F. What Was the Basis for the Proposed Standards?

The EPA proposed standards for the HAP-emitting equipment at the two affected sources: Each asphalt processing facility (blowing stills, asphalt flux storage tanks, oxidized asphalt storage tanks, and asphalt loading racks) and each asphalt roofing manufacturing line (saturator, a wet looper, a coater, coating mixers, sealant applicators, adhesive applicators, and associated storage tanks).

The EPA determined the MACT floors for existing and new sources for each type of process equipment used in asphalt processing facilities and in asphalt roofing manufacturing lines. For each equipment type, the equipment pieces were ranked in order of level of control. Combustion devices were ranked over PM control devices because combustion devices reduce both gaseous HAP and condensed HAP.

At proposal, a combustion device operating at or above 1200 °F was the basis for the MACT floor for blowing stills, asphalt storage tanks with a capacity of 1.93 megagrams or greater, and loading racks at existing, new, and reconstructed affected sources. Blowing stills that use a chlorinated catalyst produce a vent stream that contains chlorinated organic compounds. When this vent stream is sent to a combustion device, the chlorinated organic compounds are oxidized to HCl which is a HAP. Because requiring facilities to use non-chlorinated catalysts is not feasible due to the need to produce oxidized asphalt of a given quality (see generally 66 FR 58618), and because no facilities control HCl emissions, the proposed MACT floor for HCl emissions from blowing stills using catalyst was based on no control of those emissions.

With the exception of asphalt storage tanks, the MACT floor for equipment at existing asphalt roofing manufacturing lines (coaters, saturators, wet loopers, coating mixers and sealant and adhesive applicators) was based on a PM control device complying with the new source performance standards (NSPS) for asphalt processing and roofing manufacture (asphalt NSPS) (40 CFR part 60, subpart UU) PM emission limits. The floor for saturators, coaters, and coating mixers at new and reconstructed affected sources was based on a combustion device operating at or above 1200 °F. For wet loopers at existing, new, and reconstructed affected sources, the MACT floor was based on a PM control device that achieves the asphalt NSPS PM emission limits. For storage tanks with capacity of 1.93 megagrams or greater at existing, new, and reconstructed asphalt roofing manufacturing lines, the MACT floor was based on a combustion device operating at or above 1200 °F.

The EPA evaluated potential options for achieving emission reductions more stringent than the floor (beyond-the-floor options) for three groups of equipment: (1) Saturators, wet loopers, coaters, coating mixers, and sealant and adhesive applicators at existing sources; (2) blowing stills that use a chlorinated catalyst at existing, new, and reconstructed sources; and (3) wet loopers at new and reconstructed sources. For all other equipment (blowing stills, loading racks, and storage tanks at existing, new, and reconstructed sources; and for saturators, coaters, coating mixers, and sealant and adhesive applicators at new and reconstructed sources), there are no known technologies in use at asphalt processing or roofing manufacturing facilities or similar sources that would be capable of achieving a greater emission reduction than a combustion device operating with a minimum operating temperature of 1200 °F. Thus, EPA did not consider beyond-the-floor options for these types of equipment.

For saturators, wet loopers, coating mixers, coaters, and sealant and adhesive applicators at existing affected sources, the level of control achieved by a combustion device with a minimum operating temperature of 1200 °F was identified as the only beyond-the-floor option. However, due to the cost per megagram of HAP reduction ($616,000) and the increase in criteria pollutant emissions, requiring the level of control achieved by a combustion device for saturators, wet loopers, coaters, coating mixers, and sealant and adhesive applicators at existing sources was not a justifiable option.

For blowing stills that use chlorinated catalysts, emissions of HCl can be reduced by a gas scrubber using caustic scrubbing media. However, since gas scrubbing has not been demonstrated as an effective technology for controlling HCl emissions from asphalt processing and due to the potentially high cost per megagram of HCl reduced ($23,900), the additional cost of going beyond-the-floor was not warranted. Nor is process substitution a viable option for controlling HCl emissions, as noted above. Therefore, the MACT for HCl emissions from blowing stills using catalyst was based on no emission reduction. For wet loopers, EPA considered the level of control of a combustion device operating at a minimum of 1200 °F as a beyond-the-floor option. Because controlling wet loopers at new affected sources was expected to add minimal if any cost to the total control cost, the MACT for wet loopers at new or reconstructed affected sources was based on a combustion device operating at a minimum of 1200 °F. See generally 66 FR 58618–621 and the memorandum "Documentation of Existing and New Source Maximum Achievable Control Technology (MACT) Floors for the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Asphalt Processing and Asphalt Roofing Manufacturing" (Docket No. OAR–2002–0035).

With the exception of standards for certain tanks and loading racks, EPA is adopting all of these standards (and analysis) in the final rule.

II. Summary of the Final Standards

A. Does the Final NESHAP Apply to Me?

The final rule applies to you if you process asphalt (at stand-alone facilities or collocated with asphalt roofing manufacturing facilities or petroleum refineries) or manufacture asphalt roofing products at a facility that is a major source of HAP emissions. Major sources of HAP are those that emit or have the potential to emit at least 10 tpy of any one HAP or 25 tpy of any combination of HAP. All HAP emission sources at a facility, not just those related to asphalt processing or roofing manufacture, must be considered in determining major source status. Put another way, the final rule may apply to you even if the HAP emissions from your asphalt roofing products manufacturing and asphalt processing operations do not themselves exceed the major source threshold levels given above. If your facility is determined to be an area source (*i.e.*, not a major source), you would not be subject to the final rule.

For the storage tanks at asphalt processing and asphalt roofing manufacturing facilities regulated by the final NESHAP, the potential exists for these tanks to already be subject to an existing emission standard: The petroleum refinery NESHAP (40 CFR part 63, subpart CC), or standards of performance for volatile organic liquid storage vessels (40 CFR part 60, subparts K, Ka, and Kb). Storage tanks that are subject to those standards are not subject to the requirements of the asphalt rule since the control requirements specified by those standards for fixed roof storage tanks (used in the asphalt processing and asphalt roofing manufacturing industry) are as stringent as the standards

specified in the asphalt rule, and so regulation of these tanks under the asphalt rule would be duplicative, imposing costs without any environmental benefit.

The EPA also recognizes that asphalt storage tanks, blowing stills, saturators, wet loopers, and coaters at asphalt processing and asphalt roofing manufacturing facilities could be subject to both the final NESHAP and the asphalt NSPS. In cases where the requirements of the rules overlap, the final rule specifies that facilities are required to comply only with the asphalt NESHAP. However, any storage tank with a capacity less than 1.93 megagrams that is subject to the asphalt NSPS but not regulated under the asphalt NESHAP must comply with the asphalt NSPS.

Another instance where we are excluding equipment involved in asphalt roofing manufacturing from the final rule, due to regulatory overlap involves, wet-formed fiberglass mat production. Although wet-formed fiberglass mat is produced at both stand-alone facilities and those collocated with asphalt processing and roofing facilities, HAP emissions from wet-formed fiberglass mat manufacturing processes are regulated by another NESHAP (40 CFR part 63, subpart HHHH).

The final rule does not regulate asphalt processing and asphalt roofing manufacturing equipment that is used solely for research and development activities.

B. What Are the Affected Sources?

The two affected sources are defined as each asphalt processing facility and each asphalt roofing manufacturing line. An asphalt processing facility consists of one or more asphalt flux blowing stills, asphalt flux storage tanks storing asphalt flux intended for processing in the blowing stills, oxidized asphalt storage tanks, and oxidized asphalt loading racks. An asphalt roofing manufacturing line consists of a saturator (including wet looper) and/or a coater and their associated coating mixers, sealant applicators, adhesive applicators, and asphalt storage and process tanks.

To reduce repetition in the final NESHAP, we have separated asphalt storage tanks into two groups. Group 1 asphalt storage tanks: Have a capacity of 177 cubic meters (47,000 gallons) of asphalt or greater and either store asphalt at a maximum temperature of 260 °C (500 °F) or greater, or have a maximum true vapor pressure of 10.4 kiloPascals (kPa) (1.5 pounds per square inch absolute, psia) or greater. Group 2 asphalt storage tanks are those tanks with a capacity of 1.93 Mg of asphalt or greater that are not Group 1 asphalt storage tanks.

Asphalt storage tanks at asphalt processing and asphalt roofing manufacturing facilities that are collocated may be shared by the two operations. If the asphalt roofing manufacturing line is collocated with an asphalt processing facility, the storage tanks that receive asphalt directly from the on-site blowing stills are defined as part of the asphalt processing affected source.

A facility that manufactures asphalt roofing may have more than one manufacturing line. At these facilities, asphalt storage tanks and sealant and adhesive applicators may be shared by roofing manufacturing lines. A shared storage tank is considered part of the asphalt roofing manufacturing line to which the tank supplies the greatest amount of asphalt on an annual basis. Similarly, a sealant or adhesive applicator that is shared by two or more asphalt roofing manufacturing lines is considered part of the line that provides the greatest throughput to the applicator on an annual basis. Recordkeeping provisions documenting these equipment allocations are found in § 63.8694(d) of the final rule.

This definition of affected source is also used to determine if new source standards apply when subject equipment is "constructed" or "reconstructed," as defined in the NESHAP General Provisions (40 CFR 63.2). We defined the affected source as the asphalt processing facility or asphalt roofing manufacturing line, rather than on a narrow equipment-piece basis, because we believe that it is inappropriate for small changes (*e.g.*, the addition of a sealant applicator to a manufacturing line) to trigger the new source emission limits for only part of the manufacturing line. For asphalt processing facilities, this is not a concern since the existing and new source standards are the same. However, the existing and new source standards are different for asphalt roofing manufacturing lines.

For asphalt roofing manufacturing lines, the new source emission limits would be triggered only when an entire new line is added or when an existing line is reconstructed. This is appropriate because the manufacture of roofing products is a continuous process, with the equipment for the different process steps arranged in sequence. Consequently, an increase in production cannot be achieved simply by adding a single piece of process equipment (*e.g.*, a coater). To increase production capacity, significant parts of the line would have to be modified or a new line would need to be constructed.

C. What Pollutants Are Regulated by the Final NESHAP?

The final rule establishes emission limits for two pollutants, total hydrocarbons (THC) and PM, each of which serves as a surrogate for HAP emitted by the process equipment.

Total Hydrocarbons

We are regulating total gaseous organic HAP emissions using THC as a surrogate. Total hydrocarbons are an appropriate surrogate for total HAP since organic HAP constitutes a significant portion of the THC, and because combustion controls are equally effective at reducing emissions of a wide range of organic compounds (including organic HAP emitted by asphalt processing and roofing manufacturing facilities and THC). Thus, reduction of organic HAP and THC from these sources is proportionate.

Particulate Matter

Particulate matter emitted from blowing stills consists of condensed organic hydrocarbons. For organic HAP that is present in condensed PM form, we are using PM as a surrogate. Similar to the THC surrogate for gaseous HAP, PM is an appropriate surrogate because it includes the HAP that are emitted as condensed PM. Because the reductions achieved by PM control devices are not pollutant-specific (*i.e.*, one type of PM is not preferentially reduced over another type of PM), controlling PM will result in a generally proportionate amount of condensed particulate organic HAP control.

D. What Emission Limits Must I Meet?

You must meet the emission limits that are summarized in Table 1 to the final rule. The emission limits are expressed in appropriate formats for the various process equipment being regulated. Depending on the piece of process equipment, you may have the option of complying with any of several formats. These formats include a PM emission limit (expressed in terms of kilograms of PM per Mg product manufactured), a THC percent reduction standard, a THC outlet concentration, a THC destruction efficiency standard (only for combustion devices that do not use auxiliary fuel), or a combustion efficiency standard.

