compliance schedule of up to three years to demonstrate compliance with the emission standards under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221.

(iv) *Unrepresentative or inadequate historical Cl_2/HCl volumetric ratios.* (A) If you believe that the Cl_2/HCl volumetric ratio for one or more historical regulatory compliance tests is not representative of the current ratio, you may request that the permitting authority allow you to screen those ratios from the analysis of historical ratios.

(B) If the permitting authority believes that too few historical ratios are available to calculate a representative average ratio or establish a maximum ratio, the permitting authority may require you to conduct periodic testing to establish representative ratios.

(v) *Updating Cl_2/HCl ratios.* You must include the Cl_2/HCl volumetric ratio demonstrated during each performance test in your data base of historical Cl2/HCl ratios to update the ratios you establish under paragraphs (b)(6)(i) and (ii) of this section for subsequent calculations of the annual average and 1-hour average HCl-equivalent emission rates.

(7) *Emission rates are capped.* The hydrogen chloride and chlorine emission rates you use to calculate the HCl-equivalent emission rate limit for incinerators, cement kilns, and lightweight aggregate kilns must not result in total chlorine emission concentrations exceeding:

(i) For incinerators that were existing sources on April 19, 1996: 77 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(ii) For incinerators that are new or reconstructed sources after April 19, 1996: 21 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(iii) For cement kilns that were existing sources on April 19, 1996: 130 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(iv) For cement kilns that are new or reconstructed sources after April 19, 1996: 86 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(v) For lightweight aggregate kilns that were existing sources on April 19, 1996: 600 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(vi) For lightweight aggregate kilns that are new or reconstructed sources after April 19, 1996: 600 parts per million by volume, combined emissions, expressed as chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen.

(c) *Eligibility demonstration*—(1) *General.* (i) You must perform an eligibility demonstration to determine whether the total chlorine emission rates you select for each on-site hazardous waste combustor meet the national exposure standards using either a look-up table analysis prescribed by paragraph (c)(3) of this section, or a site-specific compliance demonstration prescribed by paragraph (c)(4) of this section.

(ii) You must also determine in your eligibility demonstration whether each combustor may exceed the 1-hour HCl-equivalent emission rate limit absent an hourly rolling average limit on the feedrate of total chlorine and chloride, as provided by paragraph (d) of this section.

(2) *Definition of eligibility.* (i) Eligibility for the risk-based total chlorine standard is determined by comparing the annual average HCl-equivalent emission rate for the total chlorine emission rate you select for each combustor to the annual average HCl-equivalent emission rate limit.

(ii) The annual average HCl-equivalent emission rate limit ensures that the Hazard Index for chronic exposure from HCl and chlorine emissions from all on-site hazardous waste combustors is less than or equal to 1.0, rounded to the nearest tenths decimal place (0.1), for the actual individual most exposed to the facility's emissions, considering off-site locations where people reside and where people congregate for work, school, or recreation.

(iii) Your facility is eligible for the health-based compliance alternative for total chlorine if either:

(A) The annual average HCl-equivalent emission rate for each on-site hazardous waste combustor is below the appropriate value in the look-up table determined under paragraph (c)(3) of this section; or

(B) The annual average HCl-equivalent emission rate for each on-site hazardous waste combustor is below the annual average HCl-equivalent emission rate limit you calculate based on a site-specific compliance demonstration under paragraph (c)(4) of this section.

(3) *Look-up table analysis.* Look-up tables for the eligibility demonstration are provided as Tables 1 and 2 to this section.

(i) Table 1 presents annual average HCl-equivalent emission rate limits for sources located in flat terrain. For purposes of this analysis, flat terrain is terrain that rises to a level not exceeding one half the stack height within a distance of 50 stack heights.

(ii) Table 2 presents annual average HCl-equivalent emission rate limits for sources located in simple elevated terrain. For purposes of this analysis, simple elevated terrain is terrain that rises to a level exceeding one half the stack height, but that does not exceed the stack height, within a distance of 50 stack heights.

(iii) To determine the annual average HCl-equivalent emission rate limit for a

source from the look-up table, you must use the stack height and stack diameter for your hazardous waste combustors and the distance between the stack and the property boundary.

(iv) If any of these values for stack height, stack diameter, and distance to nearest property boundary do not match the exact values in the look-up table, you must use the next lowest table value.

(v) *Adjusted HCl-equivalent emission rate limit for multiple on-site combustors.* (A) If you have more than one hazardous waste combustor on site, the sum across all hazardous waste combustors of the ratio of the adjusted HCl-equivalent emission rate limit to the HCl-equivalent emission rate limit provided by Tables 1 or 2 cannot exceed 1.0, according to the following equation:

$$\sum_{i=1}^{n} \frac{\text{HCl-Equivalent Emission Rate Limit Adjusted}_i}{\text{HCl-Equivalent Emission Rate Limit Table}_i} \leq 1.0$$

Where:

i = number of on-site hazardous waste combustors;

HCl-Equivalent Emission Rate Limit Adjusted$_i$ means the apportioned, allowable HCl-equivalent emission rate limit for combustor i, and

HCl-Equivalent Emission Rate Limit Table$_i$ means the HCl-equivalent emission rate limit from Table 1 or 2 to § 63.1215 for combustor *i*.

(B) The adjusted HCl-equivalent emission rate limit becomes the HCl-equivalent emission rate limit.

(4) *Site-specific compliance demonstration.* (i) You may use any scientifically-accepted peer-reviewed risk assessment methodology for your site-specific compliance demonstration to calculate an annual average HCl-equivalent emission rate limit for each on-site hazardous waste combustor. An example of one approach for performing the demonstration for air toxics can be found in the EPA's "Air Toxics Risk Assessment Reference Library, Volume 2, Site-Specific Risk Assessment Technical Resource Document," which may be obtained through the EPA's Air Toxics Web site at *http://www.epa.gov/ttn/fera/risk_atra_main.html.*

(ii) The annual average HCl-equivalent emission rate limit is the HCl-equivalent emission rate that ensures that the Hazard Index associated with maximum annual average exposures is not greater than 1.0 rounded to the nearest tenths decimal place (0.1).

(iii) To determine the annual average HCl-equivalent emission rate limit, your site-specific compliance demonstration must, at a minimum:

(A) Estimate long-term inhalation exposures through the estimation of annual or multi-year average ambient concentrations;

(B) Estimate the inhalation exposure for the actual individual most exposed to the facility's emissions from hazardous waste combustors, considering off-site locations where people reside and where people congregate for work, school, or recreation;

(C) Use site-specific, quality-assured data wherever possible;

(D) Use health-protective default assumptions wherever site-specific data are not available, and:

(E) Contain adequate documentation of the data and methods used for the assessment so that it is transparent and can be reproduced by an experienced risk assessor and emissions measurement expert.

(iv) Your site-specific compliance demonstration need not:

(A) Assume any attenuation of exposure concentrations due to the penetration of outdoor pollutants into indoor exposure areas;

(B) Assume any reaction or deposition of the emitted pollutants during transport from the emission point to the point of exposure.

(d) *Assurance that the 1-hour HCl-equivalent emission rate limit will not be exceeded.* To ensure that the 1-hour HCl-equivalent emission rate limit will not be exceeded when complying with the annual average HCl-equivalent emission rate limit, you must establish a 1-hour average HCl-equivalent emission rate for each combustor, establish a 1-hour average HCl-equivalent emission rate limit for each combustor, and consider site-specific factors including prescribed criteria to determine if the 1-hour average HCl-equivalent emission rate limit may be exceeded absent an hourly rolling average limit on the feedrate of total chlorine and chloride. If the 1-hour average HCl-equivalent emission rate limit may be exceeded, you must establish an hourly rolling average feedrate limit on total chlorine as provided by paragraph (f)(3) of this section.

(1) *1-hour average HCl-equivalent emission rate.* You must calculate the 1-hour average HCl-equivalent emission rate from the total chlorine emission concentration you select for each source as prescribed in paragraph (b)(6)(ii)(C) of this section.

(2) *1-hour average HCl-equivalent emission rate limit.* You must establish the 1-hour average HCl-equivalent emission rate limit for each affected source using either a look-up table analysis or site-specific analysis:

(i) *Look-up table analysis.* Look-up tables are provided for 1-hour average HCl-equivalent emission rate limits as Table 3 and Table 4 to this section. Table 3 provides limits for facilities located in flat terrain. Table 4 provides limits for facilities located in simple elevated terrain. You must use the Tables to establish 1-hour average HCl-equivalent emission rate limits as prescribed in paragraphs (c)(3)(iii) through (c)(3)(v) of this section for annual average HCl-equivalent emission rate limits.

(ii) *Site-specific analysis.* The 1-hour average HCl-equivalent emission rate limit is the HCl-equivalent emission rate that ensures that the Hazard Index associated with maximum 1-hour average exposures is not greater than 1.0 rounded to the nearest tenths decimal place (0.1). You must follow the risk assessment procedures under paragraph (c)(4) of this section to estimate short-term inhalation exposures through the estimation of maximum 1-hour average ambient concentrations.

(3) *Criteria for determining whether the 1-hour HCl-equivalent emission rate may be exceeded absent an hourly rolling average limit on the feedrate of total chlorine and chloride.* An hourly rolling average feedrate limit on total chlorine and chloride is waived if you determine considering the criteria listed below that the long-term feedrate limit (and averaging period) established under paragraph (c)(4)(i) of this section will also ensure that the 1-hour average HCl-equivalent emission rate will not exceed the 1-hour average HCl-equivalent emission rate limit you calculate for each combustor.

(i) The ratio of the 1-hour average HCl-equivalent emission rate based on the total chlorine emission rate you select for each hazardous waste combustor to the 1-hour average HCl-equivalent emission rate limit for the combustor; and

(ii) The potential for the source to vary total chlorine and chloride

feedrates substantially over the averaging period for the feedrate limit established under paragraph (c)(4)(i) of this section.

(e) *Review and approval of eligibility demonstrations*—(1) *Content of the eligibility demonstration*—(i) *General.* The eligibility demonstration must include the following information, at a minimum:

(A) Identification of each hazardous waste combustor combustion gas emission point (e.g., generally, the flue gas stack);

(B) The maximum and average capacity at which each combustor will operate, and the maximum rated capacity for each combustor, using the metric of stack gas volume (under both actual and standard conditions) emitted per unit of time, as well as any other metric that is appropriate for the combustor (e.g., million Btu/hr heat input for boilers; tons of dry raw material feed/hour for cement kilns);

(C) Stack parameters for each combustor, including, but not limited to stack height, stack diameter, stack gas temperature, and stack gas exit velocity;

(D) Plot plan showing all stack emission points, nearby residences and property boundary line;

(E) Identification of any stack gas control devices used to reduce emissions from each combustor;

(F) Identification of the RfC values used to calculate annual average HCl-equivalent emission rates and the aREL values used to calculate 1-hour average HCl-equivalent emission rates;

(G) Calculations used to determine the annual average and 1-hour average HCl-equivalent emission rates and rate limits, including calculation of the Cl_2/HCl ratios as prescribed by paragraph (b)(6) of this section;

(ii) *Additional content to implement the annual average HCl-equivalent emission rate limit.* You must include the following in your eligibility demonstration to implement the annual average HCl-equivalent emission rate limit:

(A) For incinerators, cement kilns, and lightweight aggregate kilns, calculations to confirm that the annual average HCl-equivalent emission rate that you calculate from the total chlorine emission rate you select for each combustor does not exceed the limits provided by paragraph (b)(7) of this section;

(B) Comparison of the annual average HCl-equivalent emission rate limit for each combustor to the annual average HCl-equivalent emission rate for the total chlorine emission rate you select for each combustor;

(C) The annual average HCl-equivalent emission rate limit for each hazardous waste combustor, and the limits on operating parameters required under paragraph (g)(1) of this section;

(D) Determination of the long-term chlorine feedrate limit, including the total chlorine system removal efficiency for sources that establish an (up to) annual rolling average feedrate limit under paragraph (g)(2)(ii) of this section;

(iii) *Additional content to implement the 1-hour average HCl-equivalent emission rate limit.* You must include the following in your eligibility demonstration to implement the 1-hour average HCl-equivalent emission rate limit:

(A) Determination of whether the combustor may exceed the 1-hour HCl-equivalent emission rate limit absent an hourly rolling average chlorine feedrate limit, including:

(1) Determination of the 1-hour average HCl-equivalent emission rate from the total chlorine emission rate you select for the combustor;

(2) Determination of the 1-hour average HCl-equivalent emission rate limit using either look-up Tables 3 and 4 to this section or site-specific risk analysis;

(3) Determination of the ratio of the 1-hour average HCl-equivalent emission rate to the 1-hour average HCl-equivalent emission rate limit for the combustor; and

(4) The potential for the source to vary total chlorine and chloride feedrates substantially over the averaging period for the long-term feedrate limit established under paragraphs (g)(2)(i) and (g)(2)(ii) of this section; and

(B) Determination of the hourly rolling average chlorine feedrate limit, including the total chlorine system removal efficiency.

(iv) *Additional content of a look-up table demonstration.* If you use the look-up table analysis to establish HCl-equivalent emission rate limits, your eligibility demonstration must also contain, at a minimum, the following:

(A) Documentation that the facility is located in either flat or simple elevated terrain; and

(B) For facilities with more than one on-site hazardous waste combustor, documentation that the sum of the ratios for all such combustors of the HCl-equivalent emission rate to the HCl-equivalent emission rate limit does not exceed 1.0.

(v) *Additional content of a site-specific compliance demonstration.* If you use a site-specific compliance demonstration, your eligibility demonstration must also contain, at a minimum, the following information to support your determination of the annual average HCl-equivalent emission rate limit for each combustor:

(A) Identification of the risk assessment methodology used;

(B) Documentation of the fate and transport model used;

(C) Documentation of the fate and transport model inputs, including the stack parameters listed in paragraph (d)(1)(i)(C) of this section converted to the dimensions required for the model;

(D) As applicable:

(1) Meteorological data;

(2) Building, land use, and terrain data;

(3) Receptor locations and population data, including areas where people congregate for work, school, or recreation; and

(4) Other facility-specific parameters input into the model;

(E) Documentation of the fate and transport model outputs; and

(F) Documentation of any exposure assessment and risk characterization calculations.

(2) *Review and approval*—(i) *Existing sources.* (A) If you operate an existing source, you must submit the eligibility demonstration to your permitting authority for review and approval not later than 12 months prior to the compliance date. You must also submit a separate copy of the eligibility demonstration to: U.S. EPA, Risk and Exposure Assessment Group, Emission Standards Division (C404–01), Attn: Group Leader, Research Triangle Park, North Carolina 27711, electronic mail address *REAG@epa.gov.*

(B) Your permitting authority should notify you of approval or intent to disapprove your eligibility demonstration within 6 months after receipt of the original demonstration, and within 3 months after receipt of any supplemental information that you submit. A notice of intent to disapprove your eligibility demonstration, whether before or after the compliance date, will identify incomplete or inaccurate information or noncompliance with prescribed procedures and specify how much time you will have to submit additional information or to achieve the MACT standards for total chlorine under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221. If your eligibility demonstration is disapproved, the permitting authority may extend the compliance date of the total chlorine standards to allow you to make changes to the design or operation of the combustor or related systems as quickly as practicable to enable you to achieve compliance with the MACT total chlorine standards.

(C) If your permitting authority has not approved your eligibility demonstration by the compliance date, and has not issued a notice of intent to disapprove your demonstration, you may nonetheless begin complying, on the compliance date, with the HCl-equivalent emission rate limits you present in your eligibility demonstration.

(D) If your permitting authority issues a notice of intent to disapprove your eligibility demonstration after the compliance date, the authority will identify the basis for that notice and specify how much time you will have to submit additional information or to comply with the MACT standards for total chlorine under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221. The permitting authority may extend the compliance date of the total chlorine standards to allow you to make changes to the design or operation of the combustor or related systems as quickly as practicable to enable you to achieve compliance with the MACT standards for total chlorine.

(ii) *New or reconstructed sources.* (A) *General.* The procedures for review and approval of eligibility demonstrations applicable to existing sources under paragraph (e)(2)(i) of this section also apply to new or reconstructed sources, except that the date you must submit the eligibility demonstration is as prescribed in this paragraph (e)(2)(ii).

(B) If you operate a new or reconstructed source that starts up before April 12, 2007, or a solid fuel boiler or liquid fuel boiler that is an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP before April 12, 2007, you must either:

(*1*) Comply with the final total chlorine emission standards under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221, by October 12, 2005, or upon startup, whichever is later, except for a standard that is more stringent than the standard proposed on April 20, 2004 for your source. If a final standard is more stringent than the proposed standard, you may comply with the proposed standard until October 14, 2008, after which you must comply with the final standard; or

(*2*) Submit an eligibility demonstration for review and approval under this section by April 12, 2006, and comply with the HCl-equivalent emission rate limits and operating requirements you establish in the eligibility demonstration.

(C) If you operate a new or reconstructed source that starts up on or after April 12, 2007, or a solid fuel boiler or liquid fuel boiler that is an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP on or after April 12, 2007, you must either:

(*1*) Comply with the final total chlorine emission standards under §§ 63.1216, 63.1217, 63.1219, 63.1220, and 63.1221 upon startup. If the final standard is more stringent than the standard proposed for your source on April 20, 2004, however, and if you start operations before October 14, 2008, you may comply with the proposed standard until October 14, 2008, after which you must comply with the final standard; or

(*2*) Submit an eligibility demonstration for review and approval under this section 12 months prior to startup.

(f) *Testing requirements*—(1) *General.* You must comply with the requirements for comprehensive performance testing under § 63.1207.

(2) *System removal efficiency.* (i) You must calculate the total chlorine removal efficiency of the combustor during each run of the comprehensive performance test.

(ii) You must calculate the average system removal efficiency as the average of the test run averages.

(iii) If your source does not control emissions of total chlorine, you must assume zero system removal efficiency.

(3) *Annual average HCl-equivalent emission rate limit.* If emissions during the comprehensive performance test exceed the annual average HCl-equivalent emission rate limit, eligibility for emission limits under this section is not affected. This emission rate limit is an annual average limit even though compliance is based on a 12-hour or (up to) an annual rolling average feedrate limit on total chlorine and chloride because the feedrate limit is also used for compliance assurance for the semivolatile metal emission standard

(4) *1-hour average HCl-equivalent emission rate limit.* Total chlorine emissions during each run of the comprehensive performance test cannot exceed the 1-hour average HCl-equivalent emission rate limit.

(5) *Test methods.* (i) If you operate a cement kiln or a combustor equipped with a dry acid gas scrubber, you must use EPA Method 320/321 or ASTM D 6735–01, or an equivalent method, to measure hydrogen chloride, and the back-half (caustic impingers) of Method 26/26A, or an equivalent method, to measure chlorine gas.

(ii) *Bromine and sulfur considerations.* If you operate an incinerator, boiler, or lightweight aggregate kiln and your feedstreams contain bromine or sulfur during the comprehensive performance test at levels specified under paragraph (e)(2)(ii)(B) of this section, you must use EPA Method 320/321 or ASTM D 6735–01, or an equivalent method, to measure hydrogen chloride, and Method 26/26A, or an equivalent method, to measure chlorine and hydrogen chloride, and determine your chlorine emissions as follows:

(A) You must determine you chlorine emissions to be the higher of the value measured by Method 26/26A, or an equivalent method, or the value calculated by difference between the combined hydrogen chloride and chlorine levels measured by Method 26/26a, or an equivalent method, and the hydrogen chloride measurement from EPA Method 320/321 or ASTM D 6735–01, or an equivalent method.

(B) The procedures under paragraph (f)(2)(ii) of this section for determining hydrogen chloride and chlorine emissions apply if you feed bromine or sulfur during the performance test at the levels specified in this paragraph (f)(5)(ii)(B):

(*1*) If the bromine/chlorine ratio in feedstreams is greater than 5 percent by mass; or

(*2*) If the sulfur/chlorine ratio in feedstreams is greater than 50 percent by mass.

(g) *Monitoring requirements.* (1) *General.* You must establish and comply with limits on the same operating parameters that apply to sources complying with the MACT standard for total chlorine under § 63.1209(o), except that feedrate limits on total chlorine and chloride must be established according to paragraphs (g)(2) and (g)(3) of this section:

(2) *Feedrate limit to ensure compliance with the annual average HCl-equivalent emission rate limit.* (i) For sources subject to the feedrate limit for total chlorine and chloride under § 63.1209(n)(4) to ensure compliance with the semivolatile metals standard:

(A) The feedrate limit (and averaging period) for total chlorine and chloride to ensure compliance with the annual average HCl-equivalent emission rate limit is the same as required by § 63.1209(n)(4), except as provided by paragraph (g)(2)(i)(B) of this section.

(B) The numerical value of the total chlorine and chloride feedrate limit (*i.e.*, not considering the averaging period) you establish under § 63.1209(n)(4) must not exceed the value you calculate as the annual average HCl-equivalent emission rate limit (lb/hr) divided by [1 − system removal efficiency], where the system removal efficiency is calculated as prescribed by paragraph (f)(2) of this section.

(ii) For sources exempt from the feedrate limit for total chlorine and chloride under § 63.1209(n)(4) because they comply with § 63.1207(m)(2), the feedrate limit for total chlorine and chloride to ensure compliance with the annual average HCl-equivalent emission rate must be established as follows:

(A) You must establish an average period for the feedrate limit that does not exceed an annual rolling average;

(B) The numerical value of the total chlorine and chloride feedrate limit (*i.e.*, not considering the averaging period) must not exceed the value you calculate as the annual average HCl-equivalent emission rate limit (lb/hr) divided by [1 − system removal efficiency], where the system removal efficiency is calculated as prescribed by paragraph (f)(2) of this section.

(C) You must calculate the initial rolling average as though you had selected a 12-hour rolling average, as provided by paragraph (b)(5)(i) of this section. You must calculate rolling averages thereafter as the average of the available one-minute values until enough one-minute values are available to calculate the rolling average period you select. At that time and thereafter, you update the rolling average feedrate each hour with a 60-minute average feedrate.

(3) *Feedrate limit to ensure compliance with the 1-hour average HCl-equivalent emission rate limit.* (i) You must establish an hourly rolling average feedrate limit on total chlorine and chloride to ensure compliance with the 1-hour average HCl-equivalent emission rate limit unless you determine that the hourly rolling average feedrate limit is waived under paragraph (d) of this section.

(ii) You must calculate the hourly rolling average feedrate limit for total chlorine and chloride as the 1-hour average HCl-equivalent emission rate limit (lb/hr) divided by [1 − system removal efficiency], where the system removal efficiency is calculated as prescribed by paragraph (f)(2)(ii) of this section.

(h) *Changes*—(1) *Changes over which you have control.* (i) *Changes that would affect the HCl-equivalent emission rate limit.* (A) If you plan to change the design, operation, or maintenance of the facility in a manner than would decrease the annual average or 1-hour average HCl-equivalent emission rate limit, you must submit to the permitting authority prior to the change a revised eligibility demonstration documenting the lower emission rate limits and calculations of reduced total chlorine and chloride feedrate limits.

(B) If you plan to change the design, operation, or maintenance of the facility in a manner than would increase the annual average or 1-hour average HCl-equivalent emission rate limit, and you elect to increase your total chlorine and chloride feedrate limits. You must also submit to the permitting authority prior to the change a revised eligibility demonstration documenting the increased emission rate limits and calculations of the increased feedrate limits prior to the change.

(ii) *Changes that could affect system removal efficiency.* (A) If you plan to change the design, operation, or maintenance of the combustor in a manner than could decrease the system removal efficiency, you are subject to the requirements of § 63.1206(b)(5) for conducting a performance test to reestablish the combustor's system removal efficiency and you must submit a revised eligibility demonstration documenting the lower system removal efficiency and the reduced feedrate limits on total chlorine and chloride.

(B) If you plan to change the design, operation, or maintenance of the combustor in a manner than could increase the system removal efficiency, and you elect to document the increased system removal efficiency to establish higher feedrate limits on total chlorine and chloride, you are subject to the requirements of § 63.1206(b)(5) for conducting a performance test to reestablish the combustor's system removal efficiency. You must also submit to the permitting authority a revised eligibility demonstration documenting the higher system removal efficiency and the increased feedrate limits on total chlorine and chloride.

(2) *Changes over which you do not have control that may decrease the HCl-equivalent emission rate limits.* These requirements apply if you use a site-specific risk assessment under paragraph (c)(4) of this section to demonstrate eligibility for the health-based limits.

(i) *Proactive review.* You must review the documentation you use in your eligibility demonstration every five years from the date of the comprehensive performance test and submit for review and approval with the comprehensive performance test plan either a certification that the information used in your eligibility demonstration has not changed in a manner that would decrease the annual average or 1-hour average HCl-equivalent emission rate limit, or a revised eligibility demonstration.

(ii) *Reactive review.* If in the interim between your comprehensive performance tests you have reason to know of changes that would decrease the annual average or 1-hour average HCl-equivalent emission rate limit, you must submit a revised eligibility demonstration as soon as practicable but not more frequently than annually.

(iii) *Compliance schedule.* If you determine that you cannot demonstrate compliance with a lower annual average HCl-equivalent emission rate limit during the comprehensive performance test because you need additional time to complete changes to the design or operation of the source, you may request that the permitting authority grant you additional time to make those changes as quickly as practicable.

BILLING CODE 6560–50–P

Table 1 of §63.1215: Annual Average HCl-Equivalent Emssion Rate Limits (lb/hr)—Flat Terrain

	Distance to property boundary (m)

■ 17. Section 63.1216 and an undesignated center heading are added to subpart EEE to read as follows:

Emissions Standards and Operating Limits for Solid Fuel Boilers, Liquid Fuel Boilers, and Hydrochloric Acid Production Furnaces

§ 63.1216 What are the standards for solid fuel boilers that burn hazardous waste?

(a) *Emission limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1) For dioxins and furans, either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (a)(5) of this section;

(2) Mercury in excess of 11 μg/dscm corrected to 7 percent oxygen;

(3) For cadmium and lead combined, except for an area source as defined under § 63.2, emissions in excess of 180 μg/dscm, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium combined, except for an area source as defined under § 63.2, emissions in excess of 380 μg/dscm, corrected to 7 percent oxygen;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If

you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine combined, except for an area source as defined under § 63.2, emissions in excess of 440 parts per million by volume, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) For particulate matter, except for an area source as defined under § 63.2 or as provided by paragraph (e) of this section, emissions in excess of 68 mg/dscm corrected to 7 percent oxygen.

(b) *Emission limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1) For dioxins and furans, either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (b)(5) of this section;

(2) Mercury in excess of 11 µg/dscm corrected to 7 percent oxygen;

(3) For cadmium and lead combined, except for an area source as defined under § 63.2, emissions in excess of 180 µg/dscm, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium combined, except for an area source as defined under § 63.2, emissions in excess of 190 µg/dscm, corrected to 7 percent oxygen;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine combined, except for an area source as defined under § 63.2, emissions in excess of 73 parts per million by volume, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) For particulate matter, except for an area source as defined under § 63.2 or as provided by paragraph (e) of this section, emissions in excess of 34 mg/dscm corrected to 7 percent oxygen.

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a DRE of 99.99% for each principle organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} \div W_{in})] \times 100\%$$

Where:

W_{in} = mass feedrate of one POHC in a waste feedstream; and

W_{out} = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a DRE of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-*p*-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to incinerate hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituents (POHCs).* (i) You must treat the POHCs in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

(e) *Alternative to the particulate matter standard.* (1) *General.* In lieu of complying with the particulate matter standards of this section, you may elect to comply with the following alternative metal emission control requirement:

(2) *Alternative metal emission control requirements for existing solid fuel boilers.* (i) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 180 µg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(ii) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 380 µg/dscm, combined emissions, corrected to 7 percent oxygen.

(3) Alternative metal emission control requirements for new solid fuel boilers. (i) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 180 µg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(ii) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 190 µg/dscm, combined emissions, corrected to 7 percent oxygen.

(4) *Operating limits.* Semivolatile and low volatile metal operating parameter limits must be established to ensure compliance with the alternative emission limitations described in paragraphs (e)(2) and (e)(3) of this section pursuant to § 63.1209(n), except that semivolatile metal feedrate limits apply to lead, cadmium, and selenium, combined, and low volatile metal feedrate limits apply to arsenic,

beryllium, chromium, antimony, cobalt, manganese, and nickel, combined.

(f) *Elective standards for area sources.* Area sources as defined under § 63.2 are subject to the standards for cadmium and lead, the standards for arsenic, beryllium, and chromium, the standards for hydrogen chloride and chlorine, and the standards for particulate matter under this section if they elect under § 266.100(b)(3) of this chapter to comply with those standards in lieu of the standards under 40 CFR 266.105, 266.106, and 266.107 to control those pollutants.

■ 18. Section 63.1217 is added to read as follows:

§ 63.1217 What are the standards for liquid fuel boilers that burn hazardous waste?

(a) *Emission limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1)(i) Dioxins and furans in excess of 0.40 ng TEQ/dscm, corrected to 7 percent oxygen, for liquid fuel boilers equipped with a dry air pollution control system; or

(ii) Either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (a)(5) of this section for sources not equipped with a dry air pollution control system;

(iii) A source equipped with a wet air pollution control system followed by a dry air pollution control system is not considered to be a dry air pollution control system, and a source equipped with a dry air pollution control system followed by a wet air pollution control system is considered to be a dry air pollution control system for purposes of this emission limit;

(2) For mercury, except as provided for in paragraph (a)(2)(iii) of this section:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 19 μg/dscm, corrected to 7 percent oxygen, on an (not-to-exceed) annual averaging period;

(ii) When you burn hazardous waste with an as-fired heating value 10,000 Btu/lb or greater, emissions in excess of 4.2×10^{-5} lbs mercury attributable to the hazardous waste per million Btu heat input from the hazardous waste on an (not-to-exceed) annual averaging period;

(iii) The boiler operated by Diversified Scientific Services, Inc. with EPA identification number TND982109142, and which burns radioactive waste mixed with hazardous waste, must comply with the mercury emission standard under § 63.1219(a)(2);

(3) For cadmium and lead combined, except for an area source as defined under § 63.2,

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 150 μg/dscm, corrected to 7 percent oxygen, on an (not-to-exceed) annual averaging period;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 8.2×10^{-5} lbs combined cadmium and lead emissions attributable to the hazardous waste per million Btu heat input from the hazardous waste on an (not-to-exceed) annual averaging period;

(4) For chromium, except for an area source as defined under § 63.2:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 370 μg/dscm, corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 1.3×10^{-4} lbs chromium emissions attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine, except for an area source as defined under § 63.2:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 31 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 5.08×10^{-2} lbs combined emissions of hydrogen chloride and chlorine gas attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(7) For particulate matter, except for an area source as defined under § 63.2 or as provided by paragraph (e) of this section, emissions in excess of 80 mg/dscm corrected to 7 percent oxygen.

(b) *Emission limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1)(i) Dioxins and furans in excess of 0.40 ng TEQ/dscm, corrected to 7 percent oxygen, for liquid fuel boilers equipped with a dry air pollution control system; or

(ii) Either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (b)(5) of this section for sources not equipped with a dry air pollution control system;

(iii) A source equipped with a wet air pollution control system followed by a dry air pollution control system is not considered to be a dry air pollution control system, and a source equipped with a dry air pollution control system followed by a wet air pollution control system is considered to be a dry air pollution control system for purposes of this emission limit;

(2) For mercury:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 6.8 μg/dscm, corrected to 7 percent oxygen, on an (not-to-exceed) annual averaging period;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 1.2×10^{-6} lbs mercury emissions attributable to the hazardous waste per million Btu heat input from the hazardous waste on an (not-to-exceed) annual averaging period;

(3) For cadmium and lead combined, except for an area source as defined under § 63.2:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 78 μg/dscm, corrected to 7 percent oxygen, on an (not-to-exceed) annual averaging period;

(ii) When you burn hazardous waste with an as-fired heating value greater than or equal to 10,000 Btu/lb, emissions in excess of 6.2×10^{-6} lbs combined cadmium and lead emissions attributable to the hazardous waste per

million Btu heat input from the hazardous waste on an (not-to-exceed) annual averaging period;

(4) For chromium, except for an area source as defined under § 63.2:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 12 μg/dscm, corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 1.4×10^{-5} lbs chromium emissions attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine, except for an area source as defined under § 63.2:

(i) When you burn hazardous waste with an as-fired heating value less than 10,000 Btu/lb, emissions in excess of 31 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with an as-fired heating value of 10,000 Btu/lb or greater, emissions in excess of 5.08×10^{-2} lbs combined emissions of hydrogen chloride and chlorine gas attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(7) For particulate matter, except for an area source as defined under § 63.2 or as provided by paragraph (e) of this section, emissions in excess of 20 mg/dscm corrected to 7 percent oxygen.

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a DRE of 99.99% for each principle organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} \div W_{in})] \times 100\%$$

Where:

W_{in} = mass feedrate of one POHC in a waste feedstream; and

W_{out} = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a DRE of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-*p*-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to incinerate hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituents (POHCs).* (i) You must treat the POHCs in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

(e) *Alternative to the particulate matter standard.* (1) *General.* In lieu of complying with the particulate matter standards of this section, you may elect to comply with the following alternative metal emission control requirement:

(2) *Alternative metal emission control requirements for existing liquid fuel boilers.* (i) When you burn hazardous waste with a heating value less than 10,000 Btu/lb:

(A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium, combined, in excess of 150 μg/dscm, corrected to 7 percent oxygen; and

(B) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel, combined, in excess of 370 μg/dscm, corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with a heating value of 10,000 Btu/lb or greater:

(A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain in excess of 8.2×10^{-5} lbs combined emissions of cadmium, lead, and selenium attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(B) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain either in excess of 1.3×10^{-4} lbs combined emissions of antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(3) *Alternative metal emission control requirements for new liquid fuel boilers.* (i) When you burn hazardous waste with a heating value less than 10,000 Btu/lb:

(A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium, combined, in excess of 78 μg/dscm, corrected to 7 percent oxygen; and

(B) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel, combined, in excess of 12 μg/dscm, corrected to 7 percent oxygen;

(ii) When you burn hazardous waste with a heating value greater than or equal to 10,000 Btu/lb:

(A) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain in excess of 6.2×10^{-6} lbs combined emissions of cadmium, lead, and selenium attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(B) You must not discharge or cause combustion gases to be emitted into the

atmosphere that contain either in excess of 1.4×10^{-5} lbs combined emissions of antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(4) *Operating limits.* Semivolatile and low volatile metal operating parameter limits must be established to ensure compliance with the alternative emission limitations described in paragraphs (e)(2) and (e)(3) of this section pursuant to § 63.1209(n), except that semivolatile metal feedrate limits apply to lead, cadmium, and selenium, combined, and low volatile metal feedrate limits apply to arsenic, beryllium, chromium, antimony, cobalt, manganese, and nickel, combined.

(f) *Elective standards for area sources.* Area sources as defined under § 63.2 are subject to the standards for cadmium and lead, the standards for chromium, the standards for hydrogen chloride and chlorine, and the standards for particulate matter under this section if they elect under § 266.100(b)(3) of this chapter to comply with those standards in lieu of the standards under 40 CFR 266.105, 266.106, and 266.107 to control those pollutants.

■ 19. Section 63.1218 is added to read as follows:

§ 63.1218 What are the standards for hydrochloric acid production furnaces that burn hazardous waste?

(a) *Emission limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1) For dioxins and furans, either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (a)(5) of this section;

(2) For mercury, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (a)(6) of this section;

(3) For lead and cadmium, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (a)(6) of this section;

(4) For arsenic, beryllium, and chromium, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (a)(6) of this section;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine gas, either:

(i) Emission in excess of 150 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$ equivalent, dry basis and corrected to 7 percent oxygen; or

(ii) Emissions greater than the levels that would be emitted if the source is achieving a system removal efficiency (SRE) of less than 99.923 percent for total chlorine and chloride fed to the combustor. You must calculate SRE from the following equation:

$$SRE = [1 - (Cl_{out} / Cl_{in})] \times 100\%$$

Where:

Cl in = mass feedrate of total chlorine or chloride in all feedstreams, reported as chloride; and

Cl out = mass emission rate of hydrogen chloride and chlorine gas, reported as chloride, in exhaust emissions prior to release to the atmosphere.

(7) For particulate matter, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (a)(6) of this section.

(b) *Emission limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1) For dioxins and furans, either carbon monoxide or hydrocarbon emissions in excess of the limits provided by paragraph (b)(5) of this section;

(2) For mercury, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (b)(6) of this section;

(3) For lead and cadmium, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (b)(6) of this section;

(4) For arsenic, beryllium, and chromium, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas emissions in excess of the levels provided by paragraph (b)(6) of this section;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) For hydrogen chloride and chlorine gas, either:

(i) Emission in excess of 25 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$ equivalent, dry basis and corrected to 7 percent oxygen; or

(ii) Emissions greater than the levels that would be emitted if the source is achieving a system removal efficiency (SRE) of less than 99.987 percent for total chlorine and chloride fed to the combustor. You must calculate SRE from the following equation:

$$SRE = [1 - (Cl_{out} / Cl_{in})] \times 100\%$$

Where:

Cl in = mass feedrate of total chlorine or chloride in all feedstreams, reported as chloride; and

Cl out = mass emission rate of hydrogen chloride and chlorine gas, reported as chloride, in exhaust emissions prior to release to the atmosphere.

(7) For particulate matter, except for an area source as defined under § 63.2, hydrogen chloride and chlorine gas

emissions in excess of the levels provided by paragraph (b)(6) of this section.

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a DRE of 99.99% for each principle organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} / W_{in})] \times 100\%$$

Where:

Win = mass feedrate of one POHC in a waste feedstream; and

Wout = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a DRE of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-*p*-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to incinerate hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituents (POHCs).* (i) You must treat the POHCs in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

(e) *Elective standards for area sources.* Area sources as defined under § 63.2 are subject to the standards for cadmium and lead, the standards for arsenic, beryllium, and chromium, the standards for hydrogen chloride and chlorine, and the standards for particulate matter under this section if they elect under § 266.100(b)(3) of this chapter to comply with those standards in lieu of the standards under 40 CFR 266.105, 266.106, and 266.107 to control those pollutants.

■ 20. Section 63.1219 and a new undesignated center heading are added to subpart EEE to read as follows:

Replacement Emissions Standards and Operating Limits for Incinerators, Cement Kilns, and Lightweight Aggregate Kilns

§ 63.1219 What are the replacement standards for hazardous waste incinerators?

(a) *Emission limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1) For dioxins and furans:

(i) For incinerators equipped with either a waste heat boiler or dry air pollution control system, either:

(A) Emissions in excess of 0.20 ng TEQ/dscm, corrected to 7 percent oxygen; or

(B) Emissions in excess of 0.40 ng TEQ/dscm, corrected to 7 percent oxygen, provided that the combustion gas temperature at the inlet to the initial particulate matter control device is 400°F or lower based on the average of the test run average temperatures. (For purposes of compliance, operation of a wet particulate matter control device is presumed to meet the 400°F or lower requirement);

(ii) Emissions in excess of 0.40 ng TEQ/dscm, corrected to 7 percent oxygen, for incinerators not equipped with either a waste heat boiler or dry air pollution control system;

(iii) A source equipped with a wet air pollution control system followed by a dry air pollution control system is not considered to be a dry air pollution control system, and a source equipped with a dry air pollution control system followed by a wet air pollution control system is considered to be a dry air pollution control system for purposes of this standard;

(2) Mercury in excess of 130 µg/dscm, corrected to 7 percent oxygen;

(3) Cadmium and lead in excess of 230 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) Arsenic, beryllium, and chromium in excess of 92 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) Hydrogen chloride and chlorine gas (total chlorine) in excess of 32 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) Except as provided by paragraph (e) of this section, particulate matter in excess of 0.013 gr/dscf corrected to 7 percent oxygen.

(b) *Emission limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere that contain:

(1)(i) Dioxins and furans in excess of 0.11 ng TEQ/dscm corrected to 7 percent oxygen for incinerators equipped with either a waste heat boiler or dry air pollution control system; or

(ii) Dioxins and furans in excess of 0.20 ng TEQ/dscm corrected to 7 percent oxygen for sources not equipped with either a waste heat boiler or dry air pollution control system;

(iii) A source equipped with a wet air pollution control system followed by a dry air pollution control system is not considered to be a dry air pollution control system, and a source equipped with a dry air pollution control system followed by a wet air pollution control system is considered to be a dry air pollution control system for purposes of this standard;

(2) Mercury in excess of 8.1 µg/dscm, corrected to 7 percent oxygen;

(3) Cadmium and lead in excess of 10 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) Arsenic, beryllium, and chromium in excess of 23 µg/dscm, combined

emissions, corrected to 7 percent oxygen;

(5) For carbon monoxide and hydrocarbons, either:

(i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(ii) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) Hydrogen chloride and chlorine gas in excess of 21 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) Except as provided by paragraph (e) of this section, particulate matter in excess of 0.0015 gr/dscf, corrected to 7 percent oxygen.

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a destruction and removal efficiency (DRE) of 99.99% for each principle organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} / W_{in})] \times 100\%$$

Where:

W_{in} = mass feedrate of one POHC in a waste feedstream; and

W_{out} = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a DRE of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-*p*-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to incinerate hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituent (POHC).* (i) You must treat each POHC in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

(e) *Alternative to the particulate matter standard.* (1). *General.* In lieu of complying with the particulate matter standards of this section, you may elect to comply with the following alternative metal emission control requirement:

(2) *Alternative metal emission control requirements for existing incinerators.* (i) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 230 μg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(ii) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 92 μg/dscm, combined emissions, corrected to 7 percent oxygen.

(3) *Alternative metal emission control requirements for new incinerators.* (i) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain cadmium, lead, and selenium in excess of 10 μg/dscm, combined emissions, corrected to 7 percent oxygen; and,

(ii) You must not discharge or cause combustion gases to be emitted into the atmosphere that contain antimony, arsenic, beryllium, chromium, cobalt, manganese, and nickel in excess of 23 μg/dscm, combined emissions, corrected to 7 percent oxygen.

(4) *Operating limits.* Semivolatile and low volatile metal operating parameter limits must be established to ensure compliance with the alternative emission limitations described in paragraphs (e)(2) and (e)(3) of this section pursuant to § 63.1209(n), except that semivolatile metal feedrate limits apply to lead, cadmium, and selenium, combined, and low volatile metal feedrate limits apply to arsenic, beryllium, chromium, antimony, cobalt, manganese, and nickel, combined.

■ 21. Section 63.1220 is added to subpart EEE to read as follows:

§ 63.1220 What are the replacement standards for hazardous waste burning cement kilns?

(a) *Emission and hazardous waste feed limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere or feed hazardous waste that contain:

(1) For dioxins and furans, either:

(i) Emissions in excess of 0.20 ng TEQ/dscm corrected to 7 percent oxygen; or

(ii) Emissions in excess of 0.40 ng TEQ/dscm corrected to 7 percent oxygen provided that the combustion gas temperature at the inlet to the initial dry particulate matter control device is 400 °F or lower based on the average of the test run average temperatures;

(2) For mercury, both:

(i) An average as-fired concentration of mercury in all hazardous waste feedstreams in excess of 3.0 parts per million by weight; and

(ii) Emissions in excess of 120 μg/dscm, corrected to 7 percent oxygen; or

(iii) A hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) in excess of 120 μg/dscm;

(3) For cadmium and lead, both:

(i) Emissions in excess of 7.6×10^{-4} lbs combined emissions of cadmium and lead attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 330 μg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium, both:

(i) Emissions in excess of 2.1×10^{-5} lbs combined emissions of arsenic, beryllium, and chromium attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 56 μg/dscm, combined emissions, corrected to 7 percent oxygen;

(5) *Carbon monoxide and hydrocarbons.* (i) For kilns equipped with a by-pass duct or midkiln gas sampling system, either:

(A) Carbon monoxide in the by-pass duct or mid-kiln gas sampling system in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(i)(B) of this section, you must also document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons in the by-pass duct or mid-kiln gas sampling system do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(B) Hydrocarbons in the by-pass duct or midkiln gas sampling system in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane;

(ii) For kilns not equipped with a by-pass duct or midkiln gas sampling system, either:

(A) Hydrocarbons in the main stack in excess of 20 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(B) Carbon monoxide in the main stack in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii)(A) of this section, you also must document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons in the main stack do not exceed 20 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane.

(6) Hydrogen chloride and chlorine gas in excess of 120 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis, corrected to 7 percent oxygen; and

(7) For particulate matter, both:

(i) Emissions in excess of 0.028 gr/dscf corrected to 7 percent oxygen; and

(ii) Opacity greater than 20 percent, unless your source is equipped with a bag leak detection system under § 63.1206(c)(8) or a particulate matter detection system under § 63.1206(c)(9).

(b) *Emission and hazardous waste feed limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere or feed hazardous waste that contain:

(1) For dioxins and furans, either:

(i) Emissions in excess of 0.20 ng TEQ/dscm corrected to 7 percent oxygen; or

(ii) Emissions in excess of 0.40 ng TEQ/dscm corrected to 7 percent oxygen provided that the combustion gas temperature at the inlet to the initial dry particulate matter control device is 400 °F or lower based on the average of the test run average temperatures;

(2) For mercury, both:

(i) An average as-fired concentration of mercury in all hazardous waste feedstreams in excess of 1.9 parts per million by weight; and

(ii) Emissions in excess of 120 µg/dscm, corrected to 7 percent oxygen; or

(iii) A hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) in excess of 120 µg/dscm;

(3) For cadmium and lead, both:

(i) Emissions in excess of 6.2×10^{-5} lbs combined emissions of cadmium and lead attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 180 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium, both:

(i) Emissions in excess of 1.5×10^{-5} lbs combined emissions of arsenic, beryllium, and chromium attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 54 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(5) *Carbon monoxide and hydrocarbons.* (i) For kilns equipped with a by-pass duct or midkiln gas sampling system, carbon monoxide and hydrocarbons emissions are limited in both the bypass duct or midkiln gas sampling system and the main stack as follows:

(A) Emissions in the by-pass or midkiln gas sampling system are limited to either:

(1) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(i)(A)(2) of this section, you also must document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 10 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(2) Hydrocarbons in the by-pass duct or midkiln gas sampling system in excess of 10 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; and

(B) Hydrocarbons in the main stack are limited, if construction of the kiln commenced after April 19, 1996 at a plant site where a cement kiln (whether burning hazardous waste or not) did not previously exist, to 50 parts per million by volume, over a 30-day block average (monitored continuously with a continuous monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane.

(ii) For kilns not equipped with a by-pass duct or midkiln gas sampling system, hydrocarbons and carbon monoxide are limited in the main stack to either:

(A) Hydrocarbons not exceeding 20 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(B)(1) Carbon monoxide not exceeding 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen; and

(2) Hydrocarbons not exceeding 20 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous

monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane at any time during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7); and

(3) If construction of the kiln commenced after April 19, 1996 at a plant site where a cement kiln (whether burning hazardous waste or not) did not previously exist, hydrocarbons are limited to 50 parts per million by volume, over a 30-day block average (monitored continuously with a continuous monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane.

(6) Hydrogen chloride and chlorine gas in excess of 86 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) For particulate matter, both:

(i) Emissions in excess of 0.0023 gr/dscf corrected to 7 percent oxygen; and

(ii) Opacity greater than 20 percent, unless your source is equipped with a bag leak detection system under § 63.1206(c)(8) or a particulate matter detection system under § 63.1206(c)(9).

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a destruction and removal efficiency (DRE) of 99.99% for each principle organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} / W_{in})] \times 100\%$$

Where:

W_{in} = mass feedrate of one POHC in a waste feedstream; and

W_{out} = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a DRE of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-*p*-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to incinerate hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituent (POHC).* (i) You must treat each POHC in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Cement kilns with in-line kiln raw mills.* (1) *General.* (i) You must conduct performance testing when the raw mill is on-line and when the mill is off-line to demonstrate compliance with the emission standards, and you must establish separate operating parameter limits under § 63.1209 for each mode of operation, except as provided by paragraphs (d)(1)(iv) and (d)(1)(v) of this section.

(ii) You must document in the operating record each time you change from one mode of operation to the alternate mode and begin complying with the operating parameter limits for that alternate mode of operation.

(iii) You must calculate rolling averages for operating parameter limits as provided by § 63.1209(q)(2).

(iv) If your in-line kiln raw mill has dual stacks, you may assume that the dioxin/furan emission levels in the by-pass stack and the operating parameter limits determined during performance testing of the by-pass stack when the raw mill is off-line are the same as when the mill is on-line.

(v) In lieu of conducting a performance test to demonstrate compliance with the dioxin/furan emission standards for the mode of operation when the raw mill is on-line, you may specify in the performance test workplan and Notification of Compliance the same operating parameter limits required under § 63.1209(k) for the mode of operation when the raw mill is on-line as you establish during performance testing for the mode of operation when the raw mill is off-line.

(2) *Emissions averaging.* You may comply with the mercury, semivolatile metal, low volatile metal, and hydrogen chloride/chlorine gas emission standards on a time-weighted average basis under the following procedures:

(i) *Averaging methodology.* You must calculate the time-weighted average emission concentration with the following equation:

$$C_{total} = \{C_{mill\text{-}off} \times (T_{mill\text{-}off} / (T_{mill\text{-}off} + T_{mill\text{-}on}))\} + \{C_{mill\text{-}on} \times (T_{mill\text{-}on} / (T_{mill\text{-}off} + T_{mill\text{-}on}))\}$$

Where:

C_{total} = time-weighted average concentration of a regulated constituent considering both raw mill on time and off time;

$C_{mill\text{-}off}$ = average performance test concentration of regulated constituent with the raw mill off-line;

$C_{mill\text{-}on}$ = average performance test concentration of regulated constituent with the raw mill on-line;

$T_{mill\text{-}off}$ = time when kiln gases are not routed through the raw mill; and

$T_{mill\text{-}on}$ = time when kiln gases are routed through the raw mill.

(ii) *Compliance.* (A) If you use this emission averaging provision, you must document in the operating record compliance with the emission standards on an annual basis by using the equation provided by paragraph (d)(2) of this section.

(B) Compliance is based on one-year block averages beginning on the day you submit the initial notification of compliance.

(iii) *Notification.* (A) If you elect to document compliance with one or more emission standards using this emission averaging provision, you must notify the Administrator in the initial comprehensive performance test plan submitted under § 63.1207(e).

(B) You must include historical raw mill operation data in the performance test plan to estimate future raw mill down-time and document in the performance test plan that estimated emissions and estimated raw mill down-time will not result in an exceedance of an emission standard on an annual basis.

(C) You must document in the notification of compliance submitted under § 63.1207(j) that an emission standard will not be exceeded based on the documented emissions from the performance test and predicted raw mill down-time.

(e) *Preheater or preheater/precalciner kilns with dual stacks.* (1) *General.* You must conduct performance testing on each stack to demonstrate compliance with the emission standards, and you must establish operating parameter limits under § 63.1209 for each stack, except as provided by paragraph (d)(1)(iv) of this section for dioxin/furan emissions testing and operating parameter limits for the by-pass stack of in-line raw mills.

(2) *Emissions averaging.* You may comply with the mercury, semivolatile metal, low volatile metal, and hydrogen

chloride/chlorine gas emission standards specified in this section on a gas flowrate-weighted average basis under the following procedures:

(i) *Averaging methodology.* You must calculate the gas flowrate-weighted average emission concentration using the following equation:

$$C_{tot} = \{C_{main} \times (Q_{main} / (Q_{main} + Q_{bypass}))\} + \{C_{bypass} \times (Q_{bypass} / (Q_{main} + Q_{bypass}))\}$$

Where:

C_{tot} = gas flowrate-weighted average concentration of the regulated constituent;

C_{main} = average performance test concentration demonstrated in the main stack;

C_{bypass} = average performance test concentration demonstrated in the bypass stack;

Q_{main} = volumetric flowrate of main stack effluent gas; and

Q_{bypass} = volumetric flowrate of bypass effluent gas.

(ii) *Compliance.* (A) You must demonstrate compliance with the emission standard(s) using the emission concentrations determined from the performance tests and the equation provided by paragraph (e)(1) of this section; and

(B) You must develop operating parameter limits for bypass stack and main stack flowrates that ensure the emission concentrations calculated with the equation in paragraph (e)(1) of this section do not exceed the emission standards on a 12-hour rolling average basis. You must include these flowrate limits in the Notification of Compliance.

(iii) *Notification.* If you elect to document compliance under this emissions averaging provision, you must:

(A) Notify the Administrator in the initial comprehensive performance test plan submitted under § 63.1207(e). The performance test plan must include, at a minimum, information describing the flowrate limits established under paragraph (e)(2)(ii)(B) of this section; and

(B) Document in the Notification of Compliance submitted under § 63.1207(j) the demonstrated gas flowrate-weighted average emissions that you calculate with the equation provided by paragraph (e)(2) of this section.

(f) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

(g) [Reserved].

(h) When you comply with the particulate matter requirements of paragraphs (a)(7) or (b)(7) of this section, you are exempt from the New Source Performance Standard for particulate matter and opacity under § 60.60 of this chapter.

■ 22. Section 63.1221 is added to subpart EEE to read as follows:

§ 63.1221 What are the replacement standards for hazardous waste burning lightweight aggregate kilns?

(a) *Emission and hazardous waste feed limits for existing sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere or feed hazardous waste that contain:

(1) For dioxins and furans, either:

(i) Emissions in excess of 0.20 ng TEQ/dscm corrected to 7 percent oxygen; or

(ii) Rapid quench of the combustion gas temperature at the exit of the (last) combustion chamber (or exit of any waste heat recovery system that immediately follows the last combustion chamber) to 400°F or lower based on the average of the test run average temperatures. You must also notify in writing the RCRA authority that you are complying with this option;

(2) For mercury, either:

(i) Emissions in excess of 120 µg/dscm, corrected to 7 percent oxygen; or

(ii) A hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) in excess of 120 µg/dscm;

(3) For cadmium and lead, both:

(i) Emissions in excess of 3.0×10^{-4} lbs combined emissions of cadmium and lead attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 250 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium, both:

(i) In excess of 9.5×10^{-5} lbs combined emissions of arsenic, beryllium, and chromium attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(ii) Emissions in excess of 110 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(5) *Carbon monoxide and hydrocarbons.* (i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (a)(5)(ii) of this section, you also must document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 20 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 20 parts per million by volume, over an hourly rolling average, dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) Hydrogen chloride and chlorine gas in excess of 600 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) Particulate matter emissions in excess of 0.025 gr/dscf, corrected to 7 percent oxygen.

(b) *Emission and hazardous waste feed limits for new sources.* You must not discharge or cause combustion gases to be emitted into the atmosphere or feed hazardous waste that contain:

(1) For dioxins and furans, either:

(i) Emissions in excess of 0.20 ng TEQ/dscm corrected to 7 percent oxygen; or

(ii) Rapid quench of the combustion gas temperature at the exit of the (last) combustion chamber (or exit of any waste heat recovery system that immediately follows the last combustion chamber) to 400°F or lower based on the average of the test run average temperatures. You must also notify in writing the RCRA authority that you are complying with this option;

(2) For mercury, either:

(i) Emissions in excess of 120 µg/dscm, corrected to 7 percent oxygen; or

(ii) A hazardous waste feedrate corresponding to a maximum theoretical emission concentration (MTEC) in excess of 120 µg/dscm;

(3) For cadmium and lead, both:

(i) Emissions in excess of 3.7×10^{-5} lbs combined emissions of cadmium and lead attributable to the hazardous waste per million Btu heat input from the hazardous waste; and

(ii) Emissions in excess of 43 µg/dscm, combined emissions, corrected to 7 percent oxygen;

(4) For arsenic, beryllium, and chromium, both:

(i) In excess of 3.3×10^{-5} lbs combined emissions of arsenic, beryllium, and chromium attributable to the hazardous waste per million Btu heat input from the hazardous waste;

(ii) Emissions in excess of 110 μg/dscm, combined emissions, corrected to 7 percent oxygen;

(5) *Carbon monoxide and hydrocarbons.* (i) Carbon monoxide in excess of 100 parts per million by volume, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis and corrected to 7 percent oxygen. If you elect to comply with this carbon monoxide standard rather than the hydrocarbon standard under paragraph (b)(5)(ii) of this section, you also must document that, during the destruction and removal efficiency (DRE) test runs or their equivalent as provided by § 63.1206(b)(7), hydrocarbons do not exceed 20 parts per million by volume during those runs, over an hourly rolling average (monitored continuously with a continuous emissions monitoring system), dry basis, corrected to 7 percent oxygen, and reported as propane; or

(ii) Hydrocarbons in excess of 20 parts per million by volume, over an hourly rolling average, dry basis, corrected to 7 percent oxygen, and reported as propane;

(6) Hydrogen chloride and chlorine gas in excess of 600 parts per million by volume, combined emissions, expressed as a chloride ($Cl^{(-)}$) equivalent, dry basis and corrected to 7 percent oxygen; and

(7) Particulate matter emissions in excess of 0.0098 gr/dscf corrected to 7 percent oxygen.

(c) *Destruction and removal efficiency (DRE) standard.* (1) *99.99% DRE.* Except as provided in paragraph (c)(2) of this section, you must achieve a destruction and removal efficiency (DRE) of 99.99% for each principal organic hazardous constituent (POHC) designated under paragraph (c)(3) of this section. You must calculate DRE for each POHC from the following equation:

$$DRE = [1 - (W_{out} / Win)] \times 100\%$$

Where:

W_{in} = mass feedrate of one POHC in a waste feedstream; and

W_{out} = mass emission rate of the same POHC present in exhaust emissions prior to release to the atmosphere.

(2) *99.9999% DRE.* If you burn the dioxin-listed hazardous wastes F020, F021, F022, F023, F026, or F027 (see § 261.31 of this chapter), you must achieve a destruction and removal efficiency (DRE) of 99.9999% for each POHC that you designate under paragraph (c)(3) of this section. You must demonstrate this DRE performance on POHCs that are more difficult to incinerate than tetra-, penta-, and hexachlorodibenzo-dioxins and dibenzofurans. You must use the equation in paragraph (c)(1) of this section to calculate DRE for each POHC. In addition, you must notify the Administrator of your intent to burn hazardous wastes F020, F021, F022, F023, F026, or F027.

(3) *Principal organic hazardous constituents (POHCs).* (i) You must treat each POHC in the waste feed that you specify under paragraph (c)(3)(ii) of this section to the extent required by paragraphs (c)(1) and (c)(2) of this section.

(ii) You must specify one or more POHCs that are representative of the most difficult to destroy organic compounds in your hazardous waste feedstream. You must base this specification on the degree of difficulty of incineration of the organic constituents in the hazardous waste and on their concentration or mass in the hazardous waste feed, considering the results of hazardous waste analyses or other data and information.

(d) *Significant figures.* The emission limits provided by paragraphs (a) and (b) of this section are presented with two significant figures. Although you must perform intermediate calculations using at least three significant figures, you may round the resultant emission levels to two significant figures to document compliance.

PART 260—HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

■ 1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921–6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

■ 2. Section 260.11 is amended by

■ a. Revising the first sentence in paragraph (a).

■ b. Revising paragraph (c)(1).

The revisions and additions read as follows:

§ 260.11 References.

(a) When used in parts 260 through 268 of this chapter, the following publications are incorporated by reference. * * *

* * * * *

(c) * * *

(1) "APTI Course 415: Control of Gaseous Emissions," EPA Publication EPA–450/2–81–005, December 1981, IBR approved for §§ 264.1035 and 265.1035.

* * * * *

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

■ 1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6927, 6928(h), and 6974.

■ 2. Section 264.340 is amended by revising the first sentence of paragraph (b)(1) and adding paragraph (b)(5) to read as follows:

§ 264.340 Applicability.

* * * * *

(b) * * * (1) Except as provided by paragraphs (b)(2) through (b)(5) of this section, the standards of this part do not apply to a new hazardous waste incineration unit that becomes subject to RCRA permit requirements after October 12, 2005; or no longer apply when an owner or operator of an existing hazardous waste incineration unit demonstrates compliance with the maximum achievable control technology (MACT) requirements of part 63, subpart EEE, of this chapter by conducting a comprehensive performance test and submitting to the Administrator a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with the requirements of part 63, subpart EEE, of this chapter.

* * *

* * * * *

(5) The particulate matter standard of § 264.343(c) remains in effect for incinerators that elect to comply with the alternative to the particulate matter standard of §§ 63.1206(b)(14) and 63.1219(e) of this chapter.

* * * * *

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

■ 1. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6906, 6912, 6922, 6923, 6924, 6925, 6935, 6936, and 6937.

■ 2. Section 265.340 is amended by revising paragraph (b)(1) to read as follows:

§ 265.340 Applicability.

* * * * *

(b) * * * (1) Except as provided by paragraphs (b)(2) and (b)(3) of this section, the standards of this part no longer apply when an owner or operator

demonstrates compliance with the maximum achievable control technology (MACT) requirements of part 63, subpart EEE, of this chapter by conducting a comprehensive performance test and submitting to the Administrator a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with the requirements of part 63, subpart EEE, of this chapter.

* * * * *

PART 266—STANDARDS FOR THE MANAGEMENT OF SPECIFIC HAZARDOUS WASTES AND SPECIFIC TYPES OF HAZARDOUS WASTE MANAGEMENT FACILITIES

■ 1. The authority citation for part 266 continues to read as follows:

Authority: 42 U.S.C. 1006, 2002(a), 3001–3009, 3014, 6905, 6906, 6912, 6921, 6922, 6924–6927, 6934, and 6937.

■ 2. Section 266.100 is amended by revising the first sentence of paragraph (b)(1) and adding paragraphs (b)(3) and (b)(4) to read as follows:

§ 266.100 Applicability.

* * * * *

(b) * * * (1) Except as provided by paragraphs (b)(2), (b)(3), and (b)(4) of this section, the standards of this part do not apply to a new hazardous waste boiler or industrial furnace unit that becomes subject to RCRA permit requirements after October 12, 2005; or no longer apply when an owner or operator of an existing hazardous waste boiler or industrial furnace unit demonstrates compliance with the maximum achievable control technology (MACT) requirements of part 63, subpart EEE, of this chapter by conducting a comprehensive performance test and submitting to the Administrator a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with the requirements of part 63, subpart EEE, of this chapter.

* * *

* * * * *

(3) If you own or operate a boiler or hydrochloric acid production furnace that is an area source under § 63.2 of this chapter and you elect not to comply with the emission standards under §§ 63.1216, 63.1217, and 63.1218 of this chapter for particulate matter, semivolatile and low volatile metals, and total chlorine, you also remain subject to:

(i) Section 266.105—Standards to control particulate matter;

(ii) Section 266.106—Standards to control metals emissions, except for mercury; and

(ii) Section 266.107—Standards to control hydrogen chloride and chlorine gas.

(4) The particulate matter standard of § 266.105 remains in effect for boilers that elect to comply with the alternative to the particulate matter standard under §§ 63.1216(e) and 63.1217(e) of this chapter.

* * * * *

PART 270—EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

■ 1. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6924, 6925, 6927, 6939, and 6974.

■ 2. Section 270.6 is revised to read as follows:

§ 270.6 References.

(a) When used in part 270 of this chapter, the following publications are incorporated by reference. These incorporations by reference were approved by the Director of the Federal Register pursuant to 5 U.S.C. 552(a) and 1 CFR part 51. These materials are incorporated as they exist on the date of approval and a notice of any change in these materials will be published in the **Federal Register.** Copies may be inspected at the Library, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave., NW., (3403T), Washington, DC 20460, *libraryhq@epa.gov*; or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.*

(b) The following materials are available for purchase from the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 605–6000 or (800) 553–6847; or for purchase from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 512–1800:

(1) "APTI Course 415: Control of Gaseous Emissions," EPA Publication EPA–450/2–81–005, December 1981, IBR approved for §§ 270.24 and 270.25.

(2) [Reserved].

■ 3. Section 270.10 is amended by adding paragraph (l) to read as follows:

§ 270.10 General application requirements.

* * * * *

(l) If the Director concludes, based on one or more of the factors listed in paragraph (l)(1) of this section that compliance with the standards of 40 CFR part 63, subpart EEE alone may not be protective of human health or the environment, the Director shall require the additional information or assessment(s) necessary to determine whether additional controls are necessary to ensure protection of human health and the environment. This includes information necessary to evaluate the potential risk to human health and/or the environment resulting from both direct and indirect exposure pathways. The Director may also require a permittee or applicant to provide information necessary to determine whether such an assessment(s) should be required.

(1) The Director shall base the evaluation of whether compliance with the standards of 40 CFR part 63, subpart EEE alone is protective of human health or the environment on factors relevant to the potential risk from a hazardous waste combustion unit, including, as appropriate, any of the following factors:

(i) Particular site-specific considerations such as proximity to receptors (such as schools, hospitals, nursing homes, day care centers, parks, community activity centers, or other potentially sensitive receptors), unique dispersion patterns, etc.;

(ii) Identities and quantities of emissions of persistent, bioaccumulative or toxic pollutants considering enforceable controls in place to limit those pollutants;

(iii) Identities and quantities of nondioxin products of incomplete combustion most likely to be emitted and to pose significant risk based on known toxicities (confirmation of which should be made through emissions testing);

(iv) Identities and quantities of other off-site sources of pollutants in proximity of the facility that significantly influence interpretation of a facility-specific risk assessment;

(v) Presence of significant ecological considerations, such as the proximity of a particularly sensitive ecological area;

(vi) Volume and types of wastes, for example wastes containing highly toxic constituents;

(vii) Other on-site sources of hazardous air pollutants that significantly influence interpretation of the risk posed by the operation of the source in question;

(viii) Adequacy of any previously conducted risk assessment, given any subsequent changes in conditions likely to affect risk; and

(ix) Such other factors as may be appropriate.

(2) [Reserved]

■ 4. Section 270.19 is amended by revising paragraph (e) to reads as follows:

§ 270.19 Specific part B information requirements for incinerators.

* * * * *

(e) When an owner or operator of a hazardous waste incineration unit becomes subject to RCRA permit requirements after October 12, 2005, or when an owner or operator of an existing hazardous waste incineration unit demonstrates compliance with the air emission standards and limitations in part 63, subpart EEE, of this chapter (*i.e.*, by conducting a comprehensive performance test and submitting a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with all applicable requirements of part 63, subpart EEE, of this chapter), the requirements of this section do not apply, except those provisions the Director determines are necessary to ensure compliance with §§ 264.345(a) and 264.345(c) of this chapter if you elect to comply with § 270.235(a)(1)(i) to minimize emissions of toxic compounds from startup, shutdown, and malfunction events. Nevertheless, the Director may apply the provisions of this section, on a case-by-case basis, for purposes of information collection in accordance with §§ 270.10(k), 270.10(l), 270.32(b)(2), and 270.32(b)(3).

■ 5. Section 270.22 is amended by revising the introductory text to read as follows:

§ 270.22 Specific part B information requirements for boilers and industrial furnaces burning hazardous waste.

When an owner or operator of a cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace becomes subject to RCRA permit requirements after October 12, 2005, or when an owner or operator of an existing cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace demonstrates compliance with the air emission standards and limitations in part 63, subpart EEE, of this chapter (*i.e.*, by conducting a comprehensive performance test and submitting a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with all applicable requirements of part 63, subpart EEE, of this chapter), the requirements of this section do not apply. The requirements of this section do apply, however, if the Director determines certain provisions are necessary to ensure compliance with §§ 266.102(e)(1) and 266.102(e)(2)(iii) of this chapter if you elect to comply with § 270.235(a)(1)(i) to minimize emissions of toxic compounds from startup, shutdown, and malfunction events; or if you are an area source and elect to comply with the §§ 266.105, 266.106, and 266.107 standards and associated requirements for particulate matter, hydrogen chloride and chlorine gas, and non-mercury metals; or the Director determines certain provisions apply, on a case-by-case basis, for purposes of information collection in accordance with §§ 270.10(k), 270.10(l), 270.32(b)(2), and 270.32(b)(3).

* * * * *

■ 6. Section 270.24 is amended by revising paragraph (d)(3) to read as follows:

§ 270.24 Specific part B information requirements for process vents.

* * * * *

(d) * * *

(3) A design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "APTI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 270.6) or other engineering texts acceptable to the Regional Administrator that present basic control device information. The design analysis shall address the vent stream characteristics and control device operation parameters as specified in § 264.1035(b)(4)(iii).

* * * * *

■ 7. Section 270.25 is amended by revising paragraph (e)(3) to read as follows:

§ 270.25 Specific part B information requirements for equipment.

* * * * *

(e) * * *

(3) A design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "APTI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 270.6) or other engineering texts acceptable to the Regional Administrator that present basic control device information. The design analysis shall address the vent stream characteristics and control device operation parameters as specified in § 264.1035(b)(4)(iii).

* * * * *

■ 8. Section 270.32 is amended by adding paragraph (b)(3) to read as follows:

§ 270.32 Establishing permit conditions.

* * * * *

(b) * * *

(3) If, as the result of an assessment(s) or other information, the Administrator or Director determines that conditions are necessary in addition to those required under 40 CFR parts 63, subpart EEE, 264 or 266 to ensure protection of human health and the environment, he shall include those terms and conditions in a RCRA permit for a hazardous waste combustion unit.

* * * * *

■ 9. Section 270.42 is amended by:
■ a. Revising paragraph (j)(1).
■ b. Redesignating paragraph (j)(2) as (j)(3).
■ c. Adding new paragraph (j)(2).
■ d. Adding new paragraph (k); and
■ e. Adding a new entry 10 in numerical order in the table under section L of Appendix I.

The revisions and additions read as follows:

§ 270.42 Permit modification at the request of the permittee.

* * * * *

(j) * * *

(1) Facility owners or operators must have complied with the Notification of Intent to Comply (NIC) requirements of 40 CFR 63.1210 that were in effect prior to October 11, 2000, (See 40 CFR part 63 §§ 63.1200–63.1499 revised as of July 1, 2000) in order to request a permit modification under this section for the purpose of technology changes needed to meet the standards under 40 CFR 63.1203, 63.1204, and 63.1205.

(2) Facility owners or operators must comply with the Notification of Intent to Comply (NIC) requirements of 40 CFR 63.1210(b) and 63.1212(a) before a permit modification can be requested under this section for the purpose of technology changes needed to meet the 40 CFR 63.1215, 63.1216, 63.1217, 63.1218, 63.1219, 63.1220, and 63.1221 standards promulgated on October 12, 2005.

* * * * *

(k) *Waiver of RCRA permit conditions in support of transition to the part 63 MACT standards.* (1) You may request to have specific RCRA operating and emissions limits waived by submitting a Class 1 permit modification request under Appendix I of this section, section L(10). You must:

(i) Identify the specific RCRA permit operating and emissions limits which you are requesting to waive;

(ii) Provide an explanation of why the changes are necessary in order to minimize or eliminate conflicts between the RCRA permit and MACT compliance; and

(iii) Discuss how the revised provisions will be sufficiently protective.

(iv) The Director shall approve or deny the request within 30 days of receipt of the request. The Director may, as his or her discretion, extend this 30 day deadline one time for up to 30 days by notifying the facility owner or operator.

(2) To request this modification in conjunction with MACT performance testing where permit limits may only be waived during actual test events and pretesting, as defined under 40 CFR 63.1207(h)(2)(i) and (ii), for an aggregate time not to exceed 720 hours of operation (renewable at the discretion of the Administrator) you must:

(i) Submit your modification request to the Director at the same time you submit your test plans to the Administrator; and

(ii) The Director may elect to approve or deny the request continent upon approval of the test plans.

* * * * *

■ 10. Section 270.62 is amended by revising the introductory text to read as follows:

§ 270.62 Hazardous waste incinerator permits.

When an owner or operator of a hazardous waste incineration unit becomes subject to RCRA permit requirements after October 12, 2005, or when an owner or operator of an existing hazardous waste incineration unit demonstrates compliance with the air emission standards and limitations in part 63, subpart EEE, of this chapter (*i.e.*, by conducting a comprehensive performance test and submitting a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with all applicable requirements of part 63, subpart EEE, of this chapter), the requirements of this section do not apply, except those provisions the Director determines are necessary to ensure compliance with §§ 264.345(a) and 264.345(c) of this chapter if you elect to comply with § 270.235(a)(1)(i) to minimize emissions of toxic compounds from startup, shutdown, and malfunction events. Nevertheless, the Director may apply the provisions of this section, on a case-by-case basis, for purposes of information collection in accordance with §§ 270.10(k), 270.10(l), 270.32(b)(2), and 270.32(b)(3).

* * * * *

■ 11. Section 270.66 is amended by revising the introductory text to read as follows:

§ 270.66 Permits for boilers and industrial furnaces burning hazardous waste.

When an owner or operator of a cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace becomes subject to RCRA permit requirements after October 12, 2005 or when an owner or operator of an existing cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace demonstrates compliance with the air emission standards and limitations in part 63, subpart EEE, of this chapter (*i.e.*, by conducting a comprehensive performance test and submitting a Notification of Compliance under §§ 63.1207(j) and 63.1210(d) of this chapter documenting compliance with all applicable requirements of part 63, subpart EEE, of this chapter), the requirements of this section do not apply. The requirements of this section do apply, however, if the Director determines certain provisions are necessary to ensure compliance with §§ 266.102(e)(1) and 266.102(e)(2)(iii) of this chapter if you elect to comply with § 270.235(a)(1)(i) to minimize emissions of toxic compounds from startup, shutdown, and malfunction events; or if you are an area source and elect to comply with the §§ 266.105, 266.106, and 266.107 standards and associated requirements for particulate matter, hydrogen chloride and chlorine gas, and non-mercury metals; or the Director determines certain provisions apply, on a case-by-case basis, for purposes of information collection in accordance with §§ 270.10(k), 270.10(l), 270.32(b)(2), and 270.32(b)(3).

* * * * *

■ 12. Section 270.235 is amended by:

■ a. Revising the section heading and paragraphs (a)(1) introductory text and (a)(2) introductory text.

■ b. Revising paragraphs (b)(1) introductory text and (b)(2).

■ c. Adding new paragraph (c).

The revisions read as follows:

* * * * *

§ 270.235 Options for incinerators, cement kilns, lightweight aggregate kilns, solid fuel boilers, liquid fuel boilers and hydrochloric acid production furnaces to minimize emissions from startup, shutdown, and malfunction events.

(a) * * * (1) *Revisions to permit conditions after documenting compliance with MACT.* The owner or operator of a RCRA-permitted incinerator, cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace may request that the Director address permit conditions that minimize emissions from startup, shutdown, and malfunction events under any of the following options when requesting removal of permit conditions that are no longer applicable according to §§ 264.340(b) and 266.100(b) of this chapter:

* * * * *

(2) *Addressing permit conditions upon permit reissuance.* The owner or operator of an incinerator, cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace that has conducted a comprehensive performance test and submitted to the Administrator a Notification of Compliance documenting compliance with the standards of part 63, subpart EEE, of this chapter may request in the application to reissue the permit for the combustion unit that the Director control emissions from startup,

shutdown, and malfunction events under any of the following options:

* * * * *

(b) * * * (1) *Interim status operations.* In compliance with §§ 265.340 and 266.100(b), the owner or operator of an incinerator, cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace that is operating under the interim status standards of part 265 or 266 of this chapter may control emissions of toxic compounds during startup, shutdown, and malfunction events under either of the following options after conducting a comprehensive performance test and submitting to the Administrator a Notification of Compliance documenting compliance with the standards of part 63, subpart EEE, of this chapter.

* * * * *

(2) *Operations under a subsequent RCRA permit.* When an owner or operator of an incinerator, cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace that is operating under the interim status standards of parts 265 or 266 of this chapter submits a RCRA permit application, the owner or operator may request that the Director control emissions from startup, shutdown, and malfunction events under any of the options provided by paragraphs (a)(2)(i), (a)(2)(ii), or (a)(2)(iii) of this section.

(c) *New units.* Hazardous waste incinerator, cement kiln, lightweight aggregate kiln, solid fuel boiler, liquid fuel boiler, or hydrochloric acid production furnace units that become subject to RCRA permit requirements after October 12, 2005 must control emissions of toxic compounds during startup, shutdown, and malfunction events under either of the following options:

(1) Comply with the requirements specified in § 63.1206(c)(2) of this chapter; or

(2) Request to include in the RCRA permit, conditions that ensure emissions of toxic compounds are minimized from startup, shutdown, and malfunction events, including releases from emergency safety vents, based on review of information including the source's startup, shutdown, and malfunction plan and design. The director will specify that these permit conditions apply only when the facility is operating under its startup, shutdown, and malfunction plan.

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

■ 1. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

■ 2. Section 271.1(j) is amended by adding the following entries to Table 1 in chronological order by date of publication in the **Federal Register**, to read as follows:

§ 271.1 Purpose and scope.

* * * * *

[FRL–7977–1]

RIN 2025–AA07

Cross-Media Electronic Reporting

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: EPA is establishing the framework by which it will accept electronic reports from regulated entities in satisfaction of certain document submission requirements in EPA's regulations. EPA will provide public notice when the Agency is ready to receive direct submissions of certain documents from regulated entities in electronic form consistent with this rulemaking via an EPA electronic document receiving system. This rule does not mandate that regulated entities utilize electronic methods to submit documents in lieu of paper-based submissions. In addition, EPA is not taking final action on the electronic recordkeeping requirements at this time.

States, tribes, and local governments will be able to seek EPA approval to accept electronic documents to satisfy reporting requirements under environmental programs that EPA has delegated, authorized, or approved them to administer. This rule includes performance standards against which a state's, tribe's, or local government's electronic document receiving system will be evaluated before EPA will approve changes to the delegated, authorized, or approved program to provide electronic reporting, and establishes a streamlined process that states, tribes, and local governments can use to seek and obtain such approvals.

DATES: This rule shall become effective January 11, 2006.

ADDRESSES: The public record for this rulemaking has been established under docket number OEI–2003–0001 and is located in the EPA Docket Center, (EPA/DC) EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The EPA Docket Center Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. (See **SUPPLEMENTARY INFORMATION** below.)

FOR FURTHER INFORMATION CONTACT: For general information on this final rule, contact the docket above. For more detailed information on specific aspects of this rulemaking, contact David Schwarz (2823T), Office of Environmental Information, U.S. Environmental Protection Agency, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, (202) 566–1704, *schwarz.david@epa.gov*, or Evi Huffer (2823T), Office of Environmental Information, U.S. Environmental Protection Agency, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, (202) 566–1697, *huffer.evi@epa.gov*.

SUPPLEMENTARY INFORMATION:

General Information

A. Affected Entities

This rule will potentially affect states, tribes, and local governments that have been delegated, authorized, or approved, or which seek delegation, authorization, or approval to administer a federal environmental program under Title 40 of the Code of Federal Regulations (CFR). For purposes of this rulemaking, the term "state" includes the District of Columbia and the United States territories, as specified in the applicable statutes. That is, the term "state" includes the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, the Commonwealth of Northern Marina Islands, and the Trust Territory of the Pacific Islands, depending on the statute.

The rule will also potentially affect private parties subject to any requirements in Title 40 of the CFR that require a document to be submitted to EPA. Affected Entities include, but are not necessarily limited to:

Category	Examples of affected entities
Local government	Publicly owned treatment works, owners and operators of treatment works treating domestic sewage, local and regional air boards, local and regional waste management authorities, and municipal and other drinking water authorities.
Private	Industry owners and operators, waste transporters, privately owned treatment works or other treatment works treating domestic sewage, privately owned water works, small businesses of various kinds, sponsors such as laboratories that submit or initiate/support studies, and testing facilities that both initiate and conducts studies.
Tribe and State governments.	States, tribes or territories that administer any federal environmental programs delegated, authorized, or approved by EPA under Title 40 of the CFR.
Federal government	Federally owned treatment works and industrial dischargers, and federal facilities subject to hazardous waste regulation.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. This table lists the types of entities that EPA is now aware can potentially be affected by this action. Other types of entities not listed in the table can also be affected. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. How Can I Get Copies of This Document and Other Related Information?

1. *Docket.* EPA has established an official public docket for this action under Docket ID No. OEI–2003–0001. The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the Cross-Media Electronic Reporting Rule (CROMERR) Docket in the EPA Docket Center (EPA/DC), EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The EPA Docket Center Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Office of Environmental Information Docket is (202) 566–1752. You may have to pay a reasonable fee for copying.

An electronic version of the public docket is available through EPA's

electronic public docket and comment system, EDOCKET. You may use EDOCKET at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials. After selecting the "Using EDOCKET" icon, select "quick search," then key in the appropriate docket identification number. Double click on the document identification number to bring up the docket contents.

2. *Electronic Access.* You may access this **Federal Register** document electronically through the EPA Internet under the "**Federal Register**" listings at *http://www.epa.gov/fedrgstr/.*

Organization of This Document

Information in this Preamble is organized as follows:

I. Overview
- A. Why does the Agency seek to provide electronic alternatives to paper-based reporting and recordkeeping?
- B. What does the electronic reporting rule do?
- C. What is the status of the proposed electronic recordkeeping provisions?
- D. How were stakeholders consulted during the development of today's final rule?
- E. What alternatives to today's final rule did EPA consider?

II. Background
- A. What has been EPA's electronic reporting policy?
- B. How does today's final rule change EPA's electronic reporting policy?

III. Scope of the Electronic Reporting Rule
- A. Who may submit electronic documents?
- B. Which documents can be filed electronically?
- C. How does this final rule implement electronic reporting?

IV. Major Changes from Proposed Electronic Reporting Provisions
- A. How does the rule streamline the approval of electronic reporting under authorized state, tribe, and local government programs?
  1. Review of the proposal
  2. Comments on the proposal
  3. Revisions in the final rule
- B. How has EPA revised the requirements that state, tribe, and local government electronic reporting programs must satisfy?
  1. Review of the proposal
  2. Comments on the proposed criteria for electronic document receiving systems
  3. Revisions to the criteria in the final rule
- C. How has EPA accommodated electronic submissions with follow-on paper certifications?
- D. How has EPA changed proposed definitions of terms?
  1. Definition of "acknowledgment"
  2. Definition of "electronic document"
  3. Definition of "electronic signature"
  4. Definition of "electronic signature device"
  5. Definition of "transmit"
  6. Definition of "valid electronic signature"

V. Requirements for Direct Electronic Reporting to EPA
- A. What are the requirements for electronic reporting to EPA?
- B. What is the status of existing electronic reporting to EPA?
- C. What is EPA's Central Data Exchange?
  1. Overview of general goals
  2. Comments on the proposal
  3. The aspects of CDX that have not changed since proposal
  4. The major changes that EPA has made to CDX since proposal
- D. How will EPA provide notice of changes to CDX?

VI. Requirements for Electronic Reporting under EPA-Authorized Programs
- A. What is the general regulatory approach?
- B. When must authorized state, tribe, or local government programs revise or modify their programs to allow electronic reporting?
  1. The general requirement
  2. Deferred compliance for existing systems
- C. What alternative procedures does EPA provide for revising or modifying authorized state, tribe, or local government programs for electronic reporting?
  1. The application
  2. Review for completeness
  3. EPA actions on applications
  4. Revisions or modifications associated with existing systems
  5. Public hearings for Part 142 revisions or modifications
  6. Re-submissions and amendments
- D. What general requirements must state, tribe, and local government electronic reporting programs satisfy?
- E. What standards must state, tribe, and local government electronic document receiving systems satisfy?
  1. Timeliness of data generation
  2. Copy of record
  3. Integrity of the electronic document
  4. Submission knowingly
  5. Opportunity to review and repudiate copy of record
  6. Validity of the electronic signature
  7. Binding the signature to the document
  8. Opportunity to review
  9. Understanding the act of signing
  10. The electronic signature or subscriber agreement
  11. Acknowledgment of receipt
  12. Determining the identity of the individual uniquely entitled to use a signature device

VII. What are the Costs of Today's Rule?
- A. Summary of proposal analysis
- B. Final rule costs
- C. General changes to methodology and assumptions

VIII. Statutory and Executive Order Reviews
- A. Executive Order 12866
- B. Executive Order 13132
- C. Paperwork Reduction Act
- D. Regulatory Flexibility Act
- E. Unfunded Mandates Reform Act
- F. National Technology Transfer and Advancement Act
- G. Executive Order 13045
- H. Executive Order 13175
- I. Executive Order 13211 (Energy Effects)
- J. Congressional Review Act

I. Overview

A. Why does the Agency seek to provide electronic alternatives to paper-based reporting and recordkeeping?

In the **Federal Register** of August 31, 2001 (66 FR 46162), EPA published a notice of proposed rulemaking, announcing the goal of making electronic reporting and electronic recordkeeping available under EPA regulatory programs. The Agency believes that the submission and storage of electronic documents in lieu of paper documents can:

- Reduce the cost and burden of data transfer and maintenance for all parties to the data exchanges;
- Improve the data and the various business processes associated with its use in ways that may not be reflected directly in cost-reduction, e.g., through improvements in data quality, and the speed and convenience with which data may be transferred and used; and
- Maintain the level of corporate and individual responsibility and accountability for electronic reports and records that currently exists in the paper environment.

Recent federal policy and law are also strong drivers of electronic alternatives to traditional reporting and recordkeeping. The Government Paperwork Elimination Act (GPEA) of 1998, Title XVII of Public Law 105–277, requires the Director of the Office of Management and Budget (OMB) to ensure that executive agencies provide for the option of the electronic maintenance, submission, or disclosure of information as a substitute for paper when practicable, and for the use and acceptance of electronic signatures, when practicable. See GPEA section 1704. Given the enormous strides in data transfer and management technologies, particularly in connection with the Internet, replacing paper with electronic data transfer now promises increased productivity across almost all facets of business and government.

In seeking to make electronic alternatives available that were not contemplated when most existing EPA regulations were written, EPA was mindful of the need to maintain our ability to carry out our statutory environmental and health protection mission, in part through ensuring the integrity of environmental compliance documents. Accordingly, the intended

effect of the proposed regulation was to permit and encourage the use of electronic technologies in a manner that is consistent with EPA's overall mission and that preserves the integrity of the Agency's compliance and enforcement activities.

The Agency believes that it is essential to ensure that electronic reports can play the same role as their paper counterparts in providing evidence of what was reported and to what identified individuals certified with respect to the report. Otherwise, electronic reporting places at risk the continuing viability of self-monitoring and self-reporting that provides the framework for compliance under most of our environmental programs. The purpose of today's final rule is therefore twofold. Today's rule is intended to provide regulated industry, EPA, and state, tribe, and local governments with electronic reporting alternatives that improve the efficiency, the speed, and the quality of regulatory reporting. At the same time, the rule is intended to ensure the legal dependability of electronic documents submitted under environmental programs. This includes, among other things, ensuring that individuals will be held as responsible and accountable for the electronic signatures, which they execute, and for the documents to which such signatures attest as they currently are in cases of documents where they execute handwritten signatures.

B. What does the electronic reporting rule do?

EPA is announcing today the final regulatory provisions in a new part 3 of Title 40 of the CFR for electronic reporting to EPA and under authorized state, tribe, and local government programs. "Authorized program" is shorthand for a federal program that EPA has delegated, authorized, or approved a state, tribe or local government to administer under other provisions of title 40 of the CFR, where the delegation, authorization, or approval has not been withdrawn or expired. Section 3.3 of the rule codifies this usage in the regulatory text. This use of "authorized" does not mean that EPA is precluded from an enforcement action by a prior enforcement action being taken by a state, tribe, or local government under its authorized program. The final rule incorporates changes made after publication of the proposed rule that are discussed in detail in section IV of this Preamble. This rule establishes electronic reporting as an acceptable regulatory alternative across a broad spectrum of EPA programs, and establishes requirements to assure that electronic documents are as legally dependable as their paper counterparts.

The requirements in Subpart B of the rule apply to entities that choose to submit electronic documents for direct reporting to EPA, including state, tribe, and local government facilities that choose to submit electronic documents to EPA to satisfy requirements that apply to them under other provisions of title 40 of the CFR. However, the scope of this final rule excludes any data transfers between EPA and states, tribes, or local governments as a part of their authorized programs or as a part of administrative arrangements between states, tribes, or local governments and EPA to share data. The requirements in Subpart D of the rule provide for electronic reporting under authorized state, tribe, and local government programs and apply to the governmental entities administering the authorized programs. Under the final rule, states, tribes, and local governments have the choice of using electronic submission rather than paper for reporting under their authorized programs. Comments on the proposed rule indicated that some states and local governments are now requiring electronic reporting under those programs. Existing electronic document receiving systems must receive EPA approval in accordance with Subpart D in order to meet the requirements of part 3.

This rule does not require that any document be submitted electronically, and it does not require any state, tribe, or local authorized program to receive electronic documents. Public access to environmental compliance information is not affected by today's action.

Additionally, the scope of the final rule specifically excludes the submission of any electronic document via magnetic or optical media—for example via diskette, compact disk (CD), digital video disc (DVD), or tape—as well as the transmission of documents via hard copy facsimile or "fax." The exclusion of magnetic or optical media submissions from the scope of this rule in no way indicates EPA's rejection of these technologies as a valid approach to paperless reporting. Magnetic and optical media submissions fulfill the goal of providing alternatives to submission on paper. EPA has already successfully implemented a paperless reporting alternative that utilizes magnetic and optical media submissions to fulfill many regulatory reporting requirements. Such instances include reporting related to the hazardous waste, Toxic Release Inventory, and pesticide registration programs. EPA expects these magnetic and optical media approaches to paperless reporting to continue, and nothing in today's rule should be interpreted to proscribe or discourage them.

For entities that report to EPA directly and do so by submitting electronic documents, today's action requires that these documents be submitted either to the Agency's centralized electronic document receiving system, called the "Central Data Exchange" (CDX), or to alternative systems designated by the Administrator as described herein and in a separate **Federal Register** notice. Entities that submit electronic documents directly to EPA will satisfy the requirements in today's rule by successfully submitting their reports to one of these systems. While we do not intend to codify any of the details of how CDX operates or how it is constructed, the characteristics of the CDX and the submission scenarios are described later in this Preamble. In addition, the CDX design specifications are included as a part of this rulemaking docket.

Many facilities submit documents directly to states, tribes, or local governments under authorized programs. For currently authorized programs that receive or wish to begin receiving electronic documents in lieu of paper, this rule requires EPA approval of program revisions or modifications that address their electronic reporting implementations. For programs initially seeking authorization, this rule requires EPA approval of any electronic reporting components of the programs. In both cases, EPA approval will be based largely on an assessment of the program's "electronic document receiving system" that is or will be used to implement electronic reporting. For this purpose, this rule includes performance-based standards that EPA will use to determine that an electronic document receiving system is acceptable. To implement electronic reporting under currently authorized programs, EPA is creating a streamlined procedure that states, tribes, and local governments may use to revise or modify their authorized programs to incorporate electronic reporting. Today's rulemaking also includes special provisions for authorized programs' electronic document receiving systems that exist at the time of publication of this final rule.

It is worth noting that EPA can approve changes to authorized state, tribe, or local programs that involve the use of CDX to receive data submissions from their reporting communities, and EPA is exploring opportunities to

leverage CDX resources for use by states, tribes, and local governments. As currently implemented, CDX provides the major systems infrastructure components necessary to achieve electronic reporting consistent with the standards in this rule for assessing state, tribe, or local government electronic document receiving systems. Additionally, EPA has set the goal of making CDX operations fully consistent with the requirements in today's rule within two years.

While today's rule establishes electronic reporting as a regulatory alternative, EPA will make the electronic submission alternative available for specific reports or other documents only as EPA announces its readiness to receive them through CDX or another designated system. EPA will publish announcements in the Federal Register as CDX and other systems become available for particular environmental reports. These elements are discussed in more detail in section V of this Preamble.

In a notice published concurrently with today's rule, EPA clarifies the status of electronic reporting directly to EPA systems that exist as of the rule's publication date. In accordance with 40 CFR 3.10, EPA is designating for the receipt of electronic submissions, all EPA electronic document receiving systems currently existing and receiving electronic reports as of the date of the notice. This designation is valid for a period of up to two years from the date of publication of the notice. During this two-year period, entities that report directly to EPA may continue to satisfy EPA reporting requirements by reporting to the same systems as they did prior to CROMERR's publication unless EPA publishes a notice that announces changes to, or migration from, that system. Any existing system continuing to receive electronic reports at the expiration of this two-year period must receive redesignation by the Administrator under § 3.10. Notice of such redesignation will be published in the Federal Register.

C. What is the status of the proposed electronic recordkeeping provisions?

At this time, EPA is only finalizing the provisions for electronic reporting to EPA and under authorized programs. The August 31, 2001, proposal, however, also addressed records that EPA or authorized programs require entities to maintain under any of the environmental programs governed by Title 40 of the CFR or related state, tribe, and local laws and regulations. For such records, EPA proposed specific provisions for administering the maintenance of electronic records under these environmental regulations. EPA proposed criteria under which the Agency would consider electronic records to be trustworthy, reliable, and generally equivalent to paper records in satisfying regulatory requirements. For entities that choose to keep records electronically, the proposal would have required the adoption of best practices for electronic records management. For facilities maintaining records to satisfy the requirements of authorized programs, the proposal would have allowed for EPA approval of changes to the authorized programs to provide for electronic recordkeeping. Under the proposal, approval would have been based on a determination that the authorized program would require best practices for electronic records management, corresponding to EPA's provisions for electronic records maintained to satisfy EPA recordkeeping requirements.

Further, EPA proposed that once the rule took effect, any records subject to the rule that were maintained to satisfy the requirements of EPA programs could only be maintained electronically after EPA announced in the Federal Register that EPA was ready to allow electronic records maintenance to satisfy the specified recordkeeping requirements. Also under the proposal, records maintained under an authorized state, tribe, or local government program could only be maintained electronically once EPA had approved the necessary changes to the authorized program.

Based on the comments received on the proposed electronic recordkeeping provisions, EPA reconsidered its approach to electronic recordkeeping and is not issuing final recordkeeping rules at this time. The Agency is conducting additional analysis and intends to publish a supplemental notice or re-proposal to solicit additional comments before a final rule on electronic recordkeeping is issued. We will be reviewing provisions related to the methods used to ensure accuracy, accessibility and the ability to detect alterations of records stored electronically, as well as other possible controls for electronic recordkeeping. The Agency intends to utilize this review to engage states, tribes, local governments, and industry in meaningful consultation to ensure that the EPA has the best available information on which to base its decisions. In conjunction with these consultations—and before issuing any notice or re-proposal—EPA will conduct additional analysis on the costs and benefits of alternative approaches, and the technical feasibility of various options, with a focus on impacts to small businesses. Today's rule does not authorize the conversion of existing paper documents retained to comply with existing recordkeeping requirements under other provisions of Title 40 of the CFR to an electronic format for record-retention purposes.

D. How were stakeholders consulted during the development of today's final rule?

This final rule reflects more than ten years of interaction with stakeholders that included states, tribes, and local governments, industry groups, environmental non-government organizations, national standard setting committees, and other federal agencies. As detailed in the proposal, many of our most significant interactions involved electronic reporting pilot projects conducted with state agency partners, including the States of Pennsylvania, New York, Arizona, and several others. In May, 1997, work began with approximately 35 states on the State Electronic Commerce/Electronic Data Interchange Steering Committee (SEES) convened by the National Governors' Association (NGA) Center for Best Practices (CBP). Also, EPA sponsored a series of conferences and meetings, beginning in June, 1999, with the explicit purpose of seeking stakeholder advice before drafting the proposal. Reports of these conferences and meetings are available in the docket for this rulemaking, along with the product of the SEES effort, a document entitled, "A State Guide for Electronic Reporting of Environmental Data," and reports on some of the more recent state/EPA electronic reporting pilots.

For the proposal, EPA provided a 6-month public comment period, which closed on February 27, 2002. During that time, we received 184 sets of written comments on the proposed rule. The commenters represented a broad spectrum of interested parties: States, local governments, specific businesses, trade associations, and other federal agencies. Substantive changes to the electronic reporting provisions based on public comments are discussed in detail in section IV of this Preamble. In addition, EPA received comments at four public meetings held around the country and at two meetings with states held in Washington, DC. The comments and meeting summaries can be found in the docket to this rulemaking. Today's final rule reflects many of the comments and concerns raised by commenters on the proposal. (A complete discussion of the options considered by EPA and other background information on the Agency's policy on electronic reporting

can be found in the proposed rule.) The majority of comments focused on the costs and burden of the proposed Subpart D electronic recordkeeping provisions. EPA's response to public comments to the proposal can be found in the rulemaking docket, in the Response to Comments document.

E. What alternatives to today's final rule did EPA consider?

EPA considered both a more stringent and a less stringent alternative to the regulatory approach taken in this rule. The more stringent alternative is reflected in the electronic provisions published, August 31, 2001, in the Notice of Proposed Rulemaking for CROMERR. The proposed version of CROMERR was more stringent by virtue of setting much more prescriptive, detailed requirements that electronic document receiving systems would have to satisfy. For example:

- Proposed § 3.2000(d) contained very specific requirements for submitter identity management that a system would have to satisfy, including detailed requirements for renewal of registration and revocation of registration under specified circumstances;
- Proposed § 3.2000(e) contained very detailed requirements for the signature/certification scenario that a system would have to provide for, specifying the exact sequence of steps to be followed in electronically signing a submission, and requiring such features as on-screen, scroll-through presentation of the data to be submitted for review of the signatory prior to signing.

EPA received significant public comment on this approach, both from states and from regulated companies, and there were at least three closely related themes. The first was that such prescriptive requirements would greatly limit the flexibility of states to implement electronic reporting in a cost-effective way. The second theme was that many of the requirements—especially those specifying the signature/certification scenario—were not appropriate to many cases where electronic reporting would occur. Third and finally, many of these commenters expressed skepticism that these very detailed requirements represented the only possible approach to ensuring the legal dependability of electronic submissions and signatures. These themes are discussed in detail in section IV.B of this Preamble.

EPA also considered a less stringent alternative that would have refrained from specifying requirements to establish the identity of an individual to whom a signature device or credential (e.g. a PIN, password, or PKI certificate) is issued. This less stringent alternative would have omitted the provision for identity-proofing in the final § 3.2000(b)(5)(vii). In terms of regulatory impact, this would be a significant reduction in stringency. Most of the burden on regulated entities imposed by today's rule is associated with the registration process involved in obtaining a signature device or credential, and any requirement to establish the registrant's identity raises the aggregate burden substantially.

EPA rejected this less stringent alternative, because we believe that it would seriously undermine the rule's ability to assure the legal dependability of electronic submissions. It is a basic principle of electronic authentication (E-authentication) that individuals being authenticated are who they say they are. E-authentication depends critically on the degree of trust we can place in the credential the individual presents, and such trust depends heavily on the process of establishing the individual's identity (or "identity-proofing") when he or she first registers for the credential. If the identity-proofing process is not sufficiently stringent and credible, then it may be uncertain who is using the credential in a specific instance where it is presented. Where the credential is used to create an electronic signature, inadequate identity-proofing may create uncertainty as to who the signatory is, as a result, the signature may be rendered undependable for any legal purpose. Accordingly, EPA believes that, notwithstanding the cost, it is necessary to specify that identity-proofing be conducted. The § 3.2000(b)(5)(vii) identity-proofing requirement is explained in detail in section VI.E.12 of this Preamble.

II. Background

A. What has been EPA's electronic reporting policy?

On September 4, 1996, EPA published a document entitled "Notice of Agency's General Policy for Accepting Filing of Environmental Reports via Electronic Data Interchange (EDI)" (61 FR 46684) (hereinafter referred to as 'the 1996 Policy'), where "EDI" generally refers to the transmission, in a standard syntax, of unambiguous information between computers of organizations that may be completely external to each other. This notice announced EPA's basic policy for accepting electronically submitted environmental reports, and its scope was intended to include any regulatory, compliance, or informational (voluntary) reporting to EPA via EDI.

For purposes of the 1996 policy, the standard transmission formats used by EPA were to be based on the EDI standards developed and maintained by the American National Standards Institute (ANSI) Accredited Standards Committee (ASC) X12. By linking our approach to the ANSI X12 standards, we hoped to take advantage of the robust ANSI-based EDI infrastructure already in place for commercial transactions, including a wide array of commercial off-the-shelf (COTS) software packages and communications network services, and a growing industry community of EDI experts available both to EPA and to the regulated community. At the time EPA was writing this policy, ANSI-based EDI was arguably the dominant mode of electronic commerce across almost all business sectors, from aerospace to wood products, at least in the United States. (A complete discussion of EPA's 1996 policy can be found in the preamble to the proposed rule.)

With this final rule, EPA is making changes to the 1996 policy for three primary reasons. First, and most important, the technology environment has changed substantially since the 1996 policy was written. Web-based electronic commerce and public key infrastructure (PKI) are two examples. While both were available and in use for some purposes in 1996, they had not yet achieved the level of acceptance and use that they enjoy today. We could not have anticipated in 1996 that this evolution would occur as rapidly as it has. Clearly, these developments require that we extend our approach to electronic reporting beyond EDI and Personal Identification Numbers (PINs). In addition, they teach us that it is generally unwise to base regulatory requirements on the existing information technology environment or on assumptions about the speed and direction of technological evolution.

Second, we believe that technology-specific provisions would be very complex and unwieldy. The resulting regulation would likely place unacceptable burdens on regulated entities trying to understand and comply.

Third, and finally, an electronic reporting architecture that makes a centralized EPA or state system the platform for such functions as electronic signature/certification is now quite viable—and quite consistent with the standard practices of Web-based electronic commerce. Given the state of technology six years ago, we could not

have considered this approach in the 1996 policy.

B. How does today's final rule change EPA's electronic reporting policy?

For practical purposes, the most important change that today's rule makes is in our technical approach to electronic reporting. In contrast to the 1996 policy, today's rule does not generally specify or limit the range of allowable electronic submission technologies and formats. Under today's rule, complaint electronic reporting approaches can include user-friendly 'smart' electronic forms to be completed on-line or downloaded for completion off-line at the user's personal computer, as well as data transfers via the Internet or secure email in a variety of standard and common off-the-shelf, application-based formats. Similarly, in terms of electronic signature technology, the rule allows for a range of approaches, including various implementations of PINs and passwords, the use of private or personal information, digital signatures based on PKI certificates, and other signature technologies as they become viable for our applications. As EPA or authorized programs implement electronic submission for specific reports, the rule allows them to select one or more of the available submission and signature approaches according to their circumstances and the program-specific requirements.

EPA's goals are to make this electronic reporting alternative as simple, attractive and cost-effective as possible for reporting entities, while ensuring that electronically submitted documents are as legally dependable as their paper counterparts. We believe that today's rule achieves these goals, but—unlike the 1996 policy—without requiring specific technologies or setting detailed procedural steps for the submission of electronic documents. Our strategy—as initially set out in the August 31, 2001, notice of proposed rulemaking, and as finalized today—is to impose as few specific requirements as possible on reporting entities, and to generally keep requirements neutral with respect to technology. As a consequence, today's rule enables EPA, the states, tribes, and local governments to offer regulated companies diverse approaches to electronic reporting that can be tailored to their technical capabilities and to the level of automation they wish to achieve. In addition, the strategy gives EPA, the states, tribes, and local governments the flexibility to adapt electronic reporting systems to evolving technologies without requiring that regulations be amended with each technological innovation.

However, this regulatory strategy does not mean abandoning any control over how electronic documents are submitted. In place of specific technologies or detailed procedural steps, today's rule requires that electronic submissions be made to CDX or other designated EPA systems, or to state, tribe, or local government systems that are determined to satisfy a certain specified set of technology-neutral performance standards. As a practical matter, the use of these systems (e.g., CDX or others that meet the specified performance standards) will involve submission procedures that we believe are sufficient to ensure the legal dependability of electronic reports so that they meet the needs of our compliance and enforcement programs. In addition, while the specified performance standards may be technology-neutral, agency electronic reporting systems that implement the standards will incorporate suites of very specific technologies that will further determine the process for actual electronic submission. Sections V.B and V.C of this Preamble describe these requirements and the associated technologies in some detail for the case of reporting directly to EPA via CDX.

III. Scope of the Electronic Reporting Rule

EPA is today promulgating a new Part 3 in Title 40 of the CFR. The new Part applies to all persons who submit reports or other documents to EPA under Title 40, and to state, tribe, and local programs that administer or seek to administer authorized programs under Title 40. The new part 3 does not address contracts, grants or financial management regulations contained in Title 48 of the CFR.

A. Who may submit electronic documents?

Any entity that submits documents addressed in this rule (see section III.B., below) directly to EPA can submit them electronically as soon as EPA announces that CDX or a designated alternative system is ready to receive these reports. (See section V of this Preamble for a discussion on requirements for electronic reporting to EPA, and section V.B for a discussion of the status of electronic reporting directly to EPA systems that exist as of the rule's publication date.) Under this rule, the affected entities may elect to utilize the electronic reporting alternative. These entities are not required by this final rule to report electronically; however, they may be required to report electronically under other Title 40 regulations, and nothing in today's rule limits EPA's ability to require electronic reporting under other parts of Title 40.

In general, entities may submit documents electronically as provided for under authorized state, tribe, or local government programs. Nothing in this rule prohibits state, tribe, or local governments from requiring electronic reporting under applicable state, tribe, or local law.

B. Which documents can be filed electronically?

This rule addresses document submissions required by or permitted under any EPA or authorized state, tribe, or local program governed by EPA's regulations in Title 40 of the CFR. Nonetheless, EPA will need time to develop the hardware and software components required for each individual type of document. Similarly, states, tribes, and local governments will need time to evaluate their electronic document receiving systems to ensure that they meet the standards promulgated in today's final rule. Accordingly, once this rule takes effect, specific documents submitted directly to EPA that are not already being submitted electronically to existing EPA systems can only be submitted electronically after EPA announces in the **Federal Register** that CDX or an alternative system is ready to receive those specific documents. (See section V.B of this Preamble for a discussion of the status of electronic reporting directly to EPA systems that exist as of the rule's publication date.) Documents may be submitted electronically under the provisions of an authorized state, tribe, or local program.

C. How does this final rule implement electronic reporting?

The new 40 CFR part 3 consists of four (4) Subparts. Subpart A provides that any requirement in Title 40 to submit a report directly to EPA can be satisfied with an electronic submission that meets certain conditions (specified in Subpart B) once the Agency publishes a notice that electronic document submission is available for that requirement. Subpart A also provides that electronic reporting can be made available under EPA-authorized state, tribe, or local environmental programs. In addition, Subpart A makes clear: (1) that electronic document submission, while permissible under the terms of this rule, is not required by any provision of this rule; and (2) that this rule confers no right or privilege to submit data electronically and does not obligate EPA or states, tribes, or local

agencies to accept electronic data. Subpart A also contains key definitions and discusses compliance and enforcement.

Subpart B sets forth the general requirements for acceptable electronic documents submitted to EPA. It provides that electronic documents must be submitted either to CDX or to other EPA designated systems. It also includes general requirements for electronic signatures. The requirements in Subpart B apply to entities that submit electronic documents for direct reporting to EPA, including states, tribes, and local governments that submit electronic documents to EPA to satisfy requirements that apply to them under Title 40 of the CFR. Subpart B does not apply to any data transfers between EPA and states, tribes, or local governments as a part of their authorized programs or as a part of administrative arrangements between states, tribes, or local governments and EPA to share data. Additionally, Subpart B does not apply to the submission of any electronic document via magnetic or optical media—for example via diskette, compact disk, or tape—or to the transmission of documents via hard copy facsimile or "fax."

Subpart C is reserved for future EPA electronic recordkeeping requirements.

Finally, Subpart D sets forth the process and standards for EPA approval of changes to authorized state, tribe, and local environmental programs to allow electronic reporting to satisfy requirements under these programs. Again, for purposes of Subpart D, "electronic reporting" entails submission via telecommunications, and Subpart D requirements do not apply in cases of submission via magnetic or optical media or hard copy "fax." With respect to electronic reporting, Subpart D includes simplified performance-based standards for acceptable state, tribe, or local agency electronic document receiving systems against which EPA will assess authorized program electronic reporting elements. It also provides a streamlined process for approving applications for revisions to authorized programs for electronic reporting.

Given the provisions of Subpart A, a regulated entity wishing to determine whether electronic reporting directly to EPA was available under some specific regulation will have to verify that EPA has published a Federal Register notice announcing their availability and will have to locate any additional provisions or instructions governing the electronic alternative for the particular reporting requirement. To facilitate this determination, EPA intends to maintain an easily accessed list of EPA reports for which electronic reporting has been implemented—cross-referencing the applicable Federal Register notices—on the Exchange Network and Grants webpage at *www.epa.gov/exchangenetwork.*

IV. Major Changes From Proposed Electronic Reporting Provisions

A. How does the rule streamline the approval of electronic reporting under authorized state, tribe, and local government programs?

1. *Review of the proposal.* EPA proposed that states, tribes, and local governmental entities would use the procedures for program revision or modification provided in existing program-specific regulations governing state, tribe, or local authorized programs.

In the Preamble to the proposed rule, we noted that our approach raised certain administrative concerns, especially in cases where a governmental entity wished to use a single system to accept electronic submissions across a number of authorized programs, corresponding to EPA's use of CDX to receive reports across EPA programs. To receive EPA approval for such implementations, the governmental entity would have to apply for revision or modification under each authorized program affected, using procedures that might vary substantially from program to program. While these procedures might vary, each substantive review would still refer to the same proposed part 3 criteria, and—in the case of a single system implementation—would apply these criteria to the same system. EPA intended this approach to facilitate an administrative streamlining of the approval process, by allowing a single EPA review of all cross-program applications associated with a particular electronic document receiving system, which would enable EPA to make a single decision to approve or disapprove all the associated applications. While this approach would not eliminate multiple applications, it would at least simplify the interactions between the applicant and EPA during substantive review, and would speed EPA action on the applications themselves.

EPA also considered more radical streamlining alternatives, including a centralized approval process provided for by regulation, and the proposal requested comment on whether any of these alternatives would be preferable to the administrative approach to streamlining.

2. *Comments on the proposal.* In comments on the provisions for electronic reporting under authorized programs, a recurring theme was the complexity of the proposed requirements for EPA approval of program revisions or modifications to allow electronic reporting. The comments in many cases seemed directed equally to the approval process and to the proposed criteria for approval. Comments on the criteria are discussed in more detail in section IV.B.2 of this Preamble.

As for the comments that clearly addressed the process, there were two major concerns. The first was that the process, due to the various current program authorization regulations, is inherently complicated, time-consuming and resource-intensive. In a few cases, commenters noted the particular worry that having to seek EPA approval for each program implementing electronic reporting would be especially burdensome, and that EPA's proposed approach of streamlining the internal review component of the program revision process would be of little help.

The second concern was the impact of the rule on electronic reporting that was already underway. Commenters noted that many authorized programs are already accepting electronic submissions, or would be by the time the final rule is published, and they worried about the timing of the requirement that the electronic document receiving systems they use for this purpose be approved by EPA under associated program revision or modification procedures. Under the proposed provisions, such systems would have to be EPA-approved as soon as the rule became effective, which was not practicable. Given the need to address the criteria for approval, such applications could only be initiated once the rule was finalized, and they might take months to complete and get approved, or substantially longer in cases where the revision or modification required state legislative or regulatory changes. During the months or years that the revision or modification was in process, the authorized program would either have to shut down their electronic document receiving systems or, of necessity, operate them out of compliance with the rule. Commenters were particularly concerned with the disruptive impacts of having to shut these systems down. They pointed out that reversion to paper-based submissions in such cases may be difficult and expensive, both for the agencies and for the submitting entities that are affected, and that resuming

system operation after a long hiatus may require resources more typically associated with system start-up. Additional comments on program revision or modification and EPA's responses can be found in the rulemaking docket, in the Response to Comments document.

3. *Revisions in the final rule.* To address the concern that the proposed program revision or modification to accommodate electronic reporting was too complicated and burdensome, the final rule provides streamlined procedures for adding electronic reporting to existing authorized programs. These are optional procedures that a state, tribe, or local government may use if it chooses, in place of the applicable program-specific procedures, to seek EPA approval for revisions or modifications that provide for electronic reporting. EPA believes that in most cases these optional procedures will be substantially simpler and quicker than their program-specific alternatives. These new procedures are discussed in detail in section VI.C of this Preamble.

To address the concern that the required program revisions or modifications may disrupt authorized programs that already have electronic reporting underway, the final rule provides for a two-year delayed compliance date—in effect, a two-year "grace period"—before such programs have to submit their applications for revision or modification. Programs will be allowed this grace period where they have systems that fit the definition of "existing electronic document receiving system," explained in section VI.B.2 of this Preamble. In addition, these provisions allow the grace period to be extended, on a case-by-case basis, where an authorized program may need to wait for legislative or regulatory changes before a complete application can be submitted.

B. How has EPA revised the requirements that state, tribe, and local government electronic reporting programs must satisfy?

1. *Review of the proposal.* EPA proposed a detailed set of criteria that would have to be met by any system that is used to receive electronic documents submitted to satisfy document submission requirements under any EPA-authorized state, tribe, or local environmental program. The proposed criteria addressed the capabilities that EPA believed a state, tribe, or local government's electronic document receiving system must have regarding six function-specific categories: (1) System security, (2) electronic signature method, (3) submitter registration, (4) signature/certification scenario, (5) transaction record, and (6) system archives.

These criteria were based upon EPA's consideration of the roles that many electronically submitted documents will likely play in environmental program management, including compliance monitoring and enforcement, and the need to ensure that such roles were not compromised by the transition from paper to electronic submission. In many respects electronic submission enhances a document's utility for environmental programs: it significantly reduces the resources and time involved in making the content available to its users, and can greatly facilitate data quality assurance and analysis. Nonetheless, electronic submissions may also be open to challenge, primarily with respect to their authenticity, and particularly where they are used to establish the actions and intentions of the submitters. We normally consider such uses in the case of environmental reporting, especially where electronic submissions are made to report on an entity's compliance status and where the submission includes a responsible individual's certification to the truth of what is reported. For such cases, EPA identified a programmatic need to be able to authenticate the submission content and the certification—for example, to be able to address issues of fraud or false reporting where they arise—and it is primarily this need that was addressed by the six proposed criteria.

The point of the proposal's six function-specific categories was to ensure the authenticity of electronic documents submitted in lieu of paper reports, so that they will be able to play the same role as their paper counterparts in providing evidence of what was reported and to what an identified individual certified with respect to the report. For example, in the case of paper submissions, the evidence surrounding a handwritten signature is normally sufficient to demonstrate that the signature is authentic and rebut any attempt by the signatory to repudiate it and EPA intends the standards in today's rule to provide evidence for electronic signatures that has a corresponding level of non-repudiation. Since these evidentiary issues typically arise in the context of judicial or other legal proceedings, electronic documents need the same "legal dependability" as their paper counterparts. The over-arching standard in the concept of "legal dependability" is that any electronic document that may be used as evidence to prosecute an environmental crime or to enforce against a civil violation should have no less evidentiary value than its paper equivalent. For example, where there is a question of deliberate falsification of compliance data—it must be possible to establish the signatory's identity beyond a reasonable doubt no matter whether the submission was electronic or paper.

A seventh, more general proposed criterion, entitled "Validity of Data," addressed the standard of legal dependability directly. The idea, in general, was that a system used to receive electronic documents must be capable of reliably generating evidence for use in private litigation, in civil enforcement proceedings, and in criminal proceedings in which the standard for conviction is proof beyond a reasonable doubt that the electronic document was actually signed by the individual identified as the signatory and that the data it contains was not submitted in error. The six more detailed, function-specific criteria represented the requirements for satisfying this more general "Validity of Data" criterion. Taken together, the seven proposed criteria were intended to ensure the legal dependability of electronically submitted documents by providing:

- Standards for valid electronic signatures and authentic electronic documents to be admitted as evidence in a judicial proceeding;
- Assurance that electronic documents can be authenticated to provide evidence of what an individual submitted and/or attested to; and
- Assurance that electronic signatures resist repudiation by the signatory.

By providing for these and other facets of an electronic document's legal dependability, proposed CROMERR was intended to preserve the ability of EPA and its authorized programs to hold individuals accountable when they certify, attest or agree to the content of compliance reports under environmental laws and statutes. By the same token, proposed CROMERR was also intended to ensure that EPA and its authorized programs will have the documentary evidence they need to bring actionable cases of false or fraudulent reporting into court.

2. *Comments on the proposed criteria for electronic document receiving systems.* EPA received a substantial number of comments on the proposed criteria for state, tribe, and local electronic document receiving systems, both in written submissions and at meetings with the public and with state and local government officials. While a

few of these comments questioned the "Validity of Data" criterion, the great majority dealt with the detailed function-specific criteria. There were at least three recurring and closely related themes. First, the criteria were too prescriptive and inflexible, and would prevent state, tribe, and local agencies from adapting their electronic reporting approaches to their needs and changing circumstances, and foreclose new and creative ways to achieve legal dependability. Second, the criteria would make electronic reporting unnecessarily complex, costly, and burdensome. Third, while the criteria might be appropriate for some cases, the "one size fits all" approach was not workable for all reports in all programs.

Commenters tended to associate these three themes with certain misperceptions about the proposed requirements for signature method and the signature/certification scenario. Concerning signature method, a common concern was that the criteria would require states to implement PKI-based digital signatures. Commenters generally appear to have inferred this from proposed § 3.2000(c) Electronic Signature Method, together with EPA's own choice of PKI for some submissions to CDX, as discussed in the Preamble. Whatever EPA's plans for CDX, state, tribe, and local government systems do not have to conform to the CDX model. Implementing a particular system of necessity requires the choice of specific technologies. To make those choices does not imply that these are the only possible choices that would satisfy whatever requirements the rule places on electronic reporting systems. Concerning § 3.2000(c), commenters tended to focus on paragraph (5) of this section, which stated that the signature method had to ensure "that it is impossible to modify an electronic document without detection once the electronic signature has been affixed." EPA did not intend for this provision to establish PKI-digital signature as the required signature method. Given current technology, approaches to satisfying the § 3.2000(c)(5) requirement frequently involve the computation of a number—called a "hash"—that has a unique relation to the content of the electronic document such that any change to the document content would change the computed hash. Given the hash, the associated document can be confirmed as unmodified at any time by calculating a new hash and showing that the new and original hashes are identical. Using such a hash-based approach, it is important to ensure that the hash has been secured from tampering, and encryption is probably the most straightforward way to do this. Encryption can be accomplished in a number of ways. Approaches include PKI-based digital signature, digital signature where the asymmetric key-pair is not associated with a PKI certificate, and various forms of symmetric-key cryptography. Additionally, it may be possible to avoid cryptography altogether by storing the hash value in a system with appropriately controlled access. Thus, a solution using PKI-based digital signatures represents only one among a number of possible approaches to satisfying the proposed §3.2000(c)(5) requirement.

A number of commenters also misinterpreted the criteria under proposed § 3.2000(e) Electronic signature/certification scenario (especially the provisions for signatory's review of data under § 3.2000(e)(1)(i)) as requiring signatories to scroll through their submissions on-screen before they affix their electronic signatures, and requiring state systems to enforce this required "scroll-through". However, the proposal provided not that the signatory must review the data on-screen, but rather that he or she be given the opportunity to do so. The example of the enforced on-screen "scroll-through" then envisioned for CDX, and provided in the CDX section of the proposal's preamble, was in error. EPA did not intend to require this "scroll-through" of submitted data prior to signature. EPA certainly does expect and encourage reporting entities to review data intended for electronic submission prior to signature, but does not mandate this or any other particular mode or method of signatory review in today's rule.

Returning to the three comment themes—of prescriptiveness, cost and burden, and a "one size fits all" approach—commenters who raised the prescriptiveness issue generally argued that, even supposing that there were no specific objections to the detailed § 3.2000 provisions, EPA had failed to make the case that every single requirement under these provisions is necessary to ensure the legal dependability of electronic submissions. Commenters who argued that the proposed rule would be too costly and burdensome generally focused on § 3.2000(c)(5) and § 3.2000(e)(1)(i), discussed above, or on the proposed § 3.2000(d) registration and signature agreement provisions. There were many comments to the effect that the complex § 3.2000(d) registration and re-registration requirements would pose substantial barriers to regulated company participation in electronic reporting and involve unacceptable expenses for implementing agencies. Commenters also noted that the required § 3.2000(e)(1)(i) would be difficult to integrate with company workflow practices in many cases. Finally, there is the "one size fits all" issue. Some of the comments raised this as another version of the "prescriptiveness" issue, but adding that the proposal developed just one model of electronic reporting and attempted to make it fit the differing circumstances of the various state, tribe, and local agencies that would have to comply. Other comments emphasize the point that the proposal takes requirements apparently tailored to assuring an electronic document's authenticity and applies them to all cases of electronic reporting, whether or not the question of authenticity is likely to arise.

EPA has considered these and related comments in writing today's rule. We do not wish to set overly prescriptive requirements and so foreclose acceptable electronic reporting alternatives that could offer equivalent or better assurance of legal dependability while, perhaps, being easier for a state, tribe, or local agency to implement. We do not wish to set requirements that impose unnecessary costs or burdens. And, while we do not see a "bright line" around the universe of cases where document authenticity might be of concern, we also do not wish to address authenticity with requirements that leave states, tribes, and local governments with too little flexibility in how they may adapt their electronic reporting implementations to their particular circumstances. Accordingly, EPA has decided to finalize criteria for electronic document receiving systems that directly articulate the underlying goal of assuring the legal dependability of electronic documents authenticity, and to add more specific requirements only to the extent that they are needed to achieve this underlying goal. Accordingly, the provisions of today's rule have been clarified as general performance standards necessary to ensure the legal dependability of the electronic documents they receive. Additional comments on the proposed criteria and EPA's responses can be found in the rulemaking docket, in the Response to Comments document.

3. *Revisions to the criteria in the final rule.* In today's final rule, we intend to fulfill the underlying goal of the proposed § 3.2000 criteria for electronic document receiving systems. This is to assure the authenticity and non-

repudiation of electronic documents submitted in lieu of paper reports, so that they are as legally dependable—that is, as admissible in evidence and accorded the same evidentiary weight—as their paper counterparts. As noted earlier, this goal was expressed most directly in the proposed § 3.2000(b) "Validity of Data" criterion. Accordingly, for the final rule, we started with the proposed § 3.2000(b) and then clarified the remaining proposed § 3.2000 criteria as general performance standards for electronic document receiving systems, which were incorporated as needed to assure the legal dependability of the electronic documents such systems receive. The resulting § 3.2000(b) in the final electronic reporting rule reflects the requirements discussed in the table below. The citation for the corresponding language in the proposed rulemaking is also provided.

Citation/subject area in proposed rule	Citation/requirement in final section 3.2000(b)
Proposed § 3.2000(g), addressing system archives	Section 3.2000(b)'s leading clause requires that the system be able to generate the required data as needed and in a timely manner.
Proposed §§ 3.2000(e)(3) and 3.2000(f), addressing signature/certification scenarios and transaction record.	Section 3.2000(b)'s leading clause and § 3.2000(b)(4) require that the system be able to generate a "copy of record" that is made available to the submitters and/or signatories for review and repudiation.
Proposed §§ 3.2000(c) and 3.2000(d), addressing the electronic signature method and submitter registration process.	Section 3.2000(b)(5)(i) requires that the system be able to show that any electronic signature on an electronic document was created by an authorized signatory with a device that the identified signatory was uniquely entitled and able to use.
Proposed § 3.2000(c)(5), addressing requirement that it be impossible to modify an electronic document without detection once it has been electronically signed.	Section 3.2000(b)(5)(ii) requires that the system be able to show that the electronic document cannot be altered without detection once it has been electronically signed.
Proposed § 3.2000(e), addressing the signature/certification scenario	Sections 3.2000(b)(5)(iii)—(iv) require that the system be able to show that, before signing, any signatory had the opportunity to review what he or she was certifying to in a human-readable format, and to review the certification statement including any provisions relating to criminal penalties for false certification.
Proposed § 3.2000(d), addressing the submitter registration process	Section 3.2000(b)(5)(v) requires that the system be able to show that the signatory signed an "electronic signature agreement" or a "subscriber agreement" acknowledging his or her obligations connected with preventing the compromise of the signature device.
Proposed § 3.2000(e)(2), addressing acknowledgment	Section 3.2000(b)(5)(vi) requires that the system be able to show that it automatically sent an acknowledgment of any electronic submission it received that bears an electronic signature; the acknowledgment must identify the electronic document, the signatory and the date and time of receipt, and be sent to an address that does not share the access controls of the account used to make the submission.
Proposed § 3.2000(d)(1)–(3), addressing submitter registration.	Section 3.2000(b)(5)(vii) requires, for each electronic signature device used create an electronic signature on documents that the system receives, that the system be able to establish the identity of the individual uniquely entitled to use that device and his or her relation to the entity on whose behalf he or she signs the documents.

The requirements in § 3.2000(b)(5)(iii)–(iv) of today's rule, concerning "opportunity to review," do not place the responsibility for providing an opportunity, or for showing whether or not an opportunity was actually taken, on the state, tribe, or local government electronic document receiving system. What is required is that the system provide evidence sufficient to show that an opportunity was provided; this point is explained in greater detail in sections VI.E.8 and VI.E.9 of this Preamble.

EPA believes that the standards in § 3.2000(b) of today's rule, as developed from the proposed "Validity of Data" criterion, together with other proposed criteria clarified as general performance standards, represent the minimum set of requirements for electronic document receiving systems necessary to ensure the legal dependability of the electronic documents such systems receive. For example, the requirement for a copy of record is necessary to ensure that there is an authoritative answer to the question of what information content a signatory was certifying to or attesting to. The related requirement that the system be able to provide timely access to copies of record and related data reflects a practical concern that the data be accessible in time and in a format to serve the purposes for which it is needed.

Concerning the requirement that signature devices be uniquely assigned to, and held by individuals, EPA believes that an acceptable electronic document receiving system must be able to attribute a signature to a specific individual, to help assure that the signatory cannot repudiate responsibility for the signature. Non-repudiation is also strengthened by the signed electronic signature agreement, which establishes that the signatory was informed of his or her obligation to keep the signature device from compromise by ensuring that it is not made available to anyone else. Requiring the signature agreement, as well as the opportunity to review what they are signing, helps establish that where signatures appear on electronic documents, the signatories had the requisite intent to certify. That is, these requirements help ensure that the signatories knew what they were signing, knew what signing meant, and understood the legal implications of false certification. As for the requirement that document content cannot be altered without detection after signature, an acceptable electronic document receiving system must provide evidence sufficient to allow a court to attribute the intention to certify to the document's current content to the signatory, so that he or she cannot repudiate this content.

Finally, today's § 3.2000(b)(5)(vii) requirement that the system be able to establish the identity of the individual who is assigned a signature is based on proposed § 3.2000(d). Proposed § 3.2000(d) logically entails today's § 3.2000(b)(5)(vii), because satisfying the

provisions of the former guarantees compliance with the latter. However, today's § 3.2000(b)(5)(vii) limits the scope of the proposed § 3.2000(d)(3) requirement that, in registering for their signature devices, registrants must execute their electronic signature agreements on paper with handwritten signatures. In today's § 3.2000(b)(5)(vii), this requirement is limited to a special class of "priority report" submittals. (See section VI.E.12 of this Preamble.) In addition, today's § 3.2000(b)(5)(vii) offers alternatives to this handwritten signature requirement, to allow electronic reporting solutions that are completely free of paper transactions. The alternative provisions, found in today's § 3.2000(b)(5)(vii)(A)–(B), are elaborations of the proposed § 3.2000(d)(1) requirement for "evidence [of identity] that can be verified by information sources that are independent of the registrant and the entity or entities" for which the registrant will submit electronic documents. The elaborations are necessary to assure that individuals' identities can be established without being able to rely on their handwritten signatures—and, in the final rule, the requirements apply only to "priority report" submittals, and only where the choice is made to not use paper in the execution of electronic signature agreements. Section VI.E.12 of this Preamble outlines all of today's § 3.2000(b)(5)(vii) provisions in much more detail. In any event, we have made these changes to the proposed § 3.2000(d) approach to help address commenters' concerns with "one size fits all" provisions, as well as to allow states, tribes, and local government as much flexibility as possible as they implement their electronic reporting systems.

In sum, the overall approach to the standards for electronic document receiving systems in today's rule reflects a balancing of the concerns raised by the public comments, especially those relating to the proposal's burden on states, tribes, local governments and regulated entities, against the need to ensure the legal dependability of electronic documents submitted under authorized programs. Finally, EPA notes that to date the Agency has had limited experience with the practical application of electronic signatures and electronic reporting generally. With the benefit of practical experience accepting electronic reports under this rule, EPA may determine that this rule needs to be revisited, to either add or eliminate certain safeguards. In addition, while EPA has sought to write this rule so that its provisions are technology-neutral, it remains possible that revisions will be required to reflect technological changes or changes in prevailing industry norms and practices. If these or other circumstances require it, EPA thus reserves the right to revisit the issues addressed in this rule.

C. How has EPA accommodated electronic submissions with follow-on paper certifications?

Currently there are EPA and state programs that take electronic submissions where the requirements for a signed certification statement are met with a follow-on paper submission with handwritten signatures. A number of commenters suggested that such an approach be recognized and allowed to continue under the electronic reporting rule. EPA has no wish to proscribe such an approach, and does not judge whether or not follow-on paper signature/certification is to be preferred to the approach where the signature/certification is electronic. To make this clear in the final rule, we have added a clause to § 3.10(b) that allows follow-on handwritten signatures to substitute for electronic signatures on submissions to EPA where "EPA announces special provisions" for this purpose. A corresponding clause in § 3.2000(a)(2) of today's rule makes a similar allowance for electronic reporting under authorized state, tribe, or local programs, again, where "the program makes special provisions to accept a handwritten signature on a separate paper submission."

Among other things, these "special provisions" would allow follow-on paper signature submission only if it were reliably linked or cross-referenced with the associated electronic document. The linking or cross-referencing is necessary in part to ensure that we can always determine which signature submissions belong with which electronic documents. Paper signature submissions must also provide sufficient evidence that the signatory intended to certify to or attest to the content of the electronic document as this content is recorded in the copy of record for the submission. There are various approaches to cross-referencing or linking that would meet these needs, most of which involve the inclusion of extra data elements in the signature submission that reference the associated electronic document. Such data elements might include summary data from the electronic document, the date and time of the electronic submission, or even the calculated hash value of the electronic document. EPA may use these and other alternatives if a decision is made to provide for direct electronic reporting to EPA with follow-on paper signatures. For such submissions to authorized programs, we have added to § 3.2000(a)(2) of today's rule the requirement that authorized program provisions for follow-on paper signature submissions "ensure that the paper submission contains references to the electronic document sufficient for legal certainty that the signature was executed with the intention to certify to, attest to, or agree to the content of that electronic document."

D. How has EPA changed proposed definitions of terms?

The "Definitions" section of the final rule, § 3.3, provides new definitions for "copy of record," "electronic signature agreement," and "valid electronic signature," as well as the revisions to the definition for "electronic signature device," to help articulate the final § 3.2000(b) standards for electronic document receiving systems. These terms are explained in more detail in section VI, below. (See especially, sections VI.E.2., VI.E.10. and VI.E.6.) Similarly, in section VI.B.2 of this Preamble we note the role of the new definition for "existing electronic document receiving system;" and, in section VI.E.12 we discuss the new definitions for "agreement collection certification," "disinterested individual," "information or objects of independent origin," "local registration authority," "priority reports," and "subscriber agreement." Section 3.3 also reflects a number of clarifying and/or simplifying changes for definitions of terms, as follows.

1. *Definition of "acknowledgment."* This definition has been added in conjunction with § 3.2000(b)(5)(vi) of today's rule, to make clear that in the context of this rule, acknowledgment means a confirmation of electronic document receipt.

2. *Definition of "electronic document."* This definition has been revised from the proposed version in several ways. First, the use of "communicate" has been eliminated, thereby eliminating the need for a separate definition of that term. Second, the exclusion of magnetic and optical media and facsimile submissions has been eliminated. We believe it is clearer to exclude such submissions from the scope of CROMERR under § 3.1, entitled "Who does this part apply to?" Today's rule now provides this exclusion in §§ 3.1(b) and 3.1(c). Third, the definition has also been revised so that it explains what a "document" is in an electronic medium. Instead of saying that an "*electronic document* means a

document. * * *," the final version says that "*electronic document* means any information in digital form. * * *," where *information* is explained as potentially including "data, text, sounds, codes, computer programs, software or databases." Fourth, this definition clarifies that in this context, "data," is used in its normal sense as denoting a delimited set of data elements, each of which is a unit of meaning in a document and consists of a content or value together with an understanding of what the meaning and/or context of the content or value is. Finally, the definition stipulates that where an electronic document includes data, the understanding of what the data content or value means must either be explicitly included in the electronic document or be readily available through such sources as an applicable data element dictionary, or a form or template that specifies what each data element means when it is presented in the specific file format used for the electronic document's submission.

A consequence of this approach is that the identity of an electronic document consisting wholly of data is independent of the format in which it is presented or submitted. That is to say, rearranging or reformatting the data elements in an electronic document does not change it into a different one, at least so long as the signatory's intention and understanding of what the data elements each mean is preserved in the process. This does not conflict with the ordinary understanding of the term "document," since we speak quite often of "reformatting a document," with the clear understanding that what results will be the same document in a new format. Correspondingly, under the definition of "copy of record," a "true and correct" copy of an electronic document does not necessarily have to reflect the format in which the document was submitted, provided that the document consists wholly of data. This independence of document identity from format may not always hold where other kinds of information are included in the electronic document, e.g. text or images; in such cases a copy of record may have to include format or formatting information.

3. *Definition of "electronic signature."* This definition has been revised by substituting "information in digital form" for "electronic record," to avoid problems with defining "electronic record." The definition has also been revised to make clear that the electronic signature for an electronic document need not always be "included" within that document; in some cases it may just be "logically associated" with it. This point is explained further in section VI.E.2 of this Preamble, in discussing the copy of record requirement.

4. *Definition of "electronic signature device."* The definition of "electronic signature device" has been revised to clarify that where a device is used to create an individual's electronic signature, then the device must be unique to that individual, and he or she must be uniquely entitled to use it at the time that the signature is created. Correspondingly, the device is compromised if it is available for use by any other individual, that is, if some other individual is able to use the device to create signatures if he or she wishes. To the extent that §§ 3.10(b) and 3.2000(b)(5)(i) of the final rule prohibit the acceptance of signatures created with compromised devices, via the definition of "valid electronic signature," the element of compromise rules out the sharing of electronic signature devices or delegating their use to create individuals' electronic signatures. Additionally, the definition includes the element that an individual needs to be entitled to use the electronic signature device; that is, the individual needs to be the "owner" of the device. The nature of the device itself will determine the way in which an individual comes to own it. In the case of personal identification numbers or certificate-based private/public key pairs, there is normally some process of formally assigning the device to the individual, often through a trusted third party. In other cases, for example password or personal information-based signature devices, the process may have the individuals invent and assign the devices to themselves " the basis for their ownership of the devices being determined by the circumstances or context within which they do this.