The THC destruction efficiency and combustion efficiency standards are provided as an alternative to the THC percent reduction standard in the final rule because there are some emission

sources (*e.g.*, blowing stills) for which testing of the control device inlet is impractical.

Saturators (including wet loopers) and coaters at existing roofing manufacturing lines must meet PM emission limits based on the type of substrate used in manufacturing. At existing, reconstructed, and new asphalt roofing manufacturing lines, saturators (including wet loopers) and coaters must meet an opacity limit, and the emission capture system for these equipment must meet a visible emissions standard. The final rule also provides the option for Group 2 asphalt storage tanks, saturators (including wet loopers), and coaters at existing and new asphalt roofing manufacturing lines and coating mixers, sealant applicators, and adhesive applicators at existing asphalt roofing manufacturing lines to comply with either the THC or the combustion efficiency standards instead of the PM and opacity standards.

E. When Must I Comply?

Existing sources must comply with the final rule no later than May 1, 2006. The 3-year period is necessary to allow owners and operators sufficient time to design, purchase, and install emissions capture systems and air pollution control equipment. New or reconstructed sources must comply with the final rule at startup or April 29, 2003, whichever is later.

If your asphalt processing facility or asphalt roofing manufacturing line is located at a facility that is an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP after April 29, 2003, then any portion of the existing facility that is a new affected source or a reconstructed affected source must comply with all requirements of the final rule applicable to new sources upon startup after the facility becomes a major source or by April 29, 2003, whichever is later. All other parts of any facility to which the final rule applies must be in compliance with this subpart by 3 years after becoming a major source.

F. What Are the Testing and Initial Compliance Requirements?

You must conduct a performance test to demonstrate initial compliance with the final rule emission limits unless you are using the results from an acceptable previously-conducted emission test to demonstrate compliance with the emission limitations in the final rule, or you are using a control device that the EPA has already determined achieves the required HAP destruction efficiency.

If you choose to use the results from a previously-conducted emissions test, you must demonstrate to the Administrator's (or delegated authority) satisfaction that no changes have been made to the process since the time of the emissions test, the operating conditions and test methods used during testing conform to the requirements of the final rule, and the control device and process parameter values established during the previously-conducted emission test are used to demonstrate continuous compliance with the final rule.

An initial performance test is not required for boilers or process heaters with a design heat input capacity of 44 megawatts (MW) or greater or where the emissions are introduced into the flame zone of the boiler or process heater. Performance testing is also not required for flares that meet the design and operating requirements of 40 CFR 63.11(b). An initial performance test is not required for boilers and process heaters larger than 44 MW because they operate at high temperatures and residence times. When vent streams are introduced into the flame zone of these boilers and process heaters, over 98 percent reduction or an outlet concentration of 20 parts per million per volume (ppmv) is achieved. Therefore, a performance test is not necessary. We are not requiring performance testing of flares because percent reduction and outlet concentration cannot feasibly be measured at flares. The operating conditions in § 63.11 assure that the flare will be operated properly and achieve the requisite degree of destruction of organic HAP.

As specified in 40 CFR 63.7(e), performance tests must be conducted within the range of normal operating conditions. To ensure that compliance can be achieved over the entire range of operating conditions, the performance tests must be conducted under the operating conditions that reflect the highest rate of asphalt processing or roofing production reasonably expected to be achieved by the facility. For example, performance tests of roofing manufacturing line equipment must be conducted while operating under normal conditions and while manufacturing the roofing product that is expected to result in the greatest amount of HAP emissions.

For each performance test, you must conduct a minimum of three 1-hour test runs. Compliance is determined based on the average of the three test runs. To measure PM, you must use EPA test method 5A; for THC emissions, you must use EPA test method 25A.

For the THC destruction efficiency and combustion efficiency standards, you must measure emissions of THC, carbon monoxide (CO_2), and carbon dioxide (CO_2) to demonstrate compliance. For the THC outlet concentration you must measure emissions of THC to demonstrate compliance. You must use EPA test method 10 to measure CO emissions and EPA test method 3A to measure CO_2 emissions. The EPA test methods are contained in appendix A of 40 CFR part 60. You must demonstrate compliance with the PM emission limit, THC percent reduction standard, THC outlet concentration standard, THC destruction efficiency standard, and the combustion efficiency standard using the instructions and equations in the performance test requirement section of the final rule.

The final rule also contains opacity and visible emission standards for saturators (including wet loopers) and coaters and their emissions capture systems at existing, new, and reconstructed asphalt roofing manufacturing lines and an opacity standard for certain asphalt storage tanks at existing, new, and reconstructed asphalt processing facilities and roofing manufacturing lines. Opacity and visible emission compliance determinations must be made using EPA test methods 9 and 22 in appendix A of 40 CFR part 60, respectively.

The final rule allows you to demonstrate continuous compliance with the emission standards by monitoring control device operating parameters or by using continuous emission monitoring systems (CEMS) to directly measure emissions. Although the final rule does not require continuous monitoring of opacity, you can use continuous opacity monitoring systems (COMS) if you choose to do so since the opacity standard applies at all times.

If you choose to conduct parameter monitoring, you must install, calibrate, maintain, and operate a continuous parameter monitoring system (CPMS) to monitor the control device parameters. During the performance test, you must continuously monitor and record control device parameters and establish the monitoring parameter value(s) that constitute compliance with the emission limits if you plan to use parameter monitoring to demonstrate compliance following the initial performance test. If you use a combustion device to comply with the standards, you must record the average operating temperature. The temperature monitoring device must be installed at the exit of the combustion

zone or in the ductwork immediately downstream of the combustion zone, before any substantial heat loss occurs. If you use a control device to comply with the PM standards, you must record the device inlet gas temperature and pressure drop across the device. If you use electrostatic precipitators (ESP) to achieve compliance with the PM standard, you may record the voltage of the ESP as an alternative to the pressure drop across the ESP.

For combustion devices and PM control devices, the parameters must be monitored and values recorded in 15-minute blocks during each of three 1-hour test runs. If you use a control device other than a combustion device or PM control device to comply with the final rule, you must propose the appropriate monitoring parameters, monitoring frequencies, and averaging periods. All monitoring parameters for control devices not specified in the final rule must be approved by the Administrator as specified in 40 CFR 63.8(f).

If you choose to demonstrate continuous compliance by directly measuring emissions, you must install, calibrate, maintain, and operate a CEMS and record the emissions during the performance test according to the procedures specified in 40 CFR part 63, subpart A.

For all monitoring approaches (CPMS and CEMS (and COMS, if used)), you must also monitor and record the average hourly roofing line production rate or the asphalt processing rate, as applicable, during the performance test. If you are complying with the PM emission limit, you must also determine the asphalt content of the product manufactured during the performance test.

G. What Are the Continuous Compliance Provisions?

After the performance test, you must demonstrate continuous compliance with the emission limits by monitoring either control device or process operating parameters or by monitoring emissions. The parameters or emissions must remain within the limits established during the initial performance test.

If you choose to use parametric monitoring to demonstrate continuous compliance with the standards, the final rule specifies the parameters that are to be monitored. For combustion devices (other than boilers, process heaters, and flares that meet specified design and operating requirements), you must monitor the operating temperature. For control devices used to meet the PM standards, you must monitor the inlet gas temperature and pressure drop across the device. If you use an ESP to achieve compliance with the PM standard, you may monitor the voltage of the ESP as an alternative to pressure drop.

For parametric monitoring, you must determine and record 15-minute and 3-hour block averages of the specified parameters. However, the final rule allows the option of determining continuous compliance based on any 15-minute period (*i.e.*, you are not required to calculate 3-hour block averages). If you choose this alternative, a monitoring parameter deviation would occur if the monitoring parameter value(s) is outside the approved range during any 15-minute period.

If you use a control device other than a combustion device or PM control device to achieve compliance with the emission limits, the monitoring parameters must be approved by the Administrator and established during the initial performance test. To change the value of any monitored parameter, you must conduct a performance test and submit a request to the Administrator for approval using the procedures specified in 40 CFR 63.8(f).

H. What Are the Notification, Recordkeeping and Reporting Requirements?

You must comply with the notification, recordkeeping, and reporting requirements in 40 CFR part 63, subpart A, as specified in Tables 6 and 7 to the final rule. The notification, recordkeeping, and reporting requirements include, but are not limited to: Initial notification of applicability of the rule, notification of the dates for conducting the performance test and notification of compliance status; reports of any startup, shutdown, and malfunction events that occur; and semiannual reports of excess emissions or deviations from monitoring parameter limits. When no deviations occur, you must submit semiannual reports indicating that no deviations have occurred during the period. For a combustion device, a deviation would be any time (excluding periods of startup, shutdown and malfunction which would be a separate report) that the operating temperature falls below the limit established during the initial performance test. For a control device used to meet the PM standards, a deviation would be any time (excluding periods of startup, shutdown and malfunction) that the temperature of the gas at the inlet to the control device or the pressure drop across the control device (or ESP voltage) are outside their respective limits established during the initial performance test.

You must maintain records of the following, as applicable: (1) Combustion device operating temperature; (2) PM control device inlet gas temperature and pressure drop (or voltage for ESP); (3) approved parameters for sources that comply with the emission limits using a control device other than a combustion device or PM control device; (4) CEMS; and (5) the date and time a deviation commenced if a monitoring parameter or emission deviation occurs, the date and time corrective actions were initiated and completed, a description of the cause of the deviation, and a description of the corrective actions taken. You must also prepare a startup, shutdown, and malfunction plan and maintain records of actions taken during these events, as required by 40 CFR 63.6(e)(3).

The final rule also includes a requirement to develop and make available for inspection by the permitting authority, upon request, a site-specific monitoring plan that specifies how the continuous parameter monitoring system will be installed, operated, and maintained as well as the data quality assurance procedures and ongoing recordkeeping and reporting procedures.

The NESHAP General Provisions (§ 63.10(b)) require that records be maintained for at least 5 years from the date of each record. You must retain the records onsite for at least 2 years. You may retain records for the remaining 3 years at an offsite location. The records must be readily available and in a form suitable for efficient inspection and review. The files may be retained on paper, microfilm, microfiche, a computer, computer disks, or magnetic tape. Reports may also be made on paper or on a labeled computer disk using commonly available and compatible computer software.

III. What Are the Responses to the Significant Comments?

Significant public comments on the proposed rule along with our responses to these comments are summarized in this section of the preamble. For detailed responses to all the comments, see the Background Information Document (BID) ("National Emission Standards for Hazardous Air Pollutants, Asphalt Processing and Asphalt Roofing Manufacturing, Summary of Public Comments and Responses," February 2003, EPA–453/R–03–005) (Docket No. OAR–2002–0035).

A. Rule Applicability

Comment: Several commenters noted that it was not clear if the proposed rule applied to facilities that process asphalt intended for non-roofing products. The commenters suggested that confusion regarding applicability was caused by addressing both the asphalt processing and asphalt roofing manufacturing source categories together under one NESHAP. Confusion may have also been caused by the proposed definition of asphalt flux, which read: "asphalt flux means the residual material from distillation of crude oil used to manufacture asphalt roofing products."

Response: On June 21, 2002, the EPA sent letters to the commenters to clarify two aspects of the proposed rule:

- The proposed rule was intended to cover all asphalt processing regardless of the asphalt's end use; and
- Requirements for storage vessels at asphalt roofing manufacturing facilities, inadvertently left out of the proposed rule, are the same as those for storage vessels at asphalt processing facilities.

Subsequent comments on the notice letters disagreed with EPA's interpretation of the proposed rule's applicability and contended that the EPA should address this clarification in a supplemental proposal.