5. *Definition of "transmit."* In the proposed rulemaking the term "submit" was defined as the "means to successfully and accurately convey an electronic document so that it is received by the intended recipient in a format that can be processed by the electronic document receiving system." However, the term "submit" is used more widely in the rule in ways that are not consistent with this definition. Accordingly, in the final rule the function of successful and accurate conveyance of an electronic document is now termed "transmit."

6. *Definition of "valid electronic signature."* Beyond its role in § 3.2000(b), this definition has also been added to help clarify and simplify the signature requirements associated with electronic reporting, both directly to EPA, in § 3.10, and under authorized programs, in § 3.2000(a)(2). The definition specifies three main conditions for validity. The first refers to features of the signature that are intrinsic to the items of information of which it consists: The signature must consist of the kind of information that has been established as appropriate for the signing of the document in question, and the specific information content must pass the validation tests which the system uses to determine that the signature belongs uniquely to the identified signatory. The second condition refers to the status of the electronic signature device used to create the signature, and ensuring that the device was not compromised at the time it was used to create the signature. This ties validity to the element of *compromise* within the definition of "electronic signature device." That is, at the time of signature, the device must not have been made available to someone other than the individual who is entitled to use it. The third condition refers to the signatory's status at the time of signature as someone who is authorized to sign the document in question by virtue of his or her legal status and/or relationship to the entity on whose behalf the signature is executed. In the context of environmental reporting, this condition would make invalid electronic signatures on company compliance reports created by individuals who do not work for or in any way represent the company. Generally, in the context of environmental reporting, individuals who sign submissions to environmental agencies are explicitly authorized to do so, by their management and/or by the agency to which they report. However, in some cases the authorization may be implicit in the signatory's legal status and relationship to the regulated entity. For example, an owner or operator of a company is generally authorized to sign notifications or letters to an environmental agency whether or not this is explicitly provided for by law or regulation.

As "valid electronic signature" is used in §§ 3.10 and 3.2000(a)(2), the validity of an electronic signature is necessary for the signatory's electronic submission to satisfy a federal or authorized program reporting requirement. Additionally, as the term is used in § 3.2000(b), it also refers to a performance requirement for an electronic document receiving system, namely that the system must not accept and must be able to detect submissions with signatures that are not valid. These requirements in terms of "validity" are

meant to provide a form of insurance for electronic signatures to protect against the risks of repudiation. Nonetheless, a signatory may be legally bound by a signature even where not all the requirements for its validity have been met, *e.g.*, where the signature has been executed with a compromised electronic signature device. The signatory of an electronic submission cannot avoid responsibility for its contents by pointing to a technical flaw or other defect in the signature process.

V. Requirements for Direct Electronic Reporting to EPA

A. What are the requirements for electronic reporting to EPA?

Under the final rule, the requirements for electronic reporting to EPA remain essentially unchanged from those in the proposal. Section 3.10 provides, first, that electronic documents must be submitted to an appropriate EPA electronic document receiving system. Generally this will be EPA's Central Data Exchange (CDX), although EPA can also designate additional systems for the receipt of electronic documents and is doing so in a separate **Federal Register** notice. Second, where a paper document must bear a signature under existing regulations, an electronic document that substitutes for the paper document must be signed (by the person authorized to sign under the current applicable provision) with a valid electronic signature.

Only electronic submissions that meet these two requirements will be recognized as satisfying a federal environmental reporting requirement, although failure to satisfy these requirements will not preclude EPA from bringing an enforcement action based on the submission or otherwise relying on the submission. A new compliance and enforcement section has been added to the final rule to clarify certain compliance and enforcement issues related to electronic reporting. Section 3.4 makes clear that EPA can seek and obtain any appropriate federal civil or criminal penalties or other remedies for failure to comply with an EPA reporting requirement if a person submits an electronic document to EPA under this rule that fails to comply with the provisions of § 3.10. Similarly, § 3.4 makes clear that EPA can seek and obtain any appropriate federal civil or criminal penalties or other remedies for failure to comply with a state, tribe, or local government reporting requirement if a person submits an electronic document to a state, tribe, or local government under an authorized program and fails to comply with the applicable provisions for electronic reporting. Section 3.4 also contains provisions originally published under § 3.10(d) and (e) of the proposal, stipulating that the electronic signature will make the person who signs the document responsible, bound, or obligated to the same extent as he or she would be signing the corresponding paper document by hand.

The § 3.10 requirement that there be an electronic signature applies only where a paper document would have to bear a signature were it to be submitted, either because this is required by a statute or regulation, or because a signature is required to complete the paper form. The rule does not impose any new or additional signature requirements for documents that are submitted in electronic form. In addition, as noted in section IV.C of this Preamble, § 3.10(b) of today's rule also allows EPA to make special provisions, in specific cases, for accepting handwritten signatures in follow-on paper submissions in lieu of the required electronic signatures. In such cases, it is critical that the special provisions ensure that the electronic document cannot be altered without detection and is reliably linked to the handwritten signature.

As in the proposal, this final rule does not specify any required hardware or software. Accordingly, the rule text does not include any detail about CDX per se or about what will be required of regulated entities who wish to use it. Nonetheless, as stated in the proposal, our goals include the sharing of detail on how CDX implements direct electronic reporting to EPA. Section V.C.4 of this Preamble explains how CDX has changed since we described it in the proposal, especially in relation to the many comments we received on CDX-related issues.

B. What is the status of existing electronic reporting to EPA?

In a notice published concurrently with today's rule, EPA clarifies the status of electronic reporting directly to EPA systems that exist as of the rule's publication date. In accordance with 40 CFR 3.10, EPA is designating for the receipt of electronic submissions, all EPA electronic document receiving systems currently existing and receiving electronic reports as of the date of this notice. This designation is valid for a period of up to two years from the date of publication of this notice. During this two-year period, entities that report directly to EPA may continue to satisfy EPA reporting requirements by reporting to the same systems as they did prior to CROMERR's publication unless EPA publishes a notice that announces changes to, or migration from, that system. Any existing systems continuing to receive electronic reports at the expiration of this two-year period must receive redesignation by the Administrator under § 3.10. Notice of such redesignation will be published in the **Federal Register**.

EPA's goal is that all its systems for receiving electronic reports be consistent with the CROMERR standards for electronic document receiving systems, set forth in § 3.2000(b) of today's rule. EPA generally hopes to achieve this consistency within a two-year transition period for existing EPA systems; however, EPA is not bound by the § 3.2000(b) standards of today's rule or the two-year period. This two-year period is similar to the two-year transition period provided under § 3.1000(a)(3) for systems operated under EPA-authorized programs. In a number of cases, EPA may work toward this goal by migrating existing electronic reporting to CDX or to other, new CROMERR-consistent systems. As we change or migrate existing electronic reporting programs to achieve consistency with the CROMERR standards, we intend to provide sufficient advance notice to reporting entities so that any new requirements can be accommodated without causing significant disruption to their electronic reporting activities.

C. What is EPA's Central Data Exchange?

1. *Overview of general goals.* The proposal described EPA's "Central Data Exchange" as a system to be developed and maintained by EPA's Office of Environmental Information (OEI) that would serve as EPA's gateway or "portal" for receiving documents electronically from our reporting community. The goal of CDX was to augment, and, where appropriate, streamline and consolidate EPA's environmental reporting functions by offering our reporting community faster, easier, and more secure submission options through a single venue for electronic submission of environmental data. As a cornerstone of EPA's efforts to advance electronic government, CDX would support the electronic submission needs of thousands of regulated entities submitting data to EPA for certain air, water, waste, and toxic substances programs. Ultimately, EPA planned to offer, wherever practicable, all regulated entities that report directly to EPA, an option to file their specific environmental documents

electronically through CDX. Regulated entities that submit reports under an authorized program would also be able to file their documents through CDX in cases where the state, tribe or local government that administered the program chose to use CDX as a gateway for electronic data submissions from its reporting community.

The reporting community using CDX would be able to access web "reporting" forms with built-in data quality checks, and/or submit standard file formats through common, user-friendly interfaces that allowed them to electronically submit data across vastly different environmental programs. Both the reporting community and EPA would benefit by gaining access to environmental reports more quickly and with fewer errors, and by avoiding the inefficiencies of having to keystroke data from paper reports. CDX was also being developed to support a newly emerging Environmental Information Exchange Network (EIEN) that would facilitate the electronic exchange of environmental data between EPA and state, tribe, and local environmental agencies. However, in keeping with the scope of the proposed rule the description of CDX features and functions in this section apply only to electronic submissions to CDX from regulated entities; the description doesn't apply to EIEN exchanges with CDX in which states, tribes, or local governments participate as a part of their authorized programs or as a part of administrative arrangements with EPA to share data.

The Concept of Uniformity. The proposal also characterized CDX as providing an environment that would promote a uniformity of technologies and processes. By adopting CDX to support the electronic reporting needs across various EPA programs, EPA hoped to avoid the proliferation of program-specific electronic reporting approaches that could lead to duplicative investments in electronic document receiving systems and possibly conflicting requirements for submitters.

The CDX Functions and Building Blocks. As described in the proposed rule, CDX was being designed with the goal of fully satisfying the criteria that the proposal specified for state, tribe, and local electronic document receiving systems; similarly, EPA would ensure that other systems the Administrator designated to receive electronic submissions satisfied the criteria as well. The proposal discussed how CDX would implement CROMERR-compliant electronic reporting by describing the primary CDX functions and the system building blocks that would support these functions. The functions described in the proposal included: (1) Access management, (2) data interchange, (3) signature/certification management, (4) submitter and data authentication, (5) transaction logging, (6) copy of record provisions and acknowledgment, (7) archiving, (8) error checking, (9) translation and forwarding, and (10) outreach. The proposal then described five building blocks that would support CDX functions, which were: (1) Digital signatures based on PKI, where CDX would rely predominately on a third party vendor under the General Services Administration (GSA) Access Certificates for Electronic Services (ACES), (2) a process for registering users and managing their access to the CDX, (3) a client server-architecture, (4) EDI standards, as the primary format for exchanging environmental data, and (5) a consistent user interface for making electronic submissions.

2. *Comments on the proposal.* EPA received more than 100 comments on the CDX concept as described in the proposal. A number of these comments were related to one of four main subject areas, as follows.

Comments on Uniformity of Approach. Several comments expressed concern about the proposed characterization of CDX as promoting "uniformity of process and technology". The phrase was used to highlight the benefits of CDX, which included EPA's plans to avoid the costly proliferation of redundant systems. However, comments pointed out that this "uniformity" implied an inflexible and overly prescriptive set of CDX technical and security requirements, which would discourage CDX use. Such comments were similar to those discussed in section IV.B.2 of this Preamble, raising concerns about the prescriptiveness and "one size fits all" approach of the proposed criteria for electronic document receiving systems.

EPA understands that "uniformity of process and technology" could imply inflexibility, and this is not generally how we intended to develop CDX. In fact, CDX is currently using a wide range of technologies and processes to address CDX's functions that are tailored to individual EPA program submission requirements, including the technical capabilities of the reporting community for the particular program. EPA recognizes that, for example, permitting, compliance monitoring, and the conduct of studies involve fundamentally different business processes, and that the associated submission of electronic documents may have to be handled differently in each case. In some instances CDX may support a more interactive "workflow" environment for submitting data; in others, CDX may accept batch transmissions of user-formatted files. It is also true that the technical capabilities of a particular reporting community vary considerably, so CDX will offer more than one electronic submission option in many cases. CDX currently provides support for web-forms, file, and record-level submissions in various formats including flat file and XML and EPA plans to continue this flexible approach.

Comments on registration process. Comments from regulated entities raised concerns about the costs and time required to register individuals in each company, and EPA's failure to address the increasingly common cases where the preparer of an environmental report and the certifying official are different individuals.

Because electronic submission is being offered as an option to the reporting community, EPA recognizes the need to design CDX registration to be as user-friendly as practicable, in part by taking account of the flow of work, or "workflow" involved in meeting a particular environmental reporting requirement. For example, since proposal, EPA has developed approaches to register both preparers and certifying officials for at least two reporting programs. Changes to the CDX registration process are discussed in more detail in section V.C.4.

Comments on digital signatures based on PKI. Comments pointed out that reliance on PKI for all cases of electronic signature may violate the GPEA directive to vary electronic signature approaches with the circumstances of their use. Several comments underlined this concern by pointing to PKI's costs and burdens. The comments objected that registering through CDX and acquiring digital signature certificates would be overly complicated, and would require that registrants provide private or personal information. Some comment also expressed concern about the incompatibility of a PKI-based approach with workflow, given that environmental reports were frequently prepared by staff and then signed by the facility owner, with staff turnover being frequent. Another concern was the implications of CDX PKI software for company system security, for example, given the need to download CDX software through the company firewall.

EPA agrees that it should generally minimize the complexity and cost of electronic signatures or this will deter potential users of CDX from submitting

electronic documents. In implementing CDX, EPA has revised the initial plan for electronic signatures to include non-PKI electronic signatures. Section V.C.4 discusses how we are changing the "digital signature based on PKI building block."

Comments on EDI Standards. Comments expressed both encouragement and concern over CDX's prospective implementation of standards-based exchange formats for data submissions. An exchange format is a predefined file structure, including data elements and higher level syntax that describes how the data extracted from a system must be arranged in a file for transmission to another system. A standards-based format adheres to certain widely-accepted industry, national, or international file structure definitions. Several comments expressed concern about the costs of configuring their systems to generate a CDX-specified standard format; others expressed concerns about the costs of potential changes to the format once it is implemented on their systems. By contrast, other comments strongly supported requiring standards-based formats—even recommending that we require such formats by rule for EPA and EPA-authorized state, tribe, and local electronic document receiving systems.

CDX's approach to standards-based formats has changed considerably since the proposal, in large part because of the emergence of Internet-based approaches, most notably Extensible Mark-up Language (XML). These changes are discussed in more detail in section V.C.4. EPA believes that the use of standard formats can be encouraged without requiring this by rule. Additional comments on CDX and EPA's responses can be found in the rulemaking docket, in the Response to Comments document.

3. *The aspects of CDX that have not changed since proposal.*

General Goals. EPA's continues its efforts to establish CDX as the gateway or "portal" for receiving documents electronically from the Agency's reporting community. In so doing, EPA's goal—to augment, and where appropriate, to streamline and consolidate EPA's environmental reporting functions through CDX—remains unchanged. The functions that comprise CDX operations continue to remain the same though the range of technologies and processes used to support these functions has considerably broadened. CDX continues to implement electronic reporting capabilities for EPA's many environmental programs, while advancing the efforts of EIEN in coordination with state, territorial, tribes, and other partners.

General Approach to Electronic Reporting Implementation. In general, current instructions for client-side access of CDX suggest Internet access and a system that uses both Microsoft Windows and Microsoft Internet Explorer (IE). EPA acknowledges that the Government Paperwork Elimination Act (GPEA) directs OMB to develop procedures for agencies to follow in using and accepting electronic documents and signatures and these procedures "may not inappropriately favor one industry or technology." Consistent with this GPEA directive, EPA is committed to considering ways to allow other vendors' technologies to access CDX. Accordingly, over the six months following the publication of today's rule, EPA intends to assess the full range of issues that affect CDX's ability to support multiple platforms and browsers. These issues include the technical requirements for the electronic signature options, form entry options, data upload options, network interface options, current capabilities of the CDX hardware/software platform, and potential impacts of new client-side platforms on the CDX life cycle management, technical support requirements, and help desk training and support. Based on this assessment, EPA intends to determine the target universe of client-side platforms and browsers that CDX can feasibly accommodate, and will identify the actions and timeline necessary to build out CDX support for this target universe.

As described in the proposal, CDX users will need to:

- Register with CDX, during which time they may need to supply information used to identify themselves, their company, and the EPA documents they wish to submit electronically;
- Verify and/or correct registration information; and
- Access their CDX web account through a secure website, and agree to the terms and conditions of using the site, which include safeguarding their self-generated password, before using web forms or uploading files to submit electronic documents or data to EPA.

These are the minimum steps for gaining access to CDX at this time. Additional steps are involved in acquiring an electronic signature device, although these steps have changed somewhat since the proposal and are discussed in section V.C.4. CDX also offers at least two general methods for reporting electronically for many programs it supports, either through file submission or through a "smart web form". However, the types of formats and approaches for submitting data through CDX have broadened, and these too are discussed in section V.C.4.

4. *The major changes that EPA has made to CDX since proposal.* Over the last two years, CDX has evolved from a prototype system to a fully operational electronic document receiving system. CDX supports tens of thousands of registered users providing data to dozens of environmental reporting programs across the major EPA media offices. CDX registered users include representatives from state, tribe, and local agencies, industries, laboratories, and other federal agencies. While CDX continues to provide a secure, single point of registration, access, and exchange between reporting entities and EPA programs, the building blocks supporting the CDX functions have changed substantially. These changes reflect EPA's experience operating CDX over the past two years, evolving trends in Internet technologies, and comments received on the proposed rule from potential CDX users.

Digital signatures based on PKI. The proposal described the CDX approach to electronic signatures in terms of digital signatures and PKI. Since proposal, EPA has come to appreciate the complexity and costs of implementing PKI, and to recognize that non-PKI electronic signatures, as described in section IV.B.2 of the preamble today's rule, may be acceptable in many cases. Thus, for electronic reports currently submitted to CDX, only in one case is PKI used for electronic signature. The other cases involve PIN-based electronic signatures or other non-PKI electronic signature approaches. As an example of the latter, this year we anticipate implementing electronic signatures for an EPA reporting requirement by having signatories use a password that is self-generated during CDX registration in combination with certain items of information that are unlikely to be available to anyone except the signatory. This is a "knowledge-based" approach, which is being used extensively by commercial software vendors supporting the United States Internal Revenue Service (IRS) for electronic tax filings or "e-filings', and is being adopted by other agencies. EPA expects that these non-PKI-based approaches to signature will continue to dominate CDX implementations of electronic reporting. We currently intend to use PKI where such needs as security or assuring very robust non-repudiation of signature make this the most appropriate approach.

In addition, EPA's approach to PKI itself—described in the proposal as relying on ACES—is also undergoing change. Changes with respect to the role and method of identity proofing for those persons who apply for PKI certificates is being further evaluated. As proposed, the identity proofing was to be conducted by the third party ACES vendor; currently, CDX identity proofing is conducted for the most part by EPA's own contractor staff, who are able to issue digital certificates to members of the reporting community with less cost and in less time than the ACES vendor. EPA has also begun to explore alternatives to ACES for PKI certificates, partly because ACES-provided certificates do not support message encryption, which EPA may need for certain environmental reporting applications. In addition, EPA is considering its use of ACES in the light of recent federal advances in establishing interoperability across federal PKI domains, which may allow EPA to eventually leverage PKI's of other federal agencies or institute an in-house PKI.

CDX Registration. Since the proposed rule, CDX has broadened it approach to registration to better accommodate the workflow involved in specific environmental reporting programs. While CDX still requires registration, there are three distinct areas where the registration process has changed since proposal. First, the proposal described CDX registration as the first step toward the issuance of a PKI-based digital signature, and it was implied that all persons opting to use CDX would need a digital signature. As noted above, this is no longer the case. Second, in the proposal, CDX registration began when a person received an EPA invitation letter that contained a temporary code and instructions on how to access the CDX registration website. CDX has adopted additional approaches to initiating registration for certain EPA programs, for example, embedding a link to CDX registration in reporting software that is distributed to the program's reporting community, or providing a public website where prospective CDX users can submit initial registration data EPA. While CDX continues to register persons by invitation letter for reporting under certain environmental programs, registration options will continue to broaden as the number of environmental programs supported by CDX expands.

Finally, in the proposal, CDX registration was completed when the registrant printed out a "signature holder" agreement from the CDX registration website, signed this agreement and mailed it to EPA's CDX. CDX will continue this approach for reports where electronic signatures are required, although EPA is exploring the use of an entirely paperless signature agreement process for at least some of these cases. CDX registration to submit reports that do not include electronic signatures will not involve a "signature holder" agreement.

EDI Standards. The proposal described EPA's plans to use EDI as the basis of standards-based formats for exchanging data between reporting entities and CDX. Since proposal, CDX development has reflected a significant evolution in formatting standards to accommodate the Internet—away from EDI and toward the use of XML. XML consists of a set of predefined tags and message structures that, like EDI, allows machine-to-machine exchange of data in a mutually agreed upon format, enabling exchange of data across different systems. However, unlike EDI, XML is tailored to Internet-based communications and security protocols. Additionally, an XML formatted file in combination with a style sheet can be displayed in a Web browser. Such features would allow CDX to use the same standard format both for exchanging data files and for designing web forms. The structure of XML also addresses some of the challenges in archiving data received, because the XML tags that accompany the data in an XML file can be used to interpret the data's context without the aid of additional software. This could facilitate the recovery of data from archived files, and reduces the need to maintain the versions of the software originally used to generate the files.

CDX and specific EPA programs may address the question of which (if any) standards-based format to use for a particular report on a case-by-case basis, and EPA intends to develop appropriate technical instructions for CDX submitters as program-specific reporting formats are adopted. These instructions normally will be distributed to the affected reporting communities via links on the CDX website and/or through program and CDX outreach efforts. EPA is working with authorized state, tribe, and local programs to develop standards-based reporting formats to meet their shared needs. In many instances, CDX contemplates a long transition period between file formats currently used to exchange data with regulated entities and any new, standards-based formats. During this transition, CDX may offer submitters several electronic submission options; these may include an existing data format familiar to submitters, one or more new standards-based formats, and some other approach such as a smart-form hosted on a secure website.

Client-side architecture and transaction environment. The proposal described a downloaded "client" that would generally supplement the browser to support the signature and security for CDX; such "client side" software is no longer needed for all cases of electronic reporting to CDX. However, in some cases CDX now uses various technologies to transparently insert routines into browsers during a user session to support special functions—for example to support the creation of a PKI-based electronic signature with an ACES business class certificate.

D. How will EPA provide notice of changes to CDX?

As noted in the proposal, the fully-implemented CDX will be subject to change over time, to take advantage of opportunities offered by evolving technologies, as well as to improve the system. EPA's decision to avoid codifying technology-specific or detailed procedural provisions for electronic reporting is meant, in part, to accommodate changes to CDX without requiring that we amend our regulations. Nonetheless, EPA recognizes that such changes can affect regulated entities that participate in electronic reporting; therefore, the final rule provides for advance notice when EPA intends to make changes to CDX. As discussed in the proposal, we distinguish four categories of changes:

- "Significant" changes that are likely to affect the kinds of hardware, software or services involved in transmitting electronic reports (§ 3.20(a)(1));
- "Other" changes that will affect the process or the timing of transmitting electronic reports to CDX, but without affecting the kinds of hardware, software or services involved in making the transmissions (§ 3.20(a)(2));
- "Emergency" changes necessary to protect the security or operational integrity of CDX (§ 3.20(b)).
- "*De minimis* or transparent" changes that will have minimal or no impact on the process or the timing of transmitting electronic reports to CDX.

"Significant" changes include changes to the types of file formats CDX will accept—for example a change from extended markup language (XML) formats to some non-XML format—as well as changes to the technologies that may be used for file transfer to CDX or for creating electronic signatures on transmitted reports. "Significant" changes will not generally include optional upgrades to software, the

provision of additional formatting (or other technical) options, or changes to CDX that simply reflect changes to the underlying regulatory reporting requirements. "Other" changes include an increase in—or re-ordering of—the steps involved in transmitting electronic reports, changes to the registration or credential (*e.g.*, PIN, password, PKI certificate) provisioning process that could affect users ability to access CDX, and changes to reporting formats that involve the reconfiguration of software. "Emergency" changes include such things as an upgrade to the system firewall protection. Finally, "*de minimis* or transparent" changes include the myriad small or "back end" fixes and improvements that EPA makes to CDX each week that have minimal or no impact on the transmission process. Such changes may range from fixing a typo on a data entry screen to re-engineering the system's archiving routines.

To address "significant" changes, § 3.20(a)(1) of the final rule provides that EPA will give public notice in the **Federal Register** of such changes and will seek comment. EPA proposed to provide this notice at least a year in advance of contemplated implementation, but based on experience developing and operating a CDX prototype, EPA no longer believes that a single time-frame is appropriate in all situations. For example, "significant" changes that could affect the transmission of an annual report may respond to needs or events that arise less than a year in advance of the report's due date. On the other hand, some "significant" changes may require more than a year for reporting entities to accommodate. Accordingly, the final rule provides that these **Federal Register** notices will propose and seek public comment on an implementation schedule for a "significant" change, along with describing and inviting comment on the change itself. To address "other" changes to CDX, § 3.20(a)(2) of the final rule provides that EPA will give notice at least 60 days in advance of implementation. The notice in this case will typically be to CDX users, and the method of notice may be electronic, perhaps using the facilities of CDX itself. For "emergency" and "*de minimis* or transparent" changes, EPA will make decisions on whether, when, and how to provide public notice on a case-by-case basis.

VI. Requirements for Electronic Reporting Under EPA-Authorized Programs

A. What is the general regulatory approach?

As explained in Part V of this preamble, the requirements in § 3.10 of today's rule apply to reporting entities that submit electronic reports directly to EPA. By contrast, today's rule contains no requirements that apply directly to entities who submit electronic reports to state, tribe, or local government agencies. However, Subpart D of today's rule does contain requirements that apply to state, tribe, or local government agencies that operate EPA-authorized programs. Subpart D of today's rule requires that such agencies that receive, or wish to begin receiving, electronic reports under an authorized program must apply to EPA for a revision or modification of that program and get EPA approval. Subpart D provides standards for such approvals based on consideration of the electronic document receiving system that the state, tribe, or local government will use to implement the electronic reporting. Additionally, Subpart D provides for special procedures for program revisions and modifications that provide for electronic reporting, to be used at the option of the state, tribe, or local government in place of procedures available under existing program-specific authorization regulations.

Generally speaking, EPA believes that even absent today's rule, an authorized program's electronic reporting implementation would still need EPA's approval under a program revision or modification. At least where electronic reports may play a role in enforcement proceedings, the authorized program's electronic reporting implementation has the potential to affect program enforceability, and as such, revises or modifies the program. Today's rule makes this explicit in § 3.1000. In addition, the final rule includes program-specific amendments to various provisions in 40 CFR to cross reference those rules to the new Part 3. With this approach, EPA hopes to support and promote state, tribe, and local government efforts to make electronic reporting available under their authorized programs, both by clarifying the requirement that EPA approve these electronic reporting initiatives, and by providing a single, uniform set of standards and a specially-designed process to facilitate electronic reporting approval for otherwise authorized programs.

B. When must authorized state, tribe, or local government programs revise or modify their programs to allow electronic reporting?

1. *The general requirement.* As discussed earlier, this rule does not require states, tribes, or local governments to allow or require electronic reporting. Where they choose to do so, § 3.1000 generally provides that they must revise or modify such programs to ensure that their electronic reporting implementation will meet the requirements of section 3.2000. Additionally, once these authorized programs begin operating the electronic reporting systems under EPA-approved revisions or modifications, they must keep EPA informed of changes to laws, policies or the electronic reporting systems that could affect the program's compliance with § 3.2000. Where the Administrator determines that such changes require EPA review and approval, EPA may ask the authorized program to submit an application for revision or modification to address the changes. Alternatively, the authorized program can apply for a revision or modification on its own initiative.

For any of these program revisions or modifications, states, tribes, or local governments may use either the application procedures provided under § 3.1000(b)–(e) or the program-specific procedures provided in other parts of Title 40 or the applicable statute. Whichever procedure is used, the state, tribe, or local government must submit an application that complies with the requirements of § 3.1000(b)(1), discussed in section VI.C.1. Section 3.1000(b)(1) identifies the elements of an electronic reporting program that EPA would need to consider in order to approve a state's, tribe's, or local government's approach to receiving electronic documents, in lieu of paper, to satisfy requirements under their EPA-authorized programs.

2. *Deferred compliance for existing systems.* For authorized programs that have "existing" electronic document receiving systems as of the date this final rule is published, EPA is deferring the deadline for these programs to submit their applications for program revisions or modifications with respect to such systems. The deferral is generally two years from the date of this rule's publication. This approach is consistent with similar provisions under other regulations governing program authorization where new requirements are imposed. Additionally, EPA conducted extensive discussions with entities operating authorized programs about how much time they generally

would need to bring their systems into compliance with today's rule, given their funding cycles, program review schedules under "performance partnership" agreements, the timeframes for making any necessary system upgrades and completing an application for program revision or modification, and any necessary legislative or regulatory changes. Based upon these discussions, we believe that this two-year period is generally sufficient to allow these programs to make the transition to CROMERR-compliant systems without having to discontinue their electronic reporting operations. Today's rule also allows authorized programs to request extensions to the two-year deadline where the timeframe for regulatory or legislative changes may be somewhat longer.

EPA's purpose in deferring the application deadline for program revisions or modifications with respect to existing electronic reporting is to avoid disrupting authorized programs' electronic reporting initiatives that are already underway. With this goal in mind, EPA has defined "existing electronic document receiving system" broadly, to include not only those that are actually operational at the time the final rule is published, but also those that are substantially developed. We recognize that it would be disruptive to require that authorized programs shut down their operational systems during the time it would take to prepare, submit and have their applications for revision or modification approved. However, there is often a very fine line between an operational system and a system under development; for example, where the developmental work is to scale a working prototype up to production. In addition, at least the later stages of development are likely to be restrained substantially or even halted if a system must await EPA approval to operate, and this may affect system costs, availability of contractor staff and their ability to complete the system in a timely manner. Avoiding such disruptions to substantially developed systems is part of the goal of the deferred compliance provisions. To define what counts as a "substantially developed" system for this purpose, the definition of "existing electronic document receiving system" uses evidence that system services or specifications are already established by existing contracts or other binding agreements. Where an agency has already made legally binding agreements to procure a significant proportion of the services and/or components that will constitute the system then such a system would be considered "existing" under this rule.

While many or most authorized programs with existing systems may need this two-year compliance deferral, some may have no difficulty submitting a completed application well before the end of two years. We strongly encourage such early submissions when feasible. This will make better use of EPA's review resources and will provide earlier certainty of compliance with this rule for existing state, tribe, and local government electronic reporting programs that are subject to this rule. In addition, EPA believes that, whether through informal consultation or formal application, identifying and addressing any existing system issues as early as possible is the best way to avoid disruption to electronic reporting initiatives currently underway.

C. What alternative procedures does EPA provide for revising or modifying authorized state, tribe, or local government programs for electronic reporting?

Under § 3.1000, this rule provides procedures which a state, tribe, or local government, at its option, can use to seek approval for revisions or modifications with respect to electronic reporting under its existing authorized programs. These optional procedures are available both for revisions or modifications that seek initial EPA approval for electronic reporting programs, and also for revisions or modifications to accommodate substantial changes to electronic reporting programs that already have EPA approval.

Although there is always the alternative of using the program-specific procedures provided in other parts of 40 CFR, EPA believes that, normally, a state, tribe, or local government would find the procedures provided in this rule to be shorter, simpler, and easier. The § 3.1000 procedures allow submission of a single, relatively simple application to request revisions or modifications that address electronic reporting across any number of authorized programs. Additionally, the procedures provide for a single, straightforward EPA review process, with deadlines for EPA action written into the rule. EPA believes that these procedures will be especially useful where the state, tribe, or local government is planning to implement all of its program-specific electronic reporting with a single system. Rather than requiring approval program-by-program, § 3.1000 allows the system to be addressed in a single application package that can be reviewed in its entirety and responded to within a relatively short and predictable time-frame.

1. *The application.* To request modifications or revisions under this rule, § 3.1000(b)(1) requires a state, tribe, or local government to submit an application that generally contains three elements. The first is a certification that state, tribe, or local government laws and/or regulations provide sufficient legal authority to implement electronic reporting in conformance with § 3.2000 and to enforce the affected authorized programs using electronic documents collected under those programs; the application must also include copies of the relevant laws and/or regulations. This certification of legal authority is not meant to address actual conformance with § 3.2000(b); that is, the certification is not meant to reflect a judgment about the capabilities of an agency's electronic document receiving system. However, the certification would address § 3.2000(c), and must be signed by the governmental official who is legally competent to certify with respect to legal authority on behalf of his or her government. In the case of a state, this official must be the Attorney General or his or her designee. In the case of tribes or local governments, this official must be the chief executive or administrative official or officer or his or her designee. EPA realizes that obtaining an Attorney General's certification for state applications may involve considerable administrative burden; however, as a legal matter, EPA believes that Attorneys General or their designees are the only officials capable of certifying with respect to their states' legal authority. Where there are substantial administrative obstacles to involving the Attorney General in such certifications, EPA urges the state Attorney General to provide for a legally-competent designee who is available to participate in the submission of the state's application.

The second element of the application, and the most substantive, is a listing and description of the electronic document receiving systems that do or will receive the electronic submissions addressed by the requested program revisions or modifications. The application should specify the electronic submissions each system will be used to receive, and which (if any) of these submissions involve electronic signatures. In describing each system, the application should explain how the system will satisfy the applicable requirements of § 3.2000. Many of these requirements apply only to systems that receive submissions with electronic

signatures; accordingly, the descriptions for systems that receive no electronically signed submissions will be relatively short and simple. For each of the § 3.2000 requirements that do apply, the description should explain the functions the system will perform to satisfy the requirement, and the technologies that will be used to achieve this functionality. EPA does not expect such explanations to include detailed technical specifications of the systems, but rather to provide conceptual descriptions of the technical approach and functionality. In implementing this rule, EPA will provide applicants with more detailed recommendations for preparing these system descriptions, including examples and an application checklist.

The third element of the application is simply a schedule of upgrades to each system addressed by the application—to the extent that such upgrades can be anticipated—together with a brief discussion of how the upgrades will assure continued compliance with § 3.2000. This third element should be thought of as an appendix to the second, recognizing that the functionality with which each electronic document receiving system addresses the § 3.2000 requirements normally exists within the dynamic environment of the system life cycle.

2. *Review for completeness.* Once EPA receives an application submitted under the procedures in this rule, EPA will, within 75 calendar days, send a letter that either notifies the applicant that its application is complete or identifies deficiencies that render the application incomplete. An applicant that receives a notice of deficiencies may amend the application and resubmit it. From the date EPA receives the amended application, EPA will, within 30 calendar days, respond with a letter that either notifies the applicant that the amended application is complete or else identifies remaining deficiencies. If an amended application is not submitted within a reasonable time period to remedy identified deficiencies, EPA has the authority to review and act on the incomplete application, as explained in section VI.C.3.

3. *EPA actions on applications.* EPA will act on an application by either approving or denying the requested program revisions or modifications. In the case of a consolidated application for revision or modification of more than one program, EPA need not take the same action on each revision or modification; some may be approved while others are denied. EPA will have 180 calendar days from the time it sends a notice of completeness to act on an application in its entirety. Except in certain cases of requested revisions or modifications associated with existing systems (see section VI.C.4) or with an authorized public water system program under 40 CFR part 142 (see section VI.C.5), if EPA does not act on a program revision or modification by the end of the 180-day review period, then that revision and/or modification is considered automatically approved by EPA. The rule allows this review period to be extended, at the request of the state, tribe, or local government submitting the application. This may accommodate situations where EPA and the applicant are working through issues that may take more than the 180-day review period to resolve, and they mutually find it in their best interest to continue discussion before EPA makes its decision.

Where EPA approves a program revision or modification (by either affirmative or automatic approval), the approval becomes effective when EPA publishes a notice of the approval in the **Federal Register**. Where EPA denies a requested revision or modification, EPA will explain the reasons for the action and advise the applicant of the steps that can be taken to remedy the application's defects and will generally try to work with the applicant to address the issues that have posed an obstacle to approval. Additionally, in some cases, denial of approval under the § 3.1000 process may result from EPA's determination that the application raises certain issues that are highly program-specific and that these cannot be adequately addressed through the procedures provided in this rule. For example, there may be issues that require a discussion of program features that the § 3.1000(b)(1) application would not cover. In such cases, EPA will identify the issues that exceed the scope of the § 3.1000 process and will advise the applicant to request the revision or modification under the applicable program-specific procedures provided in other parts of Title 40.

4. *Revisions or modifications associated with existing systems.* Some applications will request modification or revision to an authorized program with an "existing electronic document receiving system". As noted in section VI.B.2, the deadline for submitting such applications is two years after the publication of today's rule. Where such applications are submitted and are determined to be complete before the two-year deadline, EPA will have a 180-day review-period for any program modification or revision being requested, as explained in section VI.B.3. However, where EPA sends notification that an application is complete after the two-year deadline has passed, for example, because the application was submitted relatively late in the two-year period, EPA will have 360 days to act on any requested modification or revision addressed by the application. As with the cases where EPA has 180 days to act, this 360-day review period can be extended at the request of the state, tribe, or local government submitting the application.

The rule provides for this extended review period to deal with the possibility that EPA will receive a large number of applications associated with existing systems just before the two-year deadline expires. If the number of such applications is sufficiently large, EPA may not be able to act on all of them within a 180-day review period. States, tribes, or local governments that wish to avoid the extended review may do so by submitting their applications addressing existing systems early enough in the two-year period to ensure that EPA can determine completeness before the deadline. As noted in section VI.B.2, EPA strongly encourages such early submissions wherever they are feasible.

5. *Public hearings for Part 142 revisions or modifications.* Where a complete application requests a revision or modification of an authorized public water system program under 40 CFR part 142, EPA will make a preliminary determination on the request—either an approval or a denial—by the end of the 180-day review period (or the 360-day extended review period discussed in section VI.C.4). EPA will then publish a notice of the preliminary determination in the **Federal Register**. The notice will state the reasons for the preliminary determination, and will inform interested members of the public that they may request a public hearing on the preliminary determination. Such hearing requests must be submitted within 30 days of the notice's **Federal Register** publication. If no requests are submitted, and the Administrator does not hold a hearing on his or her own motion, then the preliminary determination will be effective 30 days after the initial **Federal Register** publication.

If a request for hearing is granted, or the Administrator determines that a hearing is warranted, EPA will publish an additional **Federal Register** notice announcing—at least 15 days in advance of any such hearing—the date and time of any hearing, contact information, and the purpose of the hearing. At the hearing, a hearing officer will receive oral and written testimony, and will forward a record of the hearing to the EPA Administrator. After

reviewing the record of the hearing, EPA will by order either affirm or rescind the preliminary determination, and will publish notice of this decision in the Federal Register. If the order is to approve the revision or modification, the approval will be effective upon publication of the order in the Federal Register.

6. *Re-submissions and amendments.* States, tribes, or local governments whose § 3.1000 applications for revisions or modifications have been denied in whole or in part may reapply for reconsideration, using either the § 3.1000 procedures again, or, at their option, the applicable program-specific procedures. A state, tribe, or local government may also, on occasion, choose to amend a § 3.1000 application after the Administrator has determined the application to be complete. In such cases, the application will be considered to have been withdrawn and resubmitted as a new package, and a new 75-day completeness determination process will begin. An applicant may choose to withdraw and resubmit the package in this manner, for example, if it becomes clear relatively early into the 180-day review period that the application cannot be approved in its current form. For such re-submissions, EPA will work diligently to expedite the completeness determination.

D. What general requirements must state, tribe, and local government electronic reporting programs satisfy?

States, tribes, and local governments that accept electronic reports in lieu of paper under their authorized programs must satisfy the requirements of § 3.2000(b) and (c). Section 3.2000(b) sets forth the standards that acceptable electronic document receiving systems must satisfy, and these are explained in detail in section VI.E. In parallel with § 3.4 on federal compliance and enforcement, § 3.2000(c) requires that the state, tribe, or local government be able to seek and obtain any appropriate civil, criminal or other remedies under state, tribe, or local law for failure to comply with a reporting requirement if a person submits an electronic document that fails to comply with the applicable provisions for electronic reporting. Similarly, § 3.2000(c) contains provisions to ensure that an electronic signature provided to a state, tribe, or local government will make the person who signs the document responsible, bound, and/or obligated to the same extent as he or she would be signing the corresponding paper document.

Additionally, under § 3.2000(a)(2), the authorized program must require that any electronic document it accepts bear a valid electronic signature wherever the corresponding paper document would have to be signed under existing regulations or guidance, with the signatory being the same person who is authorized and/or required to sign under the current applicable provision. As in the case of direct reporting to EPA (see section V.A), the requirement for an electronic signature will apply only where the document would have to bear a signature were it to be submitted on paper, either because this is required by statute or regulation, or because a signature is required to complete the paper form. This rule does not require that authorized programs impose any new or additional signature requirements for electronic documents that are submitted in lieu of paper and were not previously required to be signed when submitted in paper form.

As with direct reporting to EPA, § 3.2000(a)(2) also allows an authorized program to make special provisions for the required signatures to be executed on follow-on paper submissions. As noted in section IV.C, such provisions must ensure that the paper submission containing the signatures is adequately cross-referenced with the electronic document being signed, and must be described as a part of the § 3.1000(b)(1) application. Systems that receive electronic documents with such follow-on paper signature submissions are subject to all applicable § 3.2000(b) requirements, including the requirement that the electronic document cannot be altered without detection after the signature has been executed.

E. What standards must state, tribe, and local government electronic document receiving systems satisfy?

Section 3.2000(b) specifies the standards that electronic document receiving systems must satisfy if they are to be approved for use by states, tribes, or local governments to receive electronic documents in lieu of paper under an EPA-authorized program. EPA's purpose in specifying such standards remains the same as it was when EPA specified the proposed § 3.2000 criteria in proposed CROMERR. As discussed in section IV.B.1, that purpose was to ensure that electronically submitted documents have the same "legal dependability" as their paper counterparts, so that any electronic document that may be used as evidence to prosecute an environmental crime or to enforce against a civil violation has no less evidentiary value than its paper equivalent. EPA has been motivated to provide for the legal dependability of electronic documents submitted under authorized programs by considering, among other things:

- The roles that many electronically submitted documents would likely play in environmental program management, including compliance monitoring and enforcement;
- EPA's statutory obligation to ensure that authorized or delegated programs maintain the enforceability of environmental law and regulations; and
- The consequent need to ensure that enforceability is not compromised as authorized programs make the transition from paper to electronic submission of compliance or enforcement-related documents.

The § 3.2000(b) standards for electronic document receiving systems in today's rule provide an expanded version of what had been the proposed § 3.2000(b) "Validity of Data" criterion. Like proposed § 3.2000(b), final § 3.2000(b) requires that electronic document receiving systems reliably enable EPA, states, tribes, and local governments to prove, in civil and criminal enforcement proceedings, that the electronic documents they receive and maintain are what they purport to be, that any changes to their content are documented, and that any associated signatures were actually executed by the designated signatories intending to certify that content. Systems must be able to satisfy the § 3.2000(b) requirements for any electronic documents they receive that are submitted in lieu of paper to satisfy an authorized program requirement.

The following discussion highlights some of the § 3.2000(b) requirements for electronic document receiving systems. The first five of these requirements (timeliness of data generation, copy of record, integrity of the electronic document, submission knowingly, and opportunity to review and repudiate copy of record) apply to all electronic document receiving systems. The other highlighted requirements (validity of the electronic signature, binding the signature to the document, opportunity to review, understanding the act of signing, the electronic signature or subscriber agreement, acknowledgment of receipt, and determining the identity of an individual) apply only to systems that receive electronically signed documents.

1. *Timeliness of data generation.* Section 3.2000(b) reflects the role that electronic document receiving systems play in supporting a wide range of compliance and enforcement-related activities, including compliance research and analysis, civil actions, and

litigation, and the fact that the success of such activities may be affected by the relative ease or difficulty of accessing the data related to electronic submissions. Accordingly, electronic document receiving systems must provide timely access to such data, especially to data relevant to the questions of what was submitted, by whom, and, where signatures are involved, who the signatories were and to what they certified. Much of this data may be assembled in the copy of record, together with any data needed to establish that the copy is a "true and correct copy of an electronic document received," as specified by the § 3.3 copy of record definition. To help the litigator develop evidence and present it in the courtroom, it is advisable that the copy of record be maintained and made accessible in a form and format that requires the minimum possible "assembly" of its elements, so that its connection with what was received and what was certified to by any signatories is easy to understand and to demonstrate to others.

2. *Copy of record.* Under § 3.2000(b), an acceptable electronic document receiving system must retain and be able to make available a copy of record for each electronic document it receives that is submitted in lieu of paper to satisfy requirements under an authorized program. For such submissions, the copy of record is intended to serve as the electronic surrogate for what we refer to as the "original" of the document received where we are doing business on paper. The copy of record is meant to provide an authoritative answer to the question of what was actually submitted and, as applicable, what was signed and certified to in the particular case.

As defined in § 3.3, a copy of record must satisfy at least four requirements. First, it must be a true and correct copy of the electronic document that was received. In the case of documents consisting of data, this means that the copy of record must contain exactly the set of data elements that constituted the electronic document that was submitted. In the case of a document consisting of other forms of information, e.g., text or images, being a "true and correct copy," may mean including file and or visual format information along with the items of information themselves, to the extent the meaning of these items is dependent on format. (See the discussion of the definition of "electronic document," in section IV.D.1.) For the copy of record to fulfill its intended role, it is not enough that it be a true and correct copy; it must also be capable of being shown to be a true and correct copy; otherwise, it cannot meet other related system requirements, such as establishing document integrity. (See section VI.E.3, below.) The copy of record is shown to be true and correct in part by virtue of its not being repudiated by the submitters and/or signatories where it is made available for their review and repudiation. (See section VI.E.5., below.) In addition, the system must provide sufficient evidence to show how the copy of record was derived from and accurately reflects the electronic document as it was received by the system; such evidence is also necessary to establish document integrity. To provide for such evidence, the system may need to establish a chain of custody for the copy of record, particularly if there are a number of processing steps that separate the copy of record from the file as it enters the system. On the other hand, where the copy of record captures and preserves the file containing the electronic document exactly in the form and format in which it is received, then a chain of custody may not be necessary. Considerations of "timeliness" favor maintaining copies of record in a way that would not require a chain of custody. (See section VI.E.1., above.)

Second, the copy of record must include all the electronic signatures that have been executed to sign the document or components of the document. The method of inclusion may vary, depending on the nature of the signature. With a digital signature, created by encrypting a hash of the document being signed with the private key in a private/public key-pair, the signature is simply a number that can and should be contained as a copy of record element. There is no risk of signature theft in this case. Each digital signature is bound to the specific document it signs, and the private key, which is actually used for signing, is inaccessible to a would-be intruder.

With other forms of signature such as personal identification numbers (PINs) or passwords, items of personal information, or biometric images or values, including the signature as a copy of record element may raise signature theft issues. At least in theory, such signatures could be detached or copied from a copy of record and re-used spuriously without detection. To address this risk, the signature, especially in the case of a PIN or password, may be encrypted for storage, perhaps together with a hash of the document signed, to bind the signature to the document content. Another approach may be to validate the signatory's identity, *e.g.* by comparing a signatory-generated password with an encrypted version maintained securely at the electronic document receiving system. In such cases, the signatory-generated password—which might be regarded as the signature—never actually appears on the electronic document, so the signature that is "included" in the copy of record may be an encrypted form of the signature, or possibly nothing exactly corresponding to a signature at all, but rather pointers or references to the processes or encrypted data that provide the actual link to the signatory. There are analogous strategies for biometric signatures. For example, the validity of a biometric (*e.g.*, a finger print, a retinal scan, etc.) may be established by using certain statistical algorithms to evaluate data provided by the biometric. In such cases, the copy of record might document the process of validating the signature, but without including the biometric data that was used to show that the signature was valid. On any of these approaches, the copy of record may satisfy the requirement that the copy "include" the signatures, provided that what the copy does contain serves to establish whether the electronic document in question was signed and by whom.

Third, the copy of record must include the date and time of receipt to help establish its relation to submission deadlines, to the circumstances of its submission, and to other possibly associated documents that may have been submitted or alleged to have been submitted. This is not generally problematic, except in cases of continuous streams of data conveyed to the system. For such continuous data, reasonable alternatives may be substituted that serve the same purposes, for example, associating stages of the data flow with dates and times, say, at hourly intervals. Similarly, the copy of record may include other additional information to the extent that this is needed to establish the meaning of the content and the circumstances of receipt. Such additional information might include data field labels, signatory information such as references to PKI certificates, and transmission source information.

Fourth, the copy of record must be viewable in a human-readable format that clearly indicates what the submitter and, where applicable, the signatory intended that each of the data elements or other information items in the document means. This supports the copy of record's role as a surrogate "original" of the paper document, and serves to establish the content of the document as it was signed and/or

submitted. The copy of record may satisfy this requirement in many different ways. It might actually include explicit labels or descriptions for each data element or information item, or preserve a visual format in which the data were submitted. Alternatively, it may incorporate a conventional ordering of the items or elements, where the information that associates such ordered data with labels, descriptions, or other means of visual display is maintained externally and can be invoked as needed—for example, to make the data elements appear within fields in the image of a filled-out form. Where the electronic document is created off-line by the submitter and conveyed as a whole to the receiving system, it is preferable for the copy of record to reflect the mechanism or format for indicating meaning supplied in the submission. For example, if the submission is in some standard electronic data interchange format, then the copy of record might usefully preserve that format. Taking this approach will help to resolve potential chain of custody issues if questions arise about whether the copy of record is true and correct. However, in cases where the electronic document is created on-line, for example, through the use of a web-form, the format for the copy of record will of necessity be an artifact of the electronic document receiving system itself. This is not problematic, as long as the system provides a way to ensure that the meaning of each data element as supplied by the submitter remains unambiguous.

Some commenters objected to copy of record requirements because of the potential expense of redesigning systems that are not currently capable of creating and storing electronic copies of records. EPA notes, however, that systems satisfying copy of record requirements need not preserve the electronic documents received in separate or special storage apart from the files that maintain the data or information content of the documents. For example, data loaded from submitted electronic documents to a database may satisfy copy of record requirements where the stored content includes the signatures, the date/time of receipt, and an adequate chain of custody. This may be the most practical copy of record approach for receiving continuous data streams. Such an approach does not preclude satisfying the requirement that the copy of record be viewable in a human-readable format. The requirement does not mean that the data must be stored in a human-readable format, so long as there is a well-documented way to display the stored data in such a format. In addition, nothing in the "copy of record" definition requires such copies to be electronic. Particularly where the signature involves some easily represented numerical value, the copy of record may be created and maintained in an imaging medium or on paper, provided that such copies can be shown to have been created by the electronic document receiving system to be true and correct copies of the electronic documents received. Whether such alternatives are appropriate as interim or even long-term solutions will depend on individual circumstances. It may be difficult to provide a copy of record for review and possible repudiation if the copy is not available as an electronic document that can be viewed on-line or downloaded through the network.

3. *Integrity of the electronic document.* Under § 3.2000(b)(1)—(2), an acceptable electronic document receiving system must be able to establish that a given electronic document was not altered without detection in transmission or at any time after receipt, and any such alterations must be fully documented. For purposes of § 3.2000(b)(1)—(2), EPA excludes alterations that have no effect on the document's information content. Examples of excluded alterations include the separation of a transmitted file into packets and their error-free recombination, the error-free processes of file compression and extraction, as well as certain disk maintenance functions that may, for example, involve physically repositioning file components on the storage medium. To satisfy § 3.2000(b)(1)—(2) requirements with respect to alterations that do affect information content, a system may rely on a number of different but complementary capabilities, including general provisions for system security, access control, and secure transmission. Additionally, the system's copy of record provisions help make the case that the electronic document is unaltered, or has been altered only as documented (for example, through a chain of custody), a case which is strengthened where submitters and/or signatories have had the opportunity to review the copy and have not contacted the system to repudiate the copy. Finally there are specific technical approaches to ensuring integrity, based, for example, on calculating hash values associated with the document content.

4. *Submission knowingly.* Under § 3.2000(b)(3), an acceptable electronic document receiving system must provide evidence that the submitter had some reliable way of knowing and/or confirming that the submission took place. This requirement is necessary to help establish submitter responsibility for the electronic document and to rule out spurious submissions, whether by accident or through the actions of an unauthorized submitter or "hacker." EPA believes that to satisfy this requirement, the system must have some follow-on communication with the submitter related to the submission. This could be a communication initiated by the submitter in cases where it is realistic to rely on submitters to regularly check the system for evidence of documents submitted; where such submitter interactions are relied upon, they must be documented. Alternatively, the system must send some form of acknowledgment of submission as a response to the submitter named, and must document such acknowledgments, recording at least their date, time, content and the addresses to which they were sent. For cases where the electronic document bears an electronic signature, this acknowledgment is explicitly provided for under § 3.2000(b)(5)(vi). (See section VI.E.11.)

5. *Opportunity to review and repudiate copy of record.* Under § 3.2000(b)(4), the copy of record must be available for review and timely repudiation by the individuals to whom the document is attributed, as its submitters and/or signatories. The fact that the copy was available for this review and was not repudiated provides strong support for its being a "true and correct copy of an electronic document received," as specified by the § 3.3 copy of record definition. Program managers normally would set reasonable end dates for this process, especially where there is concern that the copy is not "officially" a copy of record until the process is complete.

Satisfying this "opportunity to review" provision involves at least two requirements. The first is that the identified submitters and/or signatories must have some way of knowing that their submission was received, and that a copy of record is available for review. This requires some follow-on communication with the submitters and signatories related to the submission—initiated either by the submitters/signatories or by the system, as discussed in section VI.E.4. Approaches should be avoided that allow the initial submission and provision of copy of record to occur as a part of the same on-line session, because in cases of spurious submission the identified submitters/signatures may never learn

that a copy of record exists. Second, to ensure that the opportunity to review and repudiate is meaningful, the copy of record must be viewable in a human-readable format that clearly and accurately associates all the information elements of the electronic document with descriptions or labeling of those elements. This second requirement is consistent with the definition of "copy of record," as discussed in section VI.E.2.

6. *Validity of the electronic signature.* Under § 3.2000(b)(5)(i), for each electronic document that is required to bear an electronic signature, the receiving system must be able to establish that each electronic signature was a valid electronic signature at the time of signing. Under § 3.3, as discussed in section IV.D.5, a valid electronic signature must satisfy three conditions. The first is that the signature must be created with a signature device that is "owned" by the individual designated as signatory—"owned" in the sense that this individual is uniquely entitled to use it for creating signatures. To establish this, an electronic document receiving system must be able to identify signature device "owners" and must be able to determine that an identified signatory is the owner of the device used to create the signature in question. Section 3.2000(b)(5)(vii) explicitly requires the ability to identify signature device owners, and section VI.E.12 of this Preamble discusses the § 3.2000(b)(5)(vii) requirements in detail.

Concerning the determination that an identified signatory is the owner of the device used to create the signature, the system needs to have unique signature validation criteria for each identified signature device owner who submits electronically signed documents; the system must be able to apply these criteria to each signature on documents received. For example, in the case of a digital signature, the validation criteria include the existence of a valid PKI certificate for the identified signatory and the ability of the associated public key to decrypt the encrypted message digest that constitutes the signature. In the case of a PIN, the validation criterion may be simply that the PIN added to the document as a signature matches the PIN on file for the identified signatory.

The second condition for an electronic signature to be considered valid is that the signature must be created with a device that has not been compromised. That is, at the time of signing, the electronic signature device must in fact be available only to the individual identified as its owner, and to no one else. Otherwise, the use of the device to create the electronic signature may not provide evidence that a specific, identifiable individual has certified to the truth or accuracy of an electronic document. Accordingly, an acceptable electronic document receiving system must provide evidence that the electronic documents it receives and maintains do not contain signatures executed with compromised devices. Such evidence will document the system's approach to three related functions: prevention of signature device compromise, detection of compromises where they occur, and rejection of known compromised submissions.

The approach to prevention will include the way the system notifies submitters of their obligations to avoid signature compromise, including the obligation not to share or delegate the use of the device as a part of the electronic signature agreement. (See sections IV.D.4 and VI.D.8. of this Preamble, respectively.) Prevention also involves choosing the kinds of signature devices to support and determining how they are to be used. Some devices are inherently vulnerable to compromise, for example, because protection from spurious use relies on "secret" (such as a PIN or password) that has to be shared when the device is used. However, vulnerable devices can sometimes be strengthened with appropriate implementation. In the case of a PIN or password, adding an element that does not rely on secrecy—e.g. a physical "token," such as a smart card or employee badge—that had to be used along with the PIN or password may greatly reduce the device's vulnerability. Alternatively, a system accepting secret-based signatures might be programmed to query the would-be signatory about a randomly selected piece of private information that has been (or could be) verified. This approach would also reduce vulnerability to compromise, since the discovery of a secret number or password does not convey other private information about the secret's owner.

For detection of compromises, there are two complementary approaches. The first is to ensure that the system recognizes the signs of spurious submission, for example, duplicate reports, off-schedule submissions, and deviations from normal content or procedure. The second is to ensure that the system empowers submitters to detect and report spurious submissions by providing the regular "out of band" acknowledgments discussed in section VI.E.11. Once spurious submissions are detected, the system must ensure their rejection, and the rejection of any subsequent submissions that use the same device. An acceptable receiving system must provide for timely revocation or suspension of access by those individuals with compromised signature devices.

Finally, a signature must be created by an individual who is authorized to do so, primarily by virtue of his or her relationship with the regulated entity on whose behalf the signature is executed. An electronic document receiving systems must be able to determine whether the identified signatories have the necessary relationship with the regulated entity that enables them to sign the documents being submitted. Generally, the system would obtain the information necessary for these determinations along with establishing the identity of the signature device owners. Section VI.E.12 of this Preamble discusses this point in more detail.

The system must also have some way to keep this information up-to-date, for example, some way to reject signatures where it is known that the signature device owner is no longer authorized to sign the electronic document in question. As with the initial registration process, the provisions for updating this information may vary. For some cases, it may be sufficient to rely on voluntary notifications from registrants when, e.g., their job status changes. For other cases, it may be appropriate to identify a responsible company official who is charged with managing the authorizations of employees signing documents on behalf of the company, to include keeping records of changes in authorization status and/or sending notifications. For certain cases, the system might limit a signature device owner's authorization to a defined period, which could be extended only through a re-registration process.

7. *Binding the signature to the document.* Under § 3.2000(b)(5)(ii), an acceptable electronic document receiving system must establish that electronic documents cannot be altered without detection once such documents are signed. Well-implemented provisions for copy of record help satisfy this requirement. The fact that a signatory has not repudiated a document's copy of record that he or she has had the opportunity to review provides evidence that the copy accurately reflects the document as it was signed. However, even where the signatory affirms the authenticity of the copy of record at the time of review, he or she may still repudiate the document at a later date. Therefore, an acceptable electronic document receiving system

must provide a method of ensuring that any breach of a signed document's integrity can be detected. As discussed in section IV.B.2., such methods are available in the form of signatures that incorporate a hash value of the content being signed, or in the form of signature processes that involve the creation of this hash and its maintenance in association with the signed document. Encrypting the hash value, for example, by executing a digital signature, provide the strongest approach to rebutting claims that the hash has been manipulated. Encryption may not be necessary to the extent that the system provides other means to prevent tampering and establish that the hash has not been altered since it was calculated.

8. *Opportunity to review.* Where a signatory is certifying to the truth or accuracy of document content, the certification represents the signatory as knowing and understanding the content, as well as certifying to its truth. Under § 3.2000(b)(5)(iii), an acceptable electronic document receiving system must be able to provide evidence that the signatory had the opportunity to review what he or she was signing in a human-readable format. Providing this evidence may be relatively simple, depending on the signature/certification scenarios that the system provides for or allows. In a case where the system only allows signature/certification during an on-line client-server session, and where the server always explicitly gives the signatory the option of scrolling through an appropriately-formatted display of the submission content before signing, documenting these server functions should suffice to provide the required evidence. Cases that may be similarly straightforward include those where signature/certification takes place off-line, at the signatory's computer, but using software provided by or certified by the governmental entity whose system will receive the signed electronic document. In this case, the evidence is provided by documenting how the software works. Less straightforward are cases where the signature/certification software is completely beyond the control of the governmental entity. In such cases, evidence of the opportunity to review may need to rely on the use of a submission format that demonstrably allows a human-readable display of the content. For example, the fact that the file format is a Word or Excel file and that the file provides a human readable display when opened with the right program may constitute sufficient evidence that the opportunity to review has been provided.

9. *Understanding the act of signing.* Where a signatory is certifying to the truth or accuracy of document content, the certification affirmatively represents that the signatory understands both what the act of signing means and that he or she is subject to criminal liability for false certification. Reporting formats in the paper medium provide evidence that certifications are made with the requisite understandings by placing the certification statement in a clearly visible position near the place where signatures are to be affixed and by prominently displaying the statement that there are criminal penalties for false certification. Under § 3.2000(b)(5)(iv), an acceptable electronic document receiving system must ensure that such statements are presented in conjunction with electronic signature/certification. Satisfying this requirement is straightforward where the system itself provides for the signature process or where the governmental entity receiving the submission provides or otherwise has control over the signature/certification software being used. In other cases, satisfaction will depend on requiring that the signatories and/or submitters incorporate such statements into their documents before they are signed or into screens that are displayed prior to signature. Confidence that the requirement is satisfied will depend in part on the extent to which the submission process involves the use of common, easy-to-display file structures together with the software to display the files being signed.

10. *The electronic signature or subscriber agreement.* Under § 3.2000(b)(5)(v), an acceptable electronic document receiving system must be able to provide evidence that any signatory of documents received by the system has signed an electronic signature agreement or subscriber agreement with respect to the electronic signature device he or she uses to sign the documents. "Electronic signature agreement" and "subscriber agreement" are defined under § 3.3, the latter referring to electronic signature agreements that are executed with ink on paper. (The distinct role of subscriber agreements is explained in section VI.E.12.) By signing such agreements, an individual agrees to protect his or her signature device from compromise, that is, to keep a secret code secret, a hardware token secured, etc., and not to deliberately compromise the device by making it available to others. He or she also agrees to promptly report any evidence that the device has been compromised, for example, to promptly notify the system manager if he or she receives system acknowledgments of submissions he or she did not make, or if the device has become available to others. Finally, by signing the electronic signature or subscribed agreement, an individual agrees that use of his or her electronic signature device to sign documents creates obligations and/or legally binds him or her to the same extent as he or she would be bound or obligated by executing handwritten signatures. EPA believes that such agreements are necessary to assure—and provide evidence—that the signatory recognizes his or her obligations with respect to the electronic signature device. Insofar as the institutions surrounding the use of electronic signatures are relatively new, EPA believes that express recognition of signatory obligations through explicit agreements avoids potential ambiguity or misunderstandings.

11. *Acknowledgment of receipt.* Where an electronic signature is used to certify to the truth or accuracy of document content—with criminal liability for false certification—then it is especially important to ensure that any individual identified as signatory has the opportunity to detect and repudiate any spurious submissions made in his or her name through unauthorized access to signature device and/or the electronic document receiving system. To provide for this, § 3.2000(b)(5)(vi) requires the system to automatically send acknowledgments of document receipt to the individuals in whose names the submissions are made, the acknowledgments in each case identifying the document in question, the signatories, and the date and time of receipt.

Additionally, § 3.2000(b)(5)(vi) requires that each acknowledgment be sent to an address with access controls different and separate from those that enable the submission itself, so that in cases of compromised access, the individual in whose name a submission is made would still receive the acknowledgment without interference. This is sometimes referred to as "out of band" acknowledgment. In web-based commerce, this is fairly standard practice—a purchase is normally acknowledged directly to the internet protocol (IP) address from which the purchase is made, as a part of the on-line session, but also is confirmed through a follow-up communication to an email address. Note that while the "out of band" acknowledgment is normally sent electronically, electronic transmission is not required. A paper acknowledgment sent by U.S. Mail, or a voice acknowledgment via telephone would serve the same purpose so long

as these are documented by the system so they may be produced, possibly as evidence, at a later date.

12. *Determining the identity of the individual uniquely entitled to use a signature device.* As discussed in section VI.E.6, a system cannot accept an electronic signature as valid unless it establishes an identity between the individual designated as signatory and the owner of the device used to create the signature. Any circumstance casting doubt on the device's ownership undermines the certainty that signatures created with the device are valid; if it's not certain whose device created the signature then it's not certain whether the actual signatory is the individual who is designated as signatory in the submitted document. Additionally, it must be clear what the signature device owner's relation is to the entity on whose behalf a document is signed, in order to be certain that this device owner is an authorized signatory. This is also a condition of signature validity. (See section VI.E.6.) Accordingly, to assure that electronically signed documents are legally reliable, a system accepting such documents must have a process for determining who owns the signature devices used to create the signatures, and their relations to the entities on whose behalf they sign submitted documents. Section 3.2000(b)(5)(vii) explicitly reflects this performance standard by requiring that a system provide for such determinations "with legal certainty." That is, the system must be able to provide evidence sufficient to prove the signature device owner's identity and relation to entities on whose behalf he or she signs in a context where designated signatories may have an interest in repudiating their signature device ownership or in distancing themselves from the entities on whose behalf they are supposed to have signed.

Section 3.2000(b)(5)(vii) does not specify how this performance standard is to be met, however, at a minimum, an "identity-proofing" capability must involve access to a set of descriptions that apply uniquely to the individual in question and refer to attributes that are durable, documented, and objective. Such descriptions must be capable of being shown at any time to uniquely identify the individual without having to depend on anyone who might have an interest in repudiating the identification. Section 3.2000(b)(5)(vii) requires that more specific conditions be met for the special class of electronically signed documents that are included in the list that defines "priority report" under § 3.3 and Appendix 1 to Part 3. The priority reports are those that EPA has identified as likely to be material to potential enforcement litigation. Given this likelihood, it is important to provide not only for the provability of signature device ownership in principle, but for the practical need to make this proof with the resources typically available to enforcement staff and within the constraints of the judicial process in criminal and civil proceedings. To address this practical dimension of identity-proofing in the case of priority reports, § 3.2000(b)(5)(vii) adds three conditions to the general performance standard. The first is that the identity of a signature device owner must be verified before the system accepts any electronic signature created with the device. The second, in § 3.2000(b)(5)(vii)(A), is that this verification must be "by attestation of disinterested individuals." The third condition, also contained in § 3.2000(b)(5)(vii)(A), specifies that the verification be "based on information or objects of independent origin, at least one item of which is not subject to change without government action or authorization."

Regarding the first condition, requiring identity-proofing before the signature device is used helps prevent systems from accepting electronic signatures that cannot be proved to be valid in the context of an enforcement proceeding. This is at least a potential concern in any case of electronic signature, but it is also a very real concern in cases where what is signed is a priority report. The second condition anticipates the need to prove signature device ownership in court, by ensuring the availability of someone credible to offer testimony about the device owner's identity who does not have an interest in repudiating device ownership. This is the idea of verification by a "disinterested individual," the term defined under § 3.3 as "a person who is not the employer; the employer's corporate parent, subsidiary, or affiliate; contracting agent; or relative (including spouse or domestic partner) of the individual in whose name the electronic signature device is issued." The condition suggests an identity-proofing process carried out by a trusted third party, and, in the current electronic commerce environment, this would typically be a PKI certificate authority (CA), whose business is to issue certificate-based electronic signature devices that reflect identity-proofing at a specified level of assurance. However, it is important to be clear that verification by a "disinterested individual" does not have to involve a PKI-based approach to electronic signatures. Indeed, it does not have to involve a third party at all; the disinterested individual could simply be an employee of the agency operating the electronic document receiving system, if that agency itself has the resources to provide for identity-proofing as it registers signature device owners to use the system. Additionally, if a trusted third party is wanted, there are alternatives to the CA. For example, with an appropriately defined procedure, a notary public or some local government official could play this role; so could some other governmental agency, such as department of motor vehicles, which is in the business of issuing credentials based (usually) on in-person verification of identity.