The EPA does not believe that a supplemental proposal is needed to clarify the applicability of the final rule. It has long been held that actual notice constitutes adequate notice and opportunity for comment for purposes of section 307 of the CAA. (See *Small Lead Refiner Phase Down Task Force* v. *EPA*, 705 F. 2d 507, 548 (D.C. Cir. 1983).) The extensive comments received in response to the June 21, 2002 letters demonstrates that the commenters had adequate notice and availed themselves of it. There is no credible claim that further comments could have been submitted had there been more notice or that the time for response was inadequate. Under these circumstances, EPA believes that it afforded all letter recipients adequate notice and opportunity for comment and a supplemental notice to clarify the applicability of the rule is not necessary.

The final NESHAP includes both asphalt processing and asphalt roofing manufacturing because many facilities both process asphalt and manufacture roofing products (asphalt roofing and other roofing products).

With respect to the issue of whether asphalt processing should include operations that process asphalt for non-roofing uses, EPA believes that it should. The HAP emissions from asphalt processing (and the means of controlling such emissions) are identical, whether or not asphalt is produced for roofing or for other uses. Nor did EPA ever intend to distinguish among asphalt uses in setting out the rule's scope. The source category definition ("Documentation for Developing the Initial Source Category List," EPA–450/3–91–030, July 1992) of "asphalt processing" reads as follows:

"The Asphalt Processing source category includes any facility *engaged in the preparation of asphalt at asphalt processing plants*, petroleum refineries, and asphalt roofing plants. Asphalt preparation, called 'blowing,' involves the oxidation of asphalt flux by bubbling air through the liquid asphalt flux at 260°C for 1 to 4.5 hours, depending upon the desired characteristics of the asphalt. The category includes, but is not limited to, the following process: asphalt heating, blowing still, and asphalt storage tanks" (emphasis added).

This definition is not limited to asphalt that is processed for roofing manufacturing, and in fact, is not limited in any respect by the ultimate use to which processed asphalt is put. Consistent with the source category definition, it was not EPA's intent to limit the applicability of the final rule to the processing of roofing asphalt or any other end use.

To clarify the final rule applicability, EPA has written the definition of asphalt processing in the final rule to read as follows:

"Asphalt processing facility means any facility engaged in the preparation of asphalt flux at stand-alone asphalt processing facilities, petroleum refineries, and asphalt roofing facilities. Asphalt preparation, called 'blowing,' is the oxidation of asphalt flux, achieved by bubbling air through the heated asphalt, to increase the softening point and reduce the penetration of the oxidized asphalt.

An asphalt processing facility includes one or more asphalt flux blowing stills and their associated asphalt flux storage tanks, oxidized asphalt storage tanks and oxidized asphalt loading racks."

The EPA has also modified the definition of "asphalt flux" as proposed to remove any suggestion that the rule's scope is limited by the intended use of the processed asphalt.

B. Asphalt Storage Tank and Loading Rack Vapor Pressure Control Cutoff

Comment: Several commenters supported using a vapor pressure cutoff, such as those found in the petroleum refinery NESHAP (40 CFR part 63, subpart CC) and the new source performance standards for storage vessels (40 CFR part 60, subparts K, Ka, and Kb) for asphalt storage tanks and loading racks. The commenters contended that equipment with vapor pressures below those thresholds would emit only minimal amounts of HAP and therefore should not be subject to control requirements. The commenters also alleged that EPA was being inconsistent among different MACT standards in developing standards applicable to similar types of equipment. For example, one commenter asserted that EPA should not declare emissions from low HAP, low vapor pressure stocks as *de minimis* sources under the petroleum refineries NESHAP and then propose to regulate those same emissions under the asphalt NESHAP. One commenter contended that it would be reasonable for EPA to use an approach similar to the petroleum refinery NESHAP because asphalt flux feedstocks and finished asphalt products are produced directly by refineries and because many refineries will be subject to the asphalt NESHAP.

Response: The proposed MACT for all asphalt storage tanks with a capacity of 1.93 Mg or greater at existing, new, and reconstructed affected sources was based on the fact that greater than 12 percent of the asphalt storage tanks were controlled with a combustion device operating at or above 1200 °F. Also, the available data showed that no sources were using a combustion device to control emissions from storage tanks with a capacity less than 1.93 Mg of asphalt. Therefore, the proposed MACT did not require control of tanks with capacities less than 1.93 Mg (66 FR 58620).

The EPA now believes that the prevalence of combustion devices on tanks storing asphalt at low vapor pressure is misleading. We believe that combustion devices in this industry are used to control emissions from tanks storing high- and low-vapor asphalt that are generally part of an "integrated system," an integrated group of process equipment including higher-emitting equipment such as a blowing still, so that what really is being controlled by combustion are the emissions from the high-emitting equipment, with emissions from other system components being "along for the ride."

An integrated system is one in which process components (*e.g.*, blowing stills, coaters, and tanks storing high- and low-vapor pressure asphalt) are utilized largely together and are generally located in close proximity. In an integrated system, emissions from process equipment that are subject to less stringent emission standards (*e.g.*, tanks storing low-vapor pressure asphalt) generally are routed to the control device (*e.g.*, combustion device) that is used to control emissions from

the equipment (*e.g.*, blowing stills, coaters) that are subject to more stringent emission standards. In other words, it is more cost effective to "over control" emissions from lower-emitting storage tanks that are nearby, using a combustion device that is selected and designed to control emissions from the entire system (*e.g.*, blowing stills, coaters, and asphalt storage tanks), than it is to install a separate control device to reduce emissions from the storage tanks to a lesser degree.

In the absence of an integrated system configuration, we do not believe that combustion controls represent the MACT floor (or otherwise represent MACT) for tanks that store low-vapor pressure asphalt since facilities that do not use a combustion device to reduce emissions from higher-emitting process equipment are unlikely to use a combustion device to reduce emissions from tanks that store low-vapor pressure asphalt (and we in fact know of no instance when a tank storing low-vapor pressure asphalt in this industry is controlled by a combustion device when the tank is a stand-alone unit). Therefore, for tanks storing asphalt with a low vapor pressure, the MACT floor largely depends on whether or not the tank is part of an integrated system.

Based on the above discussion, it would seem logical to develop one set of standards for integrated systems (including tanks) and another for nonintegrated systems (where tanks would have different standards). However, we do not have sufficient data to characterize the control level of integrated versus nonintegrated systems or even to devise workable definitions of these systems. The significance of the existence of integrated systems, therefore, relates to calculation of floor standards for tanks.

Based on the existence of integrated systems, we do not believe that we have to include all tanks storing high- and low-vapor pressure asphalt together in making a floor determination for storage tanks. We do believe that it is reasonable to assume that facilities would use combustion devices for tanks storing high-vapor pressure asphalt because of the greater potential for emissions from these tanks and the appropriateness of controlling volatile emissions using combustion devices. We, thus, included all such tanks as a single group in determining floor standards and determined that the best-performing 12 percent of tanks used to store high-vapor pressure asphalt use combustion to control the emissions. (We did not, however, include tanks used to store low-vapor pressure asphalt in this calculus and are not compelled to for the reasons explained above relating to integrated systems.) Therefore, for tanks storing asphalt with a high vapor pressure at existing and new sources, we believe that the MACT floor is a combustion device regardless of whether or not it is located in an integrated system.

For tanks storing low-vapor pressure asphalt, a separate determination must be made to establish the MACT floor for existing and new sources. For these storage tanks, the MACT floor depends mainly on whether or not the tank is part of an integrated system. However, as noted above, we are unable to devise a workable definition of the integrated system. Among other problems, we have no information regarding tank vapor pressure or facility configurations to determine the relative proximity of low-vapor pressure asphalt storage tanks to combustion devices. Although we are unable to develop a separate standard for integrated systems, the MACT floor for any storage tank cannot be less stringent than the opacity limits for controlling PM specified in the asphalt NSPS, since over 12 percent of existing storage tanks in the industry are already subject to those standards. In fact, approximately 27 percent of the storage tanks in the database use particulate controls (such as fiber-bed filters, mist eliminators, condensers) to meet the asphalt NSPS. This control of PM will necessarily control HAP emissions since a portion of the PM is condensed HAP. Therefore, the MACT floor for tanks storing asphalt with low vapor pressures at existing and new sources is the opacity limit specified in the asphalt NSPS.

We recognize that this floor for tanks storing low-vapor pressure asphalt actually applies to some tanks that are part of integrated systems. Nevertheless, we expect that tanks that are part of an integrated system are controlled by the same control device used to control the entire system, rather than being controlled separately. Therefore, using the opacity limit specified in the asphalt NSPS as a floor for tanks storing asphalt with low vapor pressures should not discourage facilities from using combustion devices to control emissions from storage tanks that are part of integrated systems. Nor is it likely to lead to removal of any existing controls on integrated systems since the combined system was already adopted by those facilities and removal would entail retrofit costs.

With regard to establishing the vapor pressure cutoff value that would be used to assign tanks into high- and low-vapor pressure groups (Groups 1 and 2, respectively), EPA does not have survey data for the vapor pressure of stored asphalt that could be used to establish this value. In the absence of vapor pressure data, we based the vapor pressure cutoff value on the MACT floor for existing storage tanks at petroleum refineries. Asphalt tanks are similar because asphalt is a petroleum refinery product, and asphalt processing facilities are located at some petroleum refineries. Therefore, EPA believes that it is reasonable for the vapor pressure cutoff in the final rule to be consistent with the maximum true vapor pressure cutoff (10.4 kPa) for existing storage tanks in the petroleum refinery NESHAP. Thus, under the final rule, tanks storing asphalt with a maximum true vapor pressure of 10.4 kPa or greater are considered "high-vapor pressure" tanks (*i.e.*, Group 1 tanks) while tanks storing asphalt with a maximum true vapor pressure less than 10.4 kPa are considered "low-vapor pressure" tanks (*i.e.*, Group 2 tanks).

The petroleum refinery NESHAP also contains an annual average true vapor pressure cutoff (8.3 kPa) and an annual HAP liquid concentration cutoff (4 percent, by weight of total organic HAP) for determining storage tank applicability. Because the storage temperature of asphalt at asphalt processing and asphalt roofing manufacturing facilities is expected to be maintained over a narrow range throughout the year, providing an annual average for storage temperature in the asphalt NESHAP is unnecessary. The concentration cutoff was included in the petroleum refinery NESHAP to address the fact that some liquids at petroleum refineries have very low HAP concentrations and high vapor pressures due to the volatility of non-HAP compounds in the material. However, because asphalt processing and asphalt roofing manufacturing facilities do not typically store products other than asphalt, the EPA believes that including an annual HAP liquid concentration cutoff in the asphalt NESHAP is unnecessary.

With regard to the proposed tank capacity cutoff of 1.93 Mg, EPA believes that the analysis used to establish the proposed capacity cutoff for combustion control was flawed since the cutoff value was based on the smallest tank controlled by a combustion device. Since we now consider the seeming prevalence of combustion devices on tanks storing low-vapor pressure asphalt to actually reflect controls on integrated systems (driven by the need to control the greatest emission source of the integrated system), we do not believe that the proposed capacity cutoff value for combustion control is valid because

it was premised on the assumption that stand-alone (*i.e.*, non-integrated) low-vapor pressure asphalt storage tanks were controlled by means of combustion devices. Consequently, we are establishing the capacity cutoff value for combustion control to be consistent with the capacity cutoff for existing tanks at petroleum refineries (again consistent with comments urging that the petroleum and asphalt NESHAP be consistent insofar as they apply to similar types of emission sources).