The third condition sets a standard for the evidence on which verification of identity would be based—evidence that would be attested to by the disinterested individual provided for by the second condition. The standard refers to "information or objects" and for each requires that they be "of independent origin" and include at least one item that requires "governmental action or authorization" to change. Information "of independent origin" must be knowable empirically, and not simply as a matter of someone's say so; objects of independent origin could provide such information. Such information, where it concerns an individual's identity, would generally come from three sources: first, documented, direct, in-person contact; second, documentation of the individual's history—e.g., as an employee, a consumer, a student, etc.—with objects such as credit cards, passports, etc., sometimes together with corroborating testimony; and third, forensic evidence of unique, immutable traits, from such objects as fingerprints, photos, and handwritten signatures.

Evidence of identity from any of these three sources will meet the § 3.2000(b)(5)(vii)(A) standard, provided that the information used also includes at least one item that cannot be changed without governmental action or authorization—for example, a social security number, a passport number, or a driver's license number. This last requirement helps assure that the identifying information used is sufficiently well-documented and durable to support re-verification of identity at some later date. The requirement also facilitates identity-proofing that relies on database searches, insofar as data on individuals tends to be keyed to government-issued identifiers. Finally, while such

identifiers are items of information, they typically are presented on objects—e.g. a driver's license or a passport—that provide independent evidence of their authenticity.

EPA recognizes that the identity-proofing requirements specified in § 3.2000(b)(5)(vii)(A) may be difficult to implement in some cases. The rule therefore allows a system to meet the § 3.2000(b)(5)(vii)(A) requirements for cases of priority reports in other ways. Under § 3.2000(b)(5)(vii)(C), a system may collect a subscriber agreement (see section VI.E.10) from each signatory of the priority reports received by the system, in lieu of satisfying § 3.2000(b)(5)(vii)(A). Alternatively, the system may collect a certification from a "local registration authority" (LRA) that such a subscriber agreement has been executed and is being securely stored. As defined under § 3.3, an LRA is an individual who plays the role of a custodian of subscriber agreements, maintaining these paper agreements as records and sending the system a certification of receipt and secure storage for each such agreement he or she receives. The presumption is that such certifications would be sent electronically to the system as signed electronic documents. To become an LRA, an individual must have his or her identity established by notarized affidavit, and must be authorized in writing by the regulated entity to issue these "agreement collection certifications" (defined under § 3.3) on its behalf.

A state, tribe, or local government adopting the subscriber agreement alternative might chose to implement through LRAs as a way of reducing the pieces of paper it had to manage in operating its electronic document receiving system. While setting up the LRA relationships requires the collection of affidavits and authorizations on paper, this involves far fewer paper transactions than collecting the individual subscriber agreements from each person who signs priority reports. However, only larger companies or facilities with many employees signing priority reports are likely to be motivated and able to designate a company official as an LRA. Although nothing in the rule prohibits third parties from serving as LRAs for the smaller companies, a subscriber agreement implementation will probably always involve accepting some of these agreements directly from priority report signatories. What is essential under § 3.2000(b)(5)(vii)(C) is that a subscriber agreement be available, as needed, to establish the identity of the associated signature device owner. Identity in this case is established based on the forensic properties of the handwritten signature on the agreement.

Finally, § 3.2000(b)(5)(vii)(B) gives states, tribes, or local governments the flexibility to propose identity-proofing methods that may not meet the specific requirements of § 3.2000(b)(5)(vii)(A), but which are no less stringent than the methods that satisfy § 3.2000(b)(5)(vii)(A). For example, if a method of electronic identity-proofing were proposed that relies on the attestations of an LRA who is not a disinterested party, EPA would look for other features in the identity-proofing method that guarantee the identity of the LRA and the trustworthiness of the identity-proofing that the LRA would conduct. Similarly, if an identity-proofing method were proposed that relies on objects or information that are not of independent origin (e.g., a company identification card), EPA would look for other features in the authentication method that guarantee that the registrant's identity could not have been manufactured by the registrant or another interested party. EPA's expectation is that the advance of technology may also make new methods of identity-proofing available that meet the needs of the enforcement community, and we expect that § 3.2000(b)(5)(vii)(B) could be used to accommodate such new methods when implemented as part of electronic document receiving systems.

VII. What are the costs of today's rule?

A. Summary of Proposal Analysis

The Agency has conducted a number of analyses to ensure that this rule complies with the various statutory and administrative requirements that apply to EPA regulations. The results of the analyses are summarized in this section.

In the proposal, EPA estimated that the proposed rule could result in an average annual reduction in burden of $52.3 million per year for those facilities reporting, $1.2 million per year for EPA, and $1.24 million for each of the 30 states that were assumed to implement programs over the eight years of the analysis. EPA received many comments on the costs associated with the proposed electronic reporting provisions. Comments included concerns about the proposal's assumptions related to the number of affected entities, the number of registered users per facility, the costs to state programs, and the costs of implementing standard formats. Several commenters expressed support for the analysis findings, concurring that electronic reporting will reduce their environmental reporting costs. EPA's response to these comments is explained in the following section. Additional comments on the cost analysis and EPA's responses can be found in the rulemaking docket, in the Response to Comments document.

B. Final Rule Costs

In response to comments received on the proposed rule, EPA conducted additional cost analyses to determine the impacts of this rule on regulated entities, states, tribes, and local governments, and EPA programs. In developing the analysis for this final rule, EPA relied heavily on existing sources of data that included:

- EPA's 2002 Government Paperwork Elimination Act (GPEA) Report to OMB;
- Interviews with EPA programs, states, and nine industry representatives currently using CDX to report electronically;
- EPA's Information Collection Requests (ICRs);
- EPA's Envirofacts Warehouse and Facility Registry System;
- Follow-up to comments received from twenty state and local government agencies and several major industry associations; and
- Market research to assess trends of large and small companies using the Internet, costs of technology for electronic signature and data exchange formats, and other technical issues.

Based on the additional analyses, EPA estimates that under this rule there will be a total cumulative cost savings to the Agency, over the period 2003 to 2012, ranging from $64.4 million to $75.4 million, depending on the discount rate used. For those that adopt electronic reporting, EPA estimates a total cumulative cost burden to state and local governments under this rule, over the period 2003 to 2012, ranging from $57.2 million to $65.2 million annually, depending on the discount rate used. These costs result from the incremental burden to states to upgrade their receiving systems to meet the rule's standards and apply for EPA approval of program modifications and revisions. The model does not consider the potential cost savings to state and local governments resulting from processing electronic submittals but believes the savings would likely offset these incremental costs. For facilities, EPA estimates a total cumulative cost during this period ranging from $41.6 million to $51.9 million, depending on the discount rate used. The net total cumulative cost of this rule, over the period 2003 to 2012, ranges from $34.4 million to $41.7 million, depending on the discount rate used.

C. General changes to methodology and assumptions

The research effort for the final rule differed from that conducted for the proposal in that it was much broader and involved far greater engagement with external stakeholders. EPA used this research to reevaluate assumptions made in the proposal and to refine the overall approach to the cost-benefit analysis. The process of reevaluating costs to regulated entities included:

- Analyzing the GPEA report to determine the specific information collections identified as being suitable for electronic reporting and their implementation schedule;
- Evaluating each information collection request for an understanding of the types of activities that would be eliminated (such as mailing paper forms) or reduced (manual data quality checks) through electronic reporting;
- Interviewing trade associations, reviewing comments received, evaluating market trend research, and querying Envirofacts warehouse and Facility Registry System to establish an understanding of the numbers of potential facility representatives that would register for a particular program, the rate of electronic reporting growth in a program, the number of facilities using web forms or file exchanges, and the relative distribution of small to large businesses; and
- Establishing an understanding of the time required by facilities to register with CDX and maintain a CDX account, through interviews with CDX registered users and the CDX hotline.

The process of reevaluating costs and benefits to EPA, state, tribes, and local governments, included:

- Meeting with EPA programs and state program counterparts to identify the broad range of EPA authorized programs and the types and number of agencies under each program;
- Interviewing state and local agencies and their associations as follow-up to public comment to obtain an understanding of their current electronic reporting systems, long-term plans, and perceived impacts to their systems from this rule;
- Evaluating current information technology expenditures of CDX and other program system development efforts, and general costs of EPA rulemakings with respect to federal costs and benefits.

In preparing the CBA, EPA used a computer model to estimate the annual costs to EPA, state and local governments and regulated entities. To evaluate the costs and benefits of this rule, two scenarios were modeled: a "Baseline" scenario in which EPA would enable electronic reporting through an approach other than CROMERR and a "To Be" scenario in which EPA enables electronic reporting under CROMERR. In comparing the cumulative costs of this rule, EPA notes that the "To Be" scenario would be a more efficient approach than the "Baseline" scenario. Under the "Baseline" scenario, EPA programs would be left to implement their own program-specific electronic reporting requirements and electronic document receiving systems. Also, under the "Baseline" scenario, electronic reporting would be delayed, because EPA would have to generate separate rules and guidance to support program-specific electronic document receiving systems. Once these systems were established, reporting entities could conceivably be required to register under different rules and through different systems across EPA programs.

Based on the new research, EPA revised assumptions about the costs associated with authorized programs and corresponding benefits to the reporting entities. In contrast to the proposal, EPA does not claim the costs associated in building electronic document receiving systems for authorized programs (state, tribe, and local) or the benefits for their reporting entities in using these systems. Since it is clear that authorized programs intend to proceed with electronic reporting on their own regardless of this rule, the analyses for the final rule looks at the incremental costs to electronic document receiving systems that would be developed absent this rule, in meeting the final rule's requirements.

Based on research and comments received on the proposal, EPA also revised the following key cost assumptions:

- *Increased costs for XML.* EPA substantially increased the cost estimate of integrating an XML format into a facility's environmental management system (from $4,000 to $10,000).
- *Increased number of registered users.* EPA substantially increased the number of registrants (from 3 registrant/facility to 6 registrants per facility) in large companies that would use CDX.
- *Broadened impacts of authorized programs.* EPA substantially broadened the number of state, tribe, and local environmental agencies potentially impacted by the rule, to include health departments, county air boards, oil and gas agencies, and publicly-owned treatment works.

VIII. Statutory and Executive Order Reviews

A. Executive Order 12866

Pursuant to the terms of Executive Order 12866 (58 FR 51735, October 4, 1993), it has been determined that this rule is a "significant regulatory action" because it raises novel legal or policy issues. As such, this action was submitted to OMB for review. Changes made in response to OMB suggestions or recommendations are documented in the public record.

For EPA, the average annual cost to implement and operate electronic reporting under this rule is estimated to be $60.94 million. The average annual cost to implement and operate electronic reporting in the absence of this rule (i.e., where EPA implements electronic reporting on a program-specific basis) is estimated to be $70.36 million for EPA. The average annual cost savings to EPA under this rule is $8.42 million. The average annual cost to states, tribes, and local governments in initially upgrading their electronic receiving systems and obtaining EPA approval for appropriate program modification under the rule ranges from roughly $5,000 to $460,000, depending on the number of systems and extent of the upgrades needed. In addition, states, tribes, and local governments that upgrade their systems are expected to incur system maintenance costs averaging about $10,000 annually. These costs reflect solely the incremental costs resulting from the rule; they do not reflect the cost savings that states, tribes, and local governments will experience in implementing their receiving systems. EPA has not quantified these savings as part of its analysis. It should be noted that EPA expects today's rule to produce a net cost savings for states, tribes, and local governments. However, it is not possible to provide an adequate year-by-year comparison of the costs of the two scenarios, because the Baseline Scenario anticipates a more gradual process of EPA approval for state, tribe, and local government electronic reporting systems, starting at a later point in time.

The average annual cost to facilities to submit electronic reports to EPA in compliance with today's rule ranges from $9 for those entities that choose simply to use a web browser to access CDX and fill out web forms, to $10,000 per facility for those companies that wish to configure their environmental management systems to exchange data with CDX, using agreed-upon data exchange formats.

In addition to the monetary benefits identified by the analysis, EPA also

believes that there are many qualitative benefits that justify the initial costs associated with the rule. These benefits include:

• Responding to federal requirements, such as GPEA, which, among other things, requires federal agencies to allow individuals or entities that deal with the agencies the option to submit information or transact with the agency electronically. This rule sets the legal framework for most major EPA initiatives implementing electronic environmental data exchanges with the various stakeholders.

• Maintaining consistency with emerging industry commercial practices. The implementation of electronic government initiatives is a reflection of the rapid evolution of electronic commerce, which has occurred in industry since the expansion of the Internet and the World Wide Web (WWW), in the early 1990s. In many ways, EPA and state, tribe, and local environmental agencies' implementations of electronic reporting under today's rule will be more consistent with emerging practices and less burdensome to industry than paper reporting.

• Providing sound environmental practice. Part of EPA's mission is conserving environmental resources. The traditional paper-based reporting practices and processes consumes trees and other resources for printing, exchanging, reproducing, storing, and retrieving grants, permits, compliance reports, and supporting documents.

• Fostering more rapid environmental compliance reporting. Organizations have become increasingly environmentally conscientious. This change stems both from a desire to be good corporate citizens and from fear of negative media reporting. Hence, organizations, especially large companies, are becoming increasingly interested in being able to demonstrate their environmental compliance. More rapid and accurate public posting of compliance data by environmental agencies is one way to help achieve this goal.

• Simplifying facility reporting. Electronic reporting and EPA's planned implementation support a single point of entry into agency systems, which will enhance facilities' ability to locate appropriate regulations, obtain information, ask questions, obtain forms, and submit data.

• Providing more accurate data. Replacing paper forms with electronic forms will result in more accurate data. Systems incorporating electronic forms can perform real time edit checks that will reduce the number of input errors. These checks can range from simple verification of valid date formats, to complex validations of proper nomenclature and limits of chemicals emitted into the environment. Improved data quality will also help reduce the time required for data correction and the effects of inaccurate reporting.

• Making data more readily available. The process of creating, mailing, receiving, entering, verifying, and correcting paper reports consumes both resources and time. This delays the analysis of the data by EPA and authorized programs and its availability to decision makers and the public.

• Provides the foundation for further process re-engineering. Moving data from a paper to an electronic system as early in the process as possible creates the foundation on which many work-flow re-engineering initiatives can be constructed.

B. Executive Order 13132

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by state and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government."

This final rule does not have federalism implications. EPA has determined that the final rule will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The final rule will not require states to accept electronic reports. The effect of this rule will be to provide an electronic alternative to currently accepted methods of receiving regulatory reports on paper and to give the states the option of choosing to receive electronic submissions in satisfaction of reporting requirements under their authorized programs or continuing to require submissions on paper.

Authorized states and local agencies that choose to receive electronic reports under this rule may incur expenses initially in developing systems or modifying existing systems to meet the standards in this rule. The average annual cost to state agencies in upgrading their electronic receiving systems and obtaining EPA program modification approval depends on the amount of effort required to adhere to the requirements of this rule. However, EPA estimates that for those states deploying systems that meet rule standards, each state will incur a cost of about $12,000 in obtaining EPA approval of its system. For a state where upgrades to its systems are needed to meet rule requirements, the costs can range up to $460,000, depending on the size and complexity of its systems and the extent of the upgrades needed. Maintenance costs for maintaining compliance with this rule will cost each state about $10,000 annually. These costs include both capital costs required for hardware and software upgrades, and labor costs incurred by state employees. EPA analyzed the most likely alternative scenario where, absent this rule, EPA programs would implement rules that would require states to seek program modifications on a program by program basis. It should be noted that these analyses do not quantify the cost savings that states will incur through offering electronic reporting options to their reporting entities. EPA believes these savings will greatly outweigh the costs of complying with the rule. Based on these analyses, EPA believes that although the final rule imposes some compliance costs on state and local governments, the costs for most states are marginal and will result in net benefits over the most likely alternative scenario.

Over the last several years, EPA has provided substantial financial support to states to assist in upgrades to information technology systems. For example, in fiscal years 2002–2004, EPA provided approximately $65 million dollars to states, tribes, and territories through grants to support their efforts to establish EIEN. EPA intends to award additional grants for fiscal year 2005. EPA's fiscal year 2006 budget includes $20 million for the EIEN Grant Program. States, tribes, and territories may apply for these grant funds to generally upgrade their EIEN capabilities, including improvements related to this rule, e.g., to improve data validity and user authentication procedures, as required by today's final rule.

Although Section 6 of Executive Order 13132 does not apply to this rule, EPA has welcomed the active participation of the states; on several separate occasions EPA has held substantial consultations with state and local officials in developing this rule. State participation has resulted in changes to the final rule, including the section 3.1000 approval process and

special provisions such as deferred compliance for existing systems.

C. Paperwork Reduction Act

OMB has approved the information collection requirements contained in this rule under the provisions of the *Paperwork Reduction Act* (PRA), 44 U.S.C. 3501 *et seq.* and has assigned OMB control number 2025–0003.

The ICR for this rule covers the registration information, which will be collected from individuals wishing to submit electronic reports to EPA on behalf of regulated facilities. The information will be used to establish the identity of that individual and the regulated entity he or she represents. This information will be used by EPA to register and provide individuals with the ability to access the EPA's electronic document receiving system, CDX. In appropriate circumstances this information will also be used to issue an electronic signature to the registered individual. The ICR also covers activities incidental to electronic reporting (*e.g.*, submittal of an electronic signature agreement to EPA as applicable). It should be noted that the submission of environmental reports in an electronic format to EPA and states, tribes, and local governments is voluntary for most examples of electronic reporting, and viewed as a service that EPA and its regulatory partners are providing to the regulated community. The rule allows reporting entities to submit reports and other information electronically, thereby streamlining and expediting the process for reporting. However, it should also be understood that this rule does set forth requirements for regulated entities that submit electronic reports directly to EPA and for states, tribes, and local governments that choose to implement electronic reporting under their authorized programs. EPA is issuing this rule on cross-media electronic reporting, in part, under the authority of GPEA, Public Law 105–277, which amends the PRA.

In addition, the ICR covers state, tribe, and local government activities involved in upgrading their electronic receiving systems to satisfy the standards in the rule and in applying to EPA for approval of program modification. States, tribes, and local governments will undertake these activities only if they intend to collect information electronically under an EPA authorized program.

The total annual reporting and recordkeeping burden this ICR estimates is 151,963 hours, which includes the tasks described above. It is expected that a respondent reporting directly to EPA will take on average ten minutes to register with CDX; however, if the respondent contacts the CDX help desk for assistance with CDX registration, on average the respondent will incur an additional six minutes. The average annual number of respondents registering with CDX is 19,434. It is further expected that 201,331 respondents will report electronically to a state, tribe, or local government receiving system. Respondents reporting to EPA or state, tribe, or local governments may also incur an additional burden of 20 minutes to prepare, sign, and submit an electronic signature agreement. The average annual number of these respondents is 177,009. In addition, the ICR estimates that 7,293 medium-sized and large companies will register local registration authorities (LRA) and incur an additional burden of 1 hour. This includes the time to prepare and submit LRA designation applications, collect and store subscriber agreements, and prepare and submit certification of receipt and secure storage.

Finally, it is expected that a state, tribe, or local government would take between 210 and 330 hours to prepare and submit its program modification application to EPA. The average annual number of states applying to EPA is expected to be 15; the average annual number of tribes and local governments applying to EPA is expected to be 46. In addition, the ICR estimates $4,450,658 in annual capital/start-up costs for states, tribes and local governments to upgrade their receiving systems. The ICR estimates $663,975 in annual operation and maintenance costs. This includes costs to registrants and state, tribes and local governments in submitting information to EPA.

Public Burden Statement

The public reporting burden is estimated to be 10 minutes for an individual that reports electronically to the CDX. This includes time for preparing the on-line application and calling the CDX help desk.

The public reporting burden in this ICR is estimated to be 15 minutes for an individual that prepares and submits a subscriber agreement.

The public reporting burden is estimated to be 30 minutes for a local registration authority. This includes time for preparing and submitting the certification of receipt and secure storage to EPA or state/local agency.

The public reporting burden is estimated to range from 210 hours for a local government to 330 hours for a state seeking to implement an electronic receiving system. This includes time for preparing and submitting the program modification application to EPA.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15. In addition, EPA is amending the table in 40 CFR part 9 of currently approved OMB control numbers for various regulations to list the regulatory citations for the information requirements contained in this final rule.

D. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA), 5 U.S.C. 601 *et seq.*, generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For the purpose of assessing the impacts of today's rule on small entities, small entity is defined as: (1) Small business as defined by the RFA and based on Small Business Administration (SBA) size standards; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less then 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, the Agency certifies, pursuant to section 605(b) of the RFA, that this

action will not have a significant economic impact on a substantial number of small entities. Courts have interpreted the RFA to require a regulatory flexibility analysis only when small entities will be subject to the requirements of the rule. See *Motor and Equip. Mfrs. Ass'n* v. *Nichols*, 142 F.3d 449 (D.C. Cir. 1998); *United Distribution Cos.* v. *FERC*, 88 F.3d 1105, 1170 (D.C. Cir. 1996); *Mid-Tex Elec. Co-op, Inc.* v. *FERC*, 773 F.2d 327, 342 (D.C. Cir. 1985) (agency's certification need only consider the rule's impact on entities subject to the rule). This final rule would not establish any new direct requirements applicable to small entities. States that are directly regulated in this rulemaking are not small entities.

This rule provides for EPA review and approval of authorized state, tribe, and local government programs that decide to provide for electronic reporting. This rule includes performance standards against which a state's, tribe's, or local government's electronic document receiving system will be evaluated before EPA will approve changes to the delegated, authorized, or approved program to provide electronic reporting, and establishes a streamlined process that states, tribes, and local governments can use to seek and obtain such approvals. The rule also includes special provisions for existing state electronic reporting systems in place at the time of publication of this rule.

Currently, entities that choose to submit electronic documents directly to EPA submit documents to a centralized Agency-wide electronic document-receiving system, called the CDX, or to alternative systems designated by the Administrator. This rule does not change those systems. In addition, today's rule, does not require the submission of electronic documents in lieu of paper documents.

Because there is no requirement to adopt electronic reporting, EPA has determined that small local governments will not be directly impacted by this rule. Nonetheless, EPA also considered the possible impacts of this rule to determine whether small local governments could potentially be subject to the provisions of § 3.1000, which would require these programs to seek EPA approval for their electronic document receiving systems if they choose to provide electronic reporting. EPA reviewed its programs and conducted follow-up to comments received from industry, state, and local government associations to determine possible impacts to small local jurisdictions. Based on its review, EPA concluded that the only small government jurisdictions possibly subject to the rule are those with Publicly-Owned Treatment Works (POTWs). Only POTWs choosing to deploy electronic document receiving systems would be subject to today's rule. Through analysis and direct discussions with municipal POTWs and trade associations, EPA did not identify any such small government jurisdictions planning to deploy electronic reporting systems.

Although not required by the RFA, (See *Michigan* v. *EPA*, 213 F.3d 663, 668–69 (D.C. Cir., 2000), *cert. den.* 121 S.Ct. 225, 149 L.Ed.2d 135 (2001)), as a part of the analysis prepared under Executive Order 12866, EPA also considered the costs to small entities that are indirect reporters to authorized state, tribal, and local government programs. For this final rule, EPA prepared a cost/benefit analysis to assess the economic impact of CROMERR, which can be found in the docket for this rule.

Although this rule will not have a significant economic impact on a substantial number of small entities, the Agency nonetheless consulted with small entities as well as organizations such as the Small Business Administration (SBA). We made several changes to the rule based upon these discussions.

E. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for federal agencies to assess the effects of their regulatory actions on states, tribes, and local governments and the private sector. Under section 202 of UMRA, EPA must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to states, tribes, and local governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted.

Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribes, it must have developed under section 203 of UMRA a small-government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input into the development of EPA regulatory proposals with significant Federal intergovernmental mandates. The plan must also provide for informing, educating, and advising small governments on compliance with the regulatory requirements.

As described in section VIII.D. of this Preamble, above, EPA also evaluated the possible impacts of this rule to small governments. In particular, EPA was concerned that small governments could potentially be subject to the provisions of § 3.1000, which would require these programs to seek EPA approval for the electronic document receiving systems. EPA reviewed its programs, and also conducted follow-up to comments from industry, state, and local government associations to determine possible impacts to small local governments. As a result of this review, EPA concluded that small local governments would not be adversely impacted by the provisions of § 3.1000 this rule.

The Agency has determined that this rule does not contain a Federal mandate that may result in expenditures of $100 million or more for states, tribes, and local governments, in the aggregate, or the private sector in any one year. Thus, today's rule is not subject to the requirements in sections 202 and 205 of UMRA. The Agency has determined that this rule contains no regulatory requirements that might significantly or uniquely affect small governments and thus this rule is not subject to the requirements in section 202 of UMRA.

F. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law 104–113, section 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs EPA to provide Congress, through OMB, with explanations when the Agency decides

not to use available and applicable voluntary consensus standards.

The consensus standards relevant to an electronic reporting rule are primarily technical standards that specify file formats for the electronic exchange of data, telecommunications network protocols, and electronic signature technologies and formats. EPA is not setting requirements for electronic reporting at the level of specificity addressed by such formats, protocols and technologies, so consensus standards are not directly applicable to today's rule. For example, the final rule does not stipulate data exchange formats, does not specify electronic signature technologies, and does not address telecommunications issues. At the same time, there is nothing in today's rule that is incompatible with these standards, and in implementing electronic reporting under this rule EPA is adopting standards-based approaches to electronic data exchange.

In the preamble to the proposed rule, EPA described its initial plans to implement a number of standards-based approaches to electronic reporting, including electronic data exchange formats based upon the ANSI Accredited Standards Committee's (ASC) X12 for Electronic Data Interchange or EDI. That preamble also discussed EPA's interest in exploring the use of Internet data exchange formats based on XML, then under development by the World Wide Web Consortium (W3C). As a part of the preamble discussion, EPA solicited comment on these planned standards-based electronic reporting implementations. In response, EPA received considerable feedback both from states and from industry indicating a trend in the direction of XML, and away from the deployment of ANSI ASC X12 standards. In any event, CDX now looks to XML to provide the formats for its Internet data exchanges. EPA currently supports multi-agency Integrated Project Teams to develop XML formats and intends to use standardized formats for this purpose to the extent that they are available. In addition, EPA currently registers XML formats in its System of Registries to facilitate easy access to these formats for partners wishing to exchange data. EPA is attempting to make use of applicable standards-setting work being done by several organizations, including the Electronic Business XML (ebXML), the Organization for the Advancement of Structured Information Standards (OASIS), and, internationally, the United Nation's Center for Administration, Commerce, and Transport (UN/CEFACT) Forum. In any event, today's rule is compatible with any of these current standards-based approaches to electronic reporting, but the rule itself does not set requirements at the level of detail that such standards address.

G. Executive Order 13045

Executive Order 13045, Protection of Children from Environmental Health Risks and Safety Risks (62 FR 19885, April 23, 1997) applies to any rule that EPA determines (1) "economically significant" as defined under Executive Order 12866 and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. EPA interprets Executive Order 13045 as encompassing only those regulatory actions that are risk-based or health-based, such that the analysis required under Section 5–501 of the Executive Order has the potential to influence the regulation.

This rule is not subject to Executive Order 13045 because it is not an economically significant action as defined by Executive Order 12866 and it does not involve decisions regarding environmental health or safety risks. This rule contains general performance standards for the submission of environmental data electronically.

H. Executive Order 13175

Executive Order 13175, entitled, "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" are defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and the Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes."

This rule does not have tribal implications, as specified in Executive Order 13175, and therefore consultation under the Order is not required. It will not have substantial direct effects on tribes, on the relationship between the federal government and Indian tribes, or on the distribution of power and responsibilities between the federal government and Indian tribes, as specified in Executive Order 13175. This action does not require Indian tribes to accept electronic reports. The effect of this rule is to provide additional regulatory flexibility to Indian tribes by giving them the opportunity to submit electronic reports to EPA in satisfaction of EPA reporting requirements and by allowing them to implement electronic reporting under their authorized programs.

I. Executive Order 13211 (Energy Effects)

This rule is not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse affect on the supply, distribution, or use of energy. EPA has concluded that this rule is not likely to have any adverse energy effects.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). This rule will become effective on January 11, 2006.

List of Subjects

40 CFR Part 3

Environmental protection, Conflict of interests, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations.

40 CFR Part 9

Environmental protection, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Reporting and recordkeeping requirements.

40 CFR Part 51

Environmental protection, Administrative practice and procedure, Air pollution control, Carbon monoxide, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Lead, Nitrogen dioxide, Ozone, Particulate matter, Reporting and recordkeeping

requirements, Sulfur oxides, Volatile organic compounds.

40 CFR Part 60

Environmental protection, Administrative practice and procedure, Air pollution control, Aluminum, Ammonium sulfate plants, Batteries, Beverages, Carbon monoxide, Cement industry, Coal, Copper, Dry cleaners, Electric power plants, Electronic records, Electronic reporting requirements, Electronic reports, Fertilizers, Fluoride, Gasoline, Glass and glass products, Grains, Graphic arts industry, Heaters, Household appliances, Insulation, Intergovernmental relations, Iron, Labeling, Lead, Lime, Metallic and nonmetallic mineral processing plants, Metals, Motor vehicles, Natural gas, Nitric acid plants, Nitrogen dioxide, Paper and paper products industry, Particulate matter, Paving and roofing materials, Petroleum, Phosphate, Plastics materials and synthetics, Polymers, Reporting and recordkeeping requirements, Sewage disposal, Steel, Sulfur oxides, Sulfuric acid plants, Tires, Urethane, Vinyl, Volatile organic compounds, Waste treatment and disposal, Zinc.

40 CFR Part 63

Environmental protection, Air pollution control, Electronic records, Electronic reporting requirements, Electronic reports, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

40 CFR Part 69

Environmental protection, Air pollution control, Electronic records, Electronic reporting requirements, Electronic reports, Guam, Intergovernmental relations.

40 CFR Part 70

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations.

40 CFR Part 71

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations.

40 CFR Part 123

Environmental protection, Administrative practice and procedure, Confidential business information, Electronic records, Electronic reporting requirements, Electronic reports, Hazardous substances, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control.

40 CFR Part 142

Environmental protection, Administrative practice and procedure, Chemicals, Electronic records, Electronic reporting requirements, Electronic reports, Indians-lands, Intergovernmental relations, Radiation protection, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 145

Environmental protection, Confidential business information, Electronic records, Electronic reporting requirements, Electronic reports, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 162

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Pesticides and pests, Reporting and recordkeeping requirements, State registration of pesticide products.

40 CFR Part 233

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control.

40 CFR Part 257

Environmental protection, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Waste treatment and disposal.

40 CFR Part 258

Environmental protection, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control.

40 CFR Part 271

Environmental protection, Administrative practice and procedure, Confidential business information, Electronic records, Electronic reporting requirements, Electronic reports, Hazardous materials transportation, Hazardous waste, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

40 CFR Part 281

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Hazardous substances, Insurance, Intergovernmental relations, Oil pollution, Reporting and recordkeeping requirements, Surety bonds, Water pollution control, Water supply.

40 CFR Part 403

Environmental protection, Confidential business information, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control.

40 CFR Part 501

Environmental protection, Administrative practice and procedure, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Sewage disposal.

40 CFR Part 745

Environmental protection, Electronic records, Electronic reporting requirements, Electronic reports, Intergovernmental relations, Hazardous substances, Lead poisoning, Reporting and recordkeeping requirements.

40 CFR Part 763

Environmental protection, Administrative practice and procedure, Asbestos, Electronic records, Electronic reporting requirements, Electronic reports, Hazardous substances, Imports, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: September 22, 2005.

Stephen L. Johnson,

Administrator.

■ Therefore, Title 40 Chapter I of the Code of Federal Regulations is amended by adding a new Part 3, and amending parts 9, 51, 60, 63, 69, 70, 71, 123, 142, 145, 162, 233, 257, 258, 271, 281, 403, 501, 745, and 763 to read as follows:

PART 3—CROSS-MEDIA ELECTRONIC REPORTING

Subpart A—General Provisions

Sec.

3.1 Who does this part apply to?
3.2 How does this part provide for electronic reporting?
3.3 What definitions are applicable to this part?

3.4 How does this part affect enforcement and compliance provisions of Title 40?

Subpart B—Electronic Reporting to EPA

3.10 What are the requirements for electronic reporting to EPA?
3.20 How will EPA provide notice of changes to the Central Data Exchange?

Subpart C—[Reserved]

Subpart D—Electronic Reporting under EPA-Authorized State, Tribe, and Local Programs

3.1000 How does a state, tribe, or local government revise or modify its authorized program to allow electronic reporting?
3.2000 What are the requirements authorized state, tribe, and local programs' reporting systems must meet?

Authority: 7 U.S.C. 136 to 136y; 15 U.S.C. 2601 to 2692; 33 U.S.C. 1251 to 1387; 33 U.S.C. 1401 to 1445; 33 U.S.C. 2701 to 2761; 42 U.S.C. 300f to 300j–26; 42 U.S.C. 4852d; 42 U.S.C. 6901–6992k; 42 U.S.C. 7401 to 7671q; 42 U.S.C. 9601 to 9675; 42 U.S.C. 11001 to 11050; 15 U.S.C. 7001; 44 U.S.C. 3504 to 3506.

Subpart A—General Provisions

§ 3.1 Who does this part apply to?

(a) This part applies to:

(1) Persons who submit reports or other documents to EPA to satisfy requirements under Title 40 of the Code of Federal Regulations (CFR); and

(2) States, tribes, and local governments administering or seeking to administer authorized programs under Title 40 of the CFR.

(b) This part does not apply to:

(1) Documents submitted via facsimile in satisfaction of reporting requirements as permitted under other parts of Title 40 or under authorized programs; or

(2) Electronic documents submitted via magnetic or optical media such as diskette, compact disc, digital video disc, or tape in satisfaction of reporting requirements, as permitted under other parts of Title 40 or under authorized programs.

(c) This part does not apply to any data transfers between EPA and states, tribes, or local governments as a part of their authorized programs or as a part of administrative arrangements between states, tribes, or local governments and EPA to share data.

§ 3.2 How does this part provide for electronic reporting?

(a) *Electronic reporting to EPA.* Except as provided in § 3.1(b), any person who is required under Title 40 to create and submit or otherwise provide a document to EPA may satisfy this requirement with an electronic document, in lieu of a paper document, provided that:

(1) He or she satisfies the requirements of § 3.10; and

(2) EPA has first published a notice in the Federal Register announcing that EPA is prepared to receive, in electronic form, documents required or permitted by the identified part or subpart of Title 40.

(b) *Electronic reporting under an EPA-authorized state, tribe, or local program.*

(1) An authorized program may allow any document submission requirement under that program to be satisfied with an electronic document provided that the state, tribe, or local government seeks and obtains revision or modification of that program in accordance with § 3.1000 and also meets the requirements of § 3.2000 for such electronic reporting.

(2) A state, tribe, or local government that is applying for initial delegation, authorization, or approval to administer a federal program or a program in lieu of the federal program, and that will allow document submission requirements under the program to be satisfied with an electronic document, must use the procedures for obtaining delegation, authorization, or approval under the relevant part of Title 40 and may not use the procedures set forth in § 3.1000; but the application must contain the information required by § 3.1000(b)(1) and the state, tribe, or local government must meet the requirements of § 3.2000.

(c) *Limitations.* This part does not require submission of electronic documents in lieu of paper. This part confers no right or privilege to submit data electronically and does not obligate EPA, states, tribes, or local governments to accept electronic documents.

§ 3.3 What definitions are applicable to this part?

The definitions set forth in this section apply when used in this part.

Acknowledgment means a confirmation of electronic document receipt.

Administrator means the Administrator of the EPA.

Agency means the EPA or a state, tribe, or local government that administers or seeks to administer an authorized program.

Agreement collection certification means a signed statement by which a local registration authority certifies that a subscriber agreement has been received from a registrant; the agreement has been stored in a manner that prevents unauthorized access to these agreements by anyone other than the local registration authority; and the local registration authority has no basis to believe that any of the collected agreements have been tampered with or prematurely destroyed.

Authorized program means a Federal program that EPA has delegated, authorized, or approved a state, tribe, or local government to administer, or a program that EPA has delegated, authorized, or approved a state, tribe or local government to administer in lieu of a Federal program, under other provisions of Title 40 and such delegation, authorization, or approval has not been withdrawn or expired.

Central Data Exchange means EPA's centralized electronic document receiving system, or its successors, including associated instructions for submitting electronic documents.

Chief Information Officer means the EPA official assigned the functions described in section 5125 of the Clinger Cohen Act (Pub. L. 104–106).

Copy of record means a true and correct copy of an electronic document received by an electronic document receiving system, which copy can be viewed in a human-readable format that clearly and accurately associates all the information provided in the electronic document with descriptions or labeling of the information. A *copy of record* includes:

(1) All electronic signatures contained in or logically associated with that document;

(2) The date and time of receipt; and

(3) Any other information used to record the meaning of the document or the circumstances of its receipt.

Disinterested individual means an individual who is not connected with the person in whose name the electronic signature device is issued. A *disinterested individual* is not any of the following: The person's employer or employer's corporate parent, subsidiary, or affiliate; the person's contracting agent; member of the person's household; or relative with whom the person has a personal relationship.

Electronic document means any information in digital form that is conveyed to an agency or third-party, where "information" may include data, text, sounds, codes, computer programs, software, or databases. "Data," in this context, refers to a delimited set of data elements, each of which consists of a content or value together with an understanding of what the content or value means; where the electronic document includes data, this understanding of what the data element content or value means must be explicitly included in the electronic document itself or else be readily available to the electronic document recipient.

Electronic document receiving system means any set of apparatus, procedures,

software, records, or documentation used to receive electronic documents.

Electronic signature means any information in digital form that is included in or logically associated with an electronic document for the purpose of expressing the same meaning and intention as would a handwritten signature if affixed to an equivalent paper document with the same reference to the same content. The electronic document bears or has on it an electronic signature where it includes or has logically associated with it such information.

Electronic signature agreement means an agreement signed by an individual with respect to an electronic signature device that the individual will use to create his or her electronic signatures requiring such individual to protect the electronic signature device from compromise; to promptly report to the agency or agencies relying on the electronic signatures created any evidence discovered that the device has been compromised; and to be held as legally bound, obligated, or responsible by the electronic signatures created as by a handwritten signature.

Electronic signature device means a code or other mechanism that is used to create electronic signatures. Where the *device* is used to create an individual's electronic signature, then the code or mechanism must be unique to that individual at the time the signature is created and he or she must be uniquely entitled to use it. The *device* is compromised if the code or mechanism is available for use by any other person.

EPA means the United States Environmental Protection Agency.

Existing electronic document receiving system means an electronic document receiving system that is being used to receive electronic documents in lieu of paper to satisfy requirements under an authorized program on October 13, 2005 or the system, if not in use, has been substantially developed on or before that date as evidenced by the establishment of system services or specifications by contract or other binding agreement.

Federal program means any program administered by EPA under any other provision of Title 40.

Federal reporting requirement means a requirement to report information directly to EPA under any other provision of Title 40.

Handwritten signature means the scripted name or legal mark of an individual, handwritten by that individual with a marking-or writing-instrument such as a pen or stylus and executed or adopted with the present intention to authenticate a writing in a permanent form, where "a writing" means any intentional recording of words in a visual form, whether in the form of handwriting, printing, typewriting, or any other tangible form. The physical instance of the scripted name or mark so created constitutes the handwritten signature. The scripted name or legal mark, while conventionally applied to paper, may also be applied to other media.

Information or objects of independent origin means data or items that originate from a disinterested individual or are forensic evidence of a unique, immutable trait which is (and may at any time be) attributed to the individual in whose name the device is issued.

Local registration authority means an individual who is authorized by a state, tribe, or local government to issue an agreement collection certification, whose identity has been established by notarized affidavit, and who is authorized in writing by a regulated entity to issue agreement collection certifications on its behalf.

Priority reports means the reports listed in Appendix 1 to part 3.

Subscriber agreement means an electronic signature agreement signed by an individual with a handwritten signature. This agreement must be stored until five years after the associated electronic signature device has been deactivated.

Transmit means to successfully and accurately convey an electronic document so that it is received by the intended recipient in a format that can be processed by the electronic document receiving system.

Valid electronic signature means an electronic signature on an electronic document that has been created with an electronic signature device that the identified signatory is uniquely entitled to use for signing that document, where this device has not been compromised, and where the signatory is an individual who is authorized to sign the document by virtue of his or her legal status and/or his or her relationship to the entity on whose behalf the signature is executed.

§ 3.4 How does this part affect enforcement and compliance provisions of Title 40?

(a) A person is subject to any applicable federal civil, criminal, or other penalties and remedies for failure to comply with a federal reporting requirement if the person submits an electronic document to EPA under this part that fails to comply with the provisions of § 3.10.

(b) A person is subject to any applicable federal civil, criminal, or other penalties or remedies for failure to comply with a State, tribe, or local reporting requirement if the person submits an electronic document to a State, tribe, or local government under an authorized program and fails to comply with the applicable provisions for electronic reporting.

(c) Where an electronic document submitted to satisfy a federal or authorized program reporting requirement bears an electronic signature, the electronic signature legally binds, obligates, and makes the signatory responsible, to the same extent as the signatory's handwritten signature would on a paper document submitted to satisfy the same federal or authorized program reporting requirement.

(d) Proof that a particular signature device was used to create an electronic signature will suffice to establish that the individual uniquely entitled to use the device did so with the intent to sign the electronic document and give it effect.

(e) Nothing in this part limits the use of electronic documents or information derived from electronic documents as evidence in enforcement or other proceedings.

Subpart B—Electronic Reporting to EPA

§ 3.10 What are the requirements for electronic reporting to EPA?

(a) A person may use an electronic document to satisfy a federal reporting requirement or otherwise substitute for a paper document or submission permitted or required under other provisions of Title 40 only if:

(1) The person transmits the electronic document to EPA's Central Data Exchange, or to another EPA electronic document receiving system that the Administrator may designate for the receipt of specified submissions, complying with the system's requirements for submission; and

(2) The electronic document bears all valid electronic signatures that are required under paragraph (b) of this section.

(b) An electronic document must bear the valid electronic signature of a signatory if that signatory would be required under Title 40 to sign the paper document for which the electronic document substitutes, unless EPA announces special provisions to accept a handwritten signature on a separate paper submission and the signatory provides that handwritten signature.

§ 3.20 How will EPA provide notice of changes to the Central Data Exchange?

(a) Except as provided under paragraph (b) of this section, whenever

EPA plans to change Central Data Exchange hardware or software in ways that would affect the transmission process, EPA will provide notice as follows:

(1) *Significant changes to CDX:* Where the equipment, software, or services needed to transmit electronic documents to the Central Data Exchange would be changed significantly, EPA will provide public notice and seek comment on the change and the proposed implementation schedule through the Federal Register;

(2) *Other changes to CDX:* EPA will provide notice of other changes to Central Data Exchange users at least sixty (60) days in advance of implementation.

(3) *De minimis or transparent changes to CDX:* For *de minimis* or transparent changes that have minimal or no impact on the transmission process, EPA may provide notice if appropriate on a case-by-case basis.

(b) *Emergency changes to CDX:* Any change which EPA's Chief Information Officer or his or her designee determines is needed to ensure the security and integrity of the Central Data Exchange is exempt from the provisions of paragraph (a) of this section. However, to the extent consistent with ensuring the security and integrity of the system, EPA will provide notice for any change other than *de minimis* or transparent changes to the Central Data Exchange.

Subpart C—[Reserved]

Subpart D—Electronic Reporting Under EPA-Authorized State, Tribe, and Local Programs

§ 3.1000 How does a state, tribe, or local government revise or modify its authorized program to allow electronic reporting?

(a) A state, tribe, or local government that receives or plans to begin receiving electronic documents in lieu of paper documents to satisfy requirements under an authorized program must revise or modify such authorized program to ensure that it meets the requirements of this part.

(1) *General procedures for program modification or revision:* To revise or modify an authorized program to meet the requirements of this part, a state, tribe, or local government must submit an application that complies with paragraph (b)(1) of this section and must follow either the applicable procedures for program revision or modification in other parts of Title 40, or, at the applicant's option, the procedures provided in paragraphs (b) through (e) of this section.

(2) *Programs planning to receive electronic documents under an authorized program:* A state, tribe, or local government that does not have an existing electronic document receiving system for an authorized program must receive EPA approval of revisions or modifications to such program in compliance with paragraph (a)(1) of this section before the program may receive electronic documents in lieu of paper documents to satisfy program requirements.

(3) *Programs already receiving electronic documents under an authorized program:* A state, tribe, or local government with an existing electronic document receiving system for an authorized program must submit an application to revise or modify such authorized program in compliance with paragraph (a)(1) of this section no later than October 13, 2007. On a case-by-case basis, this deadline may be extended by the Administrator, upon request of the state, tribe, or local government, where the Administrator determines that the state, tribe, or local government needs additional time to make legislative or regulatory changes to meet the requirements of this part.

(4) *Programs with approved electronic document receiving systems:* An authorized program that has EPA's approval to accept electronic documents in lieu of paper documents must keep EPA apprised of those changes to laws, policies, or the electronic document receiving systems that have the potential to affect program compliance with § 3.2000. Where the Administrator determines that such changes require EPA review and approval, EPA may request that the state, tribe, or local government submit an application for program revision or modification; additionally, a state, tribe, or local government on its own initiative may submit an application for program revision or modification respecting their receipt of electronic documents. Such applications must comply with paragraph (a)(1) of this section.

(5) *Restrictions on the use of procedures in this section:* The procedures provided in paragraphs (b) through (e) of this section may only be used for revising or modifying an authorized program to provide for electronic reporting and for subsequent revisions or modifications to the electronic reporting elements of an authorized program as provided under paragraph (a)(4) of this section.

(b)(1) To obtain EPA approval of program revisions or modifications using procedures provided under this section, a state, tribe, or local government must submit an application to the Administrator that includes the following elements:

(i) A certification that the state, tribe, or local government has sufficient legal authority provided by lawfully enacted or promulgated statutes or regulations that are in full force and effect on the date of the certification to implement the electronic reporting component of its authorized programs covered by the application in conformance with § 3.2000 and to enforce the affected programs using electronic documents collected under these programs, together with copies of the relevant statutes and regulations, signed by the State Attorney General or his or her designee, or, in the case of an authorized tribe or local government program, by the chief executive or administrative official or officer of the governmental entity, or his or her designee;

(ii) A listing of all the state, tribe, or local government electronic document receiving systems to accept the electronic documents being addressed by the program revisions or modifications that are covered by the application, together with a description for each such system that specifies how the system meets the applicable requirements in § 3.2000 with respect to those electronic documents;

(iii) A schedule of upgrades for the electronic document receiving systems listed under paragraph (b)(1)(ii) of this section that have the potential to affect the program's continued conformance with § 3.2000; and

(iv) Other information that the Administrator may request to fully evaluate the application.

(2) A state, tribe, or local government that revises or modifies more than one authorized program for receipt of electronic documents in lieu of paper documents may submit a consolidated application under this section covering more than one authorized program, provided the consolidated application complies with paragraph (b)(1) of this section for each authorized program.

(3)(i) Within 75 calendar days of receiving an application for program revision or modification submitted under paragraph (b)(1) of this section, the Administrator will respond with a letter that either notifies the state, tribe, or local government that the application is complete or identifies deficiencies in the application that render the application incomplete. The state, tribe, or local government receiving a notice of deficiencies may amend the application and resubmit it. Within 30 calendar days of receiving the amended application, the Administrator will respond with a letter that either notifies the applicant that the amended

application is complete or identifies remaining deficiencies that render the application incomplete.

(ii) If a state, tribe, or local government receiving notice of deficiencies under paragraph (b)(3)(i) of this section does not remedy the deficiencies and resubmit the subject application within a reasonable period of time, the Administrator may act on the incomplete application under paragraph (c) of this section.

(c)(1) The Administrator will act on an application by approving or denying the state's, tribe's or local government's request for program revision or modification.

(2) Where a consolidated application submitted under paragraph (b)(2) of this section addresses revisions or modifications to more than one authorized program, the Administrator may approve or deny the request for revision or modification of each authorized program in the application separately; the Administrator need not take the same action with respect to the requested revisions or modifications for each such program.

(3) When an application under paragraph (b) of this section requests revision or modification of an authorized public water system program under part 142 of this title, the Administrator will, in accordance with the procedures in paragraph (f) of this section, provide an opportunity for a public hearing before a final determination pursuant to paragraph (c)(1) of this section with respect to that component of the application.

(4) Except as provided under paragraph (c)(4)(i) and (ii) of this section, if the Administrator does not take any action under paragraph (c)(1) of this section on a specific request for revision or modification of a specific authorized program addressed by an application submitted under paragraph (b) of this section within 180 calendar days of notifying the state, tribe, or local government under paragraph (b)(3) of this section that the application is complete, the specific request for program revision or modification for the specific authorized program is considered automatically approved by EPA at the end of the 180 calendar days unless the review period is extended at the request of the state, tribe, or local government submitting the application.

(i) Where an opportunity for public hearing is required under paragraph (c)(3) of this section, the Administrator's action on the requested revision or modification will be in accordance with paragraph (f) of this section.

(ii) Where a requested revision or modification addressed by an application submitted under paragraph (b) of this section is to an authorized program with an existing electronic document receiving system, and where notification under paragraph (b)(3) of this section that the application is complete is executed after October 13, 2007, if the Administrator does not take any action under paragraph (c)(1) of this section on the specific request for revision or modification within 360 calendar days of such notification, the specific request is considered automatically approved by EPA at the end of the 360 calendar days unless the review period is extended at the request of the state, tribe, or local government submitting the application.

(d) Except where an opportunity for public hearing is required under paragraph (c)(3) of this section, EPA's approval of a program revision or modification under this section will be effective upon publication of a notice of EPA's approval of the program revision or modification in the **Federal Register**. EPA will publish such a notice promptly after approving a program revision or modification under paragraph (c)(1) of this section or after an EPA approval occurs automatically under paragraph (c)(4) of this section.

(e) If a state, tribe, or local government submits material to amend its application under paragraph (b)(1) of this section after the date that the Administrator sends notification under paragraph (b)(3)(i) of this section that the application is complete, this new submission will constitute withdrawal of the pending application and submission of a new, amended application for program revision or modification under paragraph (b)(1) of this section, and the 180-day time period in paragraph (c)(4) of this section or the 360-day time period in paragraph (c)(4)(ii) of this section will begin again only when the Administrator makes a new determination and notifies the state, tribe, or local government under paragraph (b)(3)(i) of this section that the amended application is complete.

(f) For an application under this section that requests revision or modification of an authorized public water system program under part 142 of this chapter:

(1) The Administrator will publish notice of the Administrator's preliminary determination under paragraph (c)(1) of this section in the **Federal Register**, stating the reasons for the determination and informing interested persons that they may request a public hearing on the Administrator's determination. Frivolous or insubstantial requests for a hearing may be denied by the Administrator;

(2) Requests for a hearing submitted under this section must be submitted to the Administrator within 30 days after publication of the notice of opportunity for hearing in the **Federal Register**. The Administrator will give notice in the **Federal Register** of any hearing to be held pursuant to a request submitted by an interested person or on the Administrator's own motion. Notice of hearing will be given not less than 15 days prior to the time scheduled for the hearing;

(3) The hearing will be conducted by a designated hearing officer in an informal, orderly, and expeditious manner. The hearing officer will have authority to take such action as may be necessary to assure the fair and efficient conduct of the hearing; and

(4) After reviewing the record of the hearing, the Administrator will issue an order either affirming the determination the Administrator made under paragraph (c)(1) of this section or rescinding such determination and will promptly publish a notice of the order in the **Federal Register**. If the order is to approve the program revision or modification, EPA's approval will be effective upon publication of the notice in the **Federal Register**. If no timely request for a hearing is received and the Administrator does not determine to hold a hearing on the Administrator's own motion, the Administrator's determination made under paragraph (c)(1) of this section will be effective 30 days after notice is published pursuant to paragraph (f)(1) of this section.

§ 3.2000 What are the requirements authorized state, tribe, and local programs' reporting systems must meet?

(a) Authorized programs that receive electronic documents in lieu of paper to satisfy requirements under such programs must:

(1) Use an acceptable electronic document receiving system as specified under paragraphs (b) and (c) of this section; and

(2) Require that any electronic document must bear the valid electronic signature of a signatory if that signatory would be required under the authorized program to sign the paper document for which the electronic document substitutes, unless the program has been approved by EPA to accept a handwritten signature on a separate paper submission. The paper submission must contain references to the electronic document sufficient for legal certainty that the signature was executed with the intention to certify to, attest to, or agree to the content of that electronic document.

(b) An electronic document receiving system that receives electronic documents submitted in lieu of paper documents to satisfy requirements under an authorized program must be able to generate data with respect to any such electronic document, as needed and in a timely manner, including a copy of record for the electronic document, sufficient to prove, in private litigation, civil enforcement proceedings, and criminal proceedings, that:

(1) The electronic document was not altered without detection during transmission or at any time after receipt;

(2) Any alterations to the electronic document during transmission or after receipt are fully documented;

(3) The electronic document was submitted knowingly and not by accident;

(4) Any individual identified in the electronic document submission as a submitter or signatory had the opportunity to review the copy of record in a human-readable format that clearly and accurately associates all the information provided in the electronic document with descriptions or labeling of the information and had the opportunity to repudiate the electronic document based on this review; and

(5) In the case of an electronic document that must bear electronic signatures of individuals as provided under paragraph (a)(2) of this section, that:

(i) Each electronic signature was a valid electronic signature at the time of signing;

(ii) The electronic document cannot be altered without detection at any time after being signed;

(iii) Each signatory had the opportunity to review in a human-readable format the content of the electronic document that he or she was certifying to, attesting to or agreeing to by signing;

(iv) Each signatory had the opportunity, at the time of signing, to review the content or meaning of the required certification statement, including any applicable provisions that false certification carries criminal penalties;

(v) Each signatory has signed either an electronic signature agreement or a subscriber agreement with respect to the electronic signature device used to create his or her electronic signature on the electronic document;

(vi) The electronic document receiving system has automatically responded to the receipt of the electronic document with an acknowledgment that identifies the electronic document received, including the signatory and the date and time of receipt, and is sent to at least one address that does not share the same access controls as the account used to make the electronic submission; and

(vii) For each electronic signature device used to create an electronic signature on the document, the identity of the individual uniquely entitled to use the device and his or her relation to any entity for which he or she will sign electronic documents has been determined with legal certainty by the issuing state, tribe, or local government. In the case of priority reports identified in the table in Appendix 1 of Part 3, this determination has been made before the electronic document is received, by means of:

(A) Identifiers or attributes that are verified (and that may be re-verified at any time) by attestation of disinterested individuals to be uniquely true of (or attributable to) the individual in whose name the application is submitted, based on information or objects of independent origin, at least one item of which is not subject to change without governmental action or authorization; or

(B) A method of determining identity no less stringent than would be permitted under paragraph (b)(5)(vii)(A) of this section; or

(C) Collection of either a subscriber agreement or a certification from a local registration authority that such an agreement has been received and securely stored.

(c) An authorized program that receives electronic documents in lieu of paper documents must ensure that:

(1) A person is subject to any appropriate civil, criminal penalties or other remedies under state, tribe, or local law for failure to comply with a reporting requirement if the person fails to comply with the applicable provisions for electronic reporting.

(2) Where an electronic document submitted to satisfy a state, tribe, or local reporting requirement bears an electronic signature, the electronic signature legally binds or obligates the signatory, or makes the signatory responsible, to the same extent as the signatory's handwritten signature on a paper document submitted to satisfy the same reporting requirement.

(3) Proof that a particular electronic signature device was used to create an electronic signature that is included in or logically associated with an electronic document submitted to satisfy a state, tribe, or local reporting requirement will suffice to establish that the individual uniquely entitled to use the device at the time of signature did so with the intent to sign the electronic document and give it effect.

(4) Nothing in the authorized program limits the use of electronic documents or information derived from electronic documents as evidence in enforcement proceedings.

Appendix 1 to Part 3—Priority Reports

Category	Description	40 CFR Citation
Required Reports		
State Implementation Plan	Emissions data reports for mobile sources	51.60(c).
Excess Emissions and Monitoring Performance Report Compliance Notification Report.	Excess emissions and monitoring performance report detailing the magnitude of excess emissions, and provides the date, time, and system status at the time of the excess emission.	60.7(c), 60.7(d).
New Source Performance Standards Reporting Requirements.	Semi-annual reports (quarterly, if report is approved for electronic submission by the permitting authority) on sulfur dioxide, nitrous oxides and particulate matter emission (includes reporting requirements in Subparts A through DDDD).	60.49a(e) & (j) & (v), 60.49b(v).
Semi-annual Operations and Corrective Action Reports.	Semi-annual report provides information on a company's exceedance of its sulfur dioxide emission rate, sulfur content of the fresh feed, and the average percent reduction and average concentration of sulfur dioxide. When emissions data is unavailable, a signed statement is required which documents the changes, if any, made to the emissions control system that would impact the company's compliance with emission limits.	60.107(c), 60.107(d).

Category	Description	40 CFR Citation
National Emission Standards for Hazardous Air Pollutants Reporting Requirements.	Include such reports as: Annual compliance, calculation, initial start-up, compliance status, certifications of compliance, waivers from compliance certifications, quarterly inspection certifications, operations, and operations and process change.	61.11, 61.24(a)(3) & (a)(8), 61.70(c)(1) & (c)(2)(v) & (c)(3) & (c)(4)(iv), 61.94(a) & (b)(9), 61.104(a) & (a)(1)(x) & (a)(1)(xi) & (a)(1)(xvi), 61.138(e) & (f), 61.165(d)(2) & (d)(3) & (d)(4) & (f)(1) & (f)(2) &(f)(3), 61.177(a)(2) & (c)(1) & (c)(2) & (c)(3) & (e)(1) & (e)(3), 61.186(b)(1) & (b)(2) & (b)(3) & (c)(1) & (f)(1), 61.247(a)(1) & (a)(4) & (a)(5)(v) & (b)(5) & (d), 61.254(a)(4), 61.275(a) & (b) & (c), 61.305(f) & (i), 61.357(a) & (b) & (c) & (d), 63.9(h).
Hazardous Air Pollutants Compliance Report.	Reports containing results from performance test, opacity tests, and visible emissions tests. Progress reports; periodic and immediate startup, shutdown, and malfunction reports; results from continuous monitoring system performance evaluations; excess emissions and continuous monitoring system performance report; or summary report.	63.10(d), 63.10(e)(1), 63.10(e)(3).
Notifications and Reports	Reports that document a facility's initial compliance status, notification of initial start-up, and periodic reports which includes the start-up, shutdown, and malfunction reports discussed in 40 CFR 65.6(c).	65.5(d), 65.5(e).
Continuous Emissions Monitoring	Quarterly emissions monitoring reports and opacity reports which document a facility's excess emission.	75.64, 75.65.
Notice of Fuel or Fuel Additive Registration and Health Effects Testing.	Registration of new fuels and additives, and the submission and certification of health effect data.	79.10, 79.11, 79.20, 79.21, 79.51.
Manufacture In-Use and Product Line Emissions Testing.	Reports that document the emissions testing results generated from the in-use testing program for new and in-use highway vehicle ignition engines; non-road spark-ignition engines; marine spark-ignition engines; and locomotives and locomotive engines.	86.1845, 86.1846, 86.1847, 90.113, 90.1205, 90.704, 91.805, 91.504, 92.607, 92.508, 92.509.
Industrial and Publicly Owned Treatment Works Reports.	Discharge monitoring reports for all individual permittees—including baseline reports, pretreatment standards report, periodic compliance reports, and reports made by significant industrial users.	122.41(l)(4)(i), 403.12(b) & (d) & (e) & (h).
Event Driven Notices		
State Implementation Plan	Owners report emissions data from stationary sources	51.211.
Report For Initial Performance Test	Report that provides the initial performance test results, site-specific operating limits, and, if installed, information on the bag leak detection device used by the facility.	60.2200 (initial performance tests).
Emissions Control Report	Report submitted by new sources within 90 days of set-up which describes emission control equipment used, processes which generate asbestos-containing waste material, and disposal information.	61.153(a)(1), 61.153(a)(4)(i), 61.153(a)(5)(ii).
State Operating Permits—Permit Content.	Monitoring and deviation reports under the State Operating Permit	70.6(a)(3)(iii)(A), 70.6(a)(3)(iii)(B).
Title V Permits—Permit Content	Monitoring and deviation reports under the Federal Operating Permit	71.6(a)(3)(iii).
Annual Export Report	Annual report summarizing the amount and type of hazardous waste exported.	262.56(a).
Exceptions Reports	Reports submitted by a generator when the generator has not received confirmation from the Treatment, Storage, and Disposal Facility (TSDF) that it received the generator's waste and when hazardous waste shipment was received by the TSDF. For exports, reports submitted when the generator has not received a copy of the manifest from the transporter with departure date and place of export indicated; and confirmation from the consignee that the hazardous waste was received or when the hazardous waste is returned to the U.S.	262.42, 262.55.
Contingency Plan Implementation Reports.	Follow-up reports made to the Agency for all incidents noted in the operating record which required the implementation of a facility's contingency plan.	264.56(j), 265.56(j).
Significant Manifest Discrepancy Report.	Report filed by Treatment, Storage, and Disposal Facilities (TSDF) within 15 days of receiving wastes, when the TSDF is unable to resolve manifest discrepancies with the generator.	264.72(b), 265.72(b).
Unmanifested Waste Report	Report that documents hazardous waste received by a Treatment, Storage, and Disposal Facility without an accompanying manifest.	264.76, 265.76.
Noncompliance Report	An owner/operator submitted report which documents hazardous waste that was placed in hazardous waste management units in noncompliance with 40 CFR sections 264.1082(c)(1) and (c)(2); 264.1084(b); 264.1035(c)(4); or 264.1033(d).	264.1090.

Category	Description	40 CFR Citation
Notification—Low Level Mixed Waste.	One-time notification concerning transportation and disposal of conditionally exempted waste.	266.345.
Notification—Land Disposal Restrictions.	One-time notification and certification that characteristic waste is no longer hazardous.	268.9(d).
Underground Storage Tank Notification.	Underground Storage Tank system notifications concerning design, construction, and installation. As well as when systems are being placed in operation. (EPA Form 7530–1 or state version.).	280.22.
Free Product Removal Report and Subsequent Investigation Report.	Report written and submitted within 45 days after confirming a free product release, including information on the release and recovery methods used for the free product, and when test indicate presence of free product, response measures.	280.64, 280.65.
Manufacture or Import Premanufacture Notification.	Premanufacture notification of intent to begin manufacturing, importing, or processing chemicals identified in Subpart E for significant new use (forms 7710–56 and 7710–25).	720.102, 721.25.
Permit Applications[1]		
State Implementation Plan	Information describing the source, its construction schedule, and the planned continuous emissions reductions system.	52.21(n).
State Operating Permits	Reports, notices, or other written submissions required by a State Operating Permit.	70.6(c)(1).
Title V Permits—Permit Content	Reports, notices, or other written submissions required by a Title V Operating Permit.	71.6(c)(1), 71.25(c)(1).
Title V Permits	Specific criteria for permit modifications and or revisions, including a certification statement by a responsible official.	71.7(e(2)(ii)(c).
Reclaimer Certification	Certification made by a reclaimer that the refrigerant was reprocessed according to specifications and that no more than 1.5% of the refrigerant was released during the reclamation.	82.164.
Application for Certification and Statement of Compliance.	Control of Emissions for New and In-Use Highway Vehicles and Engines statement of compliance made by manufacturer, attesting that the engine family complies with standards for new and in-use highway vehicles and engines.	86.007–21 (heavy duty), 1844–01 (light duty).
Application for Certification	Application made by engine manufacturer to obtain certificate of conformity.	89.115, 90.107, 91.107, 92.203, 94.203.
National Pollutant Discharge Elimination System.	National Pollutant Discharge Elimination System (NPDES) Permits and Renewals (includes individual permit applications, NPDES General Form 1, and NPDES Forms 2A–F, and 2S).	122.21.
Resource Conservation and Recovery Act Permit Applications and Modifications.	Signatures for permit applications and reports; submission of permit modifications. (This category excludes Class I permit modifications (40 CFR 270.42, Appendix I) that do not require prior approval).	270.11, 270.42.
Certifications of Compliance/Non-Applicability		
State Implementation Plan Requirements.	State implementation plan certifications for testing, inspection, enforcement, and continuous emissions monitoring.	51.212(c), 51.214(e).
Certification Statement	Chemical Accident Prevention Provisions—Risk Management Plan certification statements.	68.185.
Title V Permits	Federal compliance certifications and permit applications	70.5(c)(9), 70.5(d), 70.6(c)(5).
State Operating Permits	State compliance certifications and permit applications	71.5(c)(9), 71.5(d), 71.24(f).
Annual and Other Compliance Certification Reports.	Annual compliance certification report and is submitted by units subject to acid rain emissions limitations.	72.90.
Annual Compliance Certification Report, Opt-In Report, and Confirmation Report.	Annual compliance certification report which is submitted in lieu of annual compliance certification report listed in Subpart I of Part 72.	74.43.
Quarterly Reports and Compliance Certifications.	Continuous Emission Monitoring certifications, monitoring plans, and quarterly reports for NO_X emissions.	75.73.
Certification Letters Recovery and Recycling Equipment, Motor Vehicle Air Conditioners Recycling Program, Detergent Package.	Protection of Stratospheric Ozone: Recycling & Emissions Reduction. Acquisition of equipment for recovery or recycling made by auto repair service technician and Fuels and Fuel Additives Detergent additive certification.	79.4, 80.161, 82.162, 82.42.
Response Plan Cover Sheet	Oil Pollution Prevention certification to the truth and accuracy of information.	112 (Appendix f).
Closure Report	Report which documents that closure was in accordance with closure plan and/or details difference between actual closure and the procedures outlined in the closure plan.	146.71.
Certification of Closure and Post Closure Care, Post-Closure Notices.	Certification that Treatment, Storage, and Disposal Facilities (TSDF) are closed in accordance with approved closure plan or post-closure plan.	264.115, 264.119, 264.119(b)(2), 264.120, 265.115, 265.119(b)(2), 265.120, 265.19.
Certification of Testing Lab Analysis	Certification that the testing and/or lab analyses required for the treatment demonstration phase of a two-phase permit was conducted.	270.63.

Category	Description	40 CFR Citation
Periodic Certification	Certification that facility is operating its system to provide equivalent treatment as in initial certification.	437.41(b).

[1] Included within each permit application category, though sometimes not listed, are the permits submitted to run/operate/maintain facilities and/or equipment/products under EPA or authorized programs.

PART 9—OMB APPROVALS UNDER THE PAPERWORK REDUCTION ACT

■ 1. The authority citation for part 9 continues to read as follows:

Authority: 7 U.S.C. 135 *et seq.*, 136–136y; 15 U.S.C. 2001, 2003, 2005, 2006, 2601–2671; 21 U.S.C. 331j, 346a, 31 U.S.C. 9701; 33 U.S.C. 1251 *et seq.*, 1311, 1313d, 1314, 1318, 1321, 1326, 1330, 1342, 1344, 1345 (d) and (e), 1361; E.O. 11735, 38 FR 21243, 3 CFR, 1971–1975 Comp. p. 973; 42 U.S.C. 241, 242b, 243, 246, 300f, 300g, 300g-1, 300g-2, 300g-3, 300g-4, 300g-5, 300g-6, 300j-1, 300j-2, 300j-3, 300j-4, 300j-9, 1857 *et seq.*, 6901–6992k, 7401–7671q, 7542, 9601–9657, 11023, 11048.