Therefore, the floor for asphalt storage tanks with a capacity of 177 cubic meters or greater and storing asphalt with a maximum vapor pressure of 10.4 kPa or greater (*i.e.*, Group 1 asphalt storage tanks) at existing and new sources is combustion control. The floor for asphalt storage tanks with a capacity of 177 cubic meters or greater storing asphalt with a maximum vapor pressure less than 10.4 kPa (*i.e.*, Group 2 asphalt storage tanks) at existing and new sources is the opacity limit specified in the asphalt NSPS. As at proposal, however, we are not determining a floor level of control for tanks less than a capacity of 1.93 Mg. Based on the tank capacity data from the Asphalt Roofing Manufacturers Association survey, less than 2 percent of the tanks have capacities less than 1.93 Mg, and only one of those tanks is vented to a PM control device.

The EPA is also applying much this same reasoning in determining a MACT floor for asphalt loading racks. The proposed MACT for asphalt loading racks at existing, new, and reconstructed affected sources was based on the fact that greater than 12 percent of the loading racks were controlled with a combustion device operating at or above 1200 °F. Although we do not have vapor pressure data for loading racks, we believe (as with storage tanks) that it is reasonable to assume that facilities are using combustion devices to control emissions from loading racks that are used to transfer high-vapor pressure asphalt because of the greater potential for emissions from this asphalt and the appropriateness of controlling volatile emissions using combustion devices. Consequently, the EPA believes that the MACT floor for loading racks transferring high-vapor pressure asphalt at existing and new sources is a combustion device regardless of whether or not it is part of an integrated system. In the absence of vapor pressure data, and to be consistent with the approach used for high-vapor pressure (Group 1) asphalt storage tanks, we based the vapor pressure cutoff for loading asphalt racks on the maximum true vapor pressure cutoff (10.4 kPa) for existing storage tanks in the petroleum refinery NESHAP.

For loading racks used to transfer low-vapor pressure asphalt at existing and new sources, as with low-vapor pressure (Group 2) asphalt storage tanks, we are unable to develop a separate standard for integrated systems. However, unlike the asphalt NSPS for storage tanks, an existing regulation does not exist for asphalt loading racks that would establish a minimum level of the MACT floor. Therefore, a MACT floor for loading racks transferring asphalt with a maximum vapor pressure less than 10.4 kPa at existing and new sources could not be established.

In summary, the MACT floor for tanks with an asphalt storage capacity of 177 cubic meters or greater and storing asphalt with a maximum vapor pressure of 10.4 kPa or greater at existing and new sources is based on a combustion device operating at or above 1200 °F. For tanks with asphalt storage capacities of 177 cubic meters or greater or storing asphalt with a maximum vapor pressure less than 10.4 kPa, the MACT floor for existing and new sources is represented by the opacity limit in the asphalt NSPS. The opacity limit of the asphalt NSPS also represents the MACT floor for asphalt storage tanks with capacities less than 177 cubic meters but greater than or equal to 1.84 cubic meters at existing and new sources. For loading racks used to transfer asphalt with a maximum vapor pressure of 10.4 kPa or greater at existing and new sources, the MACT floor is a combustion device operating at or above 1200 °F. The MACT floor for loading racks used to transfer asphalt with a maximum vapor pressure less than 10.4 kPa at existing and new sources is no additional control.

Also, as explained in detail in the preamble to the proposal (66 FR 58620–21), we continue to believe that controls beyond the MACT floor for high-vapor pressure asphalt storage tanks and loading racks (where the floors have not changed between the proposed and final rule) are not technically or economically feasible (*i.e.*, there are no known controls that would reduce HAP emissions more than combustion control), so that MACT for the high-vapor pressure asphalt storage tanks and loading racks is represented by their respective MACT floors.

For the low-vapor pressure asphalt storage tanks (for which we have made a different floor determination), the only control option beyond the MACT floor is control with a combustion device. However, given the relatively low HAP emissions from this equipment, the incremental cost-effectiveness (greater than $3,000,000 per megagram of HAP reduced) of increasing the level of HAP reduction achieved by a PM control device (93.3 percent) (the device we anticipate would be used to achieve the opacity standard which is the MACT floor) to that achieved by a combustion device (95 percent) is not a justifiable option. (Additional energy use likewise would be required to achieve this modest incremental HAP reduction as well.) Therefore, MACT for low-vapor pressure asphalt storage tanks is represented by the MACT floor.

For low-vapor pressure asphalt loading racks, the control options beyond the MACT floor are a PM control device and a combustion device. However, as with low-vapor pressure asphalt storage tanks, the high costs per megagram of HAP reduction (greater than $500,000 per megagram of HAP reduced) achieved by controlling low-vapor pressure asphalt loading rack emissions with either a PM control device or combustion device make the beyond the MACT floor options economically infeasible. Therefore, MACT for low-vapor pressure asphalt loading racks is represented by the MACT floor.

Because we are specifying vapor pressure as a cutoff for different groups of tanks, it is necessary to identify how such a determination would be made if a facility were required to do so. Following proposal, the EPA met with industry representatives to identify an appropriate test method for determining the vapor pressure of stored asphalt, if EPA were to promulgate such a cutoff. According to the industry and EPA representatives, a standardized or consensus test method for measuring the vapor pressure of stored asphalt has not been established. (See the summary of the September 17, 2002 meeting with petroleum refinery representatives in Docket No. OAR–2002–0035.) Currently, the industry uses nomographs or other relationships depicting the vapor pressure of petroleum liquids as a function of storage temperature vapor pressure and asphalt composition (*e.g.*, flux versus oxidized) to determine the vapor pressure of stored asphalt.

Since there is no standardized test method for measuring the vapor pressure of stored asphalt, the EPA believes that the final rule should specify a temperature that equates to a vapor pressure of 10 kPa, instead of requiring facilities to physically measure asphalt vapor pressure. According to industry representatives, asphalt flux reaches 10.4 kPa at approximately 500 to 550 °F (oxidized asphalt would require higher

temperatures to reach 10.4 kPa). The temperature estimate cited by the industry representatives was confirmed on a theoretical level using a regression equation for asphalt vapor pressure as a function of temperature, developed by the Owens Corning Company using a modified version of the American Society of Testing and Materials (ASTM) method D2879 (Standard Test Method for Vapor Pressure-Temperature Relationship and Initial Decomposition Temperature of Liquids by Isoteniscope). According to the regression equation, asphalt flux reaches a vapor pressure of 10.4 kPa at approximately 450 °F.

Since the regression equation, which under-predicts the temperature at which asphalt flux reaches a given vapor pressure (according to industry and EPA representatives), tends to corroborate the storage temperature cited by the industry representatives, the EPA believes that a storage temperature of 500 °F appropriately represents a vapor pressure of 10.4 kPa. Consequently, the final rule specifies that tanks storing (and loading racks transferring) asphalt at a maximum vapor pressure of 10.4 kPa or greater, or at a maximum temperature of 500 °F or greater, must be controlled with a combustion device. Also, the final rule allows the use of standard industry nomographs and other relationships to determine the vapor pressure of asphalt. The docket for this NESHAP (Docket No. OAR–2002–0035) contains a memorandum from the National Petrochemical and Refiners Association (NPRA) that presents several manual methods that are currently used in the petroleum industry for estimating the vapor pressure of asphalt.

C. Level of the Standards

Comment: One commenter questioned the derivation of the THC destruction and combustion efficiency standards (95 and 99.6 percent, respectively). The commenter contended that the statistical analysis used to derive the standards from test data was incorrect.

Response: The EPA agrees with the commenter that the available data set is too small for a rigorous statistical analysis. Therefore, at proposal, we chose to account for the variability in the data by subtracting one standard deviation from the mean, rather than performing a more formal statistical analysis to derive the proposed emission limit. Despite the small size of the data set, since proposal, the EPA has calculated the 95 percent confidence interval about the mean of the test data for THC destruction efficiency. The lower limit of the 95-confidence interval is 94.85 percent THC destruction efficiency. (See section 2.3.10.2 of the BID for a more detailed discussion of this analysis.) In other words, there is only a 5 percent chance that the true population mean of THC destruction efficiency will be below 94.85 percent. In addition, all four of the facilities with THC destruction efficiency data would meet the standards. This calculation supports that a THC destruction efficiency of 95 percent is achievable. The 95 percent destruction efficiency has thus been included in the final rule.

Since proposal, the EPA has calculated the 95 percent confidence interval about the mean of the test data used to establish the proposed combustion efficiency. The lower limit of the 95 percent confidence interval is 99.49 percent combustion efficiency. Since this value is lower than the proposed combustion efficiency limit of 99.6 percent, the EPA has decided to establish the combustion efficiency limit in the final rule at 99.5 percent. (Note that this change does not affect EPA's determination, made originally at proposal, that beyond-the-floor controls remain inappropriate here, largely because EPA knows of no means of control more efficient than combustion control.)

Comments: Comments were also received on the proposed rule regarding the use of electric regenerative thermal oxidizers (RTO). One commenter explained that EPA's proposed method for calculating combustion efficiency penalizes control technologies that do not burn auxiliary fuel and, consequently, have a relatively low CO_2 concentration at their outlets. The commenters stated that the proposed method for calculating combustion efficiency understates the combustion efficiency achieved by an RTO since the only relevant source of CO_2 in RTO exhaust comes from the destruction of hydrocarbons. The commenters submitted test data and proposed a separate equation for calculating the destruction efficiency for RTO.

Response: The EPA reviewed the test data submitted by the commenters (see section of the 2.3.10.6 of the BID) and agrees that, because RTO do not use auxiliary fuel, the outlet CO_2 concentrations are much less than those of conventional thermal oxidizers without compromising THC destruction efficiency. Consequently, the final rule contains an option that allows combustion devices that do not use auxiliary fuel to use an outlet-only THC destruction efficiency equation. To determine the level of the standard for RTO, the same approach as was taken for the derivation of the THC destruction efficiency and combustion efficiency standards was used (*i.e.*, one standard deviation was subtracted from the average THC destruction efficiencies calculated from the test data submitted by the commenters). The resulting calculations (see section 2.3.10.6 of the BID) yield a THC destruction efficiency standard for RTO of 95.8 percent.

D. Compliance Options

Comment: One commenter noted that the control devices used at refineries to control blowing stills are flares, boilers, and process heaters and that refineries do not typically have thermal oxidizers. The commenter urged the EPA to allow the use of combustion devices other than thermal oxidizers to control blowing still emissions.

Response: The proposed rule did not prohibit the use of process heaters, boilers, and flares because we consider these units to be types of thermal oxidizers. However, since the term "thermal oxidizer" was not defined in the proposed rule, the proposed rule could be interpreted differently. In the final rule, we use the term "combustion device" instead of "thermal oxidizer" and have defined combustion device to include process heaters, boilers, flares, and incinerators; all devices which achieve the same high degree of HAP destruction provided they operate using efficient combustion. Consistent with other rules, a performance test and continuous parameter monitoring are not required for boilers or process heaters if the vent streams to be controlled are introduced into the flame zone, or if the unit has a design input heat capacity of 44 MW or greater since the residence time and operating temperature of these devices is great enough to ensure reduction of HAP emissions. Flares are required to meet the design and operating requirements of 40 CFR 63.11 in lieu of conducting performance tests, as explained earlier in this preamble.

E. Performance Tests

Comment: One commenter expressed concern with the requirement to conduct performance testing before the compliance date. The commenter stated that the NESHAP General Provisions and nearly all previously-issued MACT standards allow the test to be conducted within 180 days of the compliance date (existing sources) or at startup (new sources). The commenter pointed out that the testing date for existing sources is 8 months earlier than what is provided in the General Provisions and listed several problems that it would create.

Response: The EPA agrees that it is not necessary to require performance tests to be completed 60 days prior to the rule compliance date since this would effectively require that facilities be in compliance before the compliance date specified in the final rule. Consequently, the final rule (§ 63.8686(a)) has been written to be consistent with the NESHAP General Provisions (performance tests must be conducted within 180 days after the compliance date).