■ 2. Section 9.1 is amended by adding a new entry in numerical order for part 3 to read as follows:

§ 9.1 OMB approvals under the Paperwork Reduction Act.

* * * * *

40 CFR citation	OMB Control No.
* * * * *	
Cross-Media Electronic Reporting	
Part 3	2025–0003
* * * * *	

PART 51—REQUIREMENTS FOR PREPARATION, ADOPTION, AND SUBMITTAL OF IMPLEMENTATION PLANS

■ 1. The authority citation for part 51 continues to read as follows:

Authority: 23 U.S.C. 101; 42 U.S.C. 7401–7671q.

■ 2. Section 51.286 is added to Subpart O to read as follows:

§ 51.286 Electronic reporting.

States that wish to receive electronic documents must revise the State Implementation Plan to satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

■ 1. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401–7601.

■ 2. Section 60.25(b)(1) is amended by adding a sentence to the end of the paragraph to read as follows:

§ 60.25 Emission inventories, source surveillance, reports.

* * * * *

(b)(1) * * * Submission of electronic documents shall comply with the requirements of 40 CFR part 3—(Electronic reporting).

* * * * *

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

■ 2. Section 63.91 is amended by adding a new paragraph (d)(5)to read as follows:

§ 63.91 Criteria for straight delegation and criteria common to all approved options.

* * * * *

(d) * * *

(5) Electronic documents. Submission of electronic documents shall comply with the requirements of 40 CFR part 3—(Electronic reporting).

* * * * *

PART 69—SPECIAL EXEMPTIONS FROM REQUIREMENTS OF THE CLEAN AIR ACT

■ 1. The authority citation for part 69 continues to read as follows:

Authority: 42 U.S.C. 7545(c), (g) and (i), and 7625–1.

■ 2. Section 69.13 is amended by adding a new paragraph (b)(1)(v) to read as follows:

§ 69.13 Title V conditional exemption.

* * * * *

(b) * * *

(1) * * *

(v) If the program chooses to accept electronic documents it must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

* * * * *

■ 3. Section 69.22 is amended by adding a new paragraph (b)(1)(v) to read as follows:

§ 69.22 Title V conditional exemption.

* * * * *

(b) * * *

(1) * * *

(v) If the program chooses to accept electronic documents it must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

* * * * *

■ 4. Section 69.32 is amended by adding a new paragraph (b)(1)(v) to read as follows:

§ 69.32 Title V conditional exemption.

* * * * *

(b) * * *

(1) * * *

(v) If the program chooses to accept electronic documents it must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

* * * * *

PART 70—STATE OPERATING PERMIT PROGRAMS

■ 1. The authority citation for part 70 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Section 70.1 is amended by adding a new paragraph (f) to read as follows:

§ 70.1 Program overview.

* * * * *

(f) States that choose to receive electronic documents must satisfy the requirements of 40 CFR Part 3—(Electronic reporting) in their program.

PART 71—FEDERAL OPERATING PERMIT PROGRAMS

■ 1. The authority citation for part 71 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Section 71.10 is amended by adding a new sentence to the end of paragraph (a) to read as follows:

§ 71.10 Delegation of part 71 program.

(a) * * * Delegate agencies that choose to receive electronic documents as part of their delegated program must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

* * * * *

PART 123—STATE PROGRAM REQUIREMENTS

■ 1. The authority citation for part 123 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

■ 2. Section 123.25 is amended by revising paragraphs (a)(44) and (a)(45), adding the phrase "Except for paragraph (a)(46) of this section," at the beginning of the Note to paragraph (a), and adding a new paragraph (a)(46) to read as follows:

§ 123.25 Requirements for permitting.

(a) * * *

(44) § 122.35 (As an operator of a regulated small MS4, may I share the responsibility to implement the minimum control measures with other entities?);

(45) § 122.36 (As an operator of a regulated small MS4, what happens if I don't comply with the application or permit requirements in §§ 122.33 through 122.35?); and

(46) For states that wish to receive electronic documents, 40 CFR Part 3—(Electronic reporting).

* * * * *

PART 142—NATIONAL PRIMARY DRINKING WATER REGULATIONS IMPLEMENTATION

■ 1. The authority citation for part 142 continues to read as follows:

Authority: 42 U.S.C. 300f, 300g-1, 300g-2, 300g-3, 300g-4, 300g-5, 300g-6, 300j-4, 300j-9, and 300j-11.

■ 2. Section 142.10 is amended by redesignating paragraph (g) as paragraph (h) and by adding a new paragraph (g) to read as follows:

§ 142.10 Requirements for a determination of primary enforcement responsibility.

* * * * *

(g) Has adopted regulations consistent with 40 CFR Part 3—(Electronic reporting) if the state receives electronic documents.

* * * * *

PART 145—REQUIREMENTS FOR STATE PROGRAMS

■ 1. The authority citation for part 145 continues to read as follows:

Authority: 42 U.S.C. 300f *et seq.*

■ 2. Section 145.11 is amended by revising paragraphs (a)(30), (a)(31), (a)(32), and adding paragraph (a)(33) to read as follows:

§ 145.11 Requirements for permitting.

(a) * * *

(30) Section 124.12(a)—(Public hearings);

(31) Section 124.17 (a) and (c)—(Response to comments);

(32) Section 144.88—(What are the additional requirements?); and

(33) For states that wish to receive electronic documents, 40 CFR Part 3—(Electronic reporting).

* * * * *

PART 162—STATE REGISTRATION OF PESTICIDE PRODUCTS

■ 1. The authority citation for part 162 continues to read as follows:

Authority: 7 U.S.C. 136v, 136w.

■ 2. Section 162.153 is amended by adding a paragraph (a)(6) to read as follows:

§ 162.153 State registration procedures.

(a) * * *

(6) *Electronic Reporting under State Registration of Pesticide Products for Special Local Needs.* States that choose to receive electronic documents under the regulations pertaining to state registration of pesticides to meet special local needs, must ensure that the requirements of 40 CFR Part 3—(Electronic reporting) are satisfied by their state procedures for such registrations.

* * * * *

PART 233—404 STATE PROGRAM REGULATIONS

■ 1. The authority citation for part 233 continues to read as follows:

Authority: 33 U.S.C. 1251 *et seq.*

■ 2. A new § 233.39 is added to Subpart D to read as follows:

§ 233.39 Electronic reporting.

States that choose to receive electronic documents must satisfy the requirements of 40 CFR Part 3—(Electronic reporting) in their state program.

PART 257—CRITERIA FOR CLASSIFICATION OF SOLID WASTE DISPOSAL FACILITIES AND PRACTICES

■ 1. The authority citation for part 257 continues to read as follows:

Authority: 42 U.S.C. 6907(a)(3), 6912(a)(1), 6944(a) and 6949(c), 33 U.S.C. 1345(d) and (e).

■ 2. Section 257.30 is amended by adding a new paragraph (d) to read as follows:

§ 257.30 Recordkeeping requirements.

* * * * *

(d) The Director of an approved state program may receive electronic documents only if the state program includes the requirements of 40 CFR Part 3—(Electronic reporting).

PART 258—CRITERIA FOR MUNICIPAL SOLID WASTE LANDFILLS

■ 1. The authority citation for part 258 continues to read as follows:

Authority: 33 U.S.C. 1345(d) and (e); 42 U.S.C. 6902(a), 6907, 6912(a), 6944, 6945(c) and 6949a(c).

■ 2. Section 258.29 is amended by adding a new paragraph (d) to read as follows:

§ 258.29 Recordkeeping requirements.

* * * * *

(d) The Director of an approved state program may receive electronic documents only if the state program includes the requirements of 40 CFR Part 3—(Electronic reporting).

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

■ 1. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912 and 6926.

■ 2. Section 271.10 is amended by revising paragraph (b) to read as follows:

§ 271.10 Requirements for generators of hazardous waste.

* * * * *

(b) The State shall have authority to require and shall require all generators to comply with reporting and recordkeeping requirements equivalent to those under 40 CFR 262.40 and 262.41. States must require that generators keep these records at least 3 years. States that choose to receive electronic documents must include the requirements of 40 CFR Part 3—(Electronic reporting) in their Program (except that states that choose to receive electronic manifests and/or permit the use of electronic manifests must comply with any applicable requirements for e-manifest in this section of this section).

* * * * *

■ 3. Section 271.11 is amended by revising paragraph (b) to read as follows:

§ 271.11 Requirements for transporters of hazardous waste.

* * * * *

(b) The State shall have authority to require and shall require all transporters to comply with reporting and recordkeeping requirements equivalent to those under 40 CFR 263.22. States must require that transporters keep these records at least 3 years. States that choose to receive electronic documents must include the requirements of 40 CFR Part 3—(Electronic reporting) in their Program (except that states that choose to receive electronic manifests

and/or permit the use of electronic manifests must comply with any applicable requirements for e-manifest in this section of this section).

* * * * *

■ 4. Section 271.12 is amended by revising paragraph (h) to read as follows:

§ 271.12 Requirements for hazardous waste management facilities.

* * * * *

(h) Inspections, monitoring, recordkeeping, and reporting. States that choose to receive electronic documents must include the requirements of 40 CFR Part 3—(Electronic reporting) in their Program (except that states that choose to receive electronic manifests and/or permit the use of electronic manifests must comply with paragraph (i) of this section);

* * * * *

PART 281—APPROVAL OF STATE UNDERGROUND STORAGE TANK PROGRAMS

■ 1. The authority citation for part 281 continues to read as follows:

Authority: 42 U.S.C. 6912, 6991 (c), (d), (e), (g).

■ 2. Section 281.40 is amended by revising paragraph (d) to read as follows:

§ 281.40 Requirements for compliance monitoring program and authority.

* * * * *

(d) State programs must have procedures for receipt, evaluation, retention and investigation of records and reports required of owners or operators and must provide for enforcement of failure to submit these records and reports. States that choose to receive electronic documents must include the requirements of 40 CFR Part 3—(Electronic reporting) in their state program.

* * * * *

PART 403—GENERAL PRETREATMENT REGULATIONS FOR EXISTING AND NEW SOURCES OF POLLUTION

■ 1. The authority citation for part 403 continues to read as follows:

Authority: 33 U.S.C. 1251 *et seq.*

■ 2. Section 403.8 is amended by adding a new paragraph (g) to read as follows:

§ 403.8 Pretreatment Program Requirements: Development and Implementation by POTW.

* * * * *

(g) A POTW that chooses to receive electronic documents must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

■ 3. Section 403.12 is amended by adding a new paragraph (r) to read as follows:

§ 403.12 Reporting requirements for POTW's and industrial users.

* * * * *

(r) The Control Authority that chooses to receive electronic documents must satisfy the requirements of 40 CFR Part 3—(Electronic reporting).

PART 501—STATE SLUDGE MANAGEMENT PROGRAM REGULATIONS

■ 1. The authority citation for part 501 continues to read as follows:

Authority: 33 U.S.C. 1251 *et seq.*

■ 2. Section 501.15 is amended by adding a new paragraph (a)(4) to read as follows:

§ 501.15 Requirements for permitting.

(a) * * *

(4) Information requirements: All treatment works treating domestic sewage shall submit to the Director within the time frames established in paragraph (d)(1)(ii) of this section the information listed in paragraphs (a)(4)(i) through (xii) of this section. The Director of an approved state program that chooses to receive electronic documents must satisfy the requirements of 40 CFR part 3—(Electronic reporting).

* * * * *

PART 745—LEAD-BASED PAINT POISONING PREVENTION IN CERTAIN RESIDENTIAL STRUCTURES

■ 1. The authority citation for part 745 continues to read as follows:

Authority: 15 U.S.C. 2605, 2607, 2681–2692 and 42 U.S.C. 4852d.

■ 2. Section 745.327 is amended by adding a new paragraph (f) to read as follows:

§ 745.327 State or Indian Tribal lead-based paint compliance and enforcement programs.

* * * * *

(f) *Electronic reporting under State or Indian Tribe programs.* States and tribes that choose to receive electronic documents under the authorized state or Indian tribe lead-based paint program, must ensure that the requirements of 40 CFR part 3—(Electronic reporting) are satisfied in their lead-based paint program.

PART 763—ASBESTOS

■ 1. The authority citation for part 763 continues to read as follows:

Authority: 15 U.S.C. 2605, 2607(c), 2643, and 2646.

■ 2. Section 763.98 is amended by revising paragraphs (a)(1), (b)(3), and (d)(3) to read as follows:

§ 763.98 Waiver; delegation to state.

(a) *General.* (1) Upon request from a state Governor and after notice and comment and an opportunity for a public hearing in accordance with paragraphs (b) and (c) of this section, EPA may waive some or all of the requirements of this subpart E if the state has established and is implementing or intends to implement a program of asbestos inspection and management that contains requirements that are at least as stringent as the requirements of this subpart. In addition, if the state chooses to receive electronic documents, the state program must include, at a minimum, the requirements of 40 CFR part 3—(Electronic reporting).

* * * * *

(b) * * *

(3) Detailed reasons, supporting papers, and the rationale for concluding that the state's asbestos inspection and management program provisions for which the request is made are at least as stringent as the requirements of Subpart E of this part, and that, if the state chooses to receive electronic documents, the state program includes, at a minimum, the requirements of 40 CFR part 3—(Electronic reporting).

* * * * *

(d) * * *

(3) The state has an enforcement mechanism to allow it to implement the program described in the waiver request and any electronic reporting requirements are at least as stringent as 40 CFR part 3—(Electronic reporting).

* * * * *

■ 3. Appendix C to subpart E of part 763 is amended by adding paragraph (I) to section I to read as follows:

Appendix C to Subpart E of Part 763—Asbestos Model Accreditation Plan

I. Asbestos Model Accreditation Plan for States

* * * * *

(I) Electronic Reporting.

States that choose to receive electronic documents must include, at a minimum, the requirements of 40 CFR Part 3—(Electronic reporting) in their programs.

* * * * *

RIN 2060–AN38

National Emission Standards for Hazardous Air Pollutants for Secondary Aluminum Production

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule; amendments.

SUMMARY: On March 23, 2000, EPA promulgated national emission standards for hazardous air pollutants (NESHAP) for secondary aluminum production under section 112 of the Clean Air Act (CAA), and on December 30, 2002, we published final amendments to the standards based on two separate settlement agreements. This amendment corrects a punctuation error in the definition of "clean charge" previously promulgated in the December 30, 2002 amendments and a typographical error in the operating temperature of a scrap dryer/delacquering kiln/decoating kiln afterburner. We are making the amendment by direct final rule, without prior proposal, because we view the revision as noncontroversial and anticipate no adverse comments. However, in the Proposed Rules section of this **Federal Register**, we are publishing a separate document that will serve as the proposal to amend the national emission standards for secondary aluminum production, if adverse comments are filed.

If we receive any adverse comments on the direct final rule, we will publish a timely withdrawal in the **Federal Register** informing the public that the amendments are being withdrawn due to adverse comment. We will address all public comments in a subsequent final rule based on the proposed rule. If we do not receive adverse comment on the direct final rule, it will become effective on the date set out below. We will not institute a second comment period on the direct final rule. Any parties interested in commenting must do so at this time.

DATES: The direct final rule will be effective on December 2, 2005 without further notice, unless EPA receives adverse written comments by November 2, 2005 or by November 17, 2005 if a public hearing is requested. If EPA receives such comments, it will publish a timely withdrawal in the **Federal Register** indicating that the rule is being withdrawn due to adverse comment.

ADDRESSES: Submit your comments, identified by Docket ID No. OAR–2002–0084, by one of the following methods:

Federal eRulemaking Portal: *http://www.regulations.gov.* Follow the on-line instructions for submitting comments.

Agency Web site: *http://www.epa.gov/edocket.* EDOCKET, EPA's electronic public docket and comment system, is EPA's preferred method for receiving comments. Follow the on-line instructions for submitting comments.

• E-mail: *a-and-r-docket@epa.gov* and *colyer.rick@epa.gov.*

• Fax: (202) 566–1741 and (919) 541–5600.

• Mail: U.S. Postal Service, EPA Docket Center, Environmental Protection Agency, Mailcode: 6102T, Attention Docket ID No. OAR–2002–0084, 1200 Pennsylvania Avenue, NW., Washington, DC 20460. Please include a duplicate copy, if possible.

• Hand Delivery: In person or by courier, deliver comments to: EPA Docket Center (6102T), Attention Docket ID No. OAR–2002–0084, 1301 Constitution Avenue, NW., Room B–108, Washington, DC 20004. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information. Please include a total of two copies, if possible.

We request that a separate copy of each comment also be sent to the contact person listed below (see **FOR FURTHER INFORMATION CONTACT**).

Instructions: Direct your comments to Docket ID No. OAR–2002–0084. The EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *http://www.epa.gov/edocket*, including any personal information provided, unless the comment includes information claimed to be confidential business information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through EDOCKET, regulations.gov, or e-mail. Send or deliver information identified as CBI only to the following address: Mr. Roberto Morales, OAQPS Document Control Officer, EPA (C404–02), Attention Docket ID No. OAR–2002–0084, Research Triangle Park, NC 27711. Clearly mark the part or all of the information that you claim to be CBI. The EPA EDOCKET and the Federal regulations.gov websites are "anonymous access" systems, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through EDOCKET or regulations.gov, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit EDOCKET on-line or see the Federal Register of May 31, 2002 (67 FR 38102).

Docket: All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket*. Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at the EPA Docket Center, Docket ID No. OAR–2002–0084, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

FOR FURTHER INFORMATION CONTACT: Mr. Rick Colyer, EPA Office of Air Quality Planning and Standards, Emission Standards Division, Minerals and Inorganic Chemicals Group (C504–05), Research Triangle Park, NC 27711; telephone number (919) 541–5262; fax number (919) 541–5600; e-mail address: *colyer.rick@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by this action include:

TABLE 1.—REGULATED CATEGORIES AND ENTITIES

Category	NAICS[1]	Examples of regulated entities
Industry	331314	Secondary smelting and alloying of aluminum facilities.
		Secondary aluminum production facility affected sources that are collocated at:
	331312	Primary aluminum production facilities.
	331315	Aluminum sheet, plate, and foil manufacturing facilities.
	331316	Aluminum extruded product manufacturing facilities.
	331319	Other aluminum rolling and drawing facilities.
	331521	Aluminum die casting facilities.
	331524	Aluminum foundry facilities.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in 40 CFR 63.1500 of the secondary aluminum production NESHAP. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copies of today's action will be posted on the Technology Transfer Network's (TTN) policy and guidance information page *http://www.epa.gov/ttn/caaa*. The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the direct final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by December 2, 2005. Under section 307(d)(7)(B) of the CAA, only an objection to the direct final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal

proceeding brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background and Technical Corrections
II. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background and Technical Corrections

On March 23, 2000 (63 FR 15690), we promulgated the NESHAP for secondary aluminum production (40 CFR part 63, subpart RRR). The standards were established under the authority of section 112(d) of the CAA to reduce emissions of hazardous air pollutants from major and area sources.

On December 30, 2002 (67 FR 79808), we promulgated amendments to the NESHAP in response to two petitions for judicial review. Among other things, the amendments revised the definition of "clean charge."

The final rule promulgated in 2000 defined "clean charge" as "* * * furnace charge materials including molten aluminum; T-bar; sow; ingot; billet; pig; alloying elements; uncoated/unpainted thermally dried aluminum chips; aluminum scrap dried at 343 °C (650 °F) or higher; aluminum scrap delacquered/decoated at 482 °C (900 °F) or higher; other oil- and lubricant-free unpainted/uncoated gates and risers; oil- and lubricant-free unpainted/uncoated aluminum scrap, shapes, or products (e.g., pistons) that have not undergone any process (e.g., machining, coating, painting, etc.) that would cause contamination of the aluminum (with oils, lubricants, coatings, or paints); and internal runaround."

The June 14, 2002 proposed amendments (67 FR 41132) revised the definition of "clean charge" to "* * * furnace charge materials including molten aluminum; T-bar; sow; ingot; billet; pig; alloying elements; aluminum scrap known by the owner or operator to be entirely free of paints, coatings, and lubricants; uncoated/unpainted aluminum chips that have been thermally dried or treated by a centrifugal cleaner; aluminum scrap dried at 343 °C (650 °F) or higher; aluminum scrap delacquered/decoated at 482 °C (900 °F) or higher, and runaround scrap."

The December 30, 2002 final amendments (67 FR 79815) promulgated the June 14, 2002 proposed definition of "clean charge" as "* * * furnace charge materials including molten aluminum, T-bar, sow, ingot, billet, pig, alloying elements, aluminum scrap known by the owner or operator to be entirely free of paints, coatings, and lubricants; uncoated/unpainted aluminum chips that have been thermally dried or treated by a centrifugal cleaner; aluminum scrap dried at 343 °C (650 °F) or higher; aluminum scrap delacquered/decoated at 482 °C (900 °F) or higher, and runaround scrap."

While the basic substance of the definition of "clean charge" did not change between the 2002 proposal and promulgation, the punctuation did. The replacement of certain semicolons with commas had an inadvertent effect on the interpretation of parts of the definition. These typographical errors unintentionally applied the phrase "entirely free of paints, coatings, and lubricants" to molten aluminum, T-bar, sow, ingot, billet, pig, and alloying elements. The definition of "clean charge" in the June 14, 2002 proposed amendments separated the list of charge materials with semicolons indicating that the phrase "entirely free of paints, coatings, and lubricants" was intended to apply only to "aluminum scrap." This issue came to our attention when questions arose regarding paint and ink markings on aluminum ingots, T-bars, sows, etc. The die casting industry routinely marks aluminum ingots, sows, etc., with paint, ink, and grease pen marking to identify specific alloys and batch numbers. It is our intent that T-bar, sow, ingot, billet, pig, and alloying elements be considered "clean charge," notwithstanding ink, grease, or paint markings.

To clarify our intent and to correct this typographical error, we are revising the definition of "clean charge" to match that previously proposed on June 14, 2002 (67 FR 41132).

We are also correcting a typographical error in 40 CFR 63.1505(e). The operating temperature of the scrap dryer/delacquering kiln/decoating kiln afterburner should be 760 °C (1400 °F) instead of 750 °C (1400 °F).

II. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must determine whether this regulatory action is "significant," and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that the direct final amendments do not constitute a "significant regulatory action" because they do not meet any of the above criteria. Consequently, this action was not submitted to OMB for review under Executive Order 12866.

B. Paperwork Reduction Act

The information collection requirements in the final rule (65 FR 15690, March 23, 2000) were submitted to and approved by OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq*, and assigned OMB control number 2060–0433. An Information Collection Request (ICR) document was prepared by EPA (ICR No. 1894.01) and a copy may be obtained from Susan Auby by mail at Office of Environmental Information Collection Strategies Division (MD–2822T), 1200 Pennsylvania Avenue, NW., Washington DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded from the internet at *http://www.epa.gov/icr*.

Today's action makes clarifying changes to the final rule and imposes no new information collection requirements on the industry. Because there is no additional burden on the industry as a result of the direct final

rule amendments, the ICR has not been revised.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR part 63 are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with today's action.

For purposes of assessing the impacts of today's direct final rule amendments on small entities, small entity is defined as: (1) A small business as defined by the Small Business Administrations' regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's direct final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. This action will not impose any requirements on small entities. Today's direct final would only correct definitional and typographical errors.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires us to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or to the private sector in any 1 year. Thus, today's direct final rule amendments are not subject to sections 202 and 205 of the UMRA. The EPA has also determined that the direct final rule amendments contain no regulatory requirements that might significantly or uniquely affect small governments. Thus, today's direct final rule amendments are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications and will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the direct final rule amendments.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications, as specified in Executive Order 13175. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of

the Executive Order has the potential to influence the regulation. The direct final rule amendments are not subject to Executive Order 13045 because they are not "economically significant" and are based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through the OMB, explanations when the Agency decides not to use available and applicable VCS.

The direct final rule amendments do not involve technical standards. Therefore, EPA did not consider the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the direct final rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule in the Federal Register. A major rule cannot take effect until 60 days after it is published in the Federal Register. The direct final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule amendments are effective on December 2, 2005.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

Dated: September 27, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart RRR—[Amended]

■ 2. Section 63.1503 is amended by revising the definition of "Clean charge" to read as follows:

§ 63.1503 Definitions.

* * * * *

Clean charge means furnace charge materials, including molten aluminum; T-bar; sow; ingot; billet; pig; alloying elements; aluminum scrap known by the owner or operator to be entirely free of paints, coatings, and lubricants; uncoated/unpainted aluminum chips that have been thermally dried or treated by a centrifugal cleaner; aluminum scrap dried at 343 °C (650 °F) or higher; aluminum scrap delacquered/decoated at 482 °C (900 °F) or higher, and runaround scrap.

* * * * *

■ 3. Section 63.1505 is being amended by revising the first sentence of paragraph (e) introductory text to read as follows:

§ 63.1505 Emission standards for affected sources and emission units.

* * * * *

(e) *Scrap dryer/delacquering kiln/decoating kiln: alternative limits.* The owner or operator of a scrap dryer/delacquering kiln/decoating kiln may choose to comply with the emission limits in this paragraph (e) as an alternative to the limits in paragraph (d) of this section if the scrap dryer/delacquering kiln/decoating kiln is equipped with an afterburner having a design residence time of at least 1 second and the afterburner is operated at a temperature of at least 760 °C (1400 °F) at all times. * * *

* * * * *

BILLING CODE 6560–50–P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 648

[Docket No. 050613158–5237–02; I.D. 090105A]

RIN 0648–AT48

Magnuson-Stevens Fishery Conservation and Management Act Provisions; Fisheries of the Northeastern United States; Extension of Emergency Fishery Closure Due to the Presence of the Toxin That Causes Paralytic Shellfish Poisoning

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule; emergency action; extension of effective period.

SUMMARY: The regulations contained in the temporary rule, emergency action, published on September 9, 2005, at the request of the U.S. Food and Drug Administration (FDA), continue through December 31, 2005. In that action NMFS reopened a portion of Federal waters of the Gulf of Maine, Georges Bank, and southern New England that it had previously closed from June 14, 2005, through September 30, 2005, to the harvest for human consumption of certain bivalve molluscan shellfish due to the presence in those waters of the toxin that causes Paralytic Shellfish Poisoning (PSP). The FDA has determined that there is insufficient analytical data to support the scheduled reopening of the entire area to all bivalve molluscan shellfish fishing on October 1, 2005.

DATES: The temporary emergency action published September 9, 2005 (70 FR 53580), is effective from September 9, 2005, through December 31, 2005.

ADDRESSES: Copies of the small entity compliance guide prepared for the September 9, 2005, emergency action are available from Patricia A. Kurkul, Regional Administrator, National Marine Fisheries Service, One Blackburn Drive, Gloucester, MA 01930. The small entity compliance guide/permit holder letter is also accessible via the Internet at *http://www.nero.noaa.gov*. Copies of the September 9, 2005, emergency action are available from Patricia A. Kurkul, at the mailing address specified above.

FOR FURTHER INFORMATION CONTACT: E. Martin Jaffe, Fishery Policy Analyst, (978) 281–9272.

SUPPLEMENTARY INFORMATION:

■ c. Revising the existing reference in paragraph (c)(5) from "§ 60.49a(b) and (d)" to "§ 60.49Da(b) and (d)";
■ d. Revising the existing reference in paragraph (d) introductory text from "§ 60.44a" to "§ 60.44Da";
■ e. Revising the existing reference in paragraph (d)(2) from "§ 60.49a(c) and (d)" to "§ 60.49Da(c) and (d)";
■ f. Revising the existing reference in paragraph (e)(2) from "§ 60.48a(d)(1)" to "§ 60.48Da(d)(1)";
■ g. Revising the existing references in paragraph (g) introductory text from "§ 60.45a" to "§ 60.45Da" and from "§ 60.46a" to "§ 60.46Da";
■ h. Revising the existing reference in paragraph (h) introductory text from "§ 60.45a" to "§ 60.45Da"; and
■ i. Revising the existing reference in paragraph (h)(1) from "§ 60.49a(p)(4)(i)" to "§ 60.49Da(p)(4)(i)".

§ 60.51Da [Amended]

■ 10. Newly redesignated § 60.51Da is amended as follows:
■ a. Revising the existing references in paragraph (c) introductory text from "§ 60.49a" to "§ 60.49Da" and from "§ 60.48a(h)" to "§ 60.48Da(h)";
■ b. Revising the existing reference in paragraph (d) introductory text from "§ 60.43a" to "§ 60.43Da";
■ c. Revising the existing reference in paragraph (d)(1) from "§ 60.48a(d)" to "§ 60.48Da(d)";
■ d. Revising the existing reference in paragraph (e) introductory text from "§ 60.43a" to "§ 60.43Da";
■ e. Revising the existing reference in paragraph (e)(1) from "§ 60.50a" to "§ 60.50Da"; and
■ f. Revising the existing reference in paragraph (i) from "§ 60.42a(b)" to "§ 60.42Da(b)".

§ 60.52Da [Amended]

■ 11. Newly redesignated § 60.52Da is amended by revising the existing references from "§ 60.45a" to "§ 60.45Da" and from "§ 60.46a" to "§ 60.46Da".

PART 75—[AMENDED]

■ 12. The authority citation for part 75 continues to read as follows:

Authority: 42 U.S.C. 7601, 7651k, and 7651k.

■ 13. Section 75.6 is amended by revising paragraphs (b) introductory text, (c), (d) introductory text, and (e) introductory text to read as follows:

RIN 2060–AN09

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Partial withdrawal of direct final rule.

SUMMARY: On July 1, 2005, the EPA issued direct final amendments to the national emission standards for hazardous air pollutants (NESHAP) for Miscellaneous Organic Chemical Manufacturing, along with a parallel proposal to be used as the basis for final action in the event EPA received any adverse comments on the direct final amendments. Because adverse comment was received, EPA is withdrawing the corresponding parts of the direct final rule. We stated in that direct final rule that if we received adverse comment by August 1, 2005, we would publish a timely withdrawal in the Federal Register. We will address all comments in a subsequent final rule based on the parallel proposal published on July 1, 2005. As stated in the parallel proposal, we will not institute a second comment period on this action.

DATES: As of August 30, 2005, EPA withdraws the direct final rule amendments to 40 CFR 63.2485(c)(4) and Table 1 to subpart FFFF of part 63, published on July 1, 2005 (70 FR 38554). The remaining provisions published on July 1, 2005, will be effective on August 30, 2005.

ADDRESSES: EPA has established a docket for this action under Docket ID No. OAR–2003–0121. All documents in the docket are listed in the index at *http://www.epa.gov/edocket*. Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at: Air and Radiation Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Randy McDonald, Organic Chemicals Group, Emission Standards Division (Mail Code C504–04), U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5402, electronic mail address *mcdonald.randy@epa.gov*.

SUPPLEMENTARY INFORMATION: On July 1, 2005, we published a direct final rule (70 FR 38554) and a parallel proposal (70 FR 38562) amending the NESHAP for Miscellaneous Organic Chemical Manufacturing (40 CFR part 63, subpart FFFF). We amended the NESHAP by: Clarifying the compliance requirements for flares and the alternative standard, extending the vapor balancing alternative to cover transfers from barges to storage tanks, amending the procedures for correcting measured concentrations at the outlet of combustion devices to correct for dilution by supplemental gas, and clarifying the signature requirements for the notification of compliance status report. The direct final rule amendments also specified requirements for effluent from control devices, clarified the definition of the term continuous process vent, and

corrected several referencing and drafting errors. We stated in the preamble to the direct final rule and parallel proposal that if we received adverse comment by August 1, 2005, (or if a public hearing was requested by July 11, 2005) on one or more distinct provisions of the direct final rule, we would publish a timely notice in the Federal Register specifying which provisions will become effective and which provisions will be withdrawn due to adverse comment. We subsequently received adverse comment from several commenters regarding requirements for effluent from control devices. Commenters also pointed out erroneous changes made to Table 1 of subpart FFFF of part 63.

Accordingly, we are withdrawing the amendments to 40 CFR 63.2485(c)(4) and Table 1 of subpart FFFF of part 63. The amendments are withdrawn as of August 30, 2005. We will take final action on the proposed rule after considering the comments received. We will not institute a second comment period on this action. The provisions for which we did not receive adverse comment will become effective on August 30, 2005, as provided in the preamble to the direct final rule.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: August 24, 2005.

William L. Wehrum,

Acting Assistant Administrator for Air and Radiation.

RIN 2060–AN13

Protection of Stratospheric Ozone: Process for Exempting Critical Uses of Methyl Bromide for the 2005 Supplemental Request

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct Final Rule.

SUMMARY: With this action EPA is taking direct final action to authorize use of 610,665 kilograms of methyl bromide for supplemental critical uses in 2005 through the allocation of additional critical stock allowances (CSAs). This allocation supplements the critical use allowances (CUAs) and CSAs previously allocated for 2005, as published in the Federal Register on December 23, 2004 (69 FR 76982). Further, EPA is amending the list of exempted critical uses. With today's action EPA is exempting methyl bromide for critical uses beyond the phaseout under the authority of the Clean Air Act (CAA or the Act) and in accordance with the Montreal Protocol on Substances that Deplete the Ozone Layer (Protocol).

DATES: This rule is effective on October 31, 2005 without further notice, unless EPA receives adverse comment by September 29, 2005, or by October 14, 2005 if a hearing is requested. If adverse comments are received, we will publish a timely withdrawal in the Federal Register informing the public that this rule will not take effect. If anyone contacts EPA requesting to speak at a public hearing by September 9, 2005, a public hearing will be held on September 14, 2005.

ADDRESSES: Submit your comments, identified by Docket ID No. OAR–2004–0506, by one of the following methods:

- Federal eRulemaking Portal: *http://www.regulations.gov*. Follow the on-line instructions for submitting comments.
- Agency Website: *http://www.epa.gov/edocket*. EDOCKET, EPA's electronic public docket and comment system, is EPA's preferred method for receiving comments. Follow the on-line instructions for submitting comments.
- E-mail: *mebr.allocation@epa.gov*.
- Fax: 202–343–2337 attn: Marta Montoro.
- Mail: Air Docket, Environmental Protection Agency, Mailcode: 6102T, 1200 Pennsylvania Ave., NW., Washington, DC 20460. In addition, please mail a copy of your comments on the information collection provisions to the Office of Information and Regulatory Affairs, Office of Management and Budget (OMB), Attn: Desk Officer for EPA, 725 17th St., NW., Washington, DC 20503.
- Hand Delivery: EPA Air Docket, EPA West 1301 Constitution Avenue, NW., Room B108, Mail Code 6102T, Washington, DC 20460. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

Instructions: Direct your comments to Docket ID No. OAR–2004–0506. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *http://www.epa.gov/edocket*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through EDOCKET, regulations.gov, or e-mail. The EPA EDOCKET and the federal regulations.gov websites are "anonymous access" systems, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through EDOCKET or regulations.gov, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit EDOCKET on-line or see the Federal Register of May 31, 2002 (67 FR 38102).

Docket: All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket*. Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information whose disclosure is restricted by statute. Environmental Protection Agency

40 CFR Part 63
National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing; Final Rule and Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR–2003–0193; FRL–7948–5]

RIN 2060–AL91

National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule; amendments.

SUMMARY: The EPA is taking direct final action on amendments to the national emission standards for hazardous air pollutants (NESHAP) for cellulose products manufacturing, which were issued on June 11, 2002, under section 112 of the Clean Air Act (CAA). The amendments revise the work practice standards, general and initial compliance requirements, definitions, and General Provisions applicability, as well as correct typographical, formatting, and cross-referencing errors in the final rule. We are issuing the amendments as a direct final rule, without prior proposal, because we view the amendments as noncontroversial and anticipate no adverse comments. However, in the Proposed Rules section of this Federal Register, we are publishing a separate document that will serve as the proposal to amend the NESHAP for cellulose products manufacturing if adverse comments are filed.

DATES: The direct final rule is effective on October 11, 2005, unless EPA receives adverse comments by September 9, 2005, or by September 26, 2005, if a hearing is requested by August 22, 2005. If adverse comments are received, EPA will publish a timely withdrawal in the Federal Register indicating which sections will become effective, and which provisions are being withdrawn due to adverse comment. If anyone contacts the EPA requesting to speak at a public hearing, a public hearing will be held on August 24, 2005.

ADDRESSES: Submit your comments, identified by Docket ID No. OAR–2003–0193, by one of the following methods:

- Federal eRulemaking Portal: *http://www.regulations.gov*. Follow the on-line instructions for submitting comments.
- Agency Web site: *http://www.epa.gov/edocket*. EDOCKET, EPA's electronic public docket and comment system, is EPA's preferred method for receiving comments. Follow the on-line instructions for submitting comments.
- E-mail: *air-and-r-docket@epa.gov*.
- Fax: (202) 566–1741.
- Mail: EPA Docket Center, EPA, Mailcode: 6102T, 1200 Pennsylvania Avenue, NW., Washington, DC 20460. Please include a duplicate copy, if possible.
- Hand Delivery: Air and Radiation Docket, EPA, 1301 Constitution Avenue, NW., Room B–108, Washington, DC 20460. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

We request that a separate copy also be sent to the contact person listed below (see **FOR FURTHER INFORMATION CONTACT**).

Instructions. Direct your comments to Docket ID No. OAR–2003–0193. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *http://www.epa.gov/edocket*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through EDOCKET, regulations.gov, or e-mail. The EPA EDOCKET and the Federal regulations.gov Web sites are "anonymous access" systems, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through EDOCKET or regulations.gov, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit EDOCKET on-line or see the Federal Register of May 31, 2002 (67 FR 38102).

Docket. All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket*. Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hardcopy at the Air and Radiation Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

Public Hearing. If a public hearing is held, it will be held at 10 a.m. at the EPA's Environmental Research Center Auditorium, Research Triangle Park, North Carolina or at an alternate site nearby.

FOR FURTHER INFORMATION CONTACT: Mr. Bill Schrock, Organic Chemicals Group, Emission Standards Division (C504–04), Office of Air Quality Planning and Standards, U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5032, facsimile number (919) 541–3470, electronic mail (e-mail) address *schrock.bill@epa.gov*.

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include those listed in the following table:

Category	NAICS code*	Examples of regulated entities
Industry	326121	cellulose food casing operations.
	325221	rayon operations.
	326199, 325211	cellulosic sponge operations.
	326199	cellophane operations.
	325199	cellulose ether operations.
Federal Government		Not affected.

Category	NAICS code*	Examples of regulated entities
State/local/tribal government		Not affected.

*North American Industrial Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should carefully examine the applicability criteria in § 63.5485 of the national emission standards. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this document.

Public Hearing. Persons interested in presenting oral testimony or inquiring as to whether a hearing is to be held should contact Mr. Bill Schrock, Organic Chemicals Group, Emission Standards Division (Mail Code C504–05), U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5605, electronic mail address *schrock.bill@epa.gov.*, at least 2 days in advance of the potential date of the public hearing. Persons interested in attending the public hearing must also call Mr. Bill Schrock to verify the time, date, and location of the hearing. The public hearing will provide interested parties the opportunity to present data, views, or arguments concerning these proposed emission standards.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's document will also be available on the WWW through EPA's Technology Transfer Network (TTN). Following signature by the EPA Administrator, a copy of this action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Comments. We are publishing the direct final rule amendments without prior proposal because we view the amendments as noncontroversial and do not anticipate adverse comments. However, in the Proposed Rules section of this **Federal Register**, we are publishing a separate document that will serve as the proposal to amend the national emission standards for cellulose products manufacturing operations if adverse comments are filed. If we receive any adverse comments on one or more distinct amendments, we will publish a timely withdrawal in the **Federal Register** informing the public which provisions will become effective, and which provisions are being withdrawn due to adverse comment. We will address all public comments in a subsequent final rule, should the Agency determine to issue one. Any of the distinct amendments in today's direct final rule for which we do not receive adverse comment will become effective on the previously mentioned date. We will not institute a second comment period on the direct final rule amendments. Any parties interested in commenting must do so at this time.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the direct final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by October 11, 2005. Under section 307(d)(7)(B) of the CAA, only an objection to the direct final rule amendments which was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Outline. The following outline is provided to aid in reading the preamble to the direct final rule.

J. Congressional Review Act

I. Background

The EPA, under section 112 of the CAA, promulgated the NESHAP for cellulose products manufacturing on June 11, 2002 (67 FR 40044). The final rule, codified at 40 CFR part 63, subpart UUUU, includes emission limits, operating limits, and work practice standards, as well as general, initial, and continuous compliance requirements and notification, reporting, and recordkeeping requirements. Following promulgation of the rule, UCB Films, Inc. and Teepak, LLC petitioned the Agency for specific changes to the final rule, and Dow Chemical Co. informally requested that we issue specific amendments to the final rule.

In response to industry's requests, today's action issues amendments to subpart UUUU of 40 CFR part 63 to revise the work practice standards, general and initial compliance requirements, definitions, and General Provisions applicability. The amendments also include corrections of typographical, formatting, and cross-referencing errors identified after the final rule was published. The amendments are described below.

A. Work-Practice Standards

The cellophane operation at the UCB Films facility in Tecumseh, Kansas includes a number of casting machines, each of which includes concentrated sulfuric acid baths referred to as "A-tanks." Above the A-tanks are retractable hoods that can be moved up or down. To capture emissions, the hoods over the A-tanks are moved into the down position, and the vent streams from the A-tanks are routed to a thermal oxidizer. For operational purposes, the hoods over the A-tanks are at times kept in the up position, and during those times the vent streams from the A-tanks are diverted to the stack. UCB Films has asked whether the provision in the final rule requiring vent streams at cellophane operations to be routed through closed-vent systems to control devices possibly could be construed to apply to these A-tank hoods and, therefore, could require UCB Films to operate its casting machines with the A-tank hoods in the down position at all times.

The cellophane operation at the UCB Films facility is the only one currently

operating in the U.S. Consequently, the maximum achievable control technology (MACT) floor for cellophane operations was established based on the current emission limitation at the UCB Films facility. This MACT floor accounted for the A-tank hoods at the UCB Films facility at times being kept in the up position. Consequently, the closed-vent system requirement, as currently stated, would be inconsistent with MACT for cellophane operations. Therefore, through the amendments to the final rule, we are now making clear that we did not intend for the closed-vent system provision to apply to retractable hoods over sulfuric acid baths at a cellophane operation, such as the A-tank hoods at the UCB Films facility. The final rule does not prohibit UCB Films from operating its casting machines with the A-tank hoods in the up position.

B. General Compliance Requirements

In response to comments on the proposed rule, we changed the deadline for completing a performance test or other initial compliance demonstration from 180 days before to 180 days after the compliance date. To ensure that a record of compliance would be kept between the compliance date and the date when operating limits for the continuous monitoring systems (CMS) are established (*i.e.*, the date of the performance test or other initial compliance demonstration), we included a provision in § 63.5515(b)(1) of the final rule that requires affected sources to maintain an operation and maintenance (O&M) log of the process and emissions control equipment during that period.

Dow has requested that we limit the O&M log to emission control equipment because the amount and type of data associated with operation and maintenance of the process are unclear and onerous. For example, with the current text in the final rule, companies would be required to document when a pump used to inject water treatment chemicals into boiler feedwater for steam generation was replaced or repaired. Plant operators would be required to record literally thousands of data points related to the operation of "any" aspect of the production unit, even though it would have no bearing on emissions or the compliance parameters required by the final rule. According to Dow, this broad scope was certain to be inconsistently applied, and it would be difficult, if not impossible, to demonstrate compliance.

Dow has also requested that we clarify that the O&M log requirement is needed only for those control devices used to comply with the standard, not every control device unassociated with the scope of the final rule. Some control devices may be installed for odor or State requirements and do not need to be included in the O&M log. For example, one of Dow's cellulose ether facilities has a scrubber that, under a State permit, is used to control non-hazardous air pollutants emissions, and the facility does not need to monitor or conduct a performance test on this scrubber in order to comply with the final rule. According to Dow, with the current text in the final rule, the facility would have to maintain data on the scrubber for no other purpose than that stated in § 63.5515(b)(1).

Consequently, Dow has recommended that EPA revise § 63.5515(b)(1) to replace the term "process and emissions control equipment" with the term "control technique used to comply with the rule." Dow has recommended using the term "control technique" rather than "emissions control equipment" because "control technique" is defined in § 63.5610 of the final rule. Dow believes that this revision would clarify the requirement and strike a more appropriate balance without being unnecessarily burdensome. The Agency agrees with the rationale provided by Dow that a more narrow definition for items to be contained in the O&M log is appropriate. Therefore, through the amendments to the final rule, we are making the suggested revision to § 63.5515(b)(1).

C. Initial Compliance Requirements

1. Material Balance Compliance Option

One of Dow's cellulose ether facilities uses a material balance to calculate the amount of HAP reacted, *i.e.*, destroyed in the process. According to Dow, this facility's demonstration of overall control efficiency is similar to the viscose process material balance. Dow has requested that EPA provide cellulose ether affected sources with a material balance compliance option similar to that for the viscose process affected sources. This option would allow the cellulose ether affected sources to demonstrate initial compliance using a month-long initial compliance demonstration and demonstrate continuous compliance by maintaining a material balance and using it to document the percent reduction of total organic hazardous air pollutants (HAP) emissions. The Agency was unaware that any cellulose ether facilities were using the material balance technique to calculate their control efficiency and, therefore, did not provide this as a compliance option for cellulose ether facilities in the final rule. We consider this a valid approach for calculating control efficiency and extending this option to the cellulose ether affected sources makes the final rule consistent with the viscose process affected sources. Therefore, through the amendments to the final rule, we are providing the requested material balance compliance option for cellulose ether operations, with the clarification that the start point from which the percent reduction is determined must be the onset of extended cookout. Extended cookout is a means of reducing HAP emissions by allowing the reaction to occur for a longer period of time than economically desired, thus allowing for more of the HAP to be consumed in the reaction. This clarification that the start point for the material balance compliance option is necessary because cellulose ether affected sources actually consume much of the HAP in their reaction (*e.g.*, ethylene oxide), while viscose process affected sources eventually regenerate all of the HAP in their reaction (as either carbon disulfide or hydrogen sulfide).

2. Additional Testing

Tables 3 and 5 to the final rule require viscose process affected sources to prepare and maintain a material balance that includes the "pertinent data" used to determine the percent reduction of total sulfide emissions. To prepare and maintain such a material balance, emissions information to determine control efficiency would be needed in addition to that gathered through the initial performance test. According to Teepak, the "pertinent data" language in the final rule possibly could be construed to require additional testing to complete the material balance, although such additional testing is not explicitly required in the final rule and would be inconsistent with language in the preamble. Teepak has recommended that EPA revise § 63.5535(g)(1) to clarify that no additional emission tests are required. The Agency did not intend to require additional emissions tests be conducted by use of the term "pertinent data" and agrees with Teepak's request. Therefore, through the amendments to the final rule, we are making the suggested revision to § 63.5535(g)(1) for viscose process affected sources. For consistency, we are providing the same clarification for those cellulose ether affected sources that choose the material balance compliance option.

3. Batch Emission Episodes

For those sources that choose to conduct an initial performance test, Dow has noted that the final rule does

not address the testing of batch emission episodes lasting less than 1 hour. According to Dow, the final rule is unclear and has conflicting requirements between the regulatory text and tables regarding whether (1) the batch emission episode provisions in § 63.490(c) apply to calculating the emission rate, as stated in table 4 to the final rule, (2) three 1-hour tests are required, as stated in § 63.5535(d), or (3) a 3-hour test is required, as stated in table 3 to the final rule. Dow has recommended that EPA clarify in § 63.5535(d) and (e) that batch process vent tests follow the provisions listed in table 4 and § 63.490(c), which Dow has interpreted as allowing testing on a batch emission episode. Upon review of the subject testing requirements the Agency agrees with Dow's assessment that the language in the text and tables conflict and need clarification. Therefore, through the amendments to the final rule, we are making the suggested revision to § 63.5535(d) and (e). To account for the testing of batch emission episodes, which may last less than 1 hour per test run, we are also removing the "3-hour" term used in table 3 to the final rule to describe the performance test. This revision also eliminates any confusion with the requirement in § 63.5535(d) for three 1-hour test runs.

4. Uncontrolled Emissions

Both Teepak and Dow have noted that table 3 to the final rule requires operations to demonstrate initial compliance with the emission limit by "measuring" the average uncontrolled emissions during the compliance demonstration or performance test. However, the final rule does not require month-long initial performance tests, nor does it require any additional testing after the initial performance tests of control device efficiency. Teepak has recommended that EPA change the term "measured" in table 3 to the final rule to "determined" to clarify that no additional testing or measurement was intended for cellulose food casing operations or any other viscose process affected source. Dow has recommended that EPA revise tables 3 and 4 to the final rule to allow engineering assessments to be used as an alternative for determining the uncontrolled emissions from process vents. According to Dow, engineering assessments are allowed in other NESHAP, including the Hazardous Organic NESHAP (HON), the Pharmaceutical NESHAP, and the Pesticide Active Ingredient NESHAP.

The Agency agrees with Dow and Teepak that using the term "determined" instead of "measured" is consistent with the approach of using an engineering assessment as an alternative for determining uncontrolled emissions. Through the amendments to the final rule, we are making the clarification to table 3 to the final rule suggested by Teepak for viscose process affected sources. For consistency, we are providing the same clarification for those cellulose ether affected sources that choose to demonstrate initial compliance using a month-long compliance demonstration. We are also making the revision to table 3 to the final rule suggested by Dow for cellulose ether affected sources. This revision should provide cellulose ether affected sources with some flexibility in determining uncontrolled emissions, whether they are conducting an initial performance test or a month-long compliance demonstration. For consistency, we are also providing the viscose process affected sources with the same option to use engineering assessments. We are not making the revision to table 4 to the final rule suggested by Dow because this issue will already be addressed in the revision to table 3 of the final rule. Table 4 of the final rule is designed to describe the performance testing requirements, and if a source is using other means (*e.g.*, engineering assessments) to determine uncontrolled emissions, then those means should be described in table 3 of the final rule.

5. Equations

Dow has noted that § 63.5535(e)(2) requires sources to calculate the "total sulfide emission rate." According to Dow, it is not necessary for a source to calculate the total sulfide emission rate if it does not use sulfur compounds, specifically carbon disulfide, in its process. Dow has recommended that EPA clarify the final rule so that § 63.5535(e)(2) is used only for viscose processes that actually use carbon disulfide. Through the amendments to the final rule, we are revising § 63.5535(e) to require sources to use the equations "as applicable." This revision should account for those sources (*e.g.*, cellulose ether affected sources) for which an equation (*e.g.*, total sulfide emission equation) may not apply.

6. Establishing Operating Limits

Section 63.5535(h)(1) of the final rule references § 63.505(b)(2) regarding the establishment of operating limits for continuous processes. Section 63.505(b)(2) requires sources to use the average of the maximum values to establish a maximum level and the average of the minimum values to establish a minimum level. Teepak has argued that this procedure inappropriately restricts the range in which their scrubbers can be operated to ensure compliance with the emission reduction requirements. According to Teepak, the capabilities of the scrubber under a range of conditions, not simply the average capabilities, should be used to determine maximum and minimum operating limits. Teepak has recommended that we replace the procedures of § 63.505(b)(2) with those of § 63.505(c), which require sources to establish parameter operating levels based on performance tests, supplemented by engineering assessments and/or manufacturer's recommendations. According to Teepak, this change would allow the development of true operating limits of the control or recovery device. Teepak has also recommended that we revise table 3 to the final rule to clarify that a range of scrubber operating values is acceptable.

The Agency agrees with Teepak that the use of average values to establish the minimum and maximum operating limits for the scrubbers will not result in an effective measure for assessing the operational performance of the scrubbers. By using the averages for establishing both the minimum and maximum values for the scrubber operating range, an overly restrictive range is set, while the scrubbers can be demonstrated to operate effectively operate over a much broader range. Therefore, through the amendments to the final rule, we are making the suggested revisions to § 63.5535(h)(1), (5), and (6). We are also revising tables 2, 3, and 6 to final rule. For consistency, we are applying the requirement to use § 63.505(c) to both continuous and batch processes.

D. Definitions

1. Process Unit/Source Category

In response to a comment on the proposed rule, we added a definition for "cellulose ether process unit" to the final rule to help define the boundaries around equipment for equipment leak monitoring. We also revised the definition for "cellulose ether operation" to provide greater clarification of what it includes, and we revised the definition for "cellulose ether process" to specifically exclude solids handling. However, the requirements in the final rule refer only to the definitions for "cellulose ether operation" and "cellulose ether process unit," which do not exclude solids handling equipment. Dow has argued that, without clear definitions, the

regulated industry cannot delineate the equipment included in the process unit and subject to the final rule. As "cellulose ether process unit" is currently defined, equipment in the solids handling process would be a part of the cellulose ether process unit and would be subject to the equipment leak provisions. According to Dow, it is doubtful that the HAP concentration in the solids handling equipment would exceed 5 percent, and unnecessary records would be needed to document that the equipment is not monitored. Dow has recommended that EPA revise the definition for "cellulose ether process unit" to specifically include the term "cellulose ether process." According to Dow, revising this definition would be a clear and simple approach to exclude equipment not a part of the cellulose ether process unit and, therefore, not subject to equipment leaks monitoring. Dow has also recommended that EPA revise the definition for "Cellulose Ethers Production source category" to refer to "the collection of *cellulose ether* operations" to provide a similar clarification.

The Agency agrees with Dow that revising the definitions will provide clarity and consistency to what equipment is subject to the equipment leak monitoring. Additionally, based on a review of the information presented to EPA during the initial development of these provisions the solids handling equipment is unlikely to exceed the 5 percent HAP threshold and, as the rule is currently written, unnecessary records would need to be kept. Through the amendments to the final rule, we are making the suggested revisions to the definitions for "cellulose ether process unit" and "Cellulose Ethers Production source category." For consistency, we are also revising several other definitions. We are revising the definitions for "cellulose food casing process unit," "cellulosic sponge process unit," and "rayon process unit" to specifically include the term "viscose process." We are revising the definition for "cellophane process unit" to specifically include the terms "viscose process" and "solvent coating process." Finally, we are revising the definition for "Miscellaneous Viscose Processes source category" to specifically include the collection of "cellulose food casing, rayon, cellulosic sponge, and cellophane operations."

Dow has also recommended that EPA revise the tables in the final rule to refer to the definition for "cellulose ether process unit" instead of "cellulose ether operation." According to Dow, this change would allow EPA to clearly define the equipment subject to control. Specifically, Dow believes that EPA needs to define the boundaries of the process unit to determine where a wastewater process stream is discarded and, thus, becomes a wastewater. According to Dow, with the broadly defined term "cellulose ether operation," no stream ever exits the process and becomes discarded.

We do not believe that replacing the term "cellulose ether operation" with "cellulose ether process unit" in the tables is necessary or even desirable. Such a revision would effectively exclude from regulation those equipment, such as heat exchanger systems, wastewater and waste management units, and cooling towers, that are not associated with the cellulose ether process unit but are located at a cellulose ether operation. Additionally, these sources were considered in establishing the MACT floor. Consequently, we are not making this suggested revision to the final rule.

2. Process Vent

In response to a comment on the proposed rule, we revised the definition of "process vent" in the final rule to refer to "a point of discharge to the atmosphere * * * of a HAP-containing gas stream from the process operation." Noting that the term "process operation" is not defined in the final rule, Dow has recommended that EPA replace it with the term "unit operation." According to Dow, the term "unit operation" is already defined in the final rule because § 63.5610 references the definitions from § 63.101 of the HON. Dow has also expressed concern that the definition for "process vent" in the final rule does not define the basis for the concentration of a process vent, *e.g.*, HAP or total organic compound (TOC). Consequently, Dow has recommended that EPA revise the definition for "process vent" to state that it does not include "* * * vents with * * * a concentration less than 50 parts per million by volume (ppmv) of *HAP or TOC* * * *" EPA agrees with Dow's comment concerning the definition of process vent. Specifically, we agree that through the reference to § 63.101 of the HON and our definition of "process vent" we have created an inconsistency in the rule. To correct this inconsistency we are incorporating the characteristics of the vent stream from the HON into our process vent definition. Through the amendments to the final rule, we are making the suggested clarifications to the definition for "process vent."

E. Applicability of General Provisions

Facilities subject to the final rule are required to submit periodic compliance reports containing, among other things, information on episodes of startup, shutdown, or malfunction that occurred during each reporting period. UCB Films has asked whether the routine breaks of film (commonly called "wet breaks") that occur in its casting machines possibly could be construed as falling within the definition for "malfunction." The wet breaks would not affect UCB's ability to meet the standards. We do not consider this type of routine event to fall within the definition for "malfunction" and believe it should not be included within the reporting requirement. See 67 FR 72875, 72881 (December 9, 2002); 68 FR 32586, 32592–32593 (May 30, 2003). For consistency, this interpretation also applies to routine breaks of cellulose food casing and rayon.

UCB Films also requested clarification of the reporting obligations for its casting machines when they are temporarily turned off to fix wet breaks. Clarification may also be needed, according to UCB Films, regarding the subsequent restart of the casting machines after the wet breaks are fixed. The recent revisions to the 40 CFR part 63 General Provisions state that there is no duty to report the number or duration of these events or to describe each one individually in the startup, shutdown, and malfunction report as long as the provisions of the startup, shutdown, and malfunction plan are followed and the report contains a statement to that effect; see § 63.10(d)(5)(i) and 68 FR 32592. No changes to subpart UUUU of 40 CFR part 63 are needed to address this issue.

F. Miscellaneous Corrections

Through the amendments to the final rule, we are also correcting various typographical, formatting, and cross-referencing errors found in the final rule and updating the cross-references, where necessary, to include the amended sections.

II. Summary of Amendments

Today's amendments to subpart UUUU are described in Table 1 of this preamble.

TABLE 1.—SUMMARY OF AMENDMENTS TO SUBPART UUUU OF 40 CFR PART 63

Citation	Change
§ 63.5490(d)	Change "meet" to "met" for verb tense consistency.
§ 63.5515(b)(1) and (f) introductory paragraph	Remove the requirement in paragraph (b)(1) to maintain a log for O&M of process equipment and state that the O&M log is only required for control devices used to comply with the rule. Replace the phrase "to of this subpart" in (f) introductory paragraph with "to this subpart."
§ 63.5535 (d), (e) introductory paragraph, (g)(1), and (h)	Revise paragraph (d) to reference § 63.490(c) for batch process vents. Revise (e) introductory paragraph to reference § 63.490(c) for batch process vents. Also note that sources must use the equations as applicable. Revise paragraph (g)(1) to specify that no additional testing is required for viscose process affected sources required to conduct an initial performance test to determine the control efficiency of their non-recovery control devices. Replace references to § 63.505(b) (2) and (3) in paragraphs (h) (1) and (2) with references to § 63.505(c) for procedures used to establish operating limits. Combine paragraphs (h) (1) and (2) to apply to both continuous and batch processes. Renumber paragraphs (h) (3) through (10) as paragraphs (h) (2) through (9). Revise paragraphs (h) (5) and (6) to require affected sources to record the range of scrubber parameter values, rather than the average. Renumber paragraph (h) as paragraph (i) and add a new paragraph (h) that includes an initial compliance option for cellulose ether operations similar to the material balance option for the viscose process affected sources. For cellulose ether operations using extended cookout under this option, specify that the start point from which the percent reduction is determined must be the onset of extended cookout. Also specify that no additional testing is required for cellulose ether affected sources required to conduct an initial performance test to determine the control efficiency of their non-recovery control devices.
§ 63.5545(e)(4)	Change the citation, which describes the data to be excluded from continuous emissions monitoring system (CEMS) data averages, from paragraph (a)(5) to paragraph (e)(5) of this section.
§ 63.5610 (a) and (g)	Revise paragraph (a) by changing the citation for operating limit provisions from § 63.505(b) to § 63.505(c). Revise the definitions of "Cellulose Ethers Production source category" and "Miscellaneous Viscose Processes source category" in paragraph (g) to include a reference to the types of operations that are included in the source categories (cellulose ether, cellophane, cellulose food casing, cellulosic sponge, and rayon). Revise the definition of "cellulose ether process unit" in paragraph (g) to include the term "cellulose ether process." Revise the definitions of "cellulose food casing process unit," "cellulosic sponge process unit," and "rayon process unit" to include the term "viscose process." Revise the definition of "cellophane process unit" to include the terms "viscose process" and "solvent coating process." Revise the definition of "process vent" in paragraph (g)to replace the undefined term "process operation" with the defined term "unit operation" and to define the concentration basis for process vents as HAP or TOC.
Table 1, items 1.c. i and ii, 1.f. ii and iii, 9, 10, and 11	Remove the numbering for individual requirements under items 1.c. i and ii. Revise items 1.f. ii and iii, item 10, and item 11 to clarify that the standards for closed-vent systems at cellophane operations do not apply to retractable hoods over sulfuric acid baths at a cellophane operation. Revise item 9 to replace the phrase "liquid streams in open system 2" with "liquid streams in open systems." Designate the affected source text under item 11 as "a."
Table 2, items 3 and 4	Revise items 3 and 4 to require affected sources to maintain the scrubber parameters within a range of values established during the compliance demonstration, rather than above or below an average value.
Table 3, introductory statement and items 1.a.i. (1) and (2); 1.b.i. (1) and (2); 1.c.i.(1); 1.c.ii.(1); 1.d.i.(1); 1.e.i.(1); 1.f.i.(1); 1.f.ii and 2.a.i.(1); 3.a; 6.a.i.(1); and 12.a.i.(2).	Revise the introductory statement for Table 3 to include § 63.5535(h) in the list of referenced provisions. Regarding the requirement in items 1.a.i.(1), 1.b.i.(1), 1.c.i.(1), 1.c.ii.(1) 1.d.i.(1), 1.e.i.(1), 1.f.i.(1), 2.a.i.(1), 3.a, and 6.a.i.(1) to "measure" average uncontrolled emissions during the month-long compliance demonstration, change "measured" to "determined." Provide sources with the option to use engineering assessments to determine uncontrolled emissions.

TABLE 1.—SUMMARY OF AMENDMENTS TO SUBPART UUUU OF 40 CFR PART 63—Continued

Citation	Change
	Revise items 1.a.i.(2) and 1.b.i.(2) to replace the term "average operating parameter values" with "range of operating parameter values."
	Revise items 1.f. ii and iii to clarify that the standards and initial compliance requirements for closed-vent systems at cellophane operations do not apply to retractable hoods over sulfuric acid baths at a cellophane operation.
	Revise item 2.a.i to change "folling" to "rolling."
	Split item 3.a. into two parts—items 3.a and 3.b. Item 3.a applies to cellulose ether operations using a performance test to demonstrate initial compliance. Item 3.b applies to cellulose ether operations using a material balance compliance demonstration to demonstrate initial compliance. Include under item 3.b the requirements associated with the material balance compliance demonstration. Include under items 3.a and 3.b the option to use engineering assessments to determine uncontrolled emissions.
	Revise items 3.a.i. (1) and (2) to remove the term "3-hour."
	Remove the numbering for individual requirements under item 12.a.i.(2).
Table 4, introductory statement and items 3 and 4.a.i.(2).(b)	Revise the introductory statement for Table 4 to include § 63.5535(h)(1) in the list of referenced provisions. Reposition the requirements for item 3 into their proper columns. Correct the misspelling for "potentially" in item 4.a.i.(2).(b).
Table 5, items 1.a. ii and iii; 3.a; 5.a. i, ii, and iv; and 8	Revise items 1.a. ii and iii to clarify that the standards and continuous compliance requirements for closed-vent systems do not apply to retractable hoods over sulfuric acid baths at a cellophane operation.
	Under item 1.a.ii, designate the work practice standard for closed-vent systems as "iii," instead of "c."
	Split item 3.a. into two parts—items 3.a and 3.b. Item 3.a applies to cellulose ether operations using a performance test to demonstrate initial compliance. Item 3.b applies to cellulose ether operations using a material balance compliance demonstration to demonstrate initial compliance. Include under item 3.b the requirements associated with the material balance continuous compliance option.
	Under items 5.a. i, ii, and iv, remove the numbering for individual emission limits and standards (*e.g.*, remove "(1)," "(2)," and "(3)"). Also, change the numbering for individual continuous compliance requirements (*e.g.*, change "(a)," "(b)," and "(c)" to "(1)," "(2)," and "(3)").
	Correct the misspelling for "wastewater" in item 8.
Table 6, items 3 and 4	Revise items 3 and 4 to require affected sources to maintain the scrubber parameters within a range of values established during the compliance demonstration, rather than above or below an average value.

III. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 5173, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in standards that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that the direct final rule amendments are not a "significant regulatory action" because they do not meet any of the above criteria. Consequently, this action was not submitted to OMB for review under Executive Order 12866.

B. Paperwork Reduction Act

This action makes clarifying changes to the final rule and imposes no new information collection requirements on the industry. This action revises a work practice standard, general and initial compliance requirements, definitions, and General Provisions applicability, as well as correct typographical, formatting, and cross-referencing errors in the final rule. The OMB has previously approved the information collection requirements contained in the existing regulations under the provisions of the Paper Work Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0488 (EPA ICR No. 1974.02).

Copies of the Information Collection Request (ICR) document(s) may be obtained from Susan Auby, by mail at the Office of Environmental Information, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://*

www.epa.gov/icr. Include the ICR number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to respond to a collection of information; search existing data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the direct final rule amendments.

For purposes of assessing the impacts of today's direct final rule on small entities, small entity is defined as: (1) a small business that has fewer than 1,000 employees for NAICS codes 325221, 325188, and 325199; fewer than 750 employees for NAICS code 325211; or fewer than 500 employees for NAICS codes 326121 and 326199; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's direct final rule amendments on small entities, the EPA has concluded that this action will not have a significant impact on a substantial number of small entities. The direct final rule amendments will not impose any new requirements on small entities.

D. Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA's regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in aggregate, or the private sector in any 1 year, nor do the direct final rule amendments significantly or uniquely impact small governments, because the amendments contain no requirements that apply to such governments or impose obligations upon them. Thus, the requirements of the UMRA do not apply to the direct final rule amendments.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications. The amendments will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments. Thus, the requirements of section 6 of the Executive Order do not apply to the direct final rule amendments.

In the spirit of Executive Order 13132 and consistent with EPA policy to promote communications between the EPA, State and local governments, the EPA specifically solicits comment on the direct final rule amendments from State and local officials.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications, as specified in Executive Order 13175, because tribal governments do not own or operate any sources subject to the amendments in the direct final rule. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that EPA determines (1) is "economically significant" as defined under Executive Order 12866, and (2) the environmental health or safety risk addressed by the rule has a disproportionate effect on children. If the regulatory action meets both criteria, then EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives that EPA considered.

The EPA interprets Executive Order 13045 as applying only to regulatory actions that are based on health or safety risks, such that the analysis required

under section 5–501 of the Executive Order has the potential to influence the rule. The direct final rule amendments are not subject to Executive Order 13045, because the action is based on technology performance and not on health or safety risks. Furthermore, the direct final rule amendments have been determined not to be "economically significant" as defined under Executive Order 12866.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not subject to Executive Order 13211, "Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because the amendments are not considered a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) (Public Law 104–113; 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory and procurement activities, unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards. This action does not involve technical standards. Therefore, EPA did not consider the use of any voluntary consensus standards.

J. Congressional Review Act

The Congressional Review Act (5 U.S.C. 801 *et seq.*), as added by the Small Business Regulatory Enforcement Act of 1996, generally provides that, before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the direct final rule amendments and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule amendments in the Federal Register. The direct final rule amendments are not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule will become effective on October 11, 2005, unless adverse comments are received by September 26, 2005.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Cellulose products manufacturing, Hazardous substances, Reporting and recordkeeping requirements.