F. Monitoring Requirements

Comment: Comments were received on a variety of monitoring requirements. The changes made to the proposed monitoring requirements are discussed in the following paragraphs.

Response: Many facilities in the asphalt processing and asphalt roofing manufacturing industry use analog chart recorders to display and record monitored parameters. However, when these devices are used, the value of the monitored parameters is generally not recorded electronically. Parameter values therefore cannot be automatically averaged and compared to the established range to determine if there has been an parameter deviation. Such a determination would have to be made through manual calculations. One commenter suggested that chart recorders could more easily be used for monitoring if manual calculations of 3-hour averages were not required and deviations were based on 15-minute exceedances of limits. Because the commenter's suggestion is more stringent than the requirements in the proposed rule, the EPA has decided that this is an acceptable alternative for determining continuous compliance. Therefore, the final rule was written to allow facilities the option of demonstrating continuous compliance using either a 15-minute or 3-hour averaging period.

For example, if a facility uses an analog chart recorder that provides a continuous record of the combustion device operating temperature on a strip chart, the facility would be allowed to determine compliance with the NESHAP by comparing the minimum temperature reading for each 15-minute period to the minimum 15-minute value established during the initial performance test (*i.e.*, the facility would not be required to manually average the readings on the strip chart over a 3-hour period to determine compliance with the standards).

Comment: One commenter asserted that facilities should be allowed to use CEMS and COMS to demonstrate continuous compliance with the standards.

Response: The proposed rule did not preclude facilities from using CEMS and COMS, and it was not EPA's intent to discourage facilities from using CEMS and COMS where feasible and beneficial to them. However, continuous monitoring is not required for the opacity standard, even though the opacity standard applies at all times (*i.e.*, EPA test method 9 could be used at any time by the regulating agency to determine compliance with the opacity standard). To allow you to use continuous monitors without first obtaining the approval from the Administrator to use an alternative monitoring procedure, the list of acceptable monitoring systems in the final rule has been written to include CEMS (and COMS) and their applicable performance specifications from 40 CFR part 60 Appendix B.

Comment: One commenter suggested that the EPA modify the proposed rule so that a facility using an ESP as a PM control device could select which parameters are appropriate for demonstrating compliance and have those parameters approved by the EPA in the same manner as "other" control devices.

Response: The EPA agrees with the commenter that ESP operate differently from filter-type PM control devices, and that parameters other than pressure drop could be used to show proper ESP operation. For these reasons, an alternative has been provided in the final rule to allow facilities using an ESP to monitor the voltage going to the ESP instead of the pressure drop across the device. The voltage going to the ESP is a direct measure of the strength of the corona field responsible for ionizing PM as it passes through the ESP. The value or range of ESP voltage must be determined during the performance test.

G. Overlap With Other Rules

Comment: One commenter stated that the rule should be clarified so that asphalt flux and oxidized asphalt storage tanks already regulated under another MACT rule (for example, the petroleum refinery NESHAP) are not further regulated under the asphalt NESHAP.

Response: The EPA recognizes that asphalt storage vessels subject to the asphalt NESHAP could also be subject to other regulations, such as the petroleum refinery NESHAP (40 CFR part 63, subpart CC) and the storage vessel NSPS (40 CFR part 60, subpart K, Ka, or Kb). Consequently, EPA is providing in the final rule that the NESHAP does not apply to any equipment that is subject to the petroleum refinery NESHAP or to subpart K, Ka, or Kb of part 60 since the requirements specified in those rules for the types of storage tanks used in this industry (fixed roof tanks) are as stringent as the standards in the asphalt processing and asphalt roofing manufacturing NESHAP.

The EPA also recognizes that storage tanks (and blowing stills, saturators, wet loopers, and coaters) at asphalt processing and asphalt roofing manufacturing facilities could be subject to both the asphalt NESHAP and the asphalt NSPS. In cases where the rule requirements overlap, the asphalt rule specifies that facilities are required to comply only with the asphalt NESHAP. However, any storage tank with a capacity less than 1.93 mg that is subject to the asphalt NSPS but not regulated under the asphalt NESHAP must comply with the asphalt NSPS.

IV. Summary of Environmental, Energy and Economic Impacts

Although MACT floors must be based exclusively on the emission limitation achieved by the requisite percentage of best-performing similar sources (or, for new sources, the best-performing source), the EPA has compiled information on air quality impacts, costs, non-air quality impacts, and energy impacts in compliance with Executive Orders. We estimate the final rule will affect a total of 19 existing facilities (ten asphalt processing and asphalt roofing facilities and nine petroleum refineries). We estimated the number of major sources by estimating potential emissions using emission factors and available production data. We identified major facilities only for the purposes of estimating potential emissions, emission reductions, control costs, and monitoring, recordkeeping, and reporting costs. It should be noted that facilities may not necessarily be major sources for the purposes of determining applicability of the final rule because they were identified as major by our estimates. Likewise, facilities would not be relieved from complying with the final rule because they were not identified as major sources in our estimates.

A. What Are the Air Quality Impacts?

Baseline HAP emissions from the asphalt processing and asphalt roofing manufacturing facilities that are projected to be subject to the final rule are estimated to be 295 Mg/yr (325 tpy). Baseline THC emissions are estimated to be 550 Mg/yr (605 tpy). The baseline emission estimates were developed using equipment, control device, and

production rate data reported in a 1995 industry survey. The final rule is projected to reduce HAP emissions by 86 Mg/yr (95 tpy) and THC emissions by 465 Mg/yr (512 tpy). The final rule will also reduce PM emissions from asphalt processing and asphalt roofing manufacturing facilities. However, we do not have sufficient data to estimate baseline emissions or emission reductions for PM. The baseline emissions and emission reductions do not include contributions from area sources because they are not subject to the final rule.

The final rule will also likely cause an increase in emissions of nitrogen oxides (NO_X), CO, sulfur dioxide (SO_2), PM, and volatile organic compounds (VOC) due to the increased use of thermal oxidizers as control devices. The estimated increases of NO_X, CO, and SO_2 are approximately, 476, 799, and 6 Mg/yr (524, 880, and 6 tpy), respectively. These estimates are based on the amount of exhaust and auxiliary fuel that will be burned at the asphalt processing and asphalt roofing manufacturing facilities that are estimated to be major sources.

B. What Are the Cost Impacts?

The total capital cost for the industry to achieve compliance with the final rule for existing facilities is estimated to be $2.71 million. The capital costs arise from the purchase of emission capture systems and control devices. The total annualized cost is estimated to be $1.41 million. The total annualized costs for the industry include the annualized capital cost of emission capture systems and control devices and operation, maintenance, supervisory labor, maintenance materials, utilities, administrative charges, taxes, and insurance. It is estimated that the industry will spend an additional industrywide average of $320,000 per year for monitoring, recordkeeping, and reporting to comply with the final rule. This results in a total annualized cost of $1.73 million.

C. What Are the Economic Impacts?

The Agency conducted an economic impact analysis to determine the market- and industry-level impacts associated with the final rule. The compliance costs of the final rule are expected to increase the prices of asphalt processing and roofing products by 0.02 percent or less across the directly affected product markets, and domestic production and consumption of the affected products are expected to decrease by less than 0.01 percent also.

In terms of industry impacts, the asphalt processors and asphalt roofing manufacturers are projected to experience a decrease in operating profits of about 0.08 percent, which reflects the compliance costs associated with the production of asphalt processing and roofing products and the resulting reductions in revenues due to the increase in the prices of the directly affected product markets and reduced quantities purchased. Through the market impacts described above, the final rule created both gainers and losers within the asphalt processing and asphalt roofing manufacturing industry. The majority of facilities, almost 92 percent, are expected to experience profit increases with the final rule; however, there are some facilities projected to lose profits (about 8 percent of affected facilities). Furthermore, the economic impact analysis indicates that of the 123 existing asphalt roofing and processing facilities, none are at risk of closure because of the final rule. Therefore, none of the companies that own asphalt processing and roofing manufacturing facilities are projected to close due to the final rule.

Based on the market analysis, the annual social costs of the final rule are projected to be about $1.73 million. The estimated social costs differ slightly from the projected engineering costs of the final rule. These two costs differ because social costs account for producer and consumer behavior. These social costs are distributed across the many consumers and producers of asphalt processing and roofing products. For the final rule, the producers of asphalt roofing and processing products, in aggregate, are expected to incur about $1.32 million annually in costs, while the consumers of asphalt roofing and processing products are expected to incur approximately $410 thousand annually across the product markets.

The economic analysis also addressed potential changes in new asphalt processing and roofing facility construction for the year following promulgation of the final rule. This was done by estimating the total annualized costs for new facilities and projecting changes in equilibrium output due to the final rule. The economic impact analysis estimated a very small reduction in the growth of the asphalt industry represented by a small reduction in equilibrium output of asphalt products in the year following promulgation. However, the reduction in equilibrium output was only a small fraction of estimated new plant capacity. Thus, the control costs are not expected to influence the decision to enter the market for asphalt products. For more information, consult the Economic Impact Analysis report supporting the final rule in the docket.

D. What Are the Non-air Health, Environmental and Energy Impacts?

Spent filter media from certain types of PM control devices (*e.g.*, high-efficiency air filters (HEAF)) are periodically replaced and disposed of as solid waste. Although many of the emission sources subject to the final rule are already controlled by PM devices, an increase in the generation of spent filter media is expected as a result of the final rule. However, we do not have sufficient data to quantify this anticipated increase in solid waste generation.

No water impacts are anticipated due to the final rule. None of the control devices expected to be used to comply with the final rule require the use of water nor do they generate wastewater streams.

Increased energy usage is expected due to the final rule. Electricity is required to power fans for emission capture systems, and new thermal oxidizers will require supplemental fuel (*e.g.*, natural gas) to efficiently combust the HAP vent streams. The estimated annual increase in electricity consumption is 5.58 million kilowatt hours. The approximate increase in natural gas consumption is 186 million standard cubic feet per year. These estimates are for the 19 facilities considered to be major sources.

V. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must determine whether the regulatory action is "significant," and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that the final rule is not a "significant regulatory action" because it is not expected to have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities.

B. Paperwork Reduction Act

The information collection requirements of the final rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* An Information Collection Request (ICR) document has been prepared by the EPA (ICR No. 2029.01) and a copy may be obtained from Susan Auby by mail at U.S. EPA, Office of Environmental Information, Collection Strategies Division, (2822T), 1200 Pennsylvania Ave., NW., Washington, DC 20460–0001, by e-mail at *auby.susan@epa.gov* or by calling (202) 566–1672. A copy may also be downloaded off the internet at *http://www.epa.gov/icr.*

The information will be used by the EPA to ensure that the requirements of the asphalt processing and asphalt roofing manufacturing NESHAP are implemented properly and are complied with on a continuous basis. Records and reports are necessary to identify asphalt processing and asphalt roofing manufacturing facilities that might not be in compliance with the final rule. Based on reported information, the implementing agency will decide which asphalt processing and asphalt roofing manufacturing facilities should be inspected and what records or processes should be inspected. Records that owners and operators of asphalt processing and asphalt roofing manufacturing facilities maintain indicate whether personnel are operating and maintaining control equipment properly.

These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to the EPA for which a claim of confidentiality is made will be safeguarded according to the EPA policies in 40 CFR part 2, subpart B, Confidentiality of Business Information.

We estimate the final rule will affect a total of 19 existing facilities (ten asphalt processing and asphalt roofing facilities and nine petroleum refineries). We estimated the number of major sources by estimating emissions using emission factors and available production data and extrapolating potential emission from actual emissions. We identified major facilities for the purposes of estimating emissions, emission reductions, control costs, and monitoring, recordkeeping, and reporting costs only. Facilities would not necessarily be major sources for the purposes of determining applicability of the asphalt NESHAP because they were identified as major by our estimates. Likewise, facilities are not relieved from complying with the asphalt NESHAP because they were not identified as major sources in our estimates. We expect that existing facilities will be in compliance 3 years after promulgation of the final rule, but will perform related activities (*e.g.*, reading and understanding the rule, conducting performance tests) before they are in compliance. We project that one new asphalt processing and asphalt roofing facility will become subject to the final rule during each of the first 3 years.

The estimated average annual burden for industry for the first 3 years after implementation of the rule is approximately 1,962 person-hours annually. There will be no capital costs for monitoring or recordkeeping during the first 3 years. The total average annual reporting and recordkeeping burden (including industry and the EPA) for this collection is estimated at approximately 2,780 labor hours per year at an average annual cost of approximately $356,000.

Burden means total time, effort, or financial resources expended by persons to generate, maintain, retain, disclose, or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act (RFA)

The RFA generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the Agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small business, small organizations, and small government jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, a small entity is defined as: (1) A small business according to Small Business Administration (SBA) size standards by NAICS code (in this case, less than 750 employees for affected businesses classified in NAICS code 324122, Asphalt Shingles and Coating Materials Manufacturing and less than 1,500 employees for businesses in NAICS code 324110, Petroleum Refineries); (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise that is independently owned and operated and is not dominant in its field.

In accordance with the RFA, the EPA conducted an assessment of the standards on small businesses within the asphalt roofing and processing industry. Based on SBA NAICS-based size definitions and reported employment data, the EPA identified 26 of the 40 companies that own potentially affected asphalt roofing and processing facilities and petroleum refineries as small businesses. Although small businesses represent 65 percent of the companies within the source category, they are expected to incur approximately 5 percent of the total industry compliance costs of about $1.73 million annually. There are no companies with compliance costs greater than 0.04 percent of their sales. No firms are expected to close rather than incur the costs of compliance with the rule.

After considering the economic impacts of today's rule on small entities, the EPA certifies that the final rule will not have a significant economic impact on a substantial number of small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for

Federal agencies to assess the effects of their regulatory actions on State, local, or tribal governments and the private sector. Under section 202 of the UMRA, the EPA generally must prepare a written statement, including a cost-benefit analysis, for final rules with "Federal mandates" that may result in expenditures to State, local, or tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating a rule for which a written statement is needed, section 205 of the UMRA generally requires the EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before the EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of the EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or the private sector in any 1 year. In the Economic Impact Assessment (EIA) for the final rule, the EPA estimates that the total nationwide capital cost for the standards is $2.71 million. The total nationwide annual cost for the standards is $1.73 million. In addition, the EPA has determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, the final rule is not subject to the requirements of sections 202 or 205 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires the EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities under the final rule are owned or operated by State or local governments. Thus Executive Order 13132 does not apply to the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 6, 2000), requires the EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" is defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and the Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

The final rule does not have tribal implications. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. No affected facilities are owned or operated by Indian tribal governments. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045—Protection of Children From Environmental Health and Safety Risks

Executive Order 13045, "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997), applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that the EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the EPA.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045 because it is based on technology performance and not on health and safety risks.

H. Executive Order 13211, Actions That Significantly Affect Energy Supply, Distribution, or Use

Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001), provides that agencies shall prepare and submit to the Administrator of the Office of Information and Regulatory Affairs, Office of Management and Budget, a Statement of Energy Effects for certain actions identified as "significant energy actions." Section 4(b) of Executive Order 13211 defines "significant energy actions" as "any action by an agency (normally published in the **Federal Register**) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of proposed rulemaking, and notices of proposed rulemaking: (1)(i) That is a significant regulatory action under Executive Order 12866 or any successor order, and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) that is designated by the Administrator of the Office of Information and Regulatory Affairs as a significant energy action." The final rule is not a "significant regulatory action" because it is not likely to have a significant adverse effect

on the supply, distribution, or use of energy.

We have estimated that the rule will result in an additional 5.58 million kilowatt hours of electricity usage and 186 million standard cubic feet of natural gas consumption. This represents an insignificant fraction of the over 3 trillion kilowatt hours and 21,000 trillion cubic feet of natural gas consumed in the United States (Energy Information Administration, Department of Energy, *www.eia.gov*).

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law 104–113, section 12(d), (15 U.S.C. 272 note), directs the EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by one or more voluntary consensus bodies. The NTTAA directs the EPA to provide Congress, through annual reports to OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

The final rulemaking involves technical standards including EPA test methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 5A, 9, 10, 22, and 25A. Consistent with the NTTAA, the EPA conducted searches to identify voluntary consensus standards in addition to these EPA test methods. No applicable voluntary consensus standards were identified for EPA test methods 1A, 2A, 2D, 2F, 2G, 5A, 9, and 22.

The search for emissions measurement procedures identified 16 voluntary consensus standards potentially applicable to the final rule. Three of the voluntary consensus standards were not available at the time this review was conducted. For the remaining 13 standards identified for measuring emissions of the HAP or surrogates subject to emission standards in the final rule, we determined that they were impractical alternatives to EPA test methods for the purposes of the final rule. Therefore, the EPA does not intend to adopt these standards. The search and review methods can be found in docket A–95–32 (see **ADDRESSES** section of this preamble).

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The final rule will be effective on April 29, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons cited in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority : 42 U.S.C. 7401 *et seq.*

■ 2. Part 63 is amended by adding a new subpart LLLLL to read as follows:

Subpart LLLLL—National Emission Standards for Hazardous Air Pollutants: Asphalt Processing and Asphalt Roofing Manufacturing

Sec.

What This Subpart Covers

63.8680 What is the purpose of this subpart?
63.8681 Am I subject to this subpart?
63.8682 What parts of my plant does this subpart cover?
63.8683 When must I comply with this subpart?

Emission Limitations

63.8684 What emission limitations must I meet?

General Compliance Requirements

63.8685 What are my general requirements for complying with this subpart?

Testing and Initial Compliance Requirements

63.8686 By what date must I conduct performance tests or other initial compliance demonstrations?
63.8687 What performance tests, design evaluations, and other procedures must I use?
63.8688 What are my monitoring installation, operation, and maintenance requirements?
63.8689 How do I demonstrate initial compliance with the emission limitations?

Continuous Compliance Requirements

63.8690 How do I monitor and collect data to demonstrate continuous compliance?
63.8691 How do I demonstrate continuous compliance with the operating limits?

Notifications, Reports, and Records

63.8692 What notifications must I submit and when?
63.8693 What reports must I submit and when?
63.8694 What records must I keep?
63.8695 In what form and how long must I keep my records?

Other Requirements and Information

63.8696 What parts of the General Provisions apply to me?
63.8697 Who implements and enforces this subpart?
63.8698 What definitions apply to this subpart?

Tables to Subpart LLLLL of Part 63

Table 7 to Subpart LLLLL of Part 63—Applicability of General Provisions to Subpart LLLLL

Subpart LLLLL—National Emission Standards for Hazardous Air Pollutants: Asphalt Processing and Asphalt Roofing Manufacturing

What This Subpart Covers

§ 63.8680 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for existing and new asphalt processing and asphalt roofing manufacturing facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§ 63.8681 Am I subject to this subpart?

(a) You are subject to this subpart if you own or operate an asphalt processing facility or an asphalt roofing manufacturing facility, as defined in § 63.8698, that is a major source of hazardous air pollutants (HAP) emissions, or is located at, or is part of a major source of HAP emissions.

(b) After the applicable compliance date specified in § 63.8683, blowing stills, asphalt storage tanks, saturators, wet loopers, and coaters subject to the provisions of this subpart that are also subject to 40 CFR part 60, subpart UU, are required to comply only with provisions of this subpart.

(c) This subpart does not apply to any equipment that is subject to subpart CC of this part or to subpart K, Ka, or Kb of 40 CFR part 60.

(d) This subpart does not apply to asphalt processing and asphalt roofing manufacturing equipment used for research and development, as defined in § 63.8698.

(e) A major source of HAP emissions is any stationary source or group of stationary sources within a contiguous area under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (10 tons) or more per year or any combination of HAP at a rate of 22.68 megagrams (25 tons) or more per year.

§ 63.8682 What parts of my plant does this subpart cover?

(a) This subpart applies to each new, reconstructed, or existing affected source at asphalt processing and asphalt roofing manufacturing facilities.

(b) The affected source is:

(1) Each asphalt processing facility as defined in § 63.8698; or

(2) Each asphalt roofing manufacturing line as defined in § 63.8698.

(i) If the asphalt roofing manufacturing line is collocated with an asphalt processing facility, the storage tanks that store asphalt flux intended for oxidation in the blowing stills and those tanks that receive asphalt directly from the on-site blowing stills are part of the asphalt processing facility. The remaining asphalt storage tanks are considered to be part of the asphalt roofing facility.

(ii) If an asphalt storage tank is shared by two or more lines at an asphalt roofing manufacturing facility, the shared storage tank is considered part of the line to which the tank supplies the greatest amount of asphalt, on an annual basis.

(iii) If a sealant or adhesive applicator is shared by two or more asphalt roofing manufacturing lines, the shared applicator is considered part of the line that provides the greatest throughput to the applicator, on an annual basis.

(c) An affected source is a new affected source if you commenced construction of the affected source after November 21, 2001, and you met the applicability criteria at the time you commenced construction.

(d) An affected source is reconstructed if you meet the criteria in the reconstruction definition in § 63.2.

(e) An affected source is existing if it is not new or reconstructed.

§ 63.8683 When must I comply with this subpart?

(a) If you have a new or reconstructed affected source and start up:

(1) On or before April 29, 2003, then you must comply with the requirements for new and reconstructed sources in this subpart no later than April 29, 2003.

(2) After April 29, 2003, then you must comply with the requirements for new and reconstructed sources in this subpart upon startup.

(b) If you have an existing affected source, you must comply with the requirements for existing sources no later than May 1, 2006.

(c) If you have an area source that increases its emissions or its potential to emit such that it becomes a (or part of a) major source of HAP, then the following requirements apply:

(1) Any portion of the existing facility that becomes a new or reconstructed affected source must be in compliance with this subpart upon startup or by April 29, 2003, whichever is later.

(2) All other parts of the source to which this subpart applies must be in compliance with this subpart by 3 years after the date the source becomes a major source.

(d) You must meet the notification requirements in § 63.8692 according to the schedules in §§ 63.8692 and 63.9. Some of the notifications must be submitted before you are required to comply with the emission limitations in this subpart.

Emission Limitations

§ 63.8684 What emission limitations must I meet?

(a) You must meet each emission limitation in Table 1 to this subpart that applies to you.

(b) You must meet each operating limit in Table 2 to this subpart that applies to you.

General Compliance Requirements

§ 63.8685 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations (including operating limits) in this subpart at all times, except during periods of startup, shutdown, and malfunction.

(b) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i).

(c) You must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

(d) You must develop and implement a written site-specific monitoring plan according to the provisions in § 63.8688(g) and (h).

Testing and Initial Compliance Requirements

§ 63.8686 By what date must I conduct performance tests or other initial compliance demonstrations?

(a) For existing affected sources, you must conduct performance tests no later than 180 days after the compliance date that is specified for your source in § 63.8683 and according to the provisions in § 63.7(a)(2).