Dated: August 1, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart UUUU—[Amended]

■ 2. Section 63.5490 is amended by revising paragraph (d) to read as follows:

§ 63.5490 What parts of my plant does this subpart cover?

* * * * *

(d) An affected source is a new affected source if you began construction of the affected source after August 28, 2000 and you met the applicability criteria in § 63.5485 at the time you began construction.

* * * * *

■ 3. Section 63.5515 is amended by revising paragraphs (b)(1) and (f) introductory text to read as follows:

§ 63.5515 What are my general requirements for complying with this subpart?

(b) * * *

(1) During the period, if any, between the compliance date specified for your affected source in § 63.5495 and the date upon which continuous monitoring systems (CMS) have been installed and validated and any applicable operating limits have been set, you must maintain a log detailing the operation and maintenance of any control technique used to comply with this subpart.

* * * * *

(f) You are not required to conduct a performance test when you use any of the units specified in paragraphs (f)(1) through (5) of this section to comply with the applicable emission limit or work practice standard in table 1 to this subpart. You are also exempt from the continuous compliance, reporting, and recordkeeping requirements specified in tables 5 through 9 to this subpart for any of these units. This exemption applies to units used as control devices or wastewater treatment units.

* * * * *

■ 4. Section 63.5535 is amended by:
■ a. Revising paragraphs (d), (e) introductory text, (g)(1), and (h);
■ b. Redesignating paragraph (h) as paragraph (i); and
■ c. Adding a new paragraph (h).

The revisions and additions read as follows:

§ 63.5535 What performance tests and other procedures must I use?

* * * * *

(d) You must conduct three separate test runs for each performance test required in this section, as specified in § 63.7(e)(3). Each test run must last at least 1 hour, except as specified in § 63.490(c) for batch process vents.

(e) Except as specified in § 63.490(c) for batch process vents, you may use the equations in paragraphs (e)(1) through (3) of this section as applicable to determine the control efficiency for each performance test.

* * * * *

(g) * * *

(1) Viscose process affected sources that must use non-recovery control devices to meet the applicable emission limit in table 1 to this subpart must conduct an initial performance test of their non-recovery control devices according to the requirements in table 4 to this subpart to determine the control efficiency of their non-recovery control devices and incorporate this information in their material balance. No additional performance tests are required.

* * * * *

(h) Cellulose ether affected sources using the material balance compliance demonstration must conduct a month-long initial compliance demonstration according to the requirements in paragraphs (h)(1) through (4) of this section and table 3 to this subpart.

(1) Cellulose ether affected sources that must use non-recovery control devices to meet the applicable emission limit in table 1 to this subpart must conduct an initial performance test of their non-recovery control devices according to the requirements in table 4 to this subpart to determine the control efficiency of their non-recovery control devices and incorporate this information in their material balance. No additional performance tests are required.

(2) Cellulose ether affected sources that use recovery devices to meet the

applicable emission limit in table 1 to this subpart must determine the quantity of organic HAP fed to the process and the quantity of organic HAP recovered using the recovery device and incorporate this information in their material balance.

(3) Cellulose ether affected sources that use cellulose ether process changes to meet the applicable emission limit in table 1 to this subpart must determine the quantity of organic HAP used before and after the process change and incorporate this information in their material balance. For cellulose ether affected sources that use extended cookout, the start point from which the percent reduction is determined must be the onset of extended cookout.

(4) Using the pertinent material balance information obtained according to paragraphs (h)(1) through (3) of this section, cellulose ether affected sources must calculate the monthly average percent reduction for their affected source over the month-long period of the compliance demonstration.

* * * * *

(i) During the period of each compliance demonstration, you must establish each site-specific operating limit in table 2 to this subpart that applies to you according to the requirements in paragraphs (i)(1) through (9) of this section.

(1) For continuous, batch, and combinations of continuous and batch process vents, establish your site-specific operating limit using the procedures in § 63.505(c), except that, if you demonstrate initial compliance using a month-long compliance demonstration, references to "performance test" mean "compliance demonstration" for purposes of this subpart.

(2) For condensers, record the outlet (product side) gas or condensed liquid temperature averaged over the same period as the compliance demonstration while the vent stream is routed and constituted normally. Locate the temperature sensor in a position that provides a representative temperature.

(3) For thermal oxidizers, record the firebox temperature averaged over the same period as the compliance demonstration. Locate the temperature sensor in a position that provides a representative temperature.

(4) For water scrubbers, record the range of the pressure drop and flow rate of the scrubber liquid over the same time period as the compliance demonstration while the vent stream is routed and constituted normally. Locate the pressure and flow sensors in a position that provides a representative measurement of the parameter.

(5) For caustic scrubbers, record the range of the pressure drop, flow rate of the scrubber liquid, and pH, conductivity, or alkalinity of the scrubber liquid over the same time period as the compliance demonstration while the vent stream is routed and constituted normally. Locate the pressure sensors, flow sensors, and pH, conductivity, or alkalinity sensors in positions that provide representative measurements of these parameters. Ensure the sample is properly mixed and representative of the fluid to be measured.

(6) For flares, record the presence of a pilot flame. Locate the pilot flame sensor in a position that provides an accurate and continuous determination of the presence of the pilot flame.

(7) For biofilters, record the pressure drop across the biofilter beds, inlet gas temperature, and effluent pH averaged over the same time period as the compliance demonstration while the vent stream is routed and constituted normally. Locate the pressure, temperature, and pH sensors in positions that provide representative measurement of these parameters. Ensure the sample is properly mixed and representative of the fluid to be measured.

(8) For carbon adsorbers, record the total regeneration stream mass or volumetric flow during each carbon bed regeneration cycle during the period of the compliance demonstration. Record the temperature of the carbon bed after each carbon bed regeneration cycle during the period of the compliance demonstration (and within 15 minutes of completion of any cooling cycle(s)). Record the operating time since the end of the last carbon bed regeneration cycle and the beginning of the next carbon bed regeneration cycle during the period of the compliance demonstration. Locate the temperature and flow sensors in positions that provide representative measurement of these parameters.

(9) For oil absorbers, record the flow of absorption liquid through the absorber, the temperatures of the absorption liquid before and after the steam stripper, and the steam flow through the steam stripper averaged during the same period of the compliance demonstration. Locate the temperature and flow sensors in positions that provide representative measurement of these parameters.

■ 5. Section 63.5545 is amended by revising paragraph (e)(4) to read as follows:

§ 63.5545 What are my monitoring installation, operation, and maintenance requirements?

* * * * *

(e) * * *

(4) The CEMS data must be reduced to operating data averages computed using valid data from at least 75 percent of the hours during the averaging period. To have a valid hour of data, you must have four or more data points equally spaced over the 1-hour period (or at least two data points during an hour when calibration, quality assurance, or maintenance activities are being performed), except as specified in paragraph (e)(5) of this section.

* * * * *

■ 6. Section 63.5610 is amended by revising paragraph (a) and the paragraph (g) definitions for cellophane process unit, cellulose ether process unit, Cellulose Ether Production source category, cellulose food casing process unit, cellulosic sponge process unit, Miscellaneous Viscose Processes source category, process vent, and rayon process unit to read as follows:

§ 63.5610 What definitions apply to this subpart?

(a) For all affected sources complying with the batch process vent testing provisions in § 63.490(c) and the operating limit provisions in § 63.505(c), the terms used in this subpart and in subpart U of this part are defined in § 63.482 and paragraph (g) of this section.

* * * * *

(g) * * *

Cellophane process unit means all equipment associated with the viscose process or solvent coating process which collectively function to manufacture cellophane and any associated storage vessels, liquid streams in open systems (as defined in § 63.149), and equipment (as defined in § 63.161) that are used in the manufacturing of cellophane.

* * * * *

Cellulose ether process unit means all equipment associated with a cellulose ether process which collectively function to manufacture a particular cellulose ether and any associated storage vessels, liquid streams in open systems (as defined in § 63.149), and equipment (as defined in § 63.161 or 63.1020) that are used in the manufacturing of a particular cellulose ether.

Cellulose Ethers Production source category means the collection of cellulose ether operations that use the cellulose ether process to manufacture a particular cellulose ether.

* * * * *

Cellulose food casing process unit means all equipment associated with the viscose process which collectively function to manufacture cellulose food casings and any associated storage vessels, liquid streams in open systems (as defined in § 63.149), and equipment (as defined in § 63.161) that are used in the manufacturing of cellulose food casings.

* * * * *

Cellulosic sponge process unit means all equipment associated with the viscose process which collectively function to manufacture cellulosic sponges and any associated storage vessels, liquid streams in open systems (as defined in § 63.149), and equipment (as defined in § 63.161) that are used in the manufacturing of cellulosic sponges.

* * * * *

Miscellaneous Viscose Processes source category means the collection of cellulose food casing, rayon, cellulosic sponge, and cellophane operations that use the viscose process to manufacture a particular cellulose product. These cellulose products include cellulose food casings, rayon, cellulosic sponges, and cellophane.

* * * * *

Process vent means a point of discharge to the atmosphere (or the point of entry into a control device, if any) of a HAP-containing gas stream from the unit operation. Process vents do not include vents with a flow rate less than 0.005 standard cubic meter per minute or with a concentration less than 50 parts per million by volume (ppmv) of HAP or TOC, vents on storage tanks, vents on wastewater emission sources, or pieces of equipment regulated under equipment leak standards.

* * * * *

Rayon process unit means all equipment associated with the viscose process which collectively function to manufacture rayon and any associated storage vessels, liquid streams in open systems (as defined in § 63.149), and equipment (as defined in § 63.161) that are used in the manufacturing of rayon.

* * * * *

■ 7. Table 1 is amended by revising entries 1.c.i and ii, 1.f.ii and iii, and 9 through 11 to read as follows:

TABLE 1 TO SUBPART UUUU OF PART 63—EMISSION LIMITS AND WORK PRACTICE STANDARDS

* * * * * * * *

For . . .	at . . .	You must . . .
* * * * * * *		
1. the sum of all viscose process vents.	c. each existing rayon operation ...	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 35% within 3 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems; and ii. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 40% within 8 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems.
* * * * * * *		
	f. each existing or new cellophane operation.	i. * * * ii. for each vent stream that you control using a control device (except for retractable hoods over sulfuric acid baths at a cellophane operation), route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems (except for retractable hoods over sulfuric acid baths at a cellophane operation).
* * * * * * *		
9. liquid streams in open systems	each existing or new cellulose ether operation.	comply with the applicable provisions or § 63.149, except that references to "chemical manufacturing process unit" ether means "cellulose ether process unit" for the purposes of this subpart.
10. closed-vent system used to route emissions to a control device.	each existing or new affected source (except for retractable hoods over sulfuric acid baths at a cellophane operation).	conduct annual inspections, repair leaks, and maintain records as specified in § 63.148.
11. closed-vent system containing a bypass line that could divert a vent stream away from a control device, except for equipment needed for safety purposes (described in § 63.148(f)(3).	a. each existing or new affected source (except for retractable hoods over sulfuric acid baths at a cellophane operation).	(i) install, calibrate, maintain, and operate a flow indicator as specified in § 63.148(f)(1); or (ii) secure the bypass line valve in the closed position with a car-seal or lock-and-key type configuration and inspect the seal or closure mechanism at least once per month as specified in § 63.148(f)(2)).
* * * * * * *		

■ 8. Table 2 is amended by revising entries 3 and 4 to read as follows:

TABLE 2 TO SUBPART UUUU OF PART 63—OPERATING LIMITS

For the following control technique . . .	You must . . .
3. water scrubber	maintain the daily average scrubber pressure drop and scrubber liquid flow rate within the range of values established during the compliance demonstration.
4. caustic scrubber	maintain the daily average scrubber pressure drop, scrubber liquid flow rate, and scrubber liquid pH, conductivity, or alkalinity within the range of values established during the compliance demonstration.

■ 9. Table 3 is amended by:
■ a. Revising the introductory statement;
■ b. Revising entries 1.a.i.(1) and (2), 1.b.i.(1) and (2), 1.c.i.(1), 1.c.ii.(1), 1.d.i.(1), 1.e.i.(1), 1.f.i.(1), and 1.f.ii and iii;
■ c. Revising entries 2.a.i and 2.a.i.(1);
■ d. Revising entry 3.a and adding item 3.b;
■ e. Revising entry 6.a.i.(1); and
■ f. Revising entry 12.a.i.(2) to read as follows:

TABLE 3 TO SUBPART UUUU OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITS AND WORK PRACTICE STANDARDS

[As required in §§ 63.5530(a) and 63.5535(g) and (h), you must demonstrate initial compliance with the appropriate emission limits and work practice standards according to the requirements in the following table]

For . . .	At . . .	For the following emission limit or work practice standard . . .	You have demonstrated initial compliance if . . .
1. the sum of all viscose process vents.	a. each existing cellulose food casing operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 25% based on a 6-month rolling average;	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 25%; (2) you have a record of the range of operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 25%;
	b. each new cellulose food casing operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75% based on a 6-month rolling average;	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75%; (2) you have a record of the range of operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 75%;
	c. each existing rayon operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 35% within 3 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems; and	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 35% within 3 years after the effective date;
		ii. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 40% within 8 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 40% within 8 years after the effective date;

TABLE 3 TO SUBPART UUUU OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITS AND WORK PRACTICE STANDARDS—Continued

[As required in §§ 63.5530(a) and 63.5535(g) and (h), you must demonstrate initial compliance with the appropriate emission limits and work practice standards according to the requirements in the following table]

For . . .	At . . .	For the following emission limit or work practice standard . . .	You have demonstrated initial compliance if . . .
*	*	*	*
	d. each new rayon operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75%; based on a 6-month rolling average;	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75%;
*	*	*	*
	e. each existing or new cellulosic sponge operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75% based on a 6-month rolling average;	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75%;
*	*	*	*
	f. each existing or new cellophane operation.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75% based on a 6-month rolling average; ii. for each vent stream that you control using a control device (except for retractable hoods over sulfuric acid baths at a cellophane operation), route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems (except for retractable hoods over sulfuric acid baths at a cellophane operation)	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75%;
*	*	*	*
2. the sum of all solvent coating process vents.	a. each existing or new cellophane operation.	i. reduce uncontrolled toluene emissions by at least 95% based on a 6-month rolling average;	(1) the average uncontrolled toluene emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 95%;
*	*	*	*
3. the sum of all cellulose ether process vents.	a. each existing or new cellulose ether operation using a performance test to demonstrate initial compliance; or.	i. reduce total uncontrolled organic HAP emissions by at least 99%; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems; or	(1) average uncontrolled total organic HAP emissions, measured during the performance test or determined using engineering estimates are reduced by at least 99%; (2) you have a record of the average operating parameter values over the performance test during which the average uncontrolled total organic HAP emissions were reduced by at least 99%; and (3) you comply with the initial compliance requirements for closed-vent systems; or
	b. each existing or new cellulose ether operation using a material balance compliance demonstration to demonstrate initial compliance.	i. reduce total uncontrolled organic HAP emissions by at least 99% based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) average uncontrolled total organic HAP emissions, determined during the month-long compliance demonstration or using engineering estimates are reduced by at least 99%; (2) you have a record of the average operation parameter values over the month-long compliance demonstration during which the average uncontrolled total organic HAP emissions were reduced by at least 99%; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total organic HAP emissions; (4) if you use extended cookout to comply, you measure the HAP charged to the reactor, record the grade of product produced, and then calculate reactor emissions prior to extended cookout by taking a percentage of the total HAP charged.

TABLE 3 TO SUBPART UUUU OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITS AND WORK PRACTICE STANDARDS—Continued

[As required in §§ 63.5530(a) and 63.5535(g) and (h), you must demonstrate initial compliance with the appropriate emission limits and work practice standards according to the requirements in the following table]

For . . .	At . . .	For the following emission limit or work practice standard . . .	You have demonstrated initial compliance if . . .
*	*	* * *	* *
6. each toluene storage vessel.	a. each existing or new cellophane operation.	i. reduce uncontrolled toluene emissions by at least 95% based on a 6-month rolling average;	(1) the average uncontrolled toluene emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 95%;
*	*	* * *	* *
12. heat exchanger system that cools process equipment or materials in the process unit.	a. each existing or new affected source.	i. monitor and repair the heat exchanger system according to § 63.104(a) through (e), except that reference to "chemical manufacturing process unit" mean "cellulose food casing, rayon, cellulosic sponge, cellophane, or cellulose either process unit" for the purposes of this subpart.	* * * (2) if your heat exchanger system is not exempt, you identify in your Notification of Compliance Status Report the HAP or other representative substance that you will monitor, or you prepare and maintain a site-specific plan containing the information required by § 63.104(c) (1) (i) through (iv) that documents the procedures you will use to detect leaks by monitoring surrogate indicators of the leak.

■ 10. Table 4 is amended by revising the introductory statement and entries 3 and 4.a.i.(2)(b) to read as follows:

TABLE 4 TO SUBPART UUUU OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS

[As required in §§ 63.5530(b) and 63.5535(a), (b), (g)(1), and (h)(1), you must conduct performance tests, other initial compliance demonstrations, and CEMS performance evaluations and establish operating limits according to the requirements in the following table]

For . . .	At . . .	You must . . .	Using . . .	According to the following requirements . . .
*	*	*	*	* *
3. the sum of all solvent coating process vents.	a. each existing or new cellophane operation.	i. measure toluene emissions.	(1) EPA Method 18 in appendix A to part 60 of this chapter; or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 18 to determine the control efficiency of any control device for organic compounds; for a combustion device, you must use only HAP that are present in the inlet to the control device to characterize the percent reduction across the combustion device; (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in §§ 63.7(e)(1) and 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the initial compliance demonstration; or

TABLE 4 TO SUBPART UUUU OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS—Continued

[As required in §§ 63.5530(b) and 63.5535(a), (b), (g)(1), and (h)(1), you must conduct performance tests, other initial compliance demonstrations, and CEMS performance evaluations and establish operating limits according to the requirements in the following table]

RIN 2060–AM83

National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendments.

SUMMARY: On October 13, 2004, the EPA issued amendments to the national emission standards for coke oven pushing, quenching, and battery stacks as a direct final rule, along with a parallel proposal to be used as a basis for final action in the event we received any adverse comments. Because an adverse comment was received on the provisions related to operation and maintenance requirements, we have previously withdrawn the corresponding part of the direct final rule. After considering the comment, EPA is promulgating the provisions that were withdrawn based on the proposed rule published on October 13, 2004.

EFFECTIVE DATE: August 2, 2005.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. OGC–2004–0004. All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket.* Although listed in the index, some information is not publicly available, *i.e.*, confidential business information or other information whose disclosure is restricted by statute. Certain other information, such as copyrighted materials, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy form at the Air and Radiation Docket, Docket ID No. OGC–2004–0004, EPA Docket Center (EPA/DC), EPA West, Room B102, 1301 Constitution Ave., NW, Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Bob Schell, Emission Standards Division (C439–02), Office of Air Quality Planning and Standards, EPA, Research Triangle Park, NC 27711, telephone number (919) 541–4116, e-mail address *schell.bob@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by this action include:

Category	NAICS code [1]	Examples of regulated entities
Industry	331111, 324199	Coke plants and integrated iron and steel mills.
Federal government		Not affected.
State/local/tribal government		Not affected.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in 40 CFR 63.7281 of the national emission standards for hazardous air pollutants (NESHAP) for coke ovens: pushing, quenching, and battery stacks. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web. In addition to being available in the docket, an electronic copy of today's final rule amendments will also be available on the Worldwide Web (WWW) through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the final rule amendments will be placed on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by October 3, 2005. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Under CAA section 307(b)(2), the requirements established by the final rule amendments may not be challenged later in civil or criminal proceedings brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
II. Summary of the Final Rule Amendments
III. Response to Comments on the Proposed Amendments to the NESHAP for Coke Oven Pushing, Quenching, and Battery Stacks

H. Executive Order 13211: Actions that Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

On April 14, 2003 (68 FR 18008), EPA issued the NESHAP for pushing, quenching, and battery stacks at new and existing coke oven batteries (40 CFR part 63, subpart CCCCC). The NESHAP implement section 112(d) of the CAA by requiring all major sources to meet emission standards for hazardous air pollutants reflecting application of the maximum achievable control technology.

After publication of the NESHAP, the American Iron and Steel Institute (AISI)/American Coke and Coal Chemicals Institute (ACCCI) Coke Oven Environmental Task Force (COETF) filed a petition for review challenging the final rule (*AISI/ACCCI Coke Oven Environmental Task Force* v. *U.S. Environmental Protection Agency*, No. 03–1167, D.C. Cir.). The petitioners raised issues concerning:

- The provisions requiring owners or operators of coke plants having a pushing emission control device to install, operate and maintain devices to monitor daily average fan motor amperes (or volumetric flow rate at the inlet of the control device and maintain daily average volumetric flow rate) at or above minimum levels established during initial performance tests. These provisions are included in 40 CFR 63.7290, 63.7323(c), 63.7326(a)(4), 63.7330(d), 63.7331(g) and (h), and 63.7333(d).
- The provisions requiring monthly inspections of pressure sensors, dampers, damper switches and other equipment important to the performance of the total emissions capture system which also require that a facility's operation and maintenance plan include requirements to repair any defect or deficiency in the capture system before the next scheduled inspection. These provisions are included in 40 CFR 63.7300(c)(1).

Amendments developed to resolve these concerns were set out in attachment A to a proposed settlement agreement between EPA and COETF. In accordance with CAA section 113(g), we published a notice of the proposed settlement agreement (69 FR 31372, June 3, 2004) and provided a 30-day comment period which ended July 6, 2004. We received no comments on the proposed settlement agreement.

On October 13, 2004, we issued a direct final rule (69 FR 60813) and a parallel proposal (69 FR 60837) to amend the NESHAP. We stated in the preamble to the direct final rule and parallel proposal that if we received significant adverse comments by November 12, 2004 (or by November 29, 2004 if a public hearing was requested), we would publish a timely withdrawal in the Federal Register indicating which provisions would become effective and which provisions would be withdrawn due to adverse comment. We subsequently received an adverse comment from one commenter on the provisions related to the operation and maintenance requirements and withdrew the amendments to 40 CFR 63.7300(c)(1) on January 10, 2005 (70 FR 1670). The remaining provisions, for which we did not receive any adverse comments, became effective on January 11, 2005. After full and careful consideration of the comment, we are promulgating the amendments previously withdrawn based on the parallel proposal published on October 13, 2004.

II. Summary of the Final Rule Amendments

The final rule amendments affect the requirement in 40 CFR 63.7300(c)(1) for the repair of any defect or deficiency in the capture system before the next scheduled inspection. In the event a defect or deficiency is found in the capture system (during a monthly inspection or between inspections), the final rule amendments require the plant owner or operator to complete repairs within 30 days after the date that the defect or deficiency is discovered. If the repairs cannot be completed within 30 days, the plant owner or operator must submit a written request to the permitting authority for an extension of time to complete the repairs. The permitting authority must receive the request no more than 20 days after the date that the defect or deficiency is discovered. The request must contain a description of the defect or deficiency, the steps needed and taken to correct the problem, the interim steps being taken to mitigate the emissions impact of the defect or deficiency, and a proposed schedule for completing the repairs. The request is deemed approved unless and until such time as the permitting authority notifies the plant owner or operator that it objects to the request. The permitting authority may consider all relevant factors in deciding whether to approve or deny the request (including feasibility and safety). Each approved schedule must provide for completion of repairs as expeditiously as practicable, and the permitting authority may request modifications to the proposed schedule as part of the approval process.

We are also making a minor technical clarification to the sampling procedures in 40 CFR 63.7322(b)(2). This clarification is simply that the minimum sample volume is measured as "dry standard" cubic feet.

III. Response to Comments on the Proposed Amendments to the NESHAP for Coke Oven Pushing, Quenching, and Battery Stacks

We received one significant adverse comment on the amendments contained in the parallel proposal published on October 13, 2004. The commenter objected to the proposed requirement that would have allowed the owner or operator an additional 30 days (a total of 60 days) to repair a defect in the capture system applied to pushing emissions. The commenter stated that EPA had many years of experience in reviewing malfunction reports and suggested that any such extension be restricted to specific defects and historical repair times.

We reviewed the proposal and discussed in detail with coke plant operators the types of defects that might require 60 days to repair and their frequency of occurrence. Such defects occur very infrequently and are usually related to structural problems that require an engineering evaluation, scheduling a contractor to make the repairs, and coordinating with the plant's production schedule to allow the repair to be made safely. It is not possible to identify in advance what defects may require more than 30 days, and the events are so infrequent, there is not much historical information on repair times. However, we agree with the commenter in that EPA or the permitting authority should decide when additional time is needed, and that this decision should not be left solely to the discretion of the owner or operator. Consequently, we have revised the operation and maintenance requirement to require the owner or operator to submit a request for approval by the permitting authority for an extension of time to complete a

repair that cannot be completed within 30 days. The request must be received by the permitting authority within 20 days after the defect is first discovered. The owner or operator must provide enough information for the permitting authority to evaluate the request, including a description of the defect, the steps needed and taken to correct the problem, the interim steps being taken to mitigate the emissions impact of the defect, and a proposed schedule for completing the repairs. The permitting authority may approve or disapprove the request or request additional information to aid in the decision.

The commenter also suggested that the owner or operator notify EPA by fax within 24 hours of finding a deficiency with confirmation in writing by mail within 7 days. We do not agree that this notification is necessary because the notification and recordkeeping requirements for startups, shutdowns, and malfunctions (SSM) in 40 CFR 63.6(e) of the General Provisions (40 CFR part 63, subpart A) are in full effect in this case. The specific requirements in these amendments for capture systems as applied to pushing emissions are in addition to the SSM requirements and do not replace them. The SSM notification requirements have been designed to provide the permitting authority with timely and relevant information in the event that all steps in the SSM plan are not implemented. These requirements attempt to strike a balance between providing relevant information and avoiding unnecessary reporting of minor events (*e.g.*, when a malfunction is promptly corrected) that would increase the burden to both the permitting authority and the owner or operator.

IV. Summary of Environmental, Energy, and Economic Impacts

The final rule amendments will have no effect on environmental, energy, or non-air health impacts because none of the changes affect the stringency of the existing emission limits. No costs or economic impacts are associated with the amendments.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must determine whether the regulatory action is "significant" and, therefore, subject to review by the Office of Management and Budget (OMB) and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this action is not a "significant regulatory action" under the terms of Executive Order 12886 and is, therefore, not subject to OMB review.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. The costs of the information collection requirements associated with the amendments to the operation and maintenance requirements do not increase the existing burden estimates for the final rule. The OMB has previously approved the information collection requirements in the existing rule (40 CFR part 63, subpart CCCCC) under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* and has assigned OMB control number 2060–0521, EPA ICR number 1995.02. A copy of the OMB approved Information Collection Request (ICR) may be obtained from Susan Auby, Collection Strategies Division, U.S. Environmental Protection Agency (2822T), 1200 Pennsylvania Ave., NW., Washington, DC 20460 or by calling (202) 566–1672.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to respond to a collection of information; search existing data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control number for EPA's regulations are listed in 40 CFR part 9.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule amendments. For purposes of assessing the impact of today's final rule amendments on small entities, small entity is defined as: (1) A small business, as defined by the Small Business Administration's regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the proposed rule on small entities" (5 U.S.C. 603 and 604). Thus, an agency may conclude that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule.

We believe there will be a positive impact on small entities because the final rule amendments increase flexibility by providing more time for plants to make repairs that can not be completed within 30 days. These changes are voluntary and do not impose new costs. We have, therefore, concluded that today's final rule amendments will relieve regulatory burden for all small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private

sector. Under section 202 of the UMRA, the EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires the EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least-burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least-costly, most cost-effective, or least-burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before the EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

EPA has determined that the final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any 1 year. No new costs are attributable to the final rule amendments. Thus, the final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA. In addition, the final rule amendments do not significantly or uniquely affect small governments because they contain no requirements that apply to such governments or impose obligations upon them. Therefore, the final rule amendments are not subject to section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected plants are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the final rule amendments.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 6, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule amendments do not have tribal implications, as specified in Executive Order 13175. No tribal governments own or operate any plants subject to the NESHAP for coke oven pushing, quenching, and battery stacks. Thus, Executive Order 13175 does not apply to the final rule amendments.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

We interpret Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule amendments are not subject to Executive Order 13045 because the final rule (and these amendments) are based on technology performance and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

These final amendments are not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer Advancement Act

Section 112(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113; 15 U.S.C. 272 note) directs the EPA to use voluntary consensus standards (VCS) in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impracticable. VCS are technical standards (e.g., material specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA requires EPA to provide Congress, through the OMB, explanations when the Agency decides not to use available and applicable VCS.

This action does not involve technical standards. Therefore, EPA is not considering the use of any VCS.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule amendments and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final rule amendments in the Federal Register. A major rule cannot take effect until 60 days after its publication in the Federal Register. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule amendments will be effective on August 2, 2005.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous

substances, Reporting and recordkeeping requirements.

Dated: July 26, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart CCCCC—[Amended]

■ 2. Section 63.7300 is amended by removing the third (last) sentence in paragraph (c)(1) and adding in its place six new sentences to read as follows:

§ 63.7300 What are my operation and maintenance requirements?

* * * * *

(c) * * *

(1) * * * In the event a defect or deficiency is found in the capture system (during a monthly inspection or between inspections), you must complete repairs within 30 days after the date that the defect or deficiency is discovered. If you determine that the repairs cannot be completed within 30 days, you must submit a written request for an extension of time to complete the repairs that must be received by the permitting authority not more than 20 days after the date that the defect or deficiency is discovered. The request must contain a description of the defect or deficiency, the steps needed and taken to correct the problem, the interim steps being taken to mitigate the emissions impact of the defect or deficiency, and a proposed schedule for completing the repairs. The request shall be deemed approved unless and until such time as the permitting authority notifies you that it objects to the request. The permitting authority may consider all relevant factors in deciding whether to approve or deny the request (including feasibility and safety). Each approved schedule must provide for completion of repairs as expeditiously as practicable, and the permitting authority may request modifications to the proposed schedule as part of the approval process.

* * * * *

■ 3. Section 63.7322 is amended by revising paragraph (b)(2) to read as follows:

§ 63.7322 What test methods and other procedures must I use to demonstrate initial compliance with the emission limits for particulate matter?

* * * * *

(b) * * *

(2) During each particulate matter test run, sample only during periods of actual pushing when the capture system fan and control device are engaged. Collect a minimum sample volume of 30 dry standard cubic feet of gas during each test run. Three valid test runs are needed to comprise a performance test. Each run must start at the beginning of a push and finish at the end of a push (*i.e.*, sample for an integral number of pushes).

* * * * *

BILLING CODE 6560–50–P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 229

[Docket No. 030221039–5204–23; I.D. 072705A]

Taking of Marine Mammals Incidental to Commercial Fishing Operations; Atlantic Large Whale Take Reduction Plan (ALWTRP)

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule.

SUMMARY: The Assistant Administrator for Fisheries (AA), NOAA, announces temporary restrictions consistent with the requirements of the ALWTRP's implementing regulations. These regulations apply to lobster trap/pot and anchored gillnet fishermen in an area totaling approximately 1,240 nm² (4,253 km²), east of Boston, MA, for 15 days. The purpose of this action is to provide protection to an aggregation of northern right whales (right whales).

DATES: Effective beginning at 0001 hours August 4, 2005, through 2400 hours August 18, 2005.

ADDRESSES: Copies of the proposed and final Dynamic Area Management (DAM) rules, Environmental Assessments (EAs), Atlantic Large Whale Take Reduction Team (ALWTRT) meeting summaries, and progress reports on implementation of the ALWTRP may also be obtained by writing Diane Borggaard, NMFS/Northeast Region, One Blackburn Drive, Gloucester, MA 01930.

FOR FURTHER INFORMATION CONTACT: Diane Borggaard, NMFS/Northeast Region, 978–281–9300 x6503; or Kristy Long, NMFS, Office of Protected Resources, 301–713–1401.

SUPPLEMENTARY INFORMATION:

Electronic Access

Several of the background documents for the ALWTRP and the take reduction planning process can be downloaded from the ALWTRP web site at *http://www.nero.noaa.gov/whaletrp/*.

Background

The ALWTRP was developed pursuant to section 118 of the Marine Mammal Protection Act (MMPA) to reduce the incidental mortality and serious injury of three endangered species of whales (right, fin, and humpback) due to incidental interaction with commercial fishing activities. In addition, the measures identified in the ALWTRP would provide conservation benefits to a fourth species (minke), which are neither listed as endangered nor threatened under the Endangered Species Act (ESA). The ALWTRP, implemented through regulations codified at 50 CFR 229.32, relies on a combination of fishing gear modifications and time/area closures to reduce the risk of whales becoming entangled in commercial fishing gear (and potentially suffering serious injury or mortality as a result).

On January 9, 2002, NMFS published the final rule to implement the ALWTRP's DAM program (67 FR 1133). On August 26, 2003, NMFS amended the regulations by publishing a final rule, which specifically identified gear modifications that may be allowed in a DAM zone (68 FR 51195). The DAM program provides specific authority for NMFS to restrict temporarily on an expedited basis the use of lobster trap/pot and anchored gillnet fishing gear in areas north of 40° N. lat. to protect right whales. Under the DAM program, NMFS may: (1) require the removal of all lobster trap/pot and anchored gillnet fishing gear for a 15–day period; (2) allow lobster trap/pot and anchored gillnet fishing within a DAM zone with gear modifications determined by NMFS to sufficiently reduce the risk of entanglement; and/or (3) issue an alert to fishermen requesting the voluntary removal of all lobster trap/pot and anchored gillnet gear for a 15–day period and asking fishermen not to set any additional gear in the DAM zone during the 15–day period.

Approved: June 30, 2005.

Mark E. Matthews,

Deputy Commissioner for Services and Enforcement.

Eric Solomon,

Acting Deputy Assistant Secretary of the Treasury (Tax Policy).

RIN 2060–AE46

National Emission Standards for Hazardous Air Pollutants for Primary Copper Smelting

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendments.

SUMMARY: EPA is amending the national emission standards for hazardous air pollutants (NESHAP) for primary copper smelting to correct the monitoring requirements for control systems other than baghouses and venturi wet scrubbers.

DATES: Effective July 14, 2005.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. OAR–2003–0185. All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket.* Although listed in the index, some information is not publicly available, *i.e.*, confidential business information or other information whose disclosure is restricted by statute. Certain other information, such as copyrighted materials, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy form at the Air and Radiation Docket, Docket ID No. OAR–2003–0185, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Steve Fruh, Emission Standards Division (C439–02), Office of Air Quality Planning and Standards, U.S. EPA, Research Triangle Park, NC 27711, telephone number (919) 541–2837, e-mail address: *fruh.steve@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by this action include:

Category	NAICS code[1]	Examples of regulated entities
Industry	331411	Primary copper smelters.
Federal government		Not affected.
State/local/tribal government		Not affected.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in 40 CFR 63.1441 of the NESHAP for primary copper smelting. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of today's final amendments will also be available on the World Wide Web (WWW) through the Technology Transfer Network (TTN). A copy of the final amendments will be placed on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control.

I. Background

We promulgated the NESHAP for primary copper smelting (40 CFR 63, subpart QQQ) on June 12, 2002 (68 FR 40478). The final rule establishes emissions limitations and work practice standards for primary copper smelters that use batch copper converters and are a major source of hazardous air pollutant (HAP) emissions. We received a petition (included in the docket for today's final amendments) asking us to review the requirements for specific operating parameters that must be monitored when an owner or operator uses a control device other than a baghouse (fabric filter) or a venturi wet scrubber to comply with the rule. Upon review of the monitoring requirements in subpart QQQ, we discovered an error in the regulatory language for the final rule that references the operating parameters to be monitored when a control device other than a baghouse or a venturi wet scrubber is used.

If an owner or operator of a primary copper smelter elects to use a control device other than a baghouse or venturi wet scrubber for an emissions source subject to a particulate emissions limit under the final rule (*e.g.*, use an electrostatic precipitator), the rule requires that the owner or operator continuously monitor and record appropriate operating parameters for the type of control device used to demonstrate compliance with the applicable emissions standard. In such cases, the final rule does not specify the individual operating parameters that must be monitored. Instead, the owner or operator is required to select specific operating parameters appropriate for the control device design that the owner or operator determines to be a representative and reliable indicator of the control device performance. During the initial performance test that the owner or operator conducts to demonstrate compliance with the applicable emissions standard, operating limits for each of the selected operating parameters are established on a site-specific basis using the actual operating values for the control device recorded while the performance test is conducted. Continuous compliance with the emissions standard is demonstrated by maintaining the selected operating parameters within the operating limits established during the performance test.

Under the monitoring requirements for control devices other than baghouses or venturi wet scrubbers in 40 CFR 63.1452(d) and 40 CFR 63.1453(e), language referencing the operating parameters for venturi wet scrubbers (*i.e.*, hourly average pressure drop and water flow) was incorrectly included in these paragraphs. In place of the reference to venturi wet scrubbers, the rule language in 40 CFR 63.1452(d) and 40 CFR 63.1453(e) should implement

National Emission Standards for Hazardous Air Pollutants: Requirements for Control Technology Determinations for Major Sources in Accordance With Clean Air Act Sections, Sections 112(g) and 112(j)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendment.

SUMMARY: We are amending table 1 to subpart B of part 63 to reflect the revised deadlines in a recently amended consent decree. The final rule amendment (and amended consent decree) relates to boilers and hydrochloric acid production furnaces that burn hazardous waste. We are making the amendment by final rule, without prior proposal, because we view the amendment as a technical correction to an existing regulation.

DATES: *Effective Dates:* July 11, 2005.

ADDRESSES: *Docket:* The docket for the final rule amendment is Docket ID No. OAR–2002–0038. All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket.* Although listed in the index, some information is not publicly available, *i.e.*, confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at the HQ EPA Docket Center, Docket ID No. OAR–2002–0038, EPA West Building, Room B–102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

FOR FURTHER INFORMATION CONTACT: Mr. Rick Colyer, EPA, Office of Air Quality Planning and Standards, Emission Standards Division, Minerals and Inorganic Chemicals Group (C504–05), Research Triangle Park, North Carolina 27711; telephone number (919) 541–5262; fax number (919) 541–5600; e-mail address: *colyer.rick@epa.gov.*

SUPPLEMENTARY INFORMATION: Section 553 of the Administrative Procedure Act, 5 U.S.C. 553(b)(B), provides that, when an agency for good cause finds that notice and public procedure are impracticable, unnecessary, or contrary to the public interest, the agency may issue a rule without providing notice and an opportunity for public comment. The EPA has determined that there is good cause for making today's rule final without prior proposal and opportunity for public comment because the change is simply a conforming change to be

consistent with a judicial consent decree date change. Thus, notice and public procedure are unnecessary. EPA finds that this constitutes good cause under 5 U.S.C. 553(b)(B).

Regulated Entities. Categories and entities potentially regulated by this action include:

TABLE 1.—REGULATED CATEGORIES AND ENTITIES

Category	NAICS [1]	Examples of regulated entities
Industrial/commercial /institutional boilers and process heaters, and hydrochloric acid production furnaces that combust hazardous waste.	327992	Ground or treated mineral and earth manufacturing.
	325	Chemical manufacturers.
	324	Petroleum refiners.
	331	Primary aluminum.
	333	Photographic equipment and supplies.
	488, 561, 562	Sanitary services, N.E.C.[2]
	421	Scrap and waste materials.
	422	Chemical and allied products, N.E.C.[2]
	512, 541, 561, 812	Business services, N.E.C.[2]
	512, 514, 541, 711	Services, N.E.C.[2]
	924	Air, water, and solid waste management.

[1] North American Industry Classification System.
[2] Not elsewhere classified.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Worldwide Web (WWW). In addition to being available in the docket, electronic copies of today's action will be posted on the Technology Transfer Network's (TTN) policy and guidance information page at *http://www.epa.gov/ttn/caaa.* The TTN provides information and technology exchange in various areas of air pollution control.

Judicial Review. Under section 307(b)(1) of the Clean Air Act (CAA), judicial review of the final rule amendment is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia by September 9, 2005. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule amendment may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

I. New Schedule for Part 2 Permit Applications

Section 112(j) of the CAA provides a mechanism for subjecting major sources to emission standards reflecting performance of maximum available control technology (MACT) in the event that EPA fails to issue a MACT standard within the deadlines established in CAA section 112(e). In essence, if EPA fails to issue a timely MACT standard, section 112(j) requires major sources to submit permit applications to the relevant permitting authority. The permitting authority must then establish emission limitations for the source representing the authority's best estimate of what the MACT standard for the source would have been.

On May 30, 2003 (68 FR 32586), EPA issued final rules establishing dates for submitting CAA section 112(j) Part 2 permit applications, and provisions relating to the substance of those applications should they become due. Today's action deals solely with the issue of applicable dates for submitting applications.

Section 112(j) Part 2 permit application submittal dates are codified in subpart B of 40 CFR part 63 by source category. The dates are 60 days after the scheduled MACT rule completion dates for the respective source category established by the consent decree entered in *Sierra Club* v. *Johnson,* no. 1:01CV01537 (D.C.D.C.). In adopting these dates, and in particular by which the dates are tied to consent decree deadlines, we considered the possibility of what would happen if the consent decree deadlines were modified. We stated that if the deadline for promulgation of any MACT standards which appear in the consent decree is extended by the District Court in accordance with the provisions of that decree, we will consider at that time whether any corresponding adjustment in the schedule for section 112(j) Part 2 applications set forth in 40 CFR part 63, subpart B, is necessary and appropriate. We added that if we conclude that a change in the schedule for section 112(j) Part 2 applications is warranted, we will consider the use of expedited procedures. (*See* 68 FR 32594–32595.)

That possibility has now occurred. On March 30, 2005, EPA filed an unopposed motion to modify the consent decree dates for completing MACT standards for two source categories, boilers that burn hazardous waste and hydrochloric acid production furnaces that burn hazardous waste. The court entered its order modifying the decree on April 1, 2005. EPA is now required to complete the MACT standards for these source categories by September 14, 2005, a 90-day extension of the original date.

The current deadline for submitting CAA section 112(j) Part 2 permit applications is August 13, 2005 (60 days from the original rule completion date in the consent decree). We are amending the section 112(j) Part 2 permit application date so that it now follows the revised consent decree date by 60 days. Consequently, the new date in table 1 to subpart B of part 63 is November 14, 2005. The EPA fully expects to meet the revised consent decree deadline (and so informed the court in our extension motion), so we do not anticipate these permit applications having to be submitted.

We are issuing today's amendment as a final rule without prior proposal. We view this as a technical correction to the original rule, since permit applications are tied to consent decree dates (an issue discussed and fully commented upon in the initial rulemaking). Today's rule thus simply conforms the permit application date to the date in the revised consent decree. Under these circumstances, we believe that opportunity for comment is unnecessary, within the meaning of 5 U.S.C. 553(b)(3)(B). For the same reason, we believe there is good cause within the meaning of 5 U.S.C. 553(d)(3) to make this amendment effective immediately.

II. Statutory and Executive Order Reviews

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is

not a "significant regulatory action" and is, therefore, not subject to review by the Office of Management and Budget. Because the agency has made a "good cause" finding that this action is not subject to notice-and-comment requirements under the Administrative Procedure Act or any other statute, it is not subject to the regulatory flexibility provisions of the Regulatory Flexibility Act (5 U.S.C. 601, *et seq.*) or to sections 202 and 205 of the Unfunded Mandates Reform Act of 1995 (UMRA) (Pub. L. 104–4). In addition, this action does not significantly or uniquely affect small governments or impose a significant intergovernmental mandate, as described in sections 203 and 204 of UMRA. This action also does not significantly or uniquely affect the communities of tribal governments, as specified by Executive Order 13175 (65 FR 67249, November 9, 2000). This action will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999). This action also is not subject to Executive Order 13045 (62 FR 19885, April 23, 1997) because it is not economically significant. This action is not a "significant energy action" as defined in Executive Order 13211 (66 FR 28355, May 22, 2001) because it will not have a significant adverse effect on the supply, distribution, or use of energy.

This technical correction action does not involve technical standards; thus, the requirements of section 12(d) of the National Technology Transfer and Advancement Act of 1995, (15 U.S.C. 272 note) do not apply. This action also does not involve special consideration of environmental justice related issues as required by Executive Order 12898 (59 FR 7629, February 16, 1994). In issuing the final rule amendment, EPA has taken necessary steps to eliminate drafting errors and ambiguity, minimize potential litigation, and provide a clear legal standard for affected conduct, as required by section 3 of Executive Order 12988 (61 FR 4729, February 7, 1996). The EPA has complied with Executive Order 12630 (53 FR 8859, March 15, 1988), by examining the takings implications of the final rule amendment in accordance with the "Attorney General's Supplemental Guidelines for the Evaluation of Risk and Avoidance of Unanticipated Takings" issued under the executive order. This action does not impose an information collection burden under the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501, *et seq.*). The EPA's compliance with these statutes and Executive Orders for the underlying rule is discussed in the May 30, 2003 Federal Register action.

The Congressional Review Act (CRA), (5 U.S.C. 801, *et seq.*), as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. Section 808 allows the issuing agency to make a rule effective sooner than otherwise provided by the CRA if the agency makes a good cause finding that notice and public procedure is impracticable, unnecessary, or contrary to the public interest. This determination must be supported by a brief statement. 5 U.S.C. 808(2). As stated previously, EPA has made such a good cause finding, including the reasons therefore, and established an effective date of July 11, 2005. The EPA will submit a report containing this action and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the Federal Register. This action is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: July 5, 2005.

Jeffrey R. Holmstead,

Assistant Administrator for Air and Radiation.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart B—[Amended]

■ 2. Table 1 to subpart B of part 63 is amended by revising the entry dated "8/13/05" to read as follows:

TABLE 1 TO SUBPART B OF PART 63—SECTION 112(J) PART 2 APPLICATION DUE DATES

Due date	MACT standard
* * * * *	
11/14/05 ..	Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters.[5]

Fisheries of the Exclusive Economic Zone Off Alaska; License Limitation Program for the Scallop Fishery

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Final rule.

SUMMARY: NMFS issues a final rule to implement Amendment 10 to the Fishery Management Plan for the Scallop Fishery off Alaska (FMP), which modifies the gear endorsements under the License Limitation Program (LLP) for the scallop fishery. This action is necessary to allow increased participation by LLP license holders in the scallop fisheries off Alaska. This action is intended to promote the goals and objectives of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the FMP, and other applicable laws.

DATES: Effective on August 10, 2005.

ADDRESSES: Copies of Amendment 10 and the Environmental Assessment/Regulatory Impact Review/Final Regulatory Flexibility Analysis (EA/RIR/FRFA) prepared for this action may be obtained from the NMFS Alaska Region, P.O. Box 21668, Juneau, AK 99802, Attn: Lori Durall, and on the Alaska Region, NMFS, website at *http://www.fakr.noaa.gov.*

FOR FURTHER INFORMATION CONTACT: Gretchen Harrington, 907–586–7228.

[OAR–2003–0121; FRL–7932–2]

RIN A2060–AN09

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule; amendments.

SUMMARY: On November 10, 2003, EPA promulgated national emission standards for hazardous air pollutants (NESHAP) for miscellaneous organic chemical manufacturing under the authority of section 112 of the Clean Air Act (CAA). We are amending the NESHAP by clarifying the compliance requirements for flares and the alternative standard, which limits the outlet concentration to 20 parts per million. We are amending the NESHAP by extending the vapor balancing alternative to cover transfers from barges to storage tanks, amending the procedures for correcting measured concentrations at the outlet of combustion devices to correct for dilution by supplemental gas, and clarifying the signature requirements for the notification of compliance status report. The direct final rule amendments also specify requirements for effluent from control devices, clarify the definition of the term continuous process vent, and correct several referencing and drafting errors. We are issuing the amendments by direct final rule, without prior proposal, because we view the revisions as noncontroversial and anticipate no adverse comments.

In the Proposed Rules section of this Federal Register, we are publishing a separate document that will serve as the proposal in the event that timely adverse comments are received.

DATES: The direct final rule is effective on August 30, 2005, without further notice, unless EPA receives adverse written comment by August 1, 2005, or if a public hearing is requested by July 11, 2005. If EPA receives such comments or a hearing is requested, EPA will publish a timely withdrawal in the Federal Register indicating which provisions will become effective, and which provisions are being withdrawn due to adverse comment.

ADDRESSES: Submit your comments, identified by Docket ID No. OAR–2003–0121, by one of the following methods:

- Federal eRulemaking Portal: *http://www.regulations.gov*. Follow the on-line instructions for submitting comments.
- Agency Web site: *http://www.epa.gov/edocket*. EDOCKET, EPA's electronic public docket and comment system, is EPA's preferred method for receiving comments. Follow the on-line instructions for submitting comments.
- E-mail: *air-and-r-docket@epa.gov*.
- Fax: (202) 566–1741.
- Mail: EPA Docket Center, Environmental Protection Agency, Mailcode: 6102T, 1200 Pennsylvania Avenue, NW., Washington, DC 20460. Please include a duplicate copy, if possible.
- Hand Delivery: Air and Radiation Docket, Environmental Protection Agency, 1301 Constitution Avenue, NW., Room B–108, Washington, DC 20460. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

We request that a separate copy also be sent to the contact person listed below (*see* **FOR FURTHER INFORMATION CONTACT**).

Instructions: Direct your comments to Docket ID No. OAR–2003–0121. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *http://www.epa.gov/edocket*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through EDOCKET, regulations.gov, or e-mail. The EPA EDOCKET and the Federal regulations.gov Web sites are "anonymous access" systems, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through EDOCKET or regulations.gov, your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit EDOCKET on-line or see the Federal Register of May 31, 2002 (67 FR 38102).

Docket: All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket*. Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at the Air and Radiation Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: Mr. Randy McDonald, Organic Chemicals Group, Emission Standards Division (Mail Code C504–04), Office of Air Planning and Standards, EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5402, electronic mail address *mcdonald.randy@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The regulated category and entities affected by this action include:

Category	NAICS*	Examples of regulated entities
Industry	3251, 3252, 3254, 3255, 3256, and 3259, with several exceptions.	Producers of specialty organic chemicals, explosives, certain polymers and resins, and certain pesticide intermediates.

*North American Industrial Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers likely to be interested in the revisions to the rule affected by this action. To determine whether your facility, company, business, organization, etc., is regulated by this action, you should carefully examine all of the applicability criteria in 40 CFR 63.2435 of the NESHAP. If you have questions regarding the applicability of these amendments to a particular entity, consult the person listed in the preceding FOR FURTHER INFORMATION CONTACT section.

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of the direct final rule amendments will also be available on the WWW through EPA's Technology Transfer Network (TTN). Following signature by the EPA Administrator, a copy of the direct final rule amendments will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control.

Comments. We are publishing the direct final rule amendments without prior proposal because we view the amendments as noncontroversial and do not anticipate adverse comments. However, in the Proposed Rules section of this **Federal Register**, we are publishing a separate document that will serve as the proposal in the event that timely adverse comments are received. If we receive such adverse comments on the amendments, we will publish a timely withdrawal in the **Federal Register** informing the public which provisions will become effective and which provisions are being withdrawn due to adverse comment. We will address all public comments in a subsequent final rule based on the proposed rule. Any of the distinct amendments in the direct final rule for which we do not receive adverse comment will become effective on the date set out above. We will not institute a second comment period on the direct final rule amendments. Any parties interested in commenting must do so at this time.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the direct final rule amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia by August 30, 2005. Under section 307(d)(7)(B) of the CAA, only an objection to the direct final rule amendments that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the direct final rule amendments may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Why are we amending the rule?
II. What amendments are we making to the rule?
III. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments
G. Executive Order 13045: Protection of Children for Environmental Health Risks and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Why Are We Amending the Rule?

On November 10, 2003, we promulgated NESHAP for Miscellaneous Organic Chemical Manufacturing as subpart FFFF in 40 CFR part 63 (68 FR 63852). Since promulgation of the NESHAP, we determined that the alternative standard, which limits the outlet concentration to 20 parts per million, did not contain several provisions that have been included in the same alternative standard in other rules, that the flare provisions are not consistent with other rules, that the procedures to account for dilution air added to vent streams before a combustion device are unnecessarily restrictive, and that the vapor balancing alternative for storage tanks could be extended to vapor balancing to barges.

II. What Amendments Are We Making to the Rule?

Amendments to the Procedure for Correcting Measured Concentrations to Account for Supplemental Gases. If you comply with an outlet concentration emission limit and use a combustion device, the NESHAP require you to correct the measured outlet concentration to 3 percent oxygen to account for dilution caused by adding supplemental gases to the emission stream prior to the control device. The direct final rule amendments add a second option that allows you to correct only for the actual amount of supplemental gas. This option is consistent with the correction requirement in the final rule for noncombustion devices.

The correction to 3 percent oxygen was originally used in new source performance standards for air oxidation unit processes, distillation operations, and reactor processes in the synthetic organic chemical manufacturing industry (40 CFR part 60, subparts III, NNN and RRR). The value of 3 percent represents good engineering practice when oxygen-deficient streams are combusted with supplemental combustion air (*i.e.*, a supplemental gas). To prevent owners or operators from diluting streams to meet the outlet concentration emission limit for noncombustion devices, the NESHAP require correction of the actual flowrate of supplemental gases. The direct final rule amends 40 CFR 63.2450(i) to allow a correction based on the actual flowrate of supplemental gases, as well as the correction to 3 percent oxygen for combustion devices if supplemental gases are used as allowed by the NESHAP. In addition, the direct final rule amends the definition of supplemental gas to mirror the definition of supplemental combustion air in 40 CFR 63.1312, which is appropriate for both combustion and noncumbustion devices.

Clarification of the Initial Compliance Requirements for Flares. The direct final rule clarifies the initial compliance requirements for flares because we understand the promulgated language has caused some confusion. If you use a flare to comply with an emission limit, the NESHAP specify that you must comply with the requirements in 40 CFR 63.982(b), which in turn, references 40 CFR 63.987. These are the only compliance requirements that apply to flares, including flares used to control batch process vents. Thus, the procedures in § 63.2460(c)(2)(i) of the NESHAP to demonstrate compliance with a percent reduction emission limit by comparing the uncontrolled and controlled emission limits apply only if you use a non-flare control device. You never have to demonstrate the percent reduction for a flare; you only have to meet the requirements in 40 CFR 63.987. The direct final rule adds a sentence to 40 CFR 63.2460(c)(2)(i) to clarify this point.

The requirement in 40 CFR 63.2460(c)(2)(ii) to establish emission profiles before conducting a performance test or design evaluation for a control device that controls emissions from batch process vents also applies when you use a non-flare control device. The direct final rule

revises 40 CFR 63.2460(c)(2)(ii) to clarify this point.

Amendments to the Initial Compliance Requirements for Flares Used to Control Batch Process Vents. The direct final rule adds a new paragraph (b)(4)(iii) to 40 CFR 63.2460 to specify that you may designate emission streams that are controlled with a flare as Group 1. By meeting the requirements in 40 CFR 63.987, the owner or operator demonstrates compliance with the HAP destruction requirements in the NESHAP.

Amendments to Performance Testing for Demonstrating Initial Compliance with a Percent Reduction Requirement. Section 63.2450(d) through (f) of the NESHAP specify that you must comply with various requirements of 40 CFR part 63, subpart SS, for performance testing provisions. One exception is that the option in 40 CFR 63.997(e)(2)(iv) to demonstrate compliance with a percent reduction emission limit by measuring total organic compounds (TOC) was prohibited by 40 CFR 63.2450(n) of the NESHAP. Since promulgation, we have determined that this restriction is unwarranted because 40 CFR 63.997(e)(2)(iv)(G) and (H) describe procedures for using Methods 25 and 25A of 40 CFR part 60, appendix A, for measuring TOC. The direct final rule removes 40 CFR 63.2450(n) to allow compliance with a percent reduction limit to be demonstrated by measuring either total organic HAP or TOC as specified in 40 CFR 63.997(e)(2)(iv).

Amendments to the Alternative Standard. The direct final rule amendments add additional options for the monitoring provisions to the alternative standard and adds planned routine maintenance provisions for storage tanks. The direct final rule amendments also permit compliance with the emission limits and work practice standards in Tables 1 through 4 to subpart FFFF of part 63 to be met by limiting the outlet concentration and demonstrating compliance with the outlet concentration emission limit through continuous emission monitoring. The direct final rule amendments allow monitoring of operating parameters as an alternative to adjusting measured concentrations to account for dilution caused by supplemental gases, indicate that the planned routine maintenance provisions apply under the alternative standard for control devices that are used to control emissions from storage tanks, and clarify a couple of references.

The introductory text in 40 CFR 63.2505(b) of the NESHAP currently requires you to meet the requirements specified in 40 CFR 63.1258(b)(5)(i) to demonstrate compliance with the alternative standard. This reference inadvertently excludes the options in 40 CFR 63.1258(b)(5)(ii) for monitoring operating parameters as an alternative to adjusting the measured concentrations to account for the dilution caused by adding supplemental gases to the emission stream prior to the control device. For combustion devices, the option requires operation above minimum temperature and residence time limits and monitoring to demonstrate continuous compliance with the limits. For noncombustion devices used to control emissions from dense gas systems (*i.e.*, systems with oxygen levels less than 12 percent), the option requires calculation of a flowrate setpoint and monitoring of the flowrate to demonstrate continuous compliance with the setpoint. These options are as valid for miscellaneous organic chemical manufacturing sources as for pharmaceuticals production sources. The preamble to the proposed amendments to the NESHAP for pharmaceuticals production describes the rationale for these alternatives (65 FR 19152, April 10, 2000). As detailed therein, available data indicate that a properly designed and operated combustion device will reduce emissions by 98 percent if it maintains the specified residence time and temperature. With respect to dense gas systems, the flowrate setpoint calculated for dense gas systems is an indicator of HAP concentration in the gas stream into the control device, and maintaining the flowrate below this value would demonstrate that significant dilution is not occurring. Therefore, the direct final rule amendments modify the introductory text in § 63.2505(b) to reference all of the provisions in § 63.1258(b)(5).

The direct final rule amendments also add language specifying that the alternative standard does not apply to emissions from storage tanks during periods of planned routine maintenance of the control device. All of this language is identical to the planned routine maintenance language in 40 CFR 63.2470 that applies if you comply with the percent reduction emission limit. The exemption was included for compliance with the percent reduction emission limit because the storage tank cannot necessarily be shutdown while the control device is shutdown for maintenance. The same rationale applies for the alternative standard.

Section 63.2505(b)(5)(ii) in the NESHAP specifies requirements for continuous parameter monitoring systems (CPMS) for scrubbers used to comply with the option to reduce hydrogen halide and halogen HAP emissions after a combustion device by 95 percent. The current language specifies that you must install, operate, and maintain CPMS for the scrubber as specified in 40 CFR 63.2450(k). Since the actual requirements are in 40 CFR 63.994(c), which is modified by § 63.2450(k), the direct final rule amendments revise the provision to reference both sections. Finally, the direct final rule amendments reorder two of the paragraphs in § 63.2505(b) to improve readability.

Amendments to the Vapor Balancing Alternative for Storage Tanks. The direct final rule amendments extend vapor balancing to cover liquid transfers from barges to storage tanks. The NESHAP allow vapor balancing from storage tanks to tank trucks and railcars. Since promulgation of the NESHAP, we have determined that barges are used to supply materials to storage tanks in the miscellaneous organic chemical manufacturing industry, and the vapor balancing procedures are as valid for barges as for tank trucks and railcars. The only difference is that the testing procedures to determine vapor-tightness of barges are specified in 40 CFR 61.304(f).

Amendments to the Definition of Group 1 Wastewater. The direct final rule amendments add a new paragraph (4) to § 63.2485(c) to specify that effluent from a water scrubber or any other control device that has been used to comply with an emission limit for process vents is Group 1 wastewater, provided the process vent emission stream is Group 1 for HAP listed in Table 8 to 40 CFR part 63, subpart FFFF. This change is needed to ensure that HAP removed from an emission stream are destroyed or otherwise treated so that they are not simply re-emitted. The new language is similar to requirements the NESHAP for Pharmaceuticals Production.

Amendment to the Definition of Continuous Process Vent. Section 63.2550(i) of the NESHAP defines "continuous process vent" using the same language as in 40 CFR 63.107 of the Hazardous Organic NESHAP (HON), except that references to other sections in the HON are replaced by references to provisions in 40 CFR part 63, subpart FFFF. Section 63.107(d) of the HON specifies that a gas stream must contain greater than 0.005 weight percent total organic HAP to be a continuous process vent. The direct final rule amendments change "total organic HAP" to "total HAP" for the purposes of subpart FFFF, to clarify the applicability of the emission limits for inorganic HAP

emissions from process vents that are specified in Table 3 to subpart FFFF.

According to the current definition of *Continuous process vent* in the NESHAP, if the only HAP in a gas stream is inorganic HAP, then it would not be a continuous process vent (or any kind of process vent), even if it meets all of the other criteria specified in 40 CFR 63.107. This means it also would not be subject to the emission limits for inorganic HAP in Table 3 to subpart FFFF of part 63. However, in setting the MACT floor for inorganic HAP emissions, we used all available data for gas streams from processing operations, not just data for streams that also had organic HAP. Changing § 63.107(d) for the purposes of subpart FFFF ensures that such streams from continuous operations are subject to the emission limits for inorganic HAP, as we intended. This change also makes the definition for continuous process vent consistent with the definition for batch process vent, which already includes a threshold based on total HAP.

Clarification of Notification of Compliance Status Reporting Requirements. The introductory text in 40 CFR 63.9(h)(2)(i) requires the owner or operator of an affected source to submit to the Administrator a notification of compliance status, signed by the responsible official who shall certify its accuracy. Table 12 to subpart FFFF of part 63 inadvertently stated that this paragraph does not apply to subpart FFFF. This was not our intent. We intended to specify only that the subparagraphs (A) through (G) do not apply because the types of information to include in the report are specified in § 63.2520(d) of subpart FFFF rather than § 63.9(h)(2). Therefore, the direct final rule amendments revise the references in the entry for § 63.9(h)(1)—(6) in Table 12 to subpart FFFF to clarify this point.

Miscellaneous Technical Corrections. The direct final rule amendments include several changes to correct references and drafting errors.

III. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that the direct final rule amendments are not a "significant regulatory action" under the terms of Executive Order 12866 and are, therefore, not subject to OMB review.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. This action gives a source owner or operator several additional compliance options. Since they are only options, this action will not increase the information collection burden. The OMB has previously approved the information collection requirements contained in the existing regulations under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and has assigned OMB control number 2060–0533 (EPA ICR No. 1969.02).

Copies of the information collection request (ICR) document(s) may be obtained from Susan Auby, by mail at the Office of Environmental Information, Collection Strategies Division; U.S. EPA (2822T); 1200 Pennsylvania Ave., NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. Include the ICR or OMB number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the direct final rule amendments.

For purposes of assessing the impacts of today's direct final rule amendments on small entities, a small entity is defined as: (1) A small business as defined by the Small Business Administration's regulations at 13 CFR 121.201; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the proposed rule on small entities." 5 U.S.C. 603 and 604. Thus, an agency may conclude that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule.

The direct final rule amendments add several compliance options granting greater flexibility to small entities subject to the final rule that may result in a more efficient use of resources. We have therefore concluded that today's final rule will relieve regulatory burden for all affected small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least-costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least-costly, most cost effective, or least-burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the direct final rule amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or the private sector in any 1 year. The direct final rule amendments provide a source owner or operator with additional options to comply with the standards. Therefore, the direct final rule amendments are not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The direct final rule amendments do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The direct final rule amendments provide a source owner or operator with another option to comply with the standards and, therefore, impose no additional burden on sources. Thus, Executive Order 13132 does not apply to the direct final rule amendments.

In the spirit of Executive Order 13132 and consistent with EPA policy to promote communications between EPA and State and local governments, EPA specifically solicits comment on the direct final rule amendments from State and local officials.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The direct final rule amendments do not have tribal implications, as specified in Executive Order 13175. The direct final rule amendments provide a source owner or operator with another option to comply with the standards and, therefore, impose no additional burden on sources. Thus, Executive Order 13175 does not apply to the direct final rule amendments.

The EPA specifically solicits additional comment on the direct final rule amendments from tribal officials.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. Today's direct final rule amendments are not subject to Executive Order 13045 because they are based on technology performance, not health or safety risks. Furthermore, the direct final rule amendments have been determined not to be "economically significant" as defined under Executive Order 12866.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The direct final rule amendments are not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act of 1995

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law 104–113, 12(d) (15 U.S.C. 272 note), directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards.

No new standard requirements are cited in the direct final rule amendments. Therefore, EPA is not proposing or adopting any voluntary consensus standards in the direct final rule amendments.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides

that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the direct final rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the direct final rule in the Federal Register. The direct final rule is not a "major rule" as defined by 5 U.S.C. 804(2). The direct final rule amendments are effective on August 30, 2005.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: June 24, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart FFFF—[Amended]

■ 2. Section 63.2450 is amended as follows:

■ a. Revising paragraph (i); and

■ b. Removing and reserving paragraph (n).

§ 63.2450 What are my general requirements for complying with this subpart?

* * * * *

(i) *Outlet concentration correction for combustion devices.* When § 63.997(e)(2)(iii)(C) requires you to correct the measured concentration at the outlet of a combustion device to 3 percent oxygen if you add supplemental combustion air, the requirements in either paragraph (i)(1) or (2) of this section apply for the purposes of this subpart.

(1) You must correct the concentration in the gas stream at the outlet of the combustion device to 3 percent oxygen if you add supplemental gases, as defined in § 63.2550, to the vent stream, or;

(2) You must correct the measured concentration for supplemental gases using Equation 1 of § 63.2460; you may use process knowledge and representative operating data to determine the fraction of the total flow due to supplemental gas.

* * * * *

(n) [Reserved]

* * * * *

■ 3. Section 63.2460 is amended as follows:

■ a. Revising paragraph (b)(4) introductory text;

■ b. Adding new paragraph (b)(4)(iii); and

■ c. Revising paragraphs (c)(2)(i) and (ii).

§ 63.2460 What requirements must I meet for batch process vents?

* * * * *

(b) * * *

(4) You may elect to designate the batch process vents within a process as Group 1 and not calculate uncontrolled emissions under either of the situations in paragraph (b)(4)(i), (ii), or (iii) of this section.

* * * * *

(iii) If you comply with an emission limit using a flare that meets the requirements specified in § 63.987.

(c) * * *

(2) * * *

(i) To demonstrate initial compliance with a percent reduction emission limit in Table 2 to this subpart FFFF, you must compare the sums of the controlled and uncontrolled emissions for the applicable Group 1 batch process vents within the process, and show that the specified reduction is met. This requirement does not apply if you comply with the emission limits of Table 2 to this subpart FFFF by using a flare that meets the requirements of § 63.987.

(ii) When you conduct a performance test or design evaluation for a non-flare control device used to control emissions from batch process vents, you must establish emission profiles and conduct the test under worst-case conditions according to § 63.1257(b)(8) instead of under normal operating conditions as specified in § 63.7(e)(1). The requirements in § 63.997(e)(1)(i) and (iii) also do not apply for performance tests conducted to determine compliance with the emission limits for batch process vents. For purposes of this subpart FFFF, references in § 63.997(b)(1) to "methods specified in § 63.997(e)" include the methods specified in § 63.1257(b)(8).

* * * * *

■ 4. Section 63.2470 is amended by adding new paragraph (e)(4) to read as follows:

§ 63.2470 What requirements must I meet for storage tanks?