(b) As an alternative to the requirement specified in paragraph (a) of this section, you may use the results of a previously-conducted emission test to demonstrate compliance with the emission limitations in this subpart if you demonstrate to the Administrator's satisfaction that:

(1) No changes have been made to the process since the time of the emission test; and

(2) The operating conditions and test methods used during testing conform to the requirements of this subpart; and

(3) The control device and process parameter values established during the previously-conducted emission test are used to demonstrate continuous compliance with this subpart.

(c) For new sources, you must demonstrate initial compliance no later than 180 calendar days after April 29, 2003 or within 180 calendar days after startup of the source, whichever is later.

§ 63.8687 What performance tests, design evaluations, and other procedures must I use?

(a) You must conduct each performance test in Table 3 to this subpart that applies to you.

(b) Each performance test must be conducted under normal operating conditions and under the conditions specified in Table 3 to this subpart.

(c) You may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in § 63.7(e)(1).

(d) Except for opacity and visible emission observations, you must conduct three separate test runs for each performance test required in this section, as specified in § 63.7(e)(3). Each test run must last at least 1 hour.

(e) You must use the following equations to determine compliance with the emission limitations.

(1) To determine compliance with the particulate matter mass emission rate, you must use Equations 1 and 2 of this section as follows:

$$E = M_{PM}/P \qquad \text{(Eq. 1)}$$

Where:

E = Particulate matter emission rate, kilograms (pounds) of particulate matter per megagram (ton) of roofing product manufactured.

M_{PM} = Particulate matter mass emission rate, kilograms (pounds) per hour, determined using Equation 2.

P = The asphalt roofing product manufacturing rate during the emissions sampling period, including any material trimmed from the final product, megagram (tons) per hour.

$$M_{PM} = C * Q * K \qquad \text{(Eq. 2)}$$

Where:

M_{PM} = Particulate matter mass emission rate, kilograms (pounds) per hour.

C = Concentration of particulate matter on a dry basis, grams per dry standard cubic meter (g/dscm), as measured by the test method specified in Table 3 to this subpart.

Q = Vent gas stream flow rate (dry standard cubic meters per minute) at a temperature of 20°C as measured by the test method specified in Table 3 to this subpart.

K = Unit conversion constant (0.06 minute-kilogram/hour-gram.

(2) To determine compliance with the total hydrocarbon percent reduction standard, you must use Equations 3 and 4 of this section as follows:

$$RE = \left[(M_{THCi} - M_{THCo})/(M_{THCi})\right] * (100) \qquad \text{(Eq. 3)}$$

Where:

RE = Emission reduction efficiency, percent.

M_{THCi} = Mass flow rate of total hydrocarbons entering the control device, kilograms (pounds) per hour, determined using Equation 4.

M_{THCo} = Mass flow rate of total hydrocarbons exiting the control device, kilograms (pounds) per hour, determined using Equation 4.

$$M_{THC} = C * Q * K \qquad \text{(Eq. 4)}$$

Where:

M_{THC} = Total hydrocarbon emission rate, kilograms (pounds) per hour.

C = Concentration of total hydrocarbons on a dry basis, parts per million by volume (ppmv), as measured by the test method specified in Table 3 to this subpart.

Q = Vent gas stream flow rate (dscmm) at a temperature of 20 °C as measured by the test method specified in Table 3 to this subpart.

K = Unit conversion constant (3.00E–05) $(ppmv)^{-1}$ (gram-mole/standard cubic meter) (kilogram/gram) (minutes/hour)), where standard temperature for gram-mole/standard cubic meter is 20 °C.

(3) To determine compliance with the combustion efficiency standard, you must use Equation 5 of this section as follows:

$$CE = \left[1 - (CO/CO_2) - (THC/CO_2)\right] \qquad \text{(Eq. 5)}$$

Where:

CE = Combustion efficiency, percent.

CO = Carbon monoxide concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

CO_2 = Carbon dioxide concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

THC = Total hydrocarbon concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

(4) To determine compliance with the total hydrocarbon destruction efficiency standard for a combustion device that does not use auxiliary fuel, you must use Equation 6 of this section as follows:

$$THC\ DE = \left[(CO + CO_2)/(CO + CO_2 + THC)\right] \qquad \text{(Eq. 6)}$$

Where:

THC DE = THC destruction efficiency, percent.

CO = Carbon monoxide concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

CO_2 = Carbon dioxide concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

THC = Total hydrocarbon concentration at the combustion device outlet, parts per million by volume (dry), as measured by the test method specified in Table 3 to this subpart.

§ 63.8688 What are my monitoring installation, operation, and maintenance requirements?

(a) You must install, operate, and maintain each continuous parameter monitoring system (CPMS) according to the following:

(1) The CPMS must complete a minimum of one cycle of operation for each successive 15-minute period.

(2) To determine the 3-hour average, you must:

(i) Have a minimum of four successive cycles of operation to have a valid hour of data.

(ii) Have valid data from at least three of four equally spaced data values for that hour from a CPMS that is not out-of-control according to your site-specific monitoring plan.

(iii) Determine the 3-hour average of all recorded readings for each operating day, except as stated in § 63.8690(c). You must have at least two of the three hourly averages for that period using only hourly average values that are based on valid data (*i.e.*, not from out-of-control periods).

(3) You must record the results of each inspection, calibration, and validation check.

(b) For each temperature monitoring device, you must meet the requirements in paragraph (a) of this section and the following:

(1) Locate the temperature sensor in a position that provides a representative temperature.

(2) For a noncryogenic temperature range, use a temperature sensor with a minimum measurement sensitivity of 2.8 °C or 1.0 percent of the temperature value, whichever is larger.

(3) If a chart recorder is used, it must have a sensitivity in the minor division of at least 20 °F.

(4) Perform an accuracy check at least semiannually or following an operating parameter deviation:

(i) According to the procedures in the manufacturer's documentation; or

(ii) By comparing the sensor output to redundant sensor output; or

(iii) By comparing the sensor output to the output from a calibrated temperature measurement device; or

(iv) By comparing the sensor output to the output from a temperature simulator.

(5) Conduct accuracy checks any time the sensor exceeds the manufacturer's specified maximum operating temperature range or install a new temperature sensor.

(6) At least quarterly or following an operating parameter deviation, perform visual inspections of components if redundant sensors are not used.

(c) For each pressure measurement device, you must meet the requirements of paragraph (a) of this section and the following:

(1) Locate the pressure sensor(s) in, or as close as possible, to a position that provides a representative measurement of the pressure.

(2) Use a gauge with a minimum measurement sensitivity of 0.12 kiloPascals or a transducer with a minimum measurement sensitivity of 5 percent of the pressure range.

(3) Check pressure tap pluggage daily. Perform an accuracy check at least quarterly or following an operating parameter deviation:

(i) According to the procedures in the manufacturer's documentation; or

(ii) By comparing the sensor output to redundant sensor output.

(4) Conduct calibration checks any time the sensor exceeds the manufacturer's specified maximum operating pressure range or install a new pressure sensor.

(5) At least monthly or following an operating parameter deviation, perform a leak check of all components for integrity, all electrical connections for continuity, and all mechanical connections for leakage.

(6) At least quarterly or following an operating parameter deviation, perform visible inspections on all components if redundant sensors are not used.

(d) For monitoring parameters other than temperature and pressure drop, you must install and operate a CPMS to provide representative measurements of the monitored parameters.

(e) For each flare, you must install a device (including but not limited to a thermocouple, an ultraviolet beam sensor, or an infrared sensor) capable of continuously detecting the presence of a pilot flame.

(f) As an option to installing the CPMS specified in paragraph (a) of this section, you may install a continuous emissions monitoring system (CEMS) or a continuous opacity monitoring system (COMS) that meets the requirements specified in § 63.8 and the applicable performance specifications of 40 CFR part 60, appendix B.

(g) For each monitoring system required in this section, you must develop and make available for inspection by the permitting authority, upon request, a site-specific monitoring plan that addresses the following:

(1) Installation of the CPMS, CEMS, or COMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last control device);

(2) Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system; and

(3) Performance evaluation procedures and acceptance criteria (*e.g.*, calibrations).

(h) In your site-specific monitoring plan, you must also address the following:

(1) Ongoing operation and maintenance procedures in accordance with the general requirements of § 63.8(c)(1), (c)(3), (c)(4)(ii), (c)(7), and (c)(8);

(2) Ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d); and

(3) Ongoing recordkeeping and reporting procedures in accordance with the general requirements of § 63.10(c), (e)(1), and (e)(2)(i).

(i) You must conduct a performance evaluation of each CPMS, CEMS, or COMS in accordance with your site-specific monitoring plan.

(j) You must operate and maintain the CPMS, CEMS, or COMS in continuous operation according to the site-specific monitoring plan.

§ 63.8689 How do I demonstrate initial compliance with the emission limitations?

(a) You must demonstrate initial compliance with each emission limitation that applies to you according to Table 4 to this subpart.

(b) You must establish each site-specific operating limit in Table 2 to this subpart that applies to you according to the requirements in § 63.8687 and Table 3 to this subpart.

(c) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in § 63.8692(e).

Continuous Compliance Requirements

§ 63.8690 How do I monitor and collect data to demonstrate continuous compliance?

(a) You must monitor and collect data according to this section.

(b) Except for monitor malfunctions, associated repairs, and required quality assurance or control activities (including, as applicable, calibration checks and required zero and span adjustments), you must monitor continuously (or collect data at all required intervals) at all times that the affected source is operating. This includes periods of startup, shutdown, and malfunction when the affected source is operating.

(c) You may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels, nor may such data be used in fulfilling a minimum data availability requirement, if applicable. You must use all the data collected during all other periods in assessing the operation of the control device and associated control system.

§ 63.8691 How do I demonstrate continuous compliance with the operating limits?

(a) You must demonstrate continuous compliance with each operating limit in Table 2 to this subpart that applies to you according to test methods specified in Table 5 to this subpart.

(b) You must report each instance in which you did not meet each operating limit in Table 5 to this subpart that applies to you. This includes periods of startup, shutdown, and malfunction. These instances are deviations from the emission limitations in this subpart. These deviations must be reported according to the requirements in § 63.8693.

(c) During periods of startup, shutdown, and malfunction, you must operate in accordance with the SSMP.

(d) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the SSMP. The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

Notifications, Reports, and Records

§ 63.8692 What notifications must I submit and when?

(a) You must submit all of the notifications in §§ 63.6(h)(4) and (5), 63.7(b) and (c), 63.8(f), and 63.9(b) through (f) and (h) that apply to you by the dates specified.

(b) As specified in § 63.9(b)(2), if you start up your affected source before April 29, 2003, you must submit an Initial Notification not later than 120 calendar days after April 29, 2003.

(c) As specified in § 63.9(b)(3), if you start up your new or reconstructed affected source on or after April 29, 2003, you must submit an Initial Notification not later than 120 calendar days after you become subject to this subpart.

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin, as required in § 63.7(b)(1).

(e) If you are required to conduct a performance test, design evaluation, opacity observation, visible emission observation, or other initial compliance demonstration as specified in Table 3 or 4 to this subpart, you must submit a Notification of Compliance Status according to § 63.9(h)(2)(ii). You must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test according to § 63.10(d)(2).

(f) If you are using data from a previously-conducted emission test to serve as documentation of conformance with the emission standards and operating limits of this subpart, you must submit the test data in lieu of the initial performance test results with the Notification of Compliance Status required under paragraph (e) of this section.

§ 63.8693 What reports must I submit and when?

(a) You must submit each report in Table 6 to this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report by the date in Table 6 to this subpart and according to the following dates:

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in § 63.8683 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in § 63.8683.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in § 63.8683.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of the dates in paragraphs (b)(1) through (4) of this section.

(c) The compliance report must contain the following information:

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in § 63.10(d)(5)(i).

(5) If there are no deviations from any emission limitations (emission limit, operating limit, opacity limit, and visible emission limit) that apply to you, a statement that there were no deviations from the emission limitations during the reporting period.