* * * * *

(e) * * *

(4) You may comply with the vapor balancing alternative in § 63.1253(f) when your storage tank is filled from a barge. All requirements for tank trucks and railcars specified in § 63.1253(f) also apply to barges, except as specified in § 63.2470(e)(4)(i).

(i) When § 63.1253(f)(2) refers to pressure testing certifications, the requirements in 40 CFR 61.304(f) apply for barges.

(ii) [Reserved]

■ 5. Section 63.2485 is amended by adding paragraph (c)(4) and revising paragraph (d)(2) to read as follows:

§ 63.2485 What requirements must I meet for wastewater streams and liquid streams within an MCPU?

* * * * *

(c) * * *

(4) Effluent from a water scrubber or any other control device that has been used to comply with an emission limit for process vents specified in Table 1 or Table 2 to this subpart FFFF, provided the process vent emission stream is Group 1 for HAP listed in Table 8 to this subpart FFFF.

(d) * * *

(2) When § 63.133(a) refers to Table 10 of subpart G of this part 63, the maximum true vapor pressure in the table shall be limited to the HAP listed in Tables 8 and 9 of this subpart FFFF.

* * * * *

■ 6. Section 63.2505 is amended by revising paragraph (b) to read as follows:

§ 63.2505 How do I comply with the alternative standard?

* * * * *

(b) *Compliance requirements.* To demonstrate compliance with paragraph (a) of this section, you must meet the requirements of § 63.1258(b)(5) beginning no later than the initial compliance date specified in § 63.2445, except as specified in paragraphs (b)(1) through (9) of this section.

(1) You must comply with the requirements in § 63.983 and the requirements referenced therein for closed-vent systems.

(2) When § 63.1258(b)(5)(i) refers to §§ 63.1253(d) and 63.1254(c), the requirements in paragraph (a) of this section apply for the purposes of this subpart FFFF.

(3) When § 63.1258(b)(5)(i)(B) refers to "HCl," it means "total hydrogen halide and halogen HAP" for the purposes of this subpart FFFF.

(4) When § 63.1258(b)(5)(ii) refers to § 63.1257(a)(3), it means § 63.2450(j)(5) for the purposes of this subpart FFFF.

(5) You must submit the results of any determination of the target analytes of predominant HAP in the notification of compliance status report.

(6) If you elect to comply with the requirement to reduce hydrogen halide and halogen HAP by greater than or equal to 95 percent by weight in paragraph (a)(1)(i)(C) of this section, you must meet the requirements in paragraphs (b)(6)(i) and (ii) of this section.

(i) Demonstrate initial compliance with the 95 percent reduction by conducting a performance test and setting a site-specific operating limit(s) for the scrubber in accordance with § 63.994 and the requirements referenced therein. You must submit the results of the initial compliance demonstration in the notification of compliance status report.

(ii) Install, operate, and maintain CPMS for the scrubber as specified in §§ 63.994(c) and 63.2450(k), instead of as specified in § 63.1258(b)(5)(i)(C).

(7) If flow to the scrubber could be intermittent, you must install, calibrate, and operate a flow indicator as specified in § 63.2460(c)(7).

(8) Use the operating day as the averaging period for CEMS data and scrubber parameter monitoring data.

(9) The requirements in paragraph (a) of this section do not apply to emissions from storage tanks during periods of planned routine maintenance of the control device that do not exceed 240 hr/yr. You may submit an application to the Administrator requesting an extension of this time limit to a total of 360 hr/yr in accordance with the procedures specified in § 63.2470(d). You must comply with the recordkeeping and reporting specified in §§ 63.998(d)(2)(ii) and 63.999(c)(4) for periods of planned routine maintenance.

■ 7. Section 63.2520 is amended by revising paragraphs (d)(2)(viii) and (e)(9) to read as follows:

§ 63.2520 What reports must I submit and when?

* * * * *

(d) * * *

(2) * * *

(viii) Identify storage tanks for which you are complying with the vapor balancing alternative in § 63.2470(e).

* * * * *

(e) * * *

(9) Applicable records and information for periodic reports as specified in referenced subparts F, G, SS, TT, UU, WW, and GGG of this part 63.

* * * * *

■ 8. Section 63.2525 is amended by revising paragraph (a) to read as follows:

§ 63.2525 What records must I keep?

* * * * *

(a) Each applicable record required by subpart A of this part 63 and in referenced subparts F, G, SS, TT, UU, WW, and GGG of this part 63.

* * * * *

■ 9. Section 63.2550 is amended as follows:

■ a. Adding new paragraph (5) to the definition of the term *Continuous process vent*; and

■ b. Revising the definition for the terms *Supplemental gases* and *Wastewater stream*.

§ 63.2550 What definitions apply to this subpart?

* * * * *

(i) * * *

Continuous process vent * * *

(5) The reference to "total organic HAP" in § 63.107(d) means "total HAP" for the purposes of this subpart FFFF.

* * * * *

Supplemental gases means the air that is added to a vent stream after the vent stream leaves the unit operation. Air that is part of the vent stream as a result of the nature of the unit operation is not considered supplemental gases. Air required to operate combustion device burner(s) is not considered supplemental gases.

* * * * *

Wastewater stream means a stream that contains only wastewater as defined in this paragraph (i).

* * * * *

■ 10. Table 1 to subpart FFFF is amended by revising entry "1" to read as follows:

TABLE 1 TO SUBPART FFFF OF PART 63.—EMISSION LIMITS AND WORK PRACTICE STANDARDS FOR CONTINUOUS PROCESS VENTS

For each . . .	For which . . .	Then you must . . .
1. Group 1 continuous process vent.	a. Not applicable	i. Reduce emissions of total organic HAP by ≥98 percent by weight or to an outlet concentration ≤20 ppmv as organic HAP or TOC by venting emissions through a closed-vent system to any combination of control devices (except a flare); or ii. Reduce emissions of total Reduce organic HAP by venting emissions through a closed vent system to a flare; or iii. Use a recovery device Reduce to maintain the TRE above 1.9 for an existing source or above 5.0 for a new source.
*	*	* * * * * *

■ 11. Table 8 to subpart FFFF is amended by revising entry "51" to read as follows:

TABLE 8 TO SUBPART FFFF OF PART 63.—PARTIALLY SOLUBLE HAZARDOUS AIR POLLUTANTS

Chemical name	CAS No.
* * * * * * *	
51. Tetrachloroethylene (perchloroethylene)	127184
* * * * * * *	

■ 12. Table 9 to subpart FFFF is amended by revising entries "4," "8," "9," and "10" to read as follows:

TABLE 9 TO SUBMIT FFFF OF PART 63.—SOLUBLE HAZARDOUS AIR POLLUTANTS

Chemical name	CAS No.
* * * * * * *	
4. Dimethyl hydrazine (1,1)	57147
* * * * * * *	
8. Ethylene glycol dimethyl ether	110714
9. Ethylene glycol monobutyl ether acetate	112072
10. Ethylene glycol monomethyl ether acetate	110496
* * * * * * *	

■ 13. Table 12 to subpart FFFF is amended by revising the entry for § 63.9(h)(1)–(6) to read as follows:

TABLE 12 TO SUBPART FFFF OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFF

Citation	Subject	Explanation
* * * * * * *		
63.9(h)(1)–(6)	Notification of Compliance Status.	Yes, except subpart FFFF has no opacity or VE limits, and 63.9(h)(2)(i)(A) through (G) and (ii) do not apply because 63.2520(d) specifies the required contents and due date of the notification of compliance status report.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR–2003–0193; FRL–7925–8]

RIN 2060–AL91

National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; correction.

SUMMARY: We are taking final action to amend the national emission standards for hazardous air pollutants (NESHAP) for Cellulose Products Manufacturing. This amendment will correct the date in the definition of a process change that was included in the final rule. Without this amendment, the earliest date on which changes could qualify as process changes for compliance purposes would be January 1992. With this action, process changes implemented in January 1991 and later can qualify as process changes for compliance purposes.

This action corrects an error by the Agency and makes the regulatory language consistent with the technical background work that was performed during the development of the standards. Thus, it is proper to issue this final rule correction without notice and comment.

DATES: *Effective Date:* The correction is effective on June 24, 2005.

FOR FURTHER INFORMATION CONTACT: Mr. Bill Schrock, Organic Chemicals Group, Emission Standards Division (C504–04), Office of Air Quality Planning and Standards, EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5032, facsimile number (919) 541–3470, electronic mail (e-mail) address *schrock.bill@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

The EPA, under section 112 of the CAA, promulgated the NESHAP for cellulose products manufacturing on June 11, 2002 (67 FR 40044). The final rule, codified at 40 CFR part 63, subpart UUUU, includes definitions of a process change for the viscose industry, as well as the cellulose ether industry. Following promulgation of the rule, Teepak, Inc., requested that we issue specific amendments to the final rule changing the date that process changes that reduced emissions could be utilized for the purpose of demonstrating compliance. Their request was based on the calculations for the maximum achievable control technology (MACT) floor which included these process changes.

II. Summary of Amendment

This document corrects the definition for "viscose process change" under 40 CFR 63.5610 which states that the process change must occur "no earlier than January 1992." In the CAA section 114 information collection request sent to the industry in 1998, EPA requested information on source reduction measures implemented since 1987. In their response, Teepak provided information on three projects that reduced emissions per unit length of food casing produced, and one of these projects was implemented in January 1991. According to Teepak, EPA indicated it would credit Teepak for emission reductions from that project. Noting that the Teepak level of control was chosen as the MACT floor, Teepak has recommended that the definition for "viscose process change" be amended to "no earlier than January 1991."

The definition for "viscose process change" as promulgated effectively excludes the 1991 process change at Teepak that was accounted for in our MACT floor calculations. Since we established the MACT floor for cellulose food casing operations based on the level of emission control achieved at Teepak, we are making the suggested revision to the definition for "viscose process change." For consistency, we are revising the definition for "cellulose ether process change" similarly.

III. Statutory and Executive Order Reviews

Under Executive Order 12866, Regulatory Planning and Review (58 FR

51735, October 4, 1993), this action is not a "significant regulatory action" and is, therefore, not subject to review by the Office of Management and Budget ("OMB"). This action is not a "major rule" as defined by 5 U.S.C. 804(2). The technical correction does not impose an information collection burden under the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*).

Because EPA has made a "good cause" finding that this action is not subject to notice and comment requirements under the APA or any other statute, it is not subject to the regulatory flexibility provisions of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*), or to sections 202 and 205 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). In addition, this action does not significantly or uniquely affect small governments or impose a significant intergovernmental mandate, as described in sections 203 and 204 of the UMRA.

The correction does not have substantial direct effects on the States, or on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of Government, as specified in Executive Order 13132, Federalism (64 FR 43255, August 10, 1999).

Today's action also does not significantly or uniquely affect the communities of tribal governments, as specified by Executive Order 13175, Consultation and Coordination with Indian Tribal Governments (65 FR 67249, November 9, 2000). The technical correction also is not subject to Executive Order 13045, Protection of Children from Environmental Health and Safety Risks (62 FR 19885, April 23, 1997) because it is not economically significant.

The correction is not subject to Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use (66 FR 28355, May 22, 2001) because it is not a significant regulatory action under Executive Order 12866.

Section 553 of the Administrative Procedure Act (APA), 5 U.S.C. 553(b)(B), provides that, when an Agency for good cause finds that notice and public procedure are impracticable, unnecessary, or contrary to the public interest, the Agency may issue a rule without providing notice and an opportunity for public comment. We have determined that there is good cause for making today's action final without prior proposal and opportunity for comment because the change to the rule corrects an error, is noncontroversial, and is consistent with the technical basis of the rule. Thus, notice and public procedure are unnecessary. We find that this constitutes good cause under 5 U.S.C. 553(b)(B) (*see also* the final sentence of section 307(d)(1) of the CAA, 42 U.S.C. 7607(d)(1), indicating that the good cause provisions of the APA continue to apply to rulemaking under section 307(d) of the Clean Air Act (CAA).

Section 553(d)(3) allows an agency, upon a finding of good cause, to make a rule effective immediately. Because today's changes relieve an unintended restriction, we find good cause to make these technical corrections effective immediately.

The correction action does not involve changes to the technical standards related to test methods or monitoring methods; thus, the requirements of section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272) do not apply.

The correction also does not involve special consideration of environmental justice-related issues as required by Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (59 FR 7629, February 16, 1994).

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by SBREFA of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the U.S. The EPA will submit a report containing this final action and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the U.S. prior to publication of today's action in the **Federal Register**. Today's action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule will be effective on June 24, 2005.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: June 16, 2005.

Jeffrey R. Holmstead,

Assistant Administrator for Air and Radiation.

■ For the reasons set out in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart UUUU—[Amended]

■ 2. Section 63.5610 is amended by revising the following definitions in paragraph (g) to read as follows:

§ 63.5610 What definitions apply to this subpart?

* * * * *

(g) * * *

Cellulose ether process change means a change to the cellulose ether process that occurred no earlier than January 1991 that allows the recovery of organic HAP, reduction in organic HAP usage, or reduction in organic HAP leaving the reactor. Includes extended cookout.

* * * * *

Viscose process change means a change to the viscose process that occurred no earlier than January 1991 that allows either the recovery of carbon disulfide or a reduction in carbon disulfide usage in the process.

* * * * *

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 180

[OPP–2005–0155; FRL–7720–2]

Trifloxystrobin; Pesticide Tolerances for Emergency Exemptions

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes a time-limited tolerance for combined residues of trifloxystrobin in or on soybean, forage; soybean, hay; and soybean, seed. This action is in response to EPA's granting of an emergency exemption under section 18 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) authorizing use of the pesticide on soybeans. This regulation establishes a maximum permissible level for residues of trifloxystrobin in this food commodity. The tolerances will expire and are revoked on December 31, 2009.

DATES: This regulation is effective June 24, 2005. Objections and requests for hearings must be received on or before August 23, 2005.

ADDRESSES: To submit a written objection or hearing request follow the

Waste Management System; Testing and Monitoring Activities; Final Rule: Methods Innovation Rule and SW–846 Final Update IIIB

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency is amending a variety of testing and monitoring requirements in the Resource Conservation and Recovery Act (RCRA) hazardous and non-hazardous solid waste regulations and for certain Clean Air Act (CAA) regulations that relate to hazardous waste combustors. These amendments allow more flexibility when conducting RCRA-related sampling and analysis by removing from the regulations a requirement to use the methods found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," also known as "SW–846," in conducting various testing and monitoring and by limiting required uses of an SW–846 method to circumstances where the method is the only one capable of measuring the particular property (*i.e.*, the method is used to measure a required method-defined parameter). This action is an important step forward in implementing the use of a performance-based approach, which is part of the Agency's efforts toward Innovating for Better Environmental Results. Additionally, the Agency is making certain other clarifications and technical amendments. These changes should make it easier and more cost effective to comply with the affected regulations, without compromising human health or environmental protection.

DATES: This final rule is effective on July 14, 2005. The incorporation by reference of certain publications listed in the rule is approved by the Director of the Federal Register as of July 14, 2005.

ADDRESSES: EPA has established a docket for this action under Docket ID No. RCRA–2002–0025. All documents in the docket are listed in the EDOCKET index at *http://www.epa.gov/edocket.* Although listed in the index, some information is not publicly available, *i.e.*, CBI or other information for which disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in EDOCKET or in hard copy at the OSWER RCRA Docket, EPA/DC, EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744. This Docket Facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The Docket telephone number is (202) 566–0270.

FOR FURTHER INFORMATION CONTACT: For information on this rulemaking, contact Kim Kirkland at: Office of Solid Waste (5307W), U. S. Environmental Protection Agency, 1200 Pennsylvania Avenue, SW., Washington, DC 20460–0002, (703) 308–8855, e-mail address: *kirkland.kim@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does This Action Apply to Me?

You may be covered by this action if you conduct waste sampling and analysis for Resource Conservation and Recovery Act (RCRA)-or National Emission Standards for Hazardous Air Pollutants (NESHAP)-related activities. Covered entities include anyone who generates, treats, stores, or disposes of hazardous or nonhazardous solid waste and is subject to RCRA subtitle C or D sampling and analysis requirements; and entities subject to NESHAP final standards for hazardous waste combustors (40 CFR part 63, subpart EEE). All types of industries, governments, and organizations may have entities that generate or manage RCRA-regulated hazardous and nonhazardous solid wastes and may be subject to RCRA-related sampling and analysis requirements.

To determine whether your facility, company, business organization, etc., is covered by this action, you should carefully examine the applicability criteria in part 63 and in parts 258 through 299 of the Code of Federal Regulations. If you have questions regarding the applicability of this action to a particular entity, consult your regulatory authority.

B. How Do I Obtain Copies of SW–846?

The Third Edition of SW–846, as amended by Final Updates I, II, IIA, IIB, III, IIIA, and IIIB will be available in pdf format on the Internet at *http://www.epa.gov/SW–846.* A paper copy of Final Update IIIB is also located in the docket for this rule (see section I.A above). Table 1 below provides sources for both paper and electronic copies of the Third Edition of SW–846 and all of its updates.

TABLE 1.—SOURCES FOR SW–846, THIRD EDITION, AND ITS UPDATES

Source	Available portions of SW–846
Superintendent of Documents, U.S. Government Printing Office (GPO), Washington, DC 20402, phone (202) 512–1800, toll free (866) 512–1800, fax orders (202) 512–2250, and online: *http://bookstore.gpo.gov.*	—Paper copies of the SW–846, Third Edition, basic manual and of certain updates, including Final Updates, I, II, IIA, IIB, III, and IIIB and Draft Update IVA. The subscriber must integrate the updates.
National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 605–6000 or (800) 553–6847.	—Paper copy of an integrated version of SW–846, Third Edition, as amended by Final Updates, I, II, IIA, IIB, III, and IIIA. —Individual paper copies of the SW–846, Third Edition, basic manual and of certain updates, including Final Updates I, II, IIA, IIB, III, IIIA, and IIIB and Draft Updates IVA and IVB.
Internet: *http://www.epa.gov/SW-846*	—CD-ROM of integrated version of SW-846, Third Edition, as amended by Final Updates I, II, IIA, IIB, and III (pdf and WordPerfect electronic copies). —CD-ROM of Draft Update IVA (pdf and WordPerfect electronic copies). —Integrated version of SW-846, Third Edition, as amended by Final Updates I, II, IIA, IIB, III, IIIA, and IIB (pdf electronic copy). —Draft Update IVA (pdf electronic copy). —Draft Update IVB (pdf electronic copy).

C. What Is the Legal Authority for This Action?

We are promulgating the part 258, 260, 261, 264–266, 268, 270, 271, and 279 regulations under the authority of sections 1006, 2002(a), 3001–3007, 3010, 3013–3018, and 7004 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976, as amended. We are promulgating the part 63 regulation under the authority of sections 112 and 114 of the Clean Air Act.

D. How Is the Rest of This Preamble Organized?

II. Summary of Today's Rule
III. Background and Purpose of Action To Reform RCRA-Related Testing and Monitoring
A. Public Comments Regarding How to Determine if a Method Is Appropriate
B. Public Comments Regarding Other Approaches
C. Public Comments Regarding Impacts From Removal of Required Uses of SW–846 Methods
IV. Regulatory Revisions Involving Removal of SW–846 Requirements
V. Editorial Corrections to SW–846 References in the RCRA Testing and Monitoring Regulations
VI. Action to Withdraw the Reactivity Interim Guidance from SW–846 Chapter Seven and Remove Required SW–846 Reactivity Analyses and Threshold Levels from Conditional Delistings
VII. Clarifications to Corrosivity and Ignitability Hazardous Waste Characteristics
A. Revision to § 261.22(a)(2) to Clarify that SW–846 Method 1110A Is the SW–846 Standardized Version of the NACE Standard Specified for Corrosivity Characteristic Testing
B. Revisions to § 261.21(a)(1) to Remove an Unnecessary Referral to Method Equivalency Petitions; and an Explanation regarding the Decision to Not Revise the Regulation to Include the Updated ASTM Standards and References to Methods 1010A and 1020B as Proposed
VIII. Availability of Final Update IIIB and Status of Final Update IV to SW–846
IX. Addition of Method 25A to §§ 264.1034(c)(1)(ii) and (iv) and 265.1034(c)(1)(ii) and (iv)
X. Removal of Requirements from § 63.1208(b)(8)(i) and (ii) in the NESHAP Standards to Demonstrate Feedstream Analytes Are Not Present at Certain Levels
XI. Status of the RCRA Waste Sampling Draft Technical Guidance
XII. State Authorization Procedures
A. Applicability of Federal Rules in Authorized States
B. Authorization of States for Today's Rule
C. Abbreviated Authorization Procedures
XIII. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
K. Congressional Review Act

II. Summary of Today's Rule

On October 30, 2002 (67 FR 66251–66301), the Environmental Protection Agency (EPA) proposed to amend the testing and monitoring requirements under the hazardous and nonhazardous solid waste regulations, and a testing requirement under the Clean Air Act (CAA) in the National Emission Standards for Hazardous Air Pollutants (NESHAP) for hazardous waste combustors. EPA is finalizing those regulatory revisions at this time. Some of the public comments are summarized and addressed in the sections to follow, and a background document containing our responses to all public comments can be found in the docket to this rule, RCRA–2002–0025. After consideration of all comments and for the reasons summarized in today's rule, we are finalizing the following actions:

1. Reforming RCRA-related testing and monitoring by restricting requirements to use SW–846 to only those situations where the method is the only one capable of measuring the property (*i.e.*, it is used to measure a method-defined parameter). This will allow more flexibility in RCRA-related sampling and analysis by removing unnecessary required uses of SW–846.

2. Withdrawing the cyanide and sulfide reactivity guidance from sections 7.3.3 and 7.3.4 of SW–846 Chapter Seven and withdrawing required uses of reactive cyanide and sulfide methods and threshold levels from conditional delistings.

3. Amending the regulations for the ignitability and corrosivity hazardous waste characteristics. As part of this, we are clarifying in § 261.22(a)(2) that SW–846 Method 1110A, "Corrosivity Toward Steel," is the "standardized" (as described in § 261.22(a)(2)) SW–846 method that is required to be used to determine the characteristic of corrosivity for steel. We are also removing the unnecessary reference to equivalency petitions in the ignitability characteristic at § 261.21(a)(1). However, regarding the methods required for the determination of flash point under the characteristic of ignitability, the Agency decided not to replace the standard test methods ASTM D 3278–78 and D 93–79 with the latest versions of those methods.

4. Incorporating by reference Update IIIB to SW–846, which includes the revised Chapter Seven, and eleven revised methods, including method revisions to remove a requirement to use the SW–846 Chapter Nine, "Sampling Plan."

5. Adding Method 25A as an analytical option to analyses conducted in support of air emission standards for process vents and/or equipment leaks at treatment, storage, and disposal facilities.

6. Removing a requirement to demonstrate that feedstream analytes are not present at levels above the 80% upper confidence limit above the mean for sources subject to NESHAP: Final Standards for Hazardous Waste Combustors.

7. Removing from the regulations unnecessary references to SW–846, which do not affect the intent of the RCRA regulation.

This rule does not add any additional requirements to the regulations. Instead, this rule removes the requirement to use SW–846, and it clarifies what the Agency believes should be considered during the selection of other appropriate methods. Our purpose for the regulatory revisions is to make it easier and more cost effective to comply with the RCRA regulations by allowing more flexibility in method selection and use. If you prefer, where you find that a specific SW–846 method yields data that is suitably effective for demonstrating compliance in the particular matrix being analyzed, you can still use the SW–846 methods.

III. Background and Purpose of Action to Reform RCRA-Related Testing and Monitoring

Typically, the hazardous and nonhazardous solid waste RCRA regulations for testing and monitoring activities or the permits or waste analysis plans of facilities regulated by RCRA specify the analytes of concern to be determined in a matrix of concern at a particular regulatory level of concern. Additionally, some recently promulgated regulations specify the confidence level of concern. Most of the RCRA regulations leave the how (*i.e.*, which test method to use) up to the regulated community. Some RCRA regulations, however, specify the use of methods from the EPA publication

"Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," also known as "SW–846."

Initially, EPA issued SW–846 in 1980 soon after the first RCRA regulations were published. At that time, we intended that SW–846 serve two roles. First, the Agency intended that it serve as a guidance manual of generally appropriate and reliable analytical methods for RCRA-related testing and monitoring. Second, we intended that it serve as a readily-available source of those few analytical methods which were required in order to comply with the RCRA regulations. Since that time, EPA published regulations that required the use of SW–846 methods in general. Subsequently, members of the regulated public made it clear to EPA that they would like the opportunity to use other reliable methods, and EPA also decided that some of the SW–846 requirements were not necessary.

The regulatory requirement to use SW–846 in general (*e.g.*, as in the delisting regulations at § 260.22 prior to this final rule) did not identify specific SW–846 methods. Rather, this requirement typically included the regulation of many different analytes which could be determined by many different methods. Almost every update to SW–846 includes at least one method that may be applicable to one or more of these general analytical requirements. Therefore, whenever SW–846 was updated to revise or add methods, EPA had to incorporate by reference all of the new and revised methods into the RCRA regulations as part of a rulemaking. EPA issued the updates as a proposed rule, requested public comment, and then promulgated the update in a final rule. This lengthy process delayed the timely use of the new analytical technologies.

On October 30, 2002 (67 FR 66251–66301), EPA proposed to remove from the regulations a requirement to use a method found in SW–846, except when that method is the only one capable of measuring the particular property. At that time, we described our reasons for wanting to remove this requirement from the regulations, including the Agency's desire to fully implement a performance-based measurement system (PBMS) in the RCRA program. Specifically, we noted that such a change would: (1) Allow the regulated community more flexibility in method use during RCRA-required testing; (2) stimulate the development and timely use of innovative and more cost-effective monitoring technologies and approaches in the RCRA program; (3) allow more efficient and timely releases of SW–846 methods by decoupling most of the methods from required uses in the RCRA regulations; and (4) make the RCRA program more effective by focusing on measurement objectives rather than on measurement technologies. As noted, the Agency proposed to restrict the requirement to use a specific SW–846 method to only those situations where its particular procedure is the only one that is capable of measuring the property (*i.e.*, a method-defined parameter, or MDP). For example, to determine whether the levels of hazardous constituents in a particular waste stream are equal to or greater than the toxicity characteristic (TC) levels specified in § 261.24, waste generators must test their waste using SW–846 Method 1311, the "Toxicity Characteristic Leaching Procedure," or "TCLP." If levels in the waste are greater than or equal to the TC levels, the waste is a hazardous waste and is subject to the RCRA hazardous waste regulations. This is the only reliable method for determining whether TC levels are met. Thus, testing of any material to determine whether it meets the Toxicity Characteristic levels must be done using the TCLP. EPA describes the measurement obtained from the TCLP, as well as from certain other methods, as a required "method-defined parameter."

We requested public comment on the proposed revisions to the RCRA regulations, although not to the method-defined parameters, and received comments on the proposed action from over 20 different commenters, which included representatives of Federal Government agencies, State Government agencies, industry, waste generation and management entities, and analytical laboratories. The majority (86%) of the commenters generally supported, with comment, the MIR action and EPA's efforts to allow more flexibility in method selection when conducting RCRA-related sampling and analysis. Regarding the positive comments, one commenter, a state agency representative, applauded EPA for recognizing that regulating does not have to be prescriptive. Another commenter, a representative of analytical laboratories, believed that the additional flexibility will result in data quality improvements. Two representatives of waste generation or management entities concurred with EPA that the majority of the MIR revisions should make it easier and more cost effective to comply with RCRA-related regulations.

For the most part, the negative public comments may have reflected a misunderstanding of certain important aspects and premises of the MIR, which we are clarifying in our responses to those comments. With respect to other negative comments, the Agency expects that the discussion below will further clarify the purposes and premises of the MIR, and will clarify options for dealing with the inherent flexibility of this approach. Also, the Agency will continue to provide training on the concepts of this rule to further clarify its intent and support its implementation. You will find a background document containing our complete responses to all relevant public comments in the docket to this rule, docket number RCRA–2002–0025, at the location listed above under ADDRESSES. Some of the public comments are also addressed within this preamble to the final rule.

Based on our review of the public comments regarding the October 30, 2002 proposed rule, we are proceeding with publication of this final rule, which finalizes the proposed revisions to the RCRA regulations. That is, this rule removes unnecessary required uses of SW–846 in general and it removes any unnecessary required uses of specific SW–846 methods. Other reliable methods can now be used by the regulated public for compliance with the affected regulations. This action also encourages the timely use of new and innovative methods outside of SW–846 in that, for most sampling and analysis scenarios, it will not be necessary to submit an equivalency petition when using a non-SW–846 method. However, some regulations will still require use of a specific SW–846 method when that method is for determination of a RCRA-required method-defined parameter (MDP); in those cases, a regulated entity has to submit an equivalency petition and receive approval of that petition from the Agency before an alternative method can be used.

This final rule will allow the Agency to make final updates to SW–846 available in a more timely manner. For example, soon after publication of this document, we will announce the availability of Final Update IV (see section VIII of this document). The methods of Final Update IV did not have to go through the rulemaking process because, with publication of this final rule, SW–846 is no longer required in general by any existing RCRA regulation and none of the new or revised methods in Update IV are specifically required by any RCRA regulation for the analysis of method-defined parameters (MDPs). However, we did solicit and consider public comments on the methods through **Federal Register** notices, see 63 FR 25430–25438, May 8, 1998 (Draft

Update IVA), and 65 FR 70678–70681, November 27, 2000 (Draft Update IVB).

A. Public Comments Regarding How To Determine if a Method Is Appropriate

In section III.A of the preamble to the October 30, 2002 proposed rule, we discussed our proposed revisions to remove the requirement to use SW–846 methods by adding regulatory language allowing the use of appropriate methods such as those found in SW–846 or other reliable sources. In the preamble of the proposed rule, we provided guidance on how to determine if a method is appropriate for its analytical purpose. Specifically, we mentioned that such a method might be one published by EPA in a different manual or regulation or published by another government agency, a voluntary standards setting organization, or other well-known sources. We also proposed to retain mention of the SW–846 methods in the regulations as guidance and as examples of methods that could be appropriate.

In the proposed rule preamble, we gave two primary considerations in selecting an appropriate method, which together serve as our general definition of an appropriate method. As done in the preamble to the proposed rule, the text to follow explains each of these concepts and identifies other guidance that may be helpful to the regulated community.

1. Appropriate methods are reliable and accepted as such in the scientific community.

2. Appropriate methods generate effective data.

Regarding the first consideration, we noted that methods which are reliable and accepted in the scientific community might include those published by the Agency or other government entities using techniques that have documented reliability. SW–846 methods, for example, are reviewed by a technical workgroup composed of national expert-level chemists who provide peer input and determine whether method reliability is sufficiently documented. The technical reliability and acceptance of other methods published by other governmental or non-governmental organizations may also be documented, especially if the methods are subjected to some form of objective scientific review. For instance, to qualify for recognition as having developed a voluntary consensus standard (*e.g.*, analytical method) under the National Technology Transfer & Advancement Act of 1995 (NTTAA), an organization must produce standards by consensus, observe the principles of openness and balance of interests, and provide due process, including an appeals process.

Regarding the second consideration in the identification of appropriate methods—generation of effective data—we described in the preamble to the proposed rule examples of tools that might be used in this determination. *This consideration is project-specific* and therefore the tools and criteria will be different for each analytical effort. As stated in the proposed rule preamble, effective data are data of sufficiently known and appropriate quality to be used in making project-specific decisions. An example of such a decision is whether a particular waste is hazardous because a constituent of concern is present above a level of concern. Before sampling and analysis begins, project planners should identify why the analysis is being done, how the data will be used, and how "good" the data has to be (*e.g.*, the quality objectives for the project as established through a systematic planning process). Effective data meet the quality objectives set by the project planners for the specific project. The quality objectives should be rationally and systematically identified during the planning of the project and development of the project-specific Quality Assurance Project Plan (QAPP), Waste Analysis Plan (WAP), Sampling and Analysis Plan (SAP), or other appropriate systematic planning document. Sampling and analysis documentation should be sufficient to confirm that the data are effective and that the selected method is appropriate.

Quality objectives generally refer to the necessary quality of the overall decision to be made or, in other words, the tolerable error (*i.e.*, acceptable level of uncertainty for the decision). For example, a quality objective for waste analysis may be that one must demonstrate that an analyte is not present above the reported level at the 80 percent upper confidence around the mean, and that the method could have detected the presence of the analyte at that level and confidence limit. A quality objective may be specified in a regulation, a permit, a corrective action agreement, or other regulatory or enforcement document. Sometimes you must consider a quality objective regulatory specification when selecting an appropriate method. For example, the RCRA comparable fuels' provisions include quality objectives in lieu of naming the use of specific methods (see 63 FR 33781, June 19, 1998). You can find guidance on the development of formal data quality objectives (DQOs) in EPA's "Guidance for the Data Quality Objectives Process" (EPA QA/G–4) found at EPA's Quality Staff's Web site (*http://www.epa.gov/quality/*), in Chapter One, "Quality Control," of SW–846, and in ASTM D 5792, "Standard Practice for Generation of Environmental Data Related to Waste Management Activities: Development of Data Quality Objectives." You may also use other scientifically valid systematic planning processes for developing quality objectives based on specific project needs.

In the project planning document, you should identify the types of quality control (QC) concepts (*e.g.*, spike recovery analyses, blanks, etc.) you will use to determine if you meet your objectives. For example, selection of an appropriate method is sometimes demonstrated by adequate recovery of spiked or surrogate analytes and reproducible results, or through successful analysis of a standard reference material of a matrix-type analogous to that of the actual sample matrix. The method may not be appropriate for its intended use if your data show inadequate recovery of an analyte at a level that impairs a decision regarding whether the analyte is present at or below its regulatory level. Such a method would not generate effective data. Based on your QC data, you should determine whether the method generates results that are sufficiently sensitive, unbiased, and precise to demonstrate compliance with the subject regulation.

However, you should not just focus on controlling or documenting analytical quality, because regulatory decisions are also susceptible to error due to sampling procedures. If the contaminant variability is not properly addressed during the planning and collection of samples, an incorrect decision could be reached even though the method performed well in terms of laboratory quality control. No matter how accurate or precise the laboratory analysis, the data will provide misleading information if excessive error is introduced by improper sampling procedures. Guidance on identifying the necessary quality control procedures and on minimizing the potential for both analytical and sampling error can be found at the EPA Quality Staff's Web site (*http://www.epa.gov/quality/*) or in Chapters One, Two, and Nine of SW–846. In addition, guidance on determining and demonstrating the appropriateness of a selected measurement method for a particular application may be found in ASTM D 6956–03, "Standard Guide for Demonstrating and Assessing Whether a Chemical Analytical Measurement

System Provides Analytical Results Consistent with Their Intended Use."

Finally, EPA noted in the proposed rule preamble that you should identify appropriate methods for a specific project *before* sampling and analysis begins. As the regulated entity, you are ultimately responsible for compliance with a particular regulation. Therefore, you should not rely on the laboratory or other project participant to select an appropriate method. We recommend that you consult with your regulating authority during identification of performance goals and the selection of appropriate methods.

We requested and received public comment on the above considerations and on the proposal to allow the use of appropriate methods such as those found in SW–846 or other reliable sources. One supportive commenter believed the Agency had provided sufficient guidance in the preamble to the proposed rule on how to identify appropriate methods. As discussed below, a few commenters requested additional guidance regarding the selection of appropriate methods or had questions regarding the approach.

One commenter requested that an appropriate method definition be codified in the regulations. The Agency believes that codification of an appropriate method definition would be both very difficult and contrary to the intent and purpose of this rule, given the project-specific nature of "appropriate method selection" and the wide variety of data collection objectives that may be encountered. In the paragraphs above, the Agency has provided the key generic considerations for appropriate method selection, which together serve as our general definition for an appropriate method, and identified guidance sources, in the hope that this information will assist readers of this rule during the selection of appropriate methods, regardless of whether the methods are from SW–846 or other sources. In addition, since publication of the proposed rule, ASTM International published D 6956–03, "Standard Guide for Demonstrating and Assessing Whether a Chemical Analytical Measurement System Provides Analytical Results Consistent with Their Intended Use." This guidance document is not required by any EPA program, but may be useful to the regulated community during the selection of appropriate methods and during the evaluation of analytical results. The document can be obtained from ASTM by visiting its Web site at *http://www.ASTM.org* or by writing to: ASTM International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19418–2959. EPA also plans to continue to provide training to affected entities on the concepts of this rule and to support its implementation. When using any appropriate method, you should be able to determine the analyte of concern (e.g., the regulated constituent to be measured), in the matrix of concern (e.g., the physical substance which might contain the regulated constituent), at the level of concern (e.g., the regulated level of or the action level for the analyte).

One commenter was concerned that the regulated public might use other methods that do not meet the QC criteria in the SW–846 methods. The Agency does not believe that this should be a concern. The performance data and QC criteria given in the SW–846 methods are only examples, and are not requirements for analysis. The SW–846 example criteria may not be appropriate for every analytical purpose. Establishing QC criteria is a project planning issue and not a method issue. Methods should be adapted into standard operating procedures (SOPs) to meet QC criteria from systematic planning documents, not the other way around. Some analytical applications may require more or less stringent QC criteria than that given as examples in the SW–846 methods, and it would be contrary to promoting a PBMS approach if all analyses using any methods are expected to conform to the example criteria published in SW–846 methods. Sometimes, even when using an SW–846 method, it may not be necessary to fully meet its example performance criteria because project-specific quality objectives may not require evaluation of the same performance indicators or the criteria may not be appropriate to the specific application. In keeping with a PBMS approach and the goals of this rule, performance criteria should be determined on a project-specific basis during the planning stage.

Another commenter was concerned that some regulated entities might use methods that were not originally developed for environmental purposes, and thus data validity may be suspect. Provided that the method is appropriate based on the factors discussed above and in the proposed rule preamble, we do not believe that this should be a concern. If the data are suspect or otherwise not of sufficient quality for their intended use, then the method is not appropriate, regardless of its source, and thus the data are not acceptable for demonstrating compliance. Regardless of the original purpose or source of a method, it can be an appropriate method if it generates effective data, *e.g.*, the data quality objectives and performance criteria are met. Even an SW–846 method may not be appropriate for a particular application if it does not generate effective data. In addition, the application of method technologies from other disciplines promotes the use of innovative approaches and technologies, which may benefit RCRA-related analyses. Finally, many of the analytical techniques used today in environmental analyses were initially developed for other purposes.

One commenter agreed with EPA's approach to appropriate method selection, but had comments regarding the data quality objectives approach. The commenter believed that the DQO approach can be expensive and is not usually used during small analytical projects. In response, the Agency notes that, when data are being used in decision making involving two clearly alternative conditions (*e.g.*, compliance vs. noncompliance with a regulatory standard), the Agency's recommended systematic planning tool is the DQO process. While there is no regulatory obligation to use the DQO process, it is the recommended planning approach for many EPA data collection activities. However, the DQO process may be too complicated for some projects and is not the only way to generate quality data through systematic planning. It is presented here in the MIR only as an example of an approach involving systematic planning. However, at a minimum, the Agency recommends that some form of systematic planning be implemented for every data collection effort in order to generate effective data, and notes that such systematic planning should also involve consideration of cost. Systematic planning is a common sense approach, designed to ensure that the level of detail in planning is commensurate with the importance and intended use of the work and the available resources.

One commenter supported EPA's proposed flexibility, but thought that EPA should continue to use SW–846 as the primary vehicle for making recommendations regarding procedures that will meet minimum quality objectives for RCRA analyses. Thus, one would not be required to use SW–846 methods, but could choose to use them and be confident that they are appropriate sampling and analysis procedures, provided that they can be demonstrated to meet project quality objectives. Another commenter believed that it would be unrealistic for a regulated entity to agree to the use of other methods if EPA has not approved them. The commenter believed that such approval would guarantee

acceptance of the data, provided that the method was properly followed.

First, it should be noted that there are no "PBMS methods." PBMS is a regulatory approach where what has to be accomplished is specified, rather than how the monitoring is to be conducted. Under such a system, regulated entities are permitted to employ any method that is technically adequate to accomplish the compliance demonstration. Regarding EPA's approval of PBMS, EPA has already stated its objective to employ the performance approach in its regulatory and other monitoring programs to the extent feasible. On October 6, 1997 (62 FR 52098–52100), EPA published in the **Federal Register** its intent to adopt PBMS agency-wide. Subsequently, on May 8, 1998 (63 FR 25430–25438), EPA published in the **Federal Register** a notice of intent and request for comment regarding its plans to reform implementation of RCRA-related monitoring by formally adopting PBMS and by removing unnecessary required uses of methods from the RCRA regulations (part of PBMS).

EPA also believes that method selection should be a project-specific decision and therefore cannot recommend or approve any methods—even SW–846 methods—as always being appropriate for any given application. For that very reason, with this rule, EPA removed the requirement to use SW–846 methods, except when the methods are the only ones capable of measuring a particular property. Relying on the fact that a method is contained in SW–846 does not guarantee that the method will always generate effective data under any situation. If the SW–846 method is not an appropriate method for its intended application, following it exactly could generate erroneous data and could fail to demonstrate compliance with the RCRA requirements.

Second, EPA does not agree with the recommendation that it categorically state that any method is always an effective means of demonstrating compliance (with the exception of methods for the analysis of method-defined parameters) since the Agency has no way of knowing that a particular method is going to yield valid data in all potential situations and it goes counter to the performance approach which requires that regulated entities demonstrate compliance using data of known and documented quality. The Agency believes that it is up to the individual regulated entity to decide which methods are appropriate to use for any given compliance demonstration and that this determination should be initiated during the project planning stage. When considering method selection, the analytical performance indicators are key to the specific project goals that should be considered. Examples of analytical performance indicators that might be addressed include method sensitivity and selectivity, precision, bias, and reproducibility. The data user may even choose to revise method selection if additional information gathered during the project indicate that the initial selection was not appropriate. Therefore, method selection is a project-specific activity implemented by the regulated entity, and EPA's only concern is that the generated data be effective for its purpose, regardless of the method selection. The Agency does recommend that a regulated entity seek assistance from its regulating authority should the regulated entity have concerns regarding the use of any particular method. EPA also notes that guidance regarding demonstrating the performance of a given analytical method can be found in EPA-published guidance documents (some of which are listed above) and documents published by other Agencies (*e.g.*, ASTM).

One commenter was concerned regarding how method performance would be demonstrated under PBMS. The commenter claimed that implementation of a PBMS approach is very difficult and that, for it to work, there must be a "reference method" to be used as a benchmark against which to measure other methods.

EPA notes that the RCRA program does not use reference methods. Many different methods produce effective data for a particular project, which are not necessarily "equivalent," but all could be "applicable." For example, there are many analytical methodologies that can be used in analyzing a particular metal species (*e.g.*, ICAP, AA). In selecting a particular method for metal analysis, the analyst will consider analytical costs, accuracy and sensitivity needed, freedom from potential interferences, amount of sample required for an analysis, reagents to be used, and other factors in the overall process to select a method that will yield effective data at the lowest cost to the user. These factors should be considered when evaluating any method, including those published in SW–846, and the user needs to conduct the appropriate verifications to demonstrate the appropriateness of any method that is selected against its intended application. There are a number of approaches that can be used to demonstrate that a method is valid for a particular use. These include: use of appropriate reference standards, analysis of spiked samples, comparison of results to results generated using a method that employs a fundamentally different measurement process and would not be subject to the same potential interferences, etc. For further guidance in demonstrating method validity, see the previously cited ASTM document D 6956–03, "Standard Guide for Demonstrating and Assessing Whether a Chemical Analytical Measurement System Provides Analytical Results Consistent with their Intended Use."

B. Public Comments Regarding Other Approaches

As explained in section III.B of the proposed rule preamble, EPA considered several approaches to promoting "method use" flexibility in the RCRA regulations. We selected the "appropriate method" approach because it is universally applicable to the subject RCRA regulations. It also requires only minimal revisions to the regulations for implementation.

In addition, the option to use "appropriate methods" is not new to the RCRA regulations. For example, use of the TCLP, SW–846 Method 1311, is required for determining whether a waste is hazardous for the toxicity characteristic (the TC). It generates an extract (the leachate) which is subject to a determinative analysis for comparison with the TC regulatory limits. However, the TCLP procedure does not require specific analytical methods for the leachate determinative analysis, nor does it specify the use of even SW–846 methods in general for such analysis of the leachate. It allows method flexibility similar to that proposed by this rule by stating in section 7.2.14: "The TCLP extract shall be prepared and analyzed according to appropriate analytical methods."

Nevertheless, in the proposed rule preamble, the Agency requested the public's opinion on two alternative approaches that we considered during development of this rulemaking.

1. As a variation to the "appropriate method" approach described above, should we remove mention of SW–846 methods as examples of potentially appropriate methods from the subject regulations?

2. In lieu of the "appropriate method" approach, should we instead add specific measures of required measurement system performance or data quality objectives to each regulation, such as done in the comparable fuel rulemaking, and not mention or require the use of an appropriate method (including any SW–846 methods)? In the proposed MIR, we did not select this approach because it

might require significant regulatory changes with difficult to quantify impacts.

Most of the commenters preferred that EPA retain mention of SW–846 in the regulations as examples of potentially appropriate methods. However, some of these commenters appeared to believe that, by mentioning SW–846 methods as examples, it meant that such methods will always be appropriate for every data collection effort addressed by the regulation, and thus the performance of other candidate methods should be compared with the performance of the similar SW–846 method. One commenter wanted the Agency to legally recognize that the SW–846 methods are appropriate methods under the RCRA regulations.

The Agency strongly disagrees with commenters that SW–846 methods should be identified as always appropriate. As explained in section III.A of this rule, the determination of an appropriate method should be made on a project-specific basis and involves consideration of various project-specific objectives and criteria. As noted, an appropriate method might be one published by EPA in a different manual from SW–846 or might be a method published by a different government agency, a voluntary standards setting organization, or other well-known scientific sources. Whether a method is contained in SW–846 is not a primary criterion for determining if a method is appropriate. For example, there is a common misconception that the different SW–846 methods for sample extraction all have the same extraction efficiency, which is not the case at all, since the methods were intended to be appropriate for different applications. Methods found in other publications may be more appropriate based on the project-specific considerations.

Regarding the addition of performance criteria to the regulations, a few commenters did prefer that such criteria be added to the regulations. However, these commenters did not provide suggestions regarding how to best resolve those instances when such an approach might result in requiring use of methods which are more accurate or sensitive than necessary (with the result that monitoring costs may increase unnecessarily) or in other cases would not yield data of a sufficient quality to definitively determine if a facility is in compliance with a regulatory or permit level. Given these impact issues and the project-specific nature of what determines an appropriate method, it would be contrary to the purpose of this rulemaking and very difficult to develop and implement performance criteria and definitions that would be universally applicable. EPA therefore decided against adding criteria at this time to all of the regulations. We strongly believe that the appropriate method determination should be made on a project-specific basis by those familiar with the purpose of the analysis and should not be dictated by regulatory definition. EPA believes that generic performance criteria assigned by EPA would not assure consistent application of PBMS, but rather might discourage a PBMS application and flexibility in method selection and use. However, to further evaluate this issue, the Agency's Forum on Environmental Measurements (FEM) has formed an Action Team to address issues related to implementation of the performance approach. It is anticipated that the Action Team will address issues related to data quality and data quality documentation for use by all Agency programs.

In conclusion, as a result of consideration of all comments, we decided to not add performance criteria to the regulations. In addition, unlike the proposal, we decided to not include any references to SW–846 or "using appropriate methods such as those found in * * * SW–846" in the regulatory provisions because those references to SW–846 were unnecessary and, based on public comment, the regulated community may continue to believe that SW–846 methods will always be most appropriate.

C. Public Comments Regarding Impacts From Removal of Required Uses of SW–846 Methods

In the preamble to the proposed rule, we summarized the expected impacts on the regulated entities and the states, and requested public comment on the assumptions made in the analysis. We also requested public comment on the impact of this rule and how we might promote its successful implementation. The paragraphs to follow summarize our impact assumptions and provide our responses to some of the public comments regarding these topics.

As a result of this final rule, you can use any appropriate analytical test method in demonstrating compliance with the RCRA regulations, except for those regulatory provisions involving method-defined parameters. We believe that this action will not significantly or adversely impact the regulated community or other potentially affected parties because the Agency is not adding any additional regulatory requirements to the RCRA regulations, but rather is clarifying and expanding the flexibility that regulated entities have had in selecting appropriate methods to employ to demonstrate compliance whether or not such methods were described in SW–846. By making it clear that one may use any appropriate method, regulated entities may be able to cut the cost of compliance monitoring by using less expensive methods. Regulated entities may continue to use SW–846 methods to demonstrate compliance when it is appropriate to do so, and thus experience no impact from this rulemaking. EPA will also continue to publish and update SW–846 methods and ensure their scientific soundness by following peer review guidelines and requesting public comment on the methods through **Federal Register** notices.

Thus, as we noted in section III.C of the proposed rule preamble, the primary impact of this rule will be better analytical results (*e.g.*, due to paying better attention to method performance). The Agency also anticipates a tendency toward lower costs during compliance with the affected RCRA regulations because project planners may identify methods that are potentially less costly to use. Meanwhile, EPA also will continue to provide training and utilize our pool of Agency technical experts to serve the public by answering questions regarding the use of test methods during RCRA-related compliance activities.

Also, a demonstration that another method is appropriate is already allowed within RCRA-related sampling and analysis and will not involve much more than what regulated entities already should be doing. For example, as the regulated entity, you should already be setting method performance goals in your Quality Assurance Project Plan (QAPP), Sampling and Analysis Plan (SAP), or other systematic planning document and then evaluating compliance with those goals based on data quality indicators, including when using SW–846 methods.

Regarding public concerns about the comparability of data generated by different methods for the same purpose, we noted in the proposed rule preamble that this practice is not new because some regulations already allow the use of more than one method. We also do not believe that this should be a concern, provided that any alternative method is also an appropriate method as defined above. Specifically, if both methods generate effective data and meet the data quality objectives of the project, then results from both methods will be acceptable for demonstrating compliance. In addition, for situations where trends or comparability are to be

determined, measurement quality objectives should be selected for use in selecting methods to be used that will ensure that, for whatever desired level of difference one desires to determine, the data will be suitable for the purpose. This has always been EPA's approach in comparing data by different methods, and it is not affected or changed by this rule.

Some commenters preferred a more prescriptive approach in the regulations because method-specific requirements remove the burden of method-selection as it is believed that this translates into lower costs and greater agreement between permit writers and other project participants who may not have method-selection expertise. Because of consequences of this approach, the Agency believes it is undesirable. A major problem with the prescriptive-or mandated-methods approach is that it can lead to data of poor quality which can result in an incorrect assessment of compliance. Another problem is that the regulated community may not systematically plan their data collection efforts and thus not fully understand their project-specific goals. Method-selection decisions should be project specific and thus, specific methods should not be required in the regulations.

Some commenters also expressed concern regarding the impact of this rule on existing RCRA permits. RCRA permits are typically effective up to ten years. This rule will only effect new or reissued permits, and only to allow more flexibility in method selection. Therefore, RCRA permits will not be adversely impacted by this action.

Finally, this rule does not add new information collection or reporting requirements for regulated entities. Section 260.22(i) (reporting requirements for petitions to exclude wastes) and §§ 264.13(b) and 265.13(b) (reporting requirements for owners and operators of hazardous waste management facilities) provide sufficient reporting requirements to cover RCRA-related testing and analysis documentation regarding the use of other appropriate methods.

One commenter agreed, regarding impact of the rule, that the MIR will greatly benefit those situations where repeated analyses are needed, such as for a RCRA corrective action or for a WAP for a hazardous waste treatment, storage, or disposal facility (TSDF). However, the commenter also believed that smaller entities involved in waste analyses, such as small quantity generators (SQGs) will probably not benefit from the MIR. For the reasons given above, EPA believes that the impact of this rule will not be significant for any generator, including small quantity generators (SQGs), largely because the flexibility of method selection will provide better analytical results at a lower cost. Project planners and laboratories used by SQGs will identify methods that are potentially less costly and yet provide effective data. EPA believes that the regulated community will choose appropriate methods based on cost and data quality advantages, and therefore all regulated entities, including SQGs, could benefit from this rule.

One other commenter believed that if PBMS is adopted, prior approval by the State or other regulator of the method should be mandatory. The commenter argued that State reviewers are more familiar with SW–846 methods and data indicators and that a state's unfamiliarity with other methods might mean the State may not perform a timely review of the data.

As explained in the previous section, EPA believes that method approval prior to use would be contrary to the intent and philosophy of the performance concept and would negate the positive impacts of this rule. However, as also noted, the regulated community can consult with their regulating authority during the identification of performance goals and the selection of appropriate methods. EPA appreciates the commenter's concern regarding potentially negative impacts on the timely review of data. It is true some delay in data review may occur if the reviewer is not familiar with the procedure. Nevertheless, review of data should not be a new step in the process since effected entities should already be reviewing data indicators from the SW–846 methods during RCRA-related sampling and analysis. Once the reviewer and user become more familiar with a new method, less time will be needed to perform an equally thorough review. In the end, we believe the benefits of modifying the rules will far outweigh these potential impacts on data review time through the improvement of data effectiveness and a decrease in other costs. To help mitigate any potential negative impacts, we will continue to provide training and our staff are available to assist you during all stages of the process.

Some commenters expressed a concern that this action will impose an additional resource burden on States. In response, we note that the regulatory changes in this rule are equivalent to or less stringent than the existing Federal regulations which they amend. Therefore, authorized States are not required to adopt and seek authorization for this rulemaking within their programs. If a State believes that adoption may be too burdensome on their resources, then they need not adopt the revised regulations. Nevertheless, we encourage the adoption of these or similar revisions by authorized States in order to promote the national adoption of the performance approach in environmental regulations, permits, and monitoring. In addition, if States choose to adopt these revisions, the impact should not be significant since they already conduct method selection and data quality reviews to determine compliance with their testing and monitoring regulations.

Some commenters expressed a need for communication and training to assist in implementation of the MIR. We agree and the Agency plans to continue to provide education and training to States, EPA Regions, and the regulated community regarding the implementation of this rule, through such mechanisms as workshops, fact sheets, and Internet training modules. Over the past seven years, OSW has offered program-specific training (e.g., "Analytical Strategy for the RCRA Program: A Performance-Based Approach") for EPA Headquarters, Regional, and State personnel involved in RCRA activities that include sampling and analysis. The Agency plans to expand its performance approach training program and offer other courses on the evaluation of data and permit writing from a PBMS and effective data standpoint. These communication and training efforts will help ensure consistency in implementation of this and other Agency performance-based rules by the States, Regions, and regulated community and help limit any associated costs.

IV. Regulatory Revisions Involving Removal of SW–846 Requirements

In section IV of the proposed rule preamble, EPA listed and discussed each of the proposed regulatory revisions which removed the requirement to use SW–846 methods and stated that appropriate methods may be used. We requested public comment on these individual regulatory section revisions (e.g., comments regarding any impacts on implementation of each affected regulation that we may have overlooked) and in general did not receive any significant negative comments regarding the removal of the SW–846 requirements from any of the regulations. We are therefore finalizing the removal of the requirement to use SW–846 in those regulatory sections.

In addition, we are finalizing revisions to three conditional delistings in part 261, appendix IX, which were not included in the proposed rule, but which, like those delistings that were included in the proposal, unnecessarily require the use of SW–846 methods. We announced our intent to revise these delistings in a memorandum to the facilities and to the relevant EPA Regional offices. We gave the entities three weeks to comment on the revisions. One of the affected companies did not respond to the memorandum, while the other two companies responded, but did not have comments regarding the revisions.

Therefore, we decided to proceed with finalizing the revisions to these three delistings. The revisions to the conditional delistings are very similar to the other conditional delistings. We did not receive negative comments regarding the general removal of required uses of SW–846 in any of the conditional delistings listed in the proposed rule. We believe that these revisions are fully consistent with EPA's original intent to make such changes to any conditional delisting, or other regulations, which unnecessarily required the use of SW–846 methods for analyses other than for required MDPs.

The additional conditional delistings revised by this final rule are found in Table 1 of appendix IX of part 261 and address delisted wastes at the following facilities:

—Bekaert Corp., Dyersburg, TN
—OxyVinyls, L.P., Deer Park, TX
—Tokusen USA, Inc., Conway, AR

In addition, since publication of the proposed MIR, the Office of Federal Register (OFR) revised its format for incorporation by reference. Specifically, the OFR requires that the MDP methods incorporated by reference at § 260.11 be specifically mentioned in the relevant sections of the regulations, and not just include referrals to § 260.11. Therefore, in the conditional exclusion listings of part 261, appendix IX, we included a listing of the method-defined parameter methods to replace our proposed language stating that the methods listed in § 260.11 must be used without substitution when required. Those methods must be used as applicable to the particular delisting.

Finally regarding the conditional delistings, we are taking this opportunity to make several editorial corrections to Tables 1, 2 and 3 of appendix IX of part 261, which in no way substantially change or remove any requirements. We are removing repeats of the Bekaert Corp., Dyersburg, TN, conditional delisting from Tables 2 and 3 of appendix IX of part 261 because those entries were added to the tables in error. The Bekaert Corp. conditional delisting is for an F006 waste, which is from a non-specific source, and therefore the delisting only belongs in Table 1, which lists wastes excluded from non-specific sources (i.e., "F" coded listed wastes). Tables 2 and 3 of appendix IX of part 261 are meant to only list the conditional delistings of wastes excluded from specific sources (Table 2, i.e., "K" coded listed wastes) or from commercial chemical products, off-specification species, container residues, and soil residues thereof (Table 3, i.e., "P" and "U" coded listed wastes). Similarly, we are removing the OxyVinyls, Dear Park, TX, delisting from Table 1 and adding it to Table 2 of appendix IX. This is necessary because the OxyVinyls' delisting addresses K017, K019, and K020 wastes and was incorrectly placed in Table 1. Since these are changes that do not affect the implementation of the regulations, or add new or remove existing regulatory requirements, the Agency is providing notice of the changes without opportunity for comment.

Table 2 lists the regulatory revisions finalized by this rule to remove the requirement to use SW–846 methods and allow the flexibility to use other appropriate methods. As noted in the previous section of this preamble, the proposed references to "using appropriate methods such as those found in * * * SW–846" is not being included in the final regulation because the Agency decided that those references to SW–846 were unnecessary and because the regulated community may continue to believe that SW–846 methods will always be most appropriate. Finally, we corrected our proposed revision to § 261.35(b)(2)(iii)(B) by adding the relevant data from Table 1 of Method 8290 to the regulatory text so that Method 8290 (which contained the table but is not an MDP method) no longer has to be incorporated by reference. In the proposed rule, § 261.35(b)(2)(iii)(B) read as follows: "Not detected means at or below the lower method calibration limit (MCL) in SW–846 Method 8290, Table 1. Other appropriate methods from other reliable sources may be used provided that these criteria are met." In the final rule, we copied the relevant data from Table 1 directly into § 261.35(b)(2)(iii)(B) and so it is no longer necessary to mention Method 8290.

TABLE 2.—REVISIONS TO RCRA REGULATIONS TO REMOVE REQUIRED USES OF SW–846 METHODS

Regulation	Affected topic or program
§ 260.22(d)(1)(i)	Petitions to exclude waste from a particular facility.
Appendix IX to part 261	Wastes excluded under §§ 260.20 and 260.22.
§§ 261.35(b)(2)(iii)(A) and (B)	Deletion of certain waste codes following equipment cleaning.
§ 261.38(c)(7)	Comparable/syngas fuel exclusion.
§§ 264.1034(d)(1)(iii), 264.1063(d)(2), 265.1034(d)(1)(iii), and 265.1063(d)(2).	Air emission standards for process vents and equipment leaks.
§§ 265.1084(a)(3)(iii) and (b)(3)(iii), and 265.1084(a)(3)(ii)(C), (b)(3)(ii)(C), and (c)(3)(i).	Air emission control requirements for tanks, surface impoundments, and containers.
§§ 266.100(d)(1)(ii) and (g)(2), and 266.102(b)(1)	Hazardous wastes burned in boilers and industrial furnaces (BIFs).
§ 266.106(a)	Control of metal emissions at BIFs.
§§ 266.112(b)(1) and (b)(2)(i)	Residues from burning of wastes in BIFs.
Appendix IX, part 266	Methods Manual for BIF regulations.
§§ 270.19(c)(1)(iii) and (iv), 270.22(a)(2)(ii)(B), 270.62(b)(2)(i)(C) and (D), 270.66(c)(2)(i) and (ii).	Part B information and trial burn plan requirements for incinerators and BIFs.

This rule also revises the incorporation by reference of SW–846 in § 260.11 so that the paragraph only includes SW–846 methods that are required for method-defined parameters. Therefore, for each section where we removed the requirement to use only SW–846 methods, we also removed the SW–846 incorporation by reference.

Prior to this rule, all methods of SW–846 were incorporated by reference at § 260.11 "when used" within the RCRA regulations. All of SW–846 had to be incorporated by reference because some RCRA regulations required in general the SW–846 methods, *e.g.*, the delisting regulations at § 260.22(d)(1)(i). The required methods had to be incorporated by reference because their full text is too lengthy for publishing directly in the regulations and the methods are readily available to the public in the SW–846 manual. As a result of this rule, we are limiting the requirement to use SW–846 methods to when the methods analyze required method-defined parameters. Therefore, we revised § 260.11 to remove the incorporation by reference of all SW–846 methods, except those SW–846 methods that may be required for the analyses of method-defined parameters. Those methods will remain incorporated by reference when used for method-defined parameters and required by the RCRA regulations.

It is important to note that, while a method is listed in § 260.11 because it is used for analysis of a method-defined parameter, it also may be used for non-mandatory purposes. In those cases where the method is required by a specific regulation and is listed in 260.11, it is a method-defined parameter. For example, Method 9010C, "Total and Amenable Cyanide: Distillation," and Method 9012B, "Total and Amenable Cyanide (Automated Colorimetric, with Off-line Distillation)" are required under § 268.44, the universal treatment standards of the land disposal restrictions regulations, and are listed in § 260.11 as required by § 268.44. In that case, the methods cannot be substituted. However, in other circumstances, these two methods may be used when they are not required by their regulations (*e.g.*, during delistings) and in those cases they will only be considered appropriate methods and not MDPs. It is the application of a method in a regulation that determines whether a method is being used to analyze a required method-defined parameter—not simply whether the method is listed in § 260.11.

The SW–846 methods that remain as incorporated by reference in § 260.11 are listed in Table 3. The final list is different from that proposed in that Methods 3542 ("Extraction of Semivolatile Analytes Collected Using Method 0010 (Modified Method 5 Sampling Train)") and 5041A ("Analysis for Desorption of Sorbent Cartridges from Volatile Organic Sampling Train (VOST)") are no longer included. The methods were removed because they are currently not used as method-defined parameters under the RCRA program.

TABLE 3.—SW–846 METHODS TO REMAIN IN § 260.11

SW–846 method	Chapter location	Method title
0010	Ten	Modified Method 5 Sampling Train.
0011	Ten	Sampling for Selected Aldehyde and Ketone Emissions from Stationary Sources.
0020	Ten	Source Assessment Sampling System (SASS).
0023A	Ten	Sampling Method for Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofuran Emissions from Stationary Sources.
0030	Ten	Volatile Organic Sampling Train.
0031	Ten	Sampling Method for Volatile Organic Compounds (SMVOC).
0040	Ten	Sampling of Principal Organic Hazardous Constituents from Combustion Sources Using Tedlar® Bags.
0050	Ten	Isokinetic HCl/Cl_2 Emission Sampling Train.
0051	Ten	Midget Impinger HCl/Cl_2 Emission Sampling Train.
0060	Ten	Determination of Metals in Stack Emissions.
0061	Ten	Determination of Hexavalent Chromium Emissions from Stationary Sources.
1010A	Eight	Pensky-Martens Closed-Cup Method for Determining Ignitability.
1020B	Eight	Setaflash Closed-Cup Method for Determining Ignitability.
1110A	Eight	Corrosivity Toward Steel.
1310B	Eight	Extraction Procedure (EP) and Structural Integrity Test.
1311	Eight	Toxicity Characteristic Leaching Procedure.
1312	Six	Synthetic Precipitation Leaching Procedure.
1320	Six	Multiple Extraction Procedure.
1330A	Six	Extraction Procedure for Oily Wastes.
9010C	Five	Total and Amenable Cyanide: Distillation.
9012B	Five	Total and Amenable Cyanide (Automated Colorimetric, with Off-line Distillation).
9040C	Eight	pH Electrometric Measurement.
9045D	Six	Soil and Waste pH.
9060A	Five	Total Organic Carbon (TOC).
9070A	Five	n-Hexane Extractable Material (HEM) for Aqueous Samples.
9071B	Five	n-Hexane Extractable Material (HEM) for Sludge, Sediment, and Solid Samples.
9095B	Six	Paint Filter Liquids Test.

Please note that we are not adding any new methods to § 260.11—each method listed in Table 3 is already a part of SW–846 and was incorporated by reference during previous rulemakings. For each method retained as incorporated by reference, we are listing in § 260.11 the promulgated version of the method which was last incorporated by reference and thus which must be used during regulatory compliance.

In addition, since proposal of this rule, the Office of Federal Register (OFR) has revised the format of incorporation by reference sections within the Federal regulations, for instance, to include information regarding those regulatory sections or parts that specify use of the methods. We revised § 260.11(a) to reflect this new format.

V. Editorial Corrections to SW–846 References in the RCRA Testing and Monitoring Regulations

In section V of the preamble to the proposed rule, the Agency proposed to correct inaccurate references to SW–846 (some of which are logical outgrowths to the revision to § 260.11), and to clarify method selection flexibility in the RCRA regulations. We did not receive any negative comments regarding that

section of the proposed rule and thus are finalizing the editorial corrections, as proposed.

In addition, we are correcting certain regulations so that they include the appropriate suffix of the SW–846 MDP method required by them. As a result of these corrections, the method number in the regulation includes the suffix and matches the respective method number and suffix listed in § 260.11.

Table 4 lists and summarizes the editorial corrections to the RCRA regulations made by this final rule.

TABLE 4.—CORRECTIONS, CLARIFICATIONS OR REMOVALS

Regulation	Text correction, clarification, or removal
§ 258.28(c)(1)—Liquids restrictions	Correction to add "incorporated by reference in § 260.11" after "Paint Filter Liquids Test," and addition of the suffix "B" to the method number "9095."
Appendix I to part 258—Constituents for detection monitoring	Removal of footnote 1 to the table, which contains unnecessary references to SW–846.
Appendix II to part 258—List of inorganic and organic hazardous constituents.	Clarification regarding the use of other appropriate methods by removing the "Suggested Methods" and "PQLs (µg/L)" columns, removing footnotes 1, 5 and 6 and revising and renumbering the remaining footnotes, as appropriate.
§ 260.21(d)—Petitions for equivalent methods	Clarification that equivalent methods will be added to § 260.11, instead of just added to SW–846.
§ 260.22(d)(1)(i)—Petitions to amend part 261 to exclude a waste produced at a particular facility.	Removal of unnecessary reference to SW–846.
§§ 261.3(a)(2)(v), 279.10(b)(1)(ii), 279.44(c), 279.53(c), and 279.63(c)—Rebuttable presumption for used oil.	Removal of unnecessary references to SW–846.
§ 261.22(a)(1)—Characteristic of corrosivity	Addition of the suffix "C" to method number "9040."
Appendix I to part 261—Representative sampling methods	Removal of unnecessary references to SW–846.
Appendix II to part 261—Method 1311 Toxicity Characteristic Leaching Procedure (TCLP).	Removal of text in Appendix II to part 261; appendix reserved.
Appendix III to part 261—Chemical analysis test methods	Removal of text in Appendix III to part 261; appendix reserved.
§§ 264.190(a) and 265.190(a)—Applicability	Addition of the suffix "B" to method number "9095."
§ 264.314(c) and § 265.314(d)—Special requirements for bulk and containerized liquids.	Addition of the suffix "B" to method number "9095."
§§ 264.1034(f) and 265.1034(f)—Test methods and procedures.	Clarification that direct measurement is allowed to resolve disagreements regarding concentration estimates, and removal of unnecessary references to SW–846.
Appendix IX to part 264—Ground-water monitoring list	Clarification regarding the use of other appropriate methods by removing the "Suggested Methods" and "PQLs (µg/L)" columns and removing footnotes 1, 5 and 6 and revising and renumbering the subsequent footnotes, as appropriate.
§ 265.1081—Definitions	Correction to SW–846 reference in definition of "waste stabilization process."
Appendix IX to part 266—Methods manual for compliance with BIF regulations.	Corrections to reflect removal of SW–846 methods from the BIF Methods Manual on June 13, 1997 and clarification in existing guidance regarding use of other appropriate methods and SW–846.
§ 268.40(b) and table—Applicability of treatment standards	Addition of the suffix "B" to method number "1310," addition of the suffix "C" to method number "9010," and addition of the suffix "B" to method number "9012."
§ 268.44, table—Variance from a treatment standard	Addition of the suffix "C" to method number "9010" and the addition of the suffix "B" to method number "9012."
§ 268.48, table—Universal treatment standards	Addition of the suffix "C" to method number "9010" and addition of the suffix "B" to method number "9012."

VI. Action To Withdraw the Reactivity Interim Guidance From SW–846 Chapter Seven and Remove Required SW–846 Reactivity Analyses and Threshold Levels From Conditional Delistings

In section VI of the preamble to the proposed rule, the Agency proposed to withdraw the reactivity interim threshold levels and reactive cyanide and sulfide methods from Chapter Seven of SW–846 and from certain conditional delistings found in appendix IX to 40 CFR part 261. EPA proposed these actions based on conclusions it reached and announced in an April 21, 1998 memorandum, a copy of which is available in the docket to this rulemaking, in which EPA addressed concerns about the effectiveness of the reactivity analysis procedures (see the proposed rule preamble for details regarding the content of this memo and its history). (See the April 21, 1998 memorandum at *http://www.epa.gov/SW–846/* for detailed information regarding NEIC's concerns and EPA's conclusions.) EPA consequently withdrew the July 1985 guidance through the aforementioned April 21, 1998 memorandum. To summarize, EPA concluded that the guidance had the following significant problems:

(1) The test conditions evaluate a single pH condition and not the range of pH conditions (2 to 12.5) specified in the reactivity regulation;

(2) The test conditions do not adequately recover the analyte and thus the tests predict low percentages of analyte releases in the waste;

(3) The mismanagement scenario and test conditions are not correctly scaled between each other; and

(4) The mismanagement scenario of an open pit is not the only exposure of concern and may not represent a plausible worst case scenario.

EPA received comments from eleven different commenters regarding this topic. You will find a background document containing our complete responses to all relevant public comments in the docket to this rule, docket number RCRA–2002–0025, at the location listed above under **ADDRESSES.** Three commenters supported the removal of the reactivity test procedures, stating that they believed

the test and guidance is flawed and that appropriate waste classifications can be made in the absence of guidance. On the other hand, three other commenters opposed the removal of the reactivity test procedures. One of these commenters stated that there are a number of concerns about the technical reasons for removal of the procedures, and believed that these warrant reconsideration of the proposed deletion of the guidance. In reviewing these concerns, the Agency found that the commenter may be misreading the Agency's basis for deletion of the guidance from SW–846. The commenter was concerned both about the impact of certain pH testing conditions and the use of Henry's Law in the guidance. However, these topics were not the reasons for withdrawing the guidance from SW–846. The Agency will investigate the commenter's concerns regarding pH testing conditions and Henry's Law as it develops revised guidance. Another one of the commenters asserted that the narrative criteria alone can be used for classification of high concentration cyanide wastes, but that additional guidance is needed for classifying lower level cyanide-bearing wastes. The other commenter understood the difficulties associated with the reactivity method guidance, but believed that the regulated community needed something other than the "honor system" to classify these reactive wastes.

The remaining five commenters had general concerns about making the reactivity characteristic determinations, but did not specifically support or oppose deletion of the tests or threshold levels. Four commenters out of the total of eleven commenters requested that EPA replace the deleted tests with other method guidance.

In response to all comments, the Agency is currently reviewing several test methods for possible inclusion in SW–846 as methods for characterizing cyanide-bearing wastes. However, the Agency still believes it inappropriate to retain the reactive cyanide and reactive sulfide methods in SW–846 for the reasons presented in the proposed rule preamble and listed above. Regarding the characteristic of reactivity, regulated parties have always been responsible for complying with the regulation at § 261.23—Characteristic of reactivity, which does not require any particular test methods for the characterization. Therefore, generators and other persons can use other appropriate methods or process knowledge in determining whether a particular waste is hazardous due to its reactivity.

VII. Clarifications to Corrosivity and Ignitability Hazardous Waste Characteristics

In sections VII.A and VII.B of the preamble to the proposed rule, the Agency proposed revisions to the corrosivity characteristic and the ignitability characteristic testing requirements. The proposed revisions included changes to references to ASTM standards and SW–846 methods. We considered these revisions to be non-substantive updates of the methods presently used in the regulations and we believed the revisions would not affect which wastes are determined to be hazardous based on the characteristics. We requested public comment on each of the proposed revisions. Significant comments and our responses are provided below.

A. Revision to § 261.22(a)(2) To Clarify That SW–846 Method 1110A Is the SW–846 Standardized Version of the NACE Standard Specified for Corrosivity Characteristic Testing

In section VII.A of the preamble to the proposed rule, EPA addressed proposed revisions to the corrosivity characteristic testing requirements, which included a clarification to § 261.22(a)(2). Section 261.22(a)(2) defines the hazardous waste characteristic of corrosivity for a liquid which corrodes steel. The required test method is identified as "the test method specified in NACE * * * Standard TM–01–69 as standardized in * * * SW–846 * * *" As explained in the May 19, 1980 regulations (see 45 FR 33084) which added § 261.22 to the RCRA regulations, EPA standardized the NACE Standard TM–01–69 in SW–846. As also explained in the background document to the corrosivity characteristic of the 1980 regulations, NACE Standard TM–01–69 describes a simple immersion test to determine the rate of corrosion. However, the procedure described in the background document, in fact, was not completely standardized because it was designed to test the suitability of metals for a variety of uses. As a result, a comment was submitted at that time which expressed concern with the incomplete standardization of the NACE Standard which allowed variation in test conditions. EPA agreed and, in response to the comment, put a standardized version of the method in SW–846 so that the procedure more clearly defined the appropriate test conditions. At the time, we did not specify which test method of SW–846 included the standardized version of the NACE method. This SW–846 method has always been Method 1110 (now Method 1110A as of Update IIIB), "Corrosivity Toward Steel." Therefore, in the proposed MIR, we proposed adding the number of this method to § 261.22(a)(2) for clarification of which SW–846 test method is the standardized version of NACE. This revision to § 261.22(a)(2) does not represent a change to the characteristic.

Three commenters addressed this section of the proposed MIR. Two of these commenters explicitly supported the clarification in § 261.22(a)(2) that SW–846 Method 1110A, "Corrosivity Toward Steel," is the standardized version of the NACE Standard TM–01–69. The other commenter did not comment on the proposed revision, but instead requested that EPA address a unrelated concern regarding the content of Method 1110A. None of the commenters disagreed with the Agency statement that the revisions were non-substantive.

Regarding SW–846 Method 1110A, the commenter believed that the method significantly differed from the corresponding Department of Transportation (DOT) corrosivity method. Specifically, Method 1110A suggests that a 24-hour test duration be used, while the DOT method indicates use of a longer test period. The commenter requested that EPA either clarify this difference or amend the regulations to allow the use of DOT's comparable corrosivity characteristic procedure, as set out in 49 CFR 173.137(c)(2), as an alternative test method for corrosivity under the hazardous waste regulations.

First, EPA notes that the test duration time in Method 1110A was not addressed or proposed for revision by the MIR. The MIR only proposed to clarify that Method 1110A is "the test method * * * standardized * * * in SW–846" for the corrosivity characteristic determination. The commenter does not appear to disagree with the proposed clarification. Because the Agency did not take comment, or even raise an issue, with the test duration time, we believe it inappropriate to address this provision in this final rule. Nevertheless, the Agency plans to evaluate the commenter's concerns to determine if future regulatory changes are warranted.

Therefore, in response to the comments submitted, the Agency is finalizing the regulatory revision whereby Method 1110A will be specified in § 261.22(a)(2). It is not necessary to also reference the NACE Standard TM–01–69 in the regulatory text. The NACE method was used to

initially develop Method 1110A and the two methods are not identical.

B. Revisions to § 261.21(a)(1) To Remove an Unnecessary Referral to Method Equivalency Petitions; and an Explanation Regarding the Decision To Not Revise the Regulation To Include the Updated ASTM Standards and References to Methods 1010A and 1020B as Proposed

In section VII.B of the preamble to the proposed rule, the Agency addressed proposed revisions to the ignitability characteristic testing requirements in § 261.21(a)(1). Section 261.21(a)(1) of the RCRA regulations defines the hazardous waste characteristic of ignitability as a liquid which has a flash point less than 60 °C (140 °F) as determined by the use of ASTM Standard D 93–79 or D 93–80 (Pensky-Martens Closed Cup Tester) or ASTM Standard D 3278–78 (Setaflash Closed Cup Tester). Since publication of the regulation, the ASTM Standard has been revised. However, before proposing to replace the ASTM Standard now in the regulation with the newer versions D 93–99c and D 3278–96, EPA compared the newer versions of the test protocol with the older versions of the protocol and found only non-substantive differences. Therefore, EPA proposed and requested comment on replacing the older versions of the ASTM Standard in § 261.21(a)(1) with the more recent versions. In addition, although ASTM Standard D 93–00 is newer than D 93–99c, EPA proposed that D 93–99c replace D 93–80 because EPA found that D 93–00 differed in a possibly substantial manner from D 93–80 and, if it were to be specified instead of D 93–99c, characteristic results may be significantly affected. Specifically, we found that the D 93–00 version specifies different sample container volumes for different sample types. It requires that all matrices, except residual fuel oil, be collected in containers not more than 85% or less than 50% full. This revision may significantly affect the characteristic results, since the potential to lose flammable volatile constituents will be greater from sample containers that may now have as much as 50% headspace. The Agency requested comment on this evaluation.

Finally, the Agency proposed to revise § 261.21(a)(1) to clarify that the ASTM standards for ignitability characteristic determinations are used and referenced by SW–846 Methods 1010A and 1020B. The Agency believed these revisions to § 261.21(a)(1) to be non-substantive and that the changes would not affect which wastes are determined to be hazardous based on the characteristic.

Five commenters addressed this section of the proposed MIR. Two commenters supported EPA's proposal to update the references to ASTM standards in § 261.21(a)(1). Two other commenters had general concerns about the ignitability characteristic and the ASTM standards, but did not appear to specifically support or oppose the replacements. Only one commenter commented on revising § 261.21(a)(1) to clarify that the ASTM standards for the ignitability characteristic are used and referenced by SW–846 Methods 1010A and 1020B. The commenter supported the regulatory revision.

Regarding ASTM Standards D 93–99c and D 93–00, the two commenters that supported updating the references agreed with EPA that D 93–99c and D 93–00 could yield different results and therefore, different conclusions as to whether or not a waste would be identified as hazardous. The two commenters that disagreed with the Agency's conclusion regarding D 93–00 maintained that the potential to lose volatile compounds also existed in the 1999 version. One of these commenters noted that an even newer version than D 93–00 was now available from ASTM, namely D 93–02. The commenter recommended that the Agency study that standard for any significant differences.

The Agency has considered all of the comments and decided to retain the existing ASTM regulatory standards and not replace them with the newer versions at this time. The Agency agrees with the commenter who suggested that EPA further study and review the new versions of the ASTM standards. Both newer versions of D 93 require that certain ASTM sampling procedures be used, which are unnecessarily prescriptive and often inapplicable to hazardous waste collection. The newer version of D 93 may also promote potential problems with requirements for sampling and automated test equipment. As a result, the Agency believes that a more detailed evaluation is warranted. In addition, the Agency believes that, although the newer versions of D 93 allows for automated test equipment, including the use of an electric igniter which may save time, a rigorous comparison of the electrical igniter versus the flame igniter should be conducted.

In addition, the Agency decided to not finalize the addition of references to Methods 1010A and 1020B in the regulations as proposed, but rather Methods 1010A and 1020B were revised as part of Final Update IIIB (final today as part of this rule, see section VIII), whereby all method text was replaced with direct references to the ASTM standards listed in § 261.21(a)(1).

Finally, as proposed regarding § 261.21(a)(1), we are removing that portion of the last sentence which refers to the equivalent test method demonstration. This information is adequately addressed in §§ 260.20 and 260.21. It is not necessary to repeat the information regarding method equivalency petitions in each section of a RCRA regulation which requires use of a specific test method(s). Also, this revision is consistent with similar sections on testing in part 261 and other parts of the RCRA regulations.

VIII. Availability of Final Update IIIB and Status of Final Update IV to SW–846

SW–846 is a guidance document that changes over time as new information and data are developed. On October 30, 2002, we proposed to revise several methods and chapters of SW–846 and release these revisions as Update IIIB to the Third Edition of SW–846. To date, EPA has finalized Updates I, II, IIA, IIB, III, and IIIA to the Third Edition of the SW–846 manual. On May 8, 1998 (see 63 FR 25430) and on November 27, 2000 (see 65 FR 70678), we also announced the availability of Draft Update IVA and IVB, respectively, which we published for guidance purposes only.

As part of this rule, we are finalizing Update IIIB. The Methods Team Web site at *http://www.epa.gov/SW–846* has been revised to remove Proposed Update IIIB and include an integrated electronic version of SW–846 which incorporates the final version of that update. In the near future after publication of this rule, Draft Updates IVA and IVB will be replaced by Final Update IV and its availability will be announced by a Federal Register notice.

The revised methods of Update IIIB are used for method-defined parameters and thus, any required uses of those methods will remain in the RCRA regulations. Therefore, we revised § 260.11 to include the Update IIIB methods.

In the proposed rule preamble, we also requested comments on certain parts of the Update IIIB methods and chapters. We did not consider comments on the other sections or parts of the methods or chapters because those portions were not proposed for revision. Most of the comments concerned the removal of the reactivity guidance methods from Chapter Seven and updating the ASTM standards. Those comments are addressed in previous sections of this preamble. The

Agency received a few other comments regarding the documents contained in Proposed Update IIIB. The docket to this rule (RCRA–2002–0025) contains a background document with our responses to all the comments submitted. The responses also identify any revisions made to the methods due to the comments.

Table 5 provides a listing of the four chapters and eleven methods in Final Update IIIB. The method numbers in the table reflect the appropriate method revision letter suffix (*e.g.*, A, B, C, etc.). These suffixes were not always reflected in the RCRA regulations themselves, e.g., the regulations cited the method number without a suffix. The relevant regulations revised by today's rule do reflect the latest suffix. Accordingly, this final rule identifies the latest promulgated version of the methods that remain as incorporated by reference at § 260.11 in the RCRA regulations. During compliance with those regulations, the regulated community must only use the latest promulgated revision of the methods as indicated in § 260.11, *i.e.*, the regulated community must only use the version of the method cited by § 260.11.

TABLE 5.—FINAL UPDATE IIIB METHODS AND CHAPTERS

Chapters or method number	Method or chapter title
Chapter Five	Miscellaneous Test Methods.
Chapter Six	Properties.
Chapter Seven	Characteristics Introduction and Regulatory Definitions.
Chapter Eight	Methods for Determining Characteristics.
1010A	(Referral to) Pensky-Martens Closed Cup Method for Determining Ignitability.
1020B	(Referral to) Setaflash Closed Cup Method for Determining Ignitability.
1110A	Corrosivity Toward Steel.
1310B	Extraction Procedure (EP) Toxicity Test Method and Structural Integrity Test.
9010C	Total and Amenable Cyanide: Distillation.
9012B	Total and Amenable Cyanide (Automated Colorimetric, with Off-line Distillation).
9040C	pH Electrometric Measurement.
9045D	Soil and Waste pH.
9060A	Total Organic Carbon.
9070A	n-Hexane Extractable Material (HEM) for Aqueous Samples.
9095B	Paint Filter Liquids Test.

Note: A suffix of "A" in the method number indicates revision one (the method has been revised once). A suffix of "B" in the method number indicates revision two (the method has been revised twice). A suffix of "C" in the method number indicates revision three (the method has been revised three times).

IX. Addition of Method 25A to §§ 264.1034(c)(1)(ii) and (iv) and 265.1034(c)(1)(ii) and (iv)

In section IX of the preamble to the proposed rule, the Agency proposed to revise §§ 264.1034(c)(1)(ii) and (iv) and §§ 265.1034(c)(1)(ii) and (iv) to allow the use of Method 25A, as well as Method 18, during analyses in support of air emission standards for process vents and/or equipment leaks at hazardous waste management facilities. All comments supported these revisions and therefore we finalized these changes, as proposed.

X. Removal of Requirements From §§ 63.1208(b)(8)(i) and (ii) in the NESHAP Standards To Demonstrate Feedstream Analytes Are Not Present at Certain Levels

In section X of the preamble to the proposed rule, the Agency proposed to remove the requirements for analytical DQOs (*e.g.*, 80% upper confidence limit) for feedstream analyses found in §§ 63.1208(b)(8)(i) and (ii) that were previously promulgated in the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Hazardous Waste Combustors on September 30, 1999. All comments supported these revisions and therefore we are finalizing these changes, as proposed.

XI. Status of the RCRA Waste Sampling Draft Technical Guidance

In section XI of the preamble to the proposed rule, we announced the availability of a stand-alone sampling guidance document entitled, "RCRA Waste Sampling Draft Technical Guidance." We intended to replace the original sampling guidance version of Chapter Nine found in EPA publication SW–846 with this new document. We requested comment on the guidance. The Agency received a number of comments which are still under review and consideration. This additional review of the document will help us improve the guidance and ensure that it is most useful in its final form. Therefore, we are not at this time issuing a final version of the sampling guidance. Once we complete our review and evaluation of the comments, we will revise the document as appropriate and announce its availability in the Federal Register.

XII. State Authorization Procedures

A. Applicability of Federal Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified states to administer the RCRA hazardous waste program within the state. Following authorization, the state requirements authorized by EPA apply in lieu of equivalent Federal requirements and become Federally enforceable as requirements of RCRA. EPA maintains independent authority to bring enforcement actions under RCRA sections 3007, 3008, 3013, and 7003. Authorized states also have independent authority to bring enforcement actions under state law. A state may receive authorization by following the approval process described in 40 CFR part 271. 40 CFR part 271 also describes the overall standards and requirements for authorization.

After a state receives initial authorization, new regulatory requirements promulgated under the authority in the RCRA statute which existed prior to the 1984 Hazardous and Solid Waste Amendments (HSWA) do not apply in that state until the state adopts equivalent state requirements. The state must adopt such requirements to maintain authorization.

In contrast, under RCRA section 3006(g) (*i.e.*, 42 U.S.C. 6926(g)), new Federal requirements and prohibitions imposed pursuant to HSWA provisions take effect in authorized states at the same time that they take effect in unauthorized states. Although authorized states are still required to

update their hazardous waste programs to remain equivalent to the Federal program, EPA carries out HSWA requirements and prohibitions in authorized states, including the issuance of new permits implementing those requirements, until EPA authorizes the state to do so.

Finally, authorized states are required to modify their programs only when EPA promulgates Federal requirements that are more stringent or broader in scope than existing Federal requirements. RCRA section 3009 allows the states to impose standards more stringent than those in the Federal program. See also § 271.1(i). Therefore, authorized states are not required to adopt Federal regulations, both HSWA and non-HSWA, that are considered less stringent.

B. Authorization of States for Today's Rule

Today's rule affects many aspects of the RCRA Program and is promulgated pursuant to both HSWA and non-HSWA statutory authority. Therefore, the Agency added the rule to Table 1 in § 271.1(j), which identifies Federal regulations that are promulgated pursuant to the statutory authority that was added by HSWA. States may apply for final authorization for the HSWA provisions, as discussed in the following section of this preamble.

Today's rule language provides standards that are equivalent to or less stringent than the existing provisions in the Federal regulations which they would amend. Therefore, States would not be required to adopt and seek authorization for this rulemaking. EPA would implement this rulemaking only in those states which are not authorized for the RCRA Program, and will implement provisions promulgated pursuant to HSWA only in those states which have not received authorization for the HSWA provision that would be amended. In authorized States, the changes will not be applicable until and unless the State revises its program to adopt the revisions.

(Note: Procedures and deadlines for State program revisions are set forth in § 271.21.)

This rule will provide significant benefits to EPA, the states, and the regulated community, without compromising human health or environmental protection. Therefore, EPA strongly encourages authorized states to amend their programs and seek authorization for today's rule.

C. Abbreviated Authorization Procedures

EPA consider's today's rule to be a minor rulemaking and is adding it to the list of minor or routine rulemakings in Table 1 to § 271.21. Placement in this table will enable states to use the abbreviated procedures located in § 271.21(h) when they seek authorization for today's changes. These abbreviated procedures were established in the HWIR-media rulemaking (see 63 FR 65927, November 30, 1998).

XIII. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), we must determine whether a regulatory action is "significant," and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this Executive Order.

OMB determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review and the requirements of the Executive Order.

B. Paperwork Reduction Act

This action does not impose any new information collection burden. There are no additional reporting, notification, or recordkeeping provisions associated with today's rule. However, the Office of Management and Budget (OMB) previously approved the information collection requirements contained in some of the existing regulations being revised by this rule, under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and assigned OMB control numbers for those information collection requirements, as follows:

—40 CFR 258.28: OMB control number 2050–0122
—40 CFR 260.21 and 260.22: OMB control number 2050–0053
—40 CFR 261.3: OMB control number 2050–0085
—40 CFR 261.35: OMB control number 2050–0115
—40 CFR 264.1034, 264.1063, 265.1034, and 265.1063: OMB control number 2050–0050
—40 CFR 266.100, 266.102, 266.106, 266.112, Appendix IX to part 63, and 270.22: OMB control number 2050–0073
—40 CFR 270.19: OMB control number 2050–0009
—40 CFR 270.62: OMB control numbers 2050–0009 and 2050–0149
—40 CFR 270.66: OMB control numbers 2050–0073 and 2050–0149
—40 CFR 279.10, 279.44, 279.53 and 279.63: OMB control number 2050–0124

Copies of the ICR document(s) may be obtained from Sandy Farmer, by mail at the Office of Environmental Information, Collection Strategies Division; U.S. Environmental Protection Agency (2822); 1200 Pennsylvania Ave., NW., Washington, DC 20460, by email at *farmer.sandy@epa.gov*, or by calling (202) 260–2740. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. Include the ICR and/or OMB number in any correspondence.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to a collection of information, unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act generally requires an agency to prepare

a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute, unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business that is independently owned and operated and not dominant in its field as defined by Small Business Administration (SBA) regulations under Section 3 of the Small Business Act for SIC; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. In determining whether a rule has a significant economic impact on a substantial number of small entities, the impact of concern is any significant adverse economic impact on small entities, since the primary purpose of the regulatory flexibility analyses is to identify and address regulatory alternatives "which minimize any significant economic impact of the rule on small entities." 5 U.S.C. sections 603 and 604. Thus, an agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, or otherwise has a positive economic effect on all of the small entities subject to the rule. Today's rule is specifically intended to reduce economic burden for all entities. The action will provide greater flexibility and utility to all affected entities, including small entities, by providing an increase in choices of appropriate analytical methods for RCRA applications. It does not create any new regulatory requirements or require any new reports beyond those now required by the revised regulations. In addition, its revisions need not be adopted by regulated entities. If the methods are appropriate, such entities can continue to use the methods previously specified in the regulations before today instead of choosing the option to use other appropriate methods from other reliable sources. We have therefore concluded that today's final rule will relieve regulatory burden for small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA or the Act), Pubic Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed rules and final rules with Federal mandates that may result in estimated costs to State, local, and tribal governments in the aggregate, or to the private sector, of $100 million or more in any one year. When such a statement is needed, section 205 of the Act generally requires EPA to identify and consider a reasonable number of regulatory alternatives. Under section 205, EPA must adopt the least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule, unless the Administrator explains in the final rule why that alternative was not adopted. The provisions of section 205 do not apply when they are inconsistent with applicable law. Before EPA establishes regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must develop under section 203 of the Act a small government agency plan. The plan must provide for notifying potentially affected small governments, giving them meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising them on compliance with the regulatory requirements.

First, this rule does not contain a Federal mandate. The rule imposes no enforceable duty on any State, local or tribal governments. This rule contains no regulatory requirements that might significantly or uniquely affect small governments. This is due to the fact that this rule does not add any new regulatory requirements and States need not adopt its revisions. This rule only revises certain regulatory sections to remove the requirement to use SW–846 methods and allow the use of other appropriate methods—that is, clarify allowed flexibility in method selection for meeting RCRA-related testing and monitoring requirements. Under RCRA, regardless of the method used—the one previously specified in the regulation before today or another appropriate method—regulated entities should be demonstrating that the method is appropriate for its intended use. This rule also does not propose new monitoring or information collection requirements. The additional flexibility allowed by this rule should result in improved data quality at reduced cost. Thus, today's rule is not subject to the requirements of sections 202, 203 and 205 of UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government."

This final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. As explained above, today's rule does not impose new requirements on the States and its regulatory changes need not be adopted by the States. Thus, Executive Order 13132 does not apply to this rule. Because these changes are equivalent to or less stringent than the existing Federal program, States would not be required to adopt and seek authorization for them.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249) entitled, "Consultation and Coordination With Indian Tribal Governments" requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications. "Policies that have tribal implications" are defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes."

Today's rule does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes, as specified in Executive Order 13175. For many of the same reasons described above under unfunded mandates, the requirements of the Executive Order do not apply to this rulemaking. As stated above, this rule does not propose any new regulatory requirements and Indian tribal governments need not adopt it. It does not impose any direct compliance costs on tribal governments.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045, "Protection of Children From Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

This rule is not subject to the Executive Order because it is not economically significant as defined in Executive Order 12866. Also, EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Order has the potential to influence the regulation. This rule is not subject to Executive Order 13045 because it does not establish an environmental standard intended to mitigate health or safety risks. The action discussed in today's rule is intended to provide increased flexibility in the use of methods for RCRA-related testing and monitoring, and thus is not subject to Executive Order 13045.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This rule is not a "significant energy action" as defined in Executive Order 13211, "Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that this rule is not likely to have any adverse energy effects.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 ("NTTAA"), Public Law No. 104–113, section 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs us to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards.

This rule increases flexibility in the use of methods for RCRA-related testing and monitoring and does not itself identify or require the use of new methods or other technical standards. In fact, this rule, may increase the use of available voluntary consensus standards for some RCRA applications, provided that such methods are appropriate for the regulatory application.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," February 11, 1994, requires that regulatory actions be accompanied by an environmental justice analysis. This analysis must look at potentially disproportionate impacts the action may have on minority and/or low-income communities.

The Agency has determined that the action does not raise environmental justice concerns. The impact of this rule will be to provide increased flexibility in the choice of appropriate analytical methods for RCRA applications. The Agency is not aware of any disproportionate impacts that such flexibility may have on minority and/or low-income communities.

K. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the Federal Register. A major rule cannot take effect until 60 days after it is published in the Federal Register. This action is not a "major rule" as defined by 5 U.S.C. 804(2). This rule will be effective July 14, 2005.

List of Subjects

40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Reporting and recordkeeping requirements.

40 CFR Part 258

Environmental protection, Incorporation by reference, Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control.

40 CFR Part 260

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous waste, Incorporation by reference, Reporting and recordkeeping requirements.

40 CFR Part 261

Environmental protection, Comparable fuels, syngas fuels, Excluded hazardous waste, Incorporation by reference, Reporting and recordkeeping requirements.

40 CFR Part 264

Environmental protection, Air pollution control, Hazardous waste, Incorporation by reference, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds.

40 CFR Part 265

Environmental protection, Air pollution control, Hazardous waste, Incorporation by reference, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds, Water supply.

40 CFR Part 266

Environmental protection, Energy, Hazardous waste, Incorporation by reference, Recycling, Reporting and recordkeeping requirements.

40 CFR Part 268

Environmental protection, Hazardous waste, Incorporation by reference, Reporting and recordkeeping requirements.

40 CFR Part 270

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Reporting and recordkeeping requirements, Water pollution control, Water supply.

40 CFR Part 271

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

40 CFR Part 279

Environmental protection, Petroleum, Recycling, Reporting and recordkeeping requirements.

Dated: May 16, 2005.

Stephen L. Johnson,

Administrator.

■ For the reasons set out in the preamble, EPA amends title 40, chapter I, of the Code of Federal Regulations as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart EEE—National Emission Standards for Hazardous Air Pollutants From Hazardous Waste Combustors

■ 2. Section 63.1208 is amended by revising paragraph (b)(8) to read as follows:

§ 63.1208 What are the test methods?

* * * * *

(b) * * *

(8) *Feedstream analytical methods.* You may use any reliable analytical method to determine feedstream concentrations of metals, chlorine, and other constituents. It is your responsibility to ensure that the sampling and analysis procedures are unbiased, precise, and that the results are representative of the feedstream.

* * * * *

PART 258—CRITERIA FOR MUNICIPAL SOLID WASTE LANDFILLS

■ 3. The authority citation for part 258 continues to read as follows:

Authority: 33 U.S.C. 1345(d) and (e); 42 U.S.C 6902(a), 6907, 6912(a), 6944, 6945(c), and 6949a(c).

Subpart C—Operating Criteria

■ 4. Section 258.28 is amended by revising paragraph (c)(1) to read as follows:

§ 258.28 Liquids restrictions.

* * * * *

(c) * * *

(1) Liquid waste means any waste material that is determined to contain "free liquids" as defined by Method 9095B (Paint Filter Liquids Test), included in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (EPA Publication SW–846) which is incorporated by reference. A suffix of "B" in the method number indicates revision two (the method has been revised twice). Method 9095B is dated November 2004. This incorporation by reference was approved by the Director of the Federal Register pursuant to 5 U.S.C. 552(a) and 1 CFR part 51. This material is incorporated as it exists on the date of approval and a notice of any change in this material will be published in the **Federal Register**. A copy may be inspected at the Library, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave., NW. (3403T), Washington, DC 20460, *libraryhq@epa.gov;* or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.*

* * * * *

■ 5. Appendix I to part 258 is revised to read as follows:

Appendix I to Part 258—Constituents for Detection Monitoring

Common name [1]	CAS RN [2]
Inorganic Constituents:	
(1) Antimony	(Total)
(2) Arsenic	(Total)
(3) Barium	(Total)
(4) Beryllium	(Total)
(5) Cadmium	(Total)
(6) Chromium	(Total)
(7) Cobalt	(Total)
(8) Copper	(Total)
(9) Lead	(Total)
(10) Nickel	(Total)
(11) Selenium	(Total)
(12) Silver	(Total)
(13) Thallium	(Total)
(14) Vanadium	(Total)
(15) Zinc	(Total)
Organic Constituents:	
(16) Acetone	67–64–1
(17) Acrylonitrile 1	107–13–1
(18) Benzene	71–43–2
(19) Bromochloromethane	74–97–5
(20) Bromodichloromethane	75–27–4
(21) Bromoform; Tribromomethane	75–25–2
(22) Carbon disulfide	75–15–0
(23) Carbon tetrachloride	56–23–5

Common name [1]	CAS RN [2]
(24) Chlorobenzene	108–90–7
(25) Chloroethane; Ethyl chloride	75–00–3
(26) Chloroform; Trichloromethane	67–66–3
(27) Dibromochloromethane; Chlorodibromomethane	124–48–1
(28) 1,2-Dibromo-3-chloropropane; DBCP	96–12–8
(29) 1,2-Dibromoethane; Ethylene dibromide; EDB	106–93–4
(30) o-Dichlorobenzene; 1,2-Dichlorobenzene	95–50–1
(31) p-Dichlorobenzene; 1,4-Dichlorobenzene	106–46–7
(32) trans-1, 4-Dichloro-2-butene	110–57–6
(33) 1,1-Dichlorethane; Ethylidene chloride	75–34–3
(34) 1,2-Dichlorethane; Ethylene dichloride	107–06–2
(35) 1,1-Dichloroethylene; 1,1-Dichloroethene; Vinylidene chloride	75–35–4
(36) cis-1,2-Dichloroethylene; cis-1,2-Dichloroethene	156–59–2
(37) trans-1, 2-Dichloroethylene; trans-1,2-Dichloroethene	156–60–5
(38) 1,2-Dichloropropane; Propylene dichloride	78–87–5
(39) cis-1,3-Dichloropropene	10061–01–5
(40) trans-1,3-Dichloropropene	10061–02–6
(41) Ethylbenzene	100–41–4
(42) 2-Hexanone; Methyl butyl ketone	591–78–6
(43) Methyl bromide; Bromomethane	74–83–9
(44) Methyl chloride; Chloromethane	74–87–3
(45) Methylene bromide; Dibromomethane	74–95–3
(46) Methylene chloride; Dichloromethane	75–09–2
(47) Methyl ethyl ketone; MEK; 2-Butanone	78–93–3
(48) Methyl iodide; Idomethane	74–88–4
(49) 4-Methyl-2-pentanone; Methyl isobutyl ketone	108–10–1
(50) Styrene	100–42–5
(51) 1,1,1,2-Tetrachloroethane	630–20–6
(52) 1,1,2,2-Tetrachloroethane	79–34–5
(53) Tetrachloroethylene; Tetrachloroethene; Perchloroethylene	127–18–4
(54) Toluene	108–88–3
(55) 1,1,1-Trichloroethane; Methylchloroform	71–55–6
(56) 1,1,2-Trichloroethane	79–00–5
(57) Trichloroethylene; Trichloroethene	79–01–6
(58) Trichlorofluoromethane; CFC–11	75–69–4
(59) 1,2,3-Trichloropropane	96–18–4
(60) Vinyl acetate	108–05–4
(61) Vinyl chloride	75–01–4
(62) Xylenes	1330–20–7

[1] Common names are those widely used in government regulations, scientific publications, and commerce; synonyms exist for many chemicals.

[2] Chemical Abstract Service registry number. Where "Total" is entered, all species in the ground water that contain this element are included.

■ 6. Appendix II to part 258 is revised to read as follows:

Appendix II to Part 258—List of Hazardous Inorganic and Organic Constituents

Common name [1]	CAS RN [2]	Chemical abstracts service index name [3]
Acenaphthene	83–32–9	Acenaphthylene, 1,2-dihydro-
Acenaphthylene	208–96–8	Acenaphthylene
Acetone	67–64–1	2-Propanone
Acetonitrile; Methyl cyanide	75–05–8	Acetonitrile
Acetophenone	98–86–2	Ethanone, 1-phenyl-
2-Acetylaminofluorene; 2-AAF	53–96–3	Acetamide, N–9H-fluoren-2-yl-
Acrolein	107–02–8	2-Propenal
Acrylonitrile	107–13–1	2-Propenenitrile
Aldrin	309–00–2	1,4:5,8-Dimethanonaphthalene, 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-(1,4,4a,5,8,8a)-
Allyl chloride	107–05–1	1-Propene, 3-chloro-
4-Aminobiphenyl	92–67–1	[1,1'-Biphenyl]- 4-amine
Anthracene	120–12–7	Anthracene
Antimony	(Total)	Antimony
Arsenic	(Total)	Arsenic
Barium	(Total)	Barium
Benzene	71–43–2	Benzene
Benzo[a]anthracene; Benzanthracene	56–55–3	Benz[a]anthracene
Benzo[b]fluoranthene	205–99–2	Benz[e]acephenanthrylene
Benzo[k]fluoranthene	207–08–9	Benzo[k]fluoranthene
Benzo[ghi]perylene	191–24–2	Benzo[ghi]perylene
Benzo[a]pyrene	50–32–8	Benzo[a]pyrene
Benzyl alcohol	100–51–6	Benzenemethanol

NOTICE OF PUBLIC HEARING AND
PUBLIC COMMENT PERIOD

On Monday, July 9, 2007 beginning at 6 p.m., the West Virginia Department of Environmental Protection, Division of Air Quality (DAQ) will hold a public hearing on proposed revisions to existing legislative rules. Oral and written comments shall be limited only to the proposed revisions to the following existing legislative rules:

45CSR6	To Prevent and Control Air Pollution From Combustion of Refuse;
45CSR8	Ambient Air Quality Standards for Sulfur Oxides and Particulate Matter;
45CSR16	Standards of Performance for New Stationary Sources Pursuant to 40 CFR Part 60;
45CSR18	To Prevent and Control Emissions From Commercial and Industrial Solid Waste Incineration Units;
45CSR25	To Prevent and Control Air Pollution from Hazardous Waste Treatment, Storage, or Disposal Facilities;
45CSR34	Emission Standards for Hazardous Air Pollutants for Source Categories Pursuant to 40 CFR Part 63;
45CSR39	Control of Annual Nitrogen Oxide Emissions to Mitigate Interstate Transport of Fine Particulate Matter and Nitrogen Oxides;
45CSR40	Control of Ozone Season Nitrogen Oxide Emissions to Mitigate Interstate Transport of Ozone and Nitrogen Oxides; and
45CSR41	Control of Annual Sulfur Dioxide Emissions to Mitigate Interstate Transport of Fine Particulate Matter and Sulfur Dioxide.

On Monday, July 9, 2007, after public hearings on the above proposed legislative rules, the West Virginia Department of Environmental Protection, DAQ will hold a public hearing on the following proposed legislative rule:

45CSR42	Greenhouse Gas Emissions Inventory Program.

Upon authorization and promulgation of revisions to 45CSR6, 45CSR8, 45CSR39, 45CSR40 and 45CSR41, the DAQ will submit the final rules to the U.S. Environmental Protection Agency (U.S. EPA) as revisions to the State Implementation Plan, pursuant to the federal Clean Air Act.

Upon authorization and promulgation of revisions to 45CSR16, the DAQ will submit the final rule to the U.S. EPA for approval as a part of West Virginia's program delegation of the federal New Source Performance Standards.

Upon authorization and promulgation of revisions to 45CSR18, the DAQ will submit the final rule to the U.S. EPA for approval as a part of West Virginia's Section 111(d)/129 Plan and program delegation of the federal New Source Performance Standards.

Upon authorization and promulgation of revisions to 45CSR25, the DAQ will submit the final rule to the U.S. EPA for approval as part of the West Virginia Hazardous Waste Management Program.

Upon authorization and promulgation of revisions to 45CSR34, the DAQ will submit the final rule to the U.S. EPA for approval as a part of West Virginia's program delegation of the National Emission Standards for Hazardous Air Pollutants.

Upon authorization and promulgation of 45CSR42, the DAQ will begin implementation of a Greenhouse Gas Inventory Program.

The public hearing will be held at the Department of Environmental Protection, Dolly Sods Conference Room, 601 57th Street SE, Charleston and is open to the public. Written and oral comments will be accepted until the close of the hearing and will be made a part of the rulemaking record. Comments will also be accepted by fax (304-926-0479), U.S. Mail, or e-mail if postmarked or delivered by the close of business on July 9, 2007.

Copies of the proposed legislative rules may be viewed between 8:30 a.m. and 4:30 p.m. at the Division of Air Quality, 601 57th SE, Charleston, WV 25304 beginning June 8, 2007 or electronically upon e-mail request to: tmowrer@wvdep.org. For a copy of the proposed rules, access the following web address: www.wvdep.org/daq. Choose Public Notice and Comment.

Send written comments to John A. Benedict, Director, Division of Air Quality at the above address. Please identify the draft document to which the comments apply, the commenter's name, address, and telephone number. Comments will also be accepted by e-mail if transmitted by 5:00 p.m. on July 9, 2007 to: tmowrer@wvdep.org. Comments submitted by U.S. Mail must be postmarked by July 9, 2007.

Division of Mining and Reclamation

38CSR2 - Surface Mining Reclamation Rule. The public hearing will be held at 5 p.m. on July 10, 2007, in the Canaan Valley Room. The comment period will end at the conclusion of the hearing.

47CSR5A - Individual State Certification of Activities Requiring a Federal Permit. The public hearing will be held at 6 p.m. on July 10, 2007, in the Canaan Valley Room. The comment period will end at the conclusion of the hearing.

47CSR30 - WV/NPDES Rules for Coal Mining Facilities. The public hearing will be held at 6 p.m. on July 10, 2007, in the Canaan Valley Room. The comment period will end at the conclusion of the hearing.

199CSR1 - Surface Mining Blasting Rule. The public hearing will be held at 5 p.m. on July 10, 2007, in the Canaan Valley Room. The comment period will end at the conclusion of the hearing.

For more information on any of the DWWM rules, call 926-0490.

Office of Oil and Gas

35CSR3 - Coalbed Methane Wells Rule. The public hearing will be held at 6 p.m. on July 17, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing. For more information, call 926-0450.

Division of Land Restoration

33CSR10 - Recycling Assistance Grant Program. The public hearing will be held at 6 p.m. on July 12, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

40CSR3 - Voluntary Remediation and Redevelopment Rule. The public hearing will be held at 6:30 p.m. on July 12, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

For more information on any of the DLR rules, call 926-0455.

Public Information Office

60CSR8 - Environmental Excellence Rule. The public hearing will be held at 7 p.m. on July 17, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing. For more information, call 926-0440.

(287864)

Division of Water and Waste Management

33CSR9 - Standards for Beneficial use of Filtrate from Water Treatment Plants. The public hearing will be held at 6 p.m. on July 2, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

33CSR20 - Hazardous Waste Management System. The public hearing will be held at 6 p.m. on July 11, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

33CSR30 - Underground Storage Tanks. The public hearing will be held at 6:30 p.m. on July 11, 2007, in the Coopers Rock Training Room at DEP's Charleston headquarters. The comment period will end at the conclusion of the hearing.

47CSR2 - Rules Governing Water Quality Standards. The public hearing will be held at 6 p.m. on July 16, 2007, in the Coopers Rock Training Room. The comment period will end at 5 p.m. on July 17, 2007. The rule includes a proposed use redesignation for Pat's Branch in the Guyandotte River Basin (see additional information in the information sheet attached to the briefing document).

47CSR10 - National Pollutant Discharge Elimination System (NPDES). The public hearing will be held at 6:30 p.m. on July 17, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

47CSR34 - Dam Safety. The public hearing will be held at 7 p.m. on July 11, 2007, in the Coopers Rock Training Room. The comment period will end at the conclusion of the hearing.

60CSR5 - Antidegradation Implementation Procedures. The public hearing will be held at 7 p.m. on July 16, 2007, in the Coopers Rock Training Room. The comment period will end at 5:00 p.m. on July 17, 2007.

For more information on any of the DWWM rules, call 926-0495.

PUBLIC NOTICE

The West Virginia Department of Environmental Protection has scheduled public hearings for its 2008 proposed legislative rules. All hearings will be held at DEP's Charleston headquarters, 601 57th Street S.E., Charleston, WV 25304. Oral and written comments shall be limited to the proposed revisions to the following rules. All comments will be made a part of the rulemaking record. Copies of the rules and other rule documents are available from the Secretary of State's office or from the agency at www.wvdep.org/2008rules. You may also obtain paracopies of the information by calling the phone numbers listed below.

Written comments may be submitted to the Public Information Office at the above address. Comments may also be e-mailed to comments@wvdep.org. The hearing dates, locations and comment deadlines are as follows:

Division of Air Quality

45CSR6 - Control of Air Pollution from Combustion of Refuse.

45CSR8 - Ambient Air Quality Standards.

45CSR16 - Standards of Performance for New Stationary Sources.

45CSR18 - Control of Air Pollution from Combustion of Solid Waste.

45CSR25 - Control of Air Pollution from Hazardous Waste Treatment, Storage and Disposal Facilities.

45CSR34 - Emission Standards for Hazardous Air Pollutants.

45CSR39 - Control of Annual Nitrogen Oxides Emissions.

45CSR40 - Control of Ozone Season Nitrogen Oxides Emissions.

45CSR41 - Control of Annual Sulfur Dioxide Emissions.

45CSR42 - Greenhouse Gas Emissions Inventory Program.

The public hearing for all air quality rules will be held at 6 p.m. on July 9, 2007, in the Daily Soas conference room. The comment period will end at the conclusion of the hearing. Upon authorization and promulgation of revisions to 45CSR6, 45CSR8, 45CSR39, 45CSR40 and 45CSR41, the DAQ will submit the rules to the U.S. Environmental Protection Agency (EPA) as revisions to the State Implementation Plan pursuant to the federal Clean Air Act (CAA). Rules 45CSR16, 45CSR18, 45CSR25, and 45CSR34 will also be submitted to EPA to fulfill other federal obligations under the CAA, including delegations, plans and program approvals. For more information on any of the air rules, call 926-0475.

ORIGINAL

BEFORE THE WEST VIRGINIA DEPARTMENT OF
ENVIRONMENTAL PROTECTION
DIVISION OF AIR QUALITY

In the matter of: PROPOSED REVISIONS TO 45CSR34- Emission Standards for Hazardous Air Pollutants

Transcript of proceedings had at a public hearing in the above-styled matter taken by Missy L. Young, Certified Court Reporter, at the West Virginia Department of Environmental Protection, Division of Air Quality, Dolly Sods Conference Room, 601 57th Street, S.E. Charleston, West Virginia, commencing at 6:21 p.m., on the 9th day of July 2007, pursuant to notice.

P R O C E E D I N G S

MS. CHANDLER: The purpose of this public hearing is to accept comments on the proposed revisions to 45CSR34 - Emission Standards for Hazardous Air Pollutants.

This rule establishes and adopts national emission standards for hazardous air pollutants, and NESHAP is the acronym for that, and other regulatory requirements promulgated by the U.S. Environmental Protection Agency pursuant to section 112 of the federal Clean Air Act, as amended.

This rule codifies general procedures and criteria to implement emission standards for stationary sources that emit, or have the potential to emit, one or more of the eight substances listed as hazardous air pollutants in 40 CSR§61.01(a). The rule incorporates by reference the NESHAP standards of 40 CFR parts 61, 63 and 40 CFR Part 65 (Consolidated Federal Air Rule), to the extent referenced in 40 CFR Parts 61 and 63, promulgated as of June 1, 2007.

The rule also adopts associated appendices, reference methods, performance specifications and other test methods which are appended to these standards and contained in 40 CFR Parts 61 and 63. Any person who

constructs, reconstructs, modifies or operates any source subject to the provisions of 40 CFR Parts 61 and 63 must comply with the applicable NESHAPS and this rule.

This rule will repeal and replace 45CSR15 "Emission Standards for Hazardous Air Pollutants Pursuant to 40 CFR Part 61, filed April 28, 2006 and effective June 1, 2006, as 45CSR34 will now include all federal NESHAPS under 40 CFR Parts 61 and 63.

The revised rule incorporates by reference the following new or revised NESHAP standards promulgated as of June 1, 2007; Miscellaneous Organic Chemical Manufacturing, Waste Management System; Testing and Monitoring Activities, Methods Innovation Rule and SW Rule 846 Final Update IIIB, Cellulose Products manufacturing, Primary Aluminum Reduction Plants, Cross-Media Electronic Reporting, Hazardous Waste Combustors (Phase I Final Replacement Standards and Phase II); Requirements for Control Technology Determinations for Major Sources in Accordance With Clean Air Act Sections, Sections 112(g) and 112(j), Primary Copper Smelting, Coke Ovens; Pushing, Quenching and Battery Stacks, Cellulose products Manufacturing, Reinforced Plastic Composite Production; Miscellaneous Organic Chemical Manufacturing, Secondary

Aluminum Production, Brick and Structural Clay Products Manufacturing, Hazardous Waste Combustor, Exemption of Certain Area Sources From Title V Operating Permit Programs, List of Hazardous Air Pollutants, Petition Process, Lesser Quantity Designations.

Source Category List, Miscellaneous Coating Manufacturing, Industrial, Commercial, and Institutional Boilers and Process Heaters; Reconsideration, Surface Coating of Metal Cans, Refractory Products Manufacturing, Plywood and Composite Wood Products; List of Hazardous Air Pollutants, Lesser Quanity Designations, Source Category List, Miscellaneous Organic Chemical Manufacturing, Hydrochloric Acid Production, Industrial Process Cooling Towers, Magnetic Tape Manufacturing Operations, Ethylene Oxide Emissions Standards for Sterilization Facilities, Refractory Products Manufacturing, General Provisions; Printing and Publishing Industry; Source Categories; Integrated Iron and Steel Manufacturing Facilities; Dry Cleaning Facilities; Organic Liquids Distribution, nongasoline; Miscellaneous Coating Manufacturing; Site Remediation; Portland Cement Manufacturing Industry; Synthetic Organic Chemical Manufacturing Industry; Surface Coating of Automobiles and

Light-Duty Trucks; Oil and Natural Gas Production Facilities; Surface Coating of Plastic Parts and Products, and Halogenated Solvent Cleaning.

The following 40 CFR Part 63 standards affecting non-major sources of hazardous air pollutants are being excluded from incorporation by reference: Oil and Natural Gas production; Polyvinyl Chloride an Copolymers Production; Primary Copper Smelting; Secondary Copper Smelting; and Primary Nonferrous Metals - Zinc Cadmium and Beryllium.

Upon authorization and promulgation of revisions to 45CSR34, the Division of Air Quality will submit the final rules to the U.S. Environmental Protection Agency to fulfill other federal obligations under the Clean Air Act, including delegations, plans and program approvals.

The floor is now open for comments.

There being nothing further, this public hearing for the proposed revisions to 45CSR34 is concluded.

(WHEREUPON, the hearing was concluded at 6:29 p.m.)

STATE OF WEST VIRGINIA,

COUNTY OF KANAWHA, to-wit:

I, the undersigned, Missy L. Young, a Certified Court Reporter and Commissioner within and for the State of West Virginia, duly commissioned and qualified, do hereby certify that the foregoing, is to the best of my skill and ability, a true and accurate transcript of all the proceedings had in the aforementioned matter.

Given under my hand and official seal this 20th day of July 2007.

Missy L. Young CCR

Missy L. Young
Certified Court Reporter
Commissioner for the State of West Virginia

My commission expires April 15, 2008.

Re: Proposed Greenhouse Gas Emissions Inventory Program Rule –45 CSR 42; Proposed Revisions to Emission Standards for Hazardous Air Pollutants – 45 CSR 34

Dear Sir or Madam:

On behalf of the Independent Oil and Gas Association of West Virginia, Inc. ("IOGA"), I am submitting comments regarding the proposed Greenhouse Gas Emissions Inventory Program rule (the "Proposed GHG Rule") implementing SB 337 which was passed during the 2007 Regular Session of the West Virginia legislature. IOGA also offers a brief comments below regarding the proposed revisions to Emission Standards for Hazardous Air Pollutants – 45 CSR 34. IOGA is a statewide non-profit trade association representing companies engaged in the exploration, production and development of natural gas and oil resources in West Virginia, and the companies and individuals who support these activities

Proposed GHG Rule

IOGA believes that with limited exceptions, the Proposed GHG Rule succinctly and effectively reflects the legislature's intent in SB 337 and we compliment the Division of Air Quality for its efforts in this proposal. Comments on specific sections of the proposed rule are provided below.

Section 2.4 – The term "area source" is defined in the rule, but we do not find where the term is actually used. We ask that the agency clarify whether it intends some portion of the rule to apply to areas sources and, if so, in what manner.

Section 3.1 – This section sets forth the threshold levels that trigger the obligation for a stationary source to report its emissions of greenhouse gases. IOGA believes that it was the intent of the legislature that the threshold level was established to assure that the burden of reporting was not imposed on de minimis sources of emissions and that a source should be required to report emissions only for those greenhouse gases for

which the threshold is exceeded. We respectfully request that the agency clarify whether this is consistent with its interpretation of this section.

Section 5.3 – This section suggests that the Secretary may mandate industry trade groups, such as IOGA, to provide information regarding greenhouse gas emissions. Assuming such trade groups are not independent sources of greenhouse gas emissions, but rather have members that are sources, we submit that the DEP does not have jurisdiction to require that information be submitted by such groups. However, please be advised that IOGA would be pleased to consult with the DEP in any efforts it undertakes to estimate greenhouse gas emissions for oil and gas facilities.

Emission Standards for Hazardous Air Pollutants

In its proposed revisions to 45 CSR 34, the emissions standards for hazardous air pollutants, the agency has proposed to incorporate by reference federal regulations setting standards for emissions of hazardous air pollutants in effect as of June 1, 2007. See Sec. 4.1. However, the agency also proposes to except from this provision several specific federal regulations including regulations governing emissions from natural gas operations. Specifically, Subsection 4.1.c reads as follows:

> Provisions under Subpart HH of 40 CFR Part 63 which apply to non-major area sources of hazardous air pollutants described in 40 CFR §63.760(b)(2) shall be excluded [from incorporation by reference].

Because there are members of IOGA who may be covered by the regulations referenced in Subsection 4.1.c, we are requesting that the agency provide some explanation regarding its reasons for excluding these rules from incorporation by reference. In addition, what guidance will the agency be providing to those sources who may be covered by the excluded regulations? Absent some justification for this proposed exclusion and adequate guidance to the regulated sources regarding how they can achieve compliance with these standards, IOGA must objection to Subsection 4.1.c and requests its deletion from the final version of this rule.

IOGA appreciates the opportunity to present these comments to the agency and requests that they be given careful consideration.

Very truly yours,

Charlie Burd

Re: **Comments on DAQ's Proposed Rules**

Dear Director Benedict:

Please find enclosed herewith the **COMMENTS OF THE WEST VIRGINIA MANUFACTURERS ASSOCIATION AND THE WEST VIRGINIA OIL AND NATURAL GAS ASSOCIATION ON THE WEST VIRGINIA DEPARTMENT OF ENVIRONMENTAL PROTECTION, DIVISION OF AIR QUALITY 2007 PROPOSED RULES.**

Please contact me with any questions you may have regarding the enclosed.

Very truly yours,

Anne C. Blankenship
Counsel to the West Virginia Manufacturers Association and the West Virginia Oil and Natural Gas Association

acb
Enclosures
cc: Ms. Karen Price (w/encl.)
Mr. Nicholas DeMarco (w/encl.)

COMMENTS OF THE WEST VIRGINIA MANUFACTURERS ASSOCIATION AND THE WEST VIRGINIA OIL AND NATURAL GAS ASSOCIATION ON THE WEST VIRGINIA DEPARTMENT OF ENVIRONMENTAL PROTECTION, DIVISION OF AIR QUALITY 2007 PROPOSED RULES

The West Virginia Manufacturers Association ("WVMA") represents numerous manufacturers throughout the state which are subject to the regulations of the West Virginia Department of Environmental Protection, Division of Air Quality ("DAQ"). Likewise, the West Virginia Oil and Natural Gas Association ("WVONGA") also has member companies which are subject to the DAQ's regulations. Therefore, the WVMA and WVONGA (collectively the "Associations") submit the following comments on the DAQ's proposed revisions to its regulations and the new proposed 45 CSR 42, Greenhouse Gas Emissions Inventory Program.

I. 45 CSR 42 – Greenhouse Gas Emissions Inventory Program

The Associations have an interest in the development of a reasonable and effective greenhouse gas emissions inventory program and the implementing rule. During the 2007 West Virginia Legislative Session, the Associations supported the DAQ's bill to develop a greenhouse gas inventory program (SB 337) and provided suggestions on the bill during the legislative process, including suggestions on which sources should be required to report emissions and the appropriate *de minimis* levels which trigger reporting requirements. We appreciate the DAQ's reception to the comments and suggestions made to SB 337 and believe that with the suggested changes to the rule addressed below, 45 CSR 42 will lay the foundation for an effective greenhouse gas inventory program which will be reflective of the state's greenhouse gas emissions and reductions. Many of

the comments below were provided to the DAQ during the DEP Advisory Council Meeting on May 30, 2007, including a proposed mark-up of the rule, attached hereto. We believe the comments and suggestions clarify the provisions set forth in the proposed rule in order to preclude any confusion to what, we believe, was the DAQ's intent in drafting the proposed rule.

Section 2.3 Definitions.

The definition of "anthropogenic" should be revised to state that it is the "result of natural processes that have been influenced significantly by human activities". Adding the term "significantly" makes the definition consistent with the definition of "biogenic" which means a "naturally occurring biological source or process that is not significantly affected by human actions or activity." (emphasis added.)

Section 3.1 Applicability.

Our greatest concern with this proposed regulation is the proposed applicability provision as it relates to what types of emissions an affected source is required to report. As drafted, an affected source which emits any of the listed greenhouse gases above the *de minimis* amounts would be required to report any emissions of the listed greenhouse gases, no matter how insignificant. This means that any greenhouse gas emissions above zero would have to be reported. We do not believe that this was the intent of DAQ in drafting this rule. The reporting of insignificant emissions below the *de minimis* amounts would be meaningless for purposes of an inventory and would be extremely burdensome for the affected sources as it would be nearly impossible for sources to quantify such emissions. Affected sources should only be required to report emissions which are above the *de miminis* amounts listed in Section 3.1. Therefore, this section should be

revised to clarify that only individual greenhouse gases emitted above the *de minimis* amounts are required to be reported. Otherwise, affected sources that trigger any of the *de minimis* amounts could be required to report emissions of all of the greenhouse gases even if they are below the *de minimis* amounts.

Also, this section should be revised to clarify that the *de minimis* amounts do not include biogenic emissions. We do not believe that it is the intent of DAQ for facilities to include biogenic emissions in determining whether they emit more than the *de minimis* amounts of greenhouse gases. As provided for in Section 4.2 of the proposed rule, the affected sources will not be required to report biogenic emissions. Therefore, facilities should not be required to include biogenic emissions to determine whether they emit more than the *de minimis* amount and, as a result, be considered an affected source.

Section 4.1 Reporting Requirements.

This section requires that sources must report their greenhouse gas emissions by March 31, 2007. This section should be revised to require reporting of greenhouse gases at the same time the air emissions inventory reporting is required. During the DEP Advisory Council meeting, the DAQ stated that March 31 will be the reporting date for the air emissions inventory program. Due to the many other reporting deadlines in the month of March, requiring greenhouse gas emissions reporting and air emissions inventory reporting in March would be extremely burdensome to affected sources. Currently, the air emissions inventory reporting is due July 1. There is no statutory or regulatory requirement for when sources must report air emissions inventory and it is our understanding that this date may be moved in the future. Therefore, we believe that the greenhouse gas rule should also remain silent as to a particular reporting date to allow

flexibility to correspond to the air emissions inventory reporting. Otherwise, sources may be subject to two different reporting dates. Sources should not be required to report their emissions at two different times. This section should also be clarified so that only greenhouse gases emitted above the *de minimis* amounts are required to be reported, as discussed above.

Section 4.2

This section should be revised so that "mobile" emissions of greenhouse gases are not required to be reported. This section should also be revised to clarify that only direct emissions and not indirect greenhouse gas emissions (e.g., emissions occurring offsite from electricity consumption) are required to be reported. The references in section 4.3 to programs like Climate Leaders could lead sources to include indirect and direct emissions in their reporting. This would lead to double counting of electric generation greenhouse gas emissions and to higher source emissions compared to the *de minimis* amounts.

Section 4.4

WVONGA requests that Section 4.4 of the rule be modified so that the Interstate Natural Gas Association of America's ("INGAA") greenhouse gas protocol is recognized as an approved greenhouse gas inventory protocol for the natural gas transmission sector. In the proposed rule, use of these protocols would require approval by the Secretary on a case-by-case basis. The INGAA protocol, Greenhouse Gas Emission Estimate Guidelines for Natural Gas Transmission and Storage, Volume 1 – Emission Estimating Methodologies and Procedures, Revision 2, September 28, 2005 can be found and reviewed at http://www.ingaa.org/environment/Climate.htm. We believe that this is the

best source currently available for measuring greenhouse gas emissions from the natural gas transmission sector.

Section 4.6

This section should be revised to clarify that sources will not be subject to fees for reporting greenhouse gas emissions. The DAQ has no statutory authority under W.Va. Code §22-5-19 to require sources to pay fees based on emissions of greenhouse gases. In addition, unlike the air emissions inventory program, the greenhouse emissions reporting serves only to develop a greenhouse gas inventory and is not intended to generate fees. Therefore, we suggest that a provision be added to the rule to provide that affected sources will not be subject to fees under the greenhouse gas emissions inventory program.

Section 5.3 Greenhouse Gas Emissions Inventory.

This section should be revised to delete the requirement that certain entities, including trade associations, must provide relevant information on greenhouse gas emissions, reductions, capture and sequestration to the Secretary upon request. This requirement is not found in the statute and could be interpreted to require such entities to report reductions, which is also not required under the statute. We believe the proposed language in the rule is broader than that in the statute and we request that the language in the rule by made consistent with the statutory language.

Section 7.1 Economic Development Potential.

This section should be revised to require the DEP to also determine whether reduction and sequestration will result in a deterrent to net economic development – not just whether it will be an asset. It is equally important to determine whether the

reduction and sequestration will result in a deterrent to economic development as it is to determine whether it could be as asset.

The Associations also request that a reasonable protocol for reporting greenhouse gas emissions from stationary sources should be developed. Affected sources should be allowed reasonable flexibility to determine the best reporting method. Affected sources should not be required to report emissions from individual units within a stationary source if such emissions are insignificant, as this would be extremely burdensome. Affected stationary sources should have the option to report all of its greenhouse gas emissions in the aggregate. The Associations request that the greenhouse gas emissions reporting program allow the same flexibility as that under the air emissions inventory program.

Finally, the Associations suggest that the DAQ coordinate with nationally recognized greenhouse gas inventory programs, such as "The Climate Registry", which currently includes 31 states, to ensure that West Virginia's program is consistent with other states' programs across the nation.

II. 45 CSR 34 Emissions Standards for Hazardous Air Pollutants

Under Section 4, the Secretary sets forth the federal regulations which the DAQ adopts and incorporates by reference. The DAQ has proposed not to adopt certain federal regulations that apply to area sources, including the provisions in Subpart HH of 40 CFR §63 which apply to non-major area sources of hazardous air pollutants described in 40 CFR §63.760(b)(2). In addition, it is the Associations' understanding that the DAQ does not plan to adopt any federal MACT regulations that will apply to area

sources. The Associations do not favor the DAQ's refusal to accept delegation of these federal programs, as it raises many questions and uncertainties as to how such programs will be implemented and enforced. Therefore, in order to provide certainty and consistency with the current delegation of federal programs, the Associations request that the DAQ reconsider its decision not to adopt the federal regulations for area sources. The Associations appreciate the opportunity to provide comments on the proposed rules and hope that the DAQ seriously considers the suggestions and comments made herein.

Sincerely,

Karen S. Price

45CSR34

EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS

RESPONSE TO COMMENTS

On June 8, 2007, the Division of Air Quality (DAQ) commenced a thirty day public comment period and subsequently held a public hearing on July 9, 2007 to accept oral comments on proposed revisions to legislative rule 45CSR34. Written comments were also accepted through 6:00 PM on Monday, July 9, 2007. Two commenters submitted written comments regarding proposed revisions to rule 45CSR34, and no commenter provided verbal comments. DAQ addresses the written comments below.

I. COMMENTER: Independent Oil and Gas Association of West Virginia

COMMENT A. The commenter states, *"In its proposed revisions to 45 CSR 34, the emissions standards for hazardous air pollutants, the agency has proposed to incorporate by reference federal regulations setting standards for emissions of hazardous air pollutants in effect as of June 1, 2007. See Sec. 4.1. However, the agency also proposes to except from this provision several specific federal regulations including regulations governing emissions from natural gas operations. Specifically, Subsection 4.1.c reads as follows:*

> *Provisions under Subpart HH of 40 CFR Part 63 which apply to non-major area sources of hazardous air pollutants described in 40 CFR §63.760(b)(2) shall be excluded [from incorporation by reference].*

Because there are members of IOGA who may be covered by the regulations referenced in Subsection 4.1.c, we are requesting that the agency provide some explanation regarding its reasons for excluding these rules from incorporation by reference. In addition, what guidance will the agency be providing to those sources who may be covered by the excluded regulations? Absent some justification for this proposed exclusion and adequate guidance to the regulated sources regarding how they can achieve compliance with these standards, IOGA must objection (sic) *to Subsection 4.1.c and requests its deletion from the final version of this rule."*

RESPONSE A. DAQ appreciates IOGA's question, and may provide guidance for some categories of area sources (minor sources) potentially affected by the new air toxics standards.

DAQ considers U.S. EPA's new area source toxics rules, as promulgated, including those under 40 CFR 63, Subpart HH, to be resource-intensive and costly to implement as a practical matter, without achieving commensurate air quality benefits. Over the next two years, U.S. EPA will be promulgating forty six additional area source toxics standards. Some of these categories will be very broad and resource-intensive for DAQ to implement (for example: small boilers; autobody refinishing paint shops, and paint stripping operations).

No additional funding has been provided by U.S. EPA to implement these new federal area source air toxics rules, which are not required to be incorporated by reference in order to go into effect. DAQ is in the midst of implementing the federal major source toxics program using existing resources. U.S. EPA's incorporation of case-by-case, health-based compliance alternatives within the major source air toxics programs has added to the toll on resources required to maintain consistent implementation. U.S. EPA's risk and technology reviews of these major source categories is underway, and may result in additional rulemaking as well.

Therefore, due to the complexity and scope of the new and upcoming federal area source air toxics rules, as well as budget constraints and limited staffing resources, DAQ does not intend at this time to incorporate by reference, nor request delegation of any of the recent area source Generally Available Control Technology standards promulgated by U.S. EPA, including those under 40 CFR 63, Subpart HH.

II. COMMENTER: West Virginia Manufacturer's Association and the West Virginia Oil and Natural Gas Association

COMMENT A. The commenter states, *"Under Section 4, the Secretary sets forth the federal regulations which the DAQ adopts and incorporates by reference. The DAQ has proposed not to adopt certain federal regulations that apply to area sources, including the provisions in Subpart HH of 40 CFR §63 which apply to non-major area sources of hazardous air pollutants described in 40 CFR §63.760(b)(2)..... The Associations do not favor the DAQ's refusal to accept delegation of these federal programs, as it raises many questions and uncertainties as to how such programs will be implemented and enforced. Therefore, in order to provide certainty and consistency with the current delegation of federal programs, the Associations request that the DAQ reconsider its decision not to adopt the federal regulations for area sources."*

RESPONSE A. DAQ appreciates the Association's concerns regarding certainty and consistency with respect to rule implementation. However, since these new area source air toxics standards are federal rules promulgated by U.S. EPA, and the U.S. EPA Regional offices will be implementing these standards, certainty and consistency will be retained nationally among states.

However, as stated in Response I.A, due to the complexity and scope of the new and upcoming federal area source air toxics rules, as well as budget constraints and limited staffing resources, DAQ does not intend at this time to incorporate by reference, nor request delegation of any of the recent area source Generally Available Control Technology standards promulgated by U.S. EPA, including those under 40 CFR 63, Subpart HH.

COMMENT B. The commenter states, *"In addition, it is the Associations' understanding that the DAQ does not plan to adopt any federal MACT regulations that will apply to area sources."*

RESPONSE B. DAQ would like to clarify that the agency indeed plans to continue requesting incorporation by reference and accepting delegation of new federal Maximum Achievable Control Technology regulations for area sources.