(6) If there were no periods during which the CPMS, CEMS, or COMS was out-of-control as specified in § 63.8(c)(7), a statement that there were no periods during which the CPMS, CEMS, or COMS was out-of-control during the reporting period.

(d) For each deviation from an emission limitation (emission limit, operating limit, opacity limit, and visible emission limit), you must include the information in paragraphs (c)(1) through (6) of this section, and the information in paragraphs (d)(1) through (12) of this section. This includes periods of startup, shutdown, and malfunction.

(1) The date and time that each malfunction started and stopped.

(2) The date and time that each CPMS, CEMS, or COMS was inoperative, except for zero (low-level) and high-level checks.

(3) The date, time and duration that each CPMS, CEMS, or COMS was out-of-control, including the information in § 63.8(c)(8).

(4) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(5) A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

(6) A breakdown of the total duration of the deviations during the reporting period into those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(7) A summary of the total duration of CPMS, CEMS, or COMS downtime during the reporting period and the total duration of CPMS, CEMS, or COMS downtime as a percent of the total source operating time during that reporting period.

(8) An identification of each air pollutant that was monitored at the affected source.

(9) A brief description of the process units.

(10) A brief description of the CPMS, CEMS, or COMS.

(11) The date of the latest CPMS, CEMS, or COMS certification or audit.

(12) A description of any changes in CPMS, CEMS, or COMS, processes, or controls since the last reporting period.

(e) Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 40 CFR part 71 must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a compliance report pursuant to Table 6 to this subpart along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report includes all required information concerning deviations from any emission limitation (including any operating limit), submission of the compliance report shall be deemed to satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submission of a compliance report shall not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permit authority.

(f) If acceptable to both the Administrator and you, you may submit reports and notifications electronically.

§ 63.8694 What records must I keep?

(a) You must keep the following records:

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) Records of performance tests, performance evaluations, and opacity and visible emission observations as required in § 63.10(b)(2)(viii).

(b) You must keep the records in § 63.6(h)(6) for visible emission observations.

(c) You must keep the records required in Table 5 to this subpart to show continuous compliance with each operating limit that applies to you.

(d) Records of any shared equipment determinations as specified in § 63.8682(b).

§ 63.8695 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You can keep the records offsite for the remaining 3 years.

Other Requirements and Information

§ 63.8696 What parts of the General Provisions apply to me?

Table 7 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

§ 63.8697 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. Environmental Protection Agency (U.S. EPA), or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the U.S. EPA, has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if implementation and enforcement of this subpart is delegated.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under 40 CFR part 63, subpart E, the following authorities are retained by the Administrator of U.S. EPA:

(1) Approval of alternatives to the requirements in §§ 63.8681, 63.8682, 63.8683, 63.8684(a) through (c), 63.8686, 63.8687, 63.8688, 63.8689, 63.8690, and 63.8691.

(2) Approval of major changes to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major changes to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.8698 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in 40 CFR 63.2, the General Provisions of this part, and in this section as follows:

Adhesive applicator means the equipment used to apply adhesive to roofing shingles for producing laminated or dimensional roofing shingles.

Asphalt flux means the organic residual material from distillation of crude oil that is generally used in asphalt roofing manufacturing and paving and non-paving asphalt products.

Asphalt loading rack means the equipment at an asphalt processing facility used to transfer oxidized asphalt from a storage tank into a tank truck, rail car, or barge.

Asphalt processing facility means any facility engaged in the preparation of asphalt flux at stand-alone asphalt processing facilities, petroleum refineries, and asphalt roofing facilities. Asphalt preparation, called "blowing," is the oxidation of asphalt flux, achieved by bubbling air through the heated asphalt, to raise the softening point and to reduce penetration of the oxidized asphalt. An asphalt processing facility includes one or more asphalt flux blowing stills, asphalt flux storage tanks storing asphalt flux intended for processing in the blowing stills, oxidized asphalt storage tanks, and oxidized asphalt loading racks.

Asphalt roofing manufacturing facility means a facility consisting of one or more asphalt roofing manufacturing lines.

Asphalt roofing manufacturing line means the collection of equipment used to manufacture asphalt roofing products through a series of sequential process steps. The equipment that comprises an asphalt roofing manufacturing line varies depending on the type of substrate used (*i.e.*, organic or inorganic) and the final product manufactured (*e.g.*, roll roofing, laminated shingles). For example, an asphalt roofing manufacturing line that uses fiberglass mat as a substrate typically would not include a saturator/wet looper (or the saturator/wet looper could be bypassed if the line manufacturers multiple types of products). An asphalt roofing manufacturing line can include a saturator (including wet looper), coater, coating mixers, sealant applicators, adhesive applicators, and asphalt storage and process tanks. The number of asphalt roofing manufacturing lines at a particular facility is determined by the number of saturators (or coaters) operated in parallel. For example, an asphalt roofing manufacturing facility with two saturators (or coaters) operating in parallel would be considered to have two separate roofing manufacturing lines.

Asphalt storage tank means any tank used to store asphalt flux, oxidized asphalt, and modified asphalt, at asphalt roofing manufacturing facilities, petroleum refineries, and asphalt processing facilities. Storage tanks containing cutback asphalts (asphalts diluted with solvents to reduce viscosity for low temperature applications) and emulsified asphalts (asphalts dispersed in water with an emulsifying agent) are not subject to this subpart.

Blowing still means the equipment in which air is blown through asphalt flux to change the softening point and penetration rate of the asphalt flux, creating oxidized asphalt.

Boiler means any enclosed combustion device that extracts useful energy in the form of steam and is not an incinerator.

Coater means the equipment used to apply amended (filled or modified) asphalt to the top and bottom of the substrate (typically fiberglass mat) used to manufacture shingles and rolled roofing products.

Coating mixer means the equipment used to mix coating asphalt and a mineral stabilizer, prior to applying the stabilized coating asphalt to the substrate.

Combustion device means an individual unit of equipment such as a flare, incinerator, process heater, or boiler used for the combustion of organic hazardous air pollutant vapors.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limitation (including any operating limit), or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart, and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation (including any operating limit) or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Emission limitation means any emission limit, opacity limit, operating limit, or visible emission limit.

Group 1 asphalt loading rack means an asphalt loading rack loading asphalt with a maximum temperature of 260 °C (500 °F) or greater or with a maximum true vapor pressure of 10.4 kiloPascals (kPa) (1.5 pounds per square inch absolute (psia)) or greater.

Group 2 asphalt loading rack means an asphalt loading rack loading asphalt with a maximum temperature less than 260 °C (500 °F) or with a maximum true vapor pressure less than 10.4 kPa, 1.5 psia.

Group 1 asphalt storage tank means an asphalt storage tank that meets both of the following two criteria:

(1) Has a capacity of 177 cubic meters (47,000 gallons) of asphalt or greater; and

(2) Stores asphalt at a maximum temperature of 260 °C (500 °F) or greater, or has a maximum true vapor pressure of 10.4 kPa, (1.5, psia) or greater.

Group 2 asphalt storage tank means any asphalt storage tank with a capacity of 1.93 megagrams (Mg) of asphalt or greater that is not a Group 1 asphalt storage tank.

Incinerator means an enclosed combustion device that is used for destroying organic compounds. Auxiliary fuel may be used to heat waste gas to combustion temperatures. Any energy recovery section present is not physically formed into one manufactured or assembled unit with the combustion section; rather, the energy recovery section is a separate section following the combustion section and the two are joined by ducts or connections carrying flue gas.

Maximum true vapor pressure means the equilibrium partial pressure exerted by the stored asphalt at its maximum storage temperature.

Modified asphalt means asphalt that has been mixed with polymer modifiers.

Oxidized asphalt means asphalt that has been prepared by passing air through liquid asphalt flux in a blowing still.

Process heater means an enclosed combustion device that primarily transfers heat liberated by burning fuel directly to process streams or to heat transfer liquids other than water.

Research and development equipment means any equipment whose primary purpose is to conduct research and development to develop new processes and products, where such equipment is operated under the close supervision of technically trained personnel and is not engaged in the manufacture of products for commercial sale in commerce, except in a *de minimis* manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Saturator means the equipment in which substrate (predominantly organic felt) is filled with asphalt. Saturators are predominantly used for the manufacture of saturated felt products. The term saturator includes the saturator and wet looper.

Sealant applicator means the equipment used to apply a sealant strip to a roofing product. The sealant strip is used to seal overlapping pieces of roofing product after they have been applied.

Work practice standard means any design, equipment, work practice, or operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the Clean Air Act.

Tables to Subpart LLLLL of Part 63

TABLE 1 TO SUBPART LLLLL OF PART 63.—EMISSION LIMITATIONS

For—	You must meet the following emission limitation—
1. Each blowing still, Group 1 asphalt loading rack, and Group 1 asphalt storage tank at existing, new, and reconstructed asphalt processing facilities; and each Group 1 asphalt storage tank at existing, new, and reconstructed roofing manufacturing lines; and each coating mixer, saturator (including wet looper), coater, sealant applicator, adhesive applicator, and Group 1 asphalt storage tank at new and reconstructed asphalt roofing manufacturing lines.	a. Reduce total hydrocarbon mass emissions by 95 percent, or to a concentration of 20 ppmv, on a dry basis corrected to 3 percent oxygen; b. Route the emissions to a combustion device achieving a combustion efficiency of 99.5 percent; c. Route the emissions to a combustion device that does not use auxiliary fuel achieving a total hydrocarbon (THC) destruction efficiency of 95.8 percent; d. Route the emissions to a boiler or process heater with a design heat input capacity of 44 megawatts (MW) or greater; e. Introduce the emissions into the flame zone of a boiler or process heater; or f. Route emissions to a flare meeting the requirements of § 63.11(b).

TABLE 1 TO SUBPART LLLLL OF PART 63.—EMISSION LIMITATIONS—Continued

For—	You must meet the following emission limitation—
2. The total emissions from the coating mixer, saturator (including wet looper), coater, sealant applicator, and adhesive applicator at each existing asphalt roofing manufacturing line.[a]	a. Limit particulate matter emissions to 0.04 kilograms emissions per megagram (kg/Mg) (0.08 pounds per ton, lb/ton) of asphalt shingle or mineral-surfaced roll roofing produced; or b. Limit particulate matter emissions to 0.4 kg/Mg (0.8 lb/ton) of saturated felt or smooth-surfaced roll roofing produced.
3. Each saturator (including wet looper) and coater at existing, new, and reconstructed asphalt roofing manufacturing lines.[a]	a. Limit exhaust gases to 20 percent opacity; and b. Limit visible emissions from the emission capture system to 20 percent of any period of consecutive valid observations totaling 60 minutes.
4. Each Group 2 asphalt storage tank at existing, new, and reconstructed asphalt processing facility and asphalt roofing manufacturing lines.[a]	Limit exhaust gases to 0 percent opacity.[b]

[a] As an alternative to meeting the particulate matter and opacity limits, these emission sources may comply with the THC percent reduction or combustion efficiency standards.

[b] The opacity limit can be exceeded for on consecutive 15-minute period in any 24-hour period when the storage tank transfer lines are being cleared. During this 15-minute period, the control device must not be bypassed. If the emissions from the asphalt storage tank are ducted to the saturator control device, the combined emissions from the saturator and storage tank must meet the 20 percent opacity limit (specified in 4.a of table 1) during this 15-minute period. At any other time, the opacity limit applies to Group 2 asphalt storage tanks.

TABLE 2 TO SUBPART LLLLL OF PART 63.—OPERATING LIMITS

For—	You must[a]
1. Non-flare combustion devices with a design heat input capacity less than 44 MW or where the emissions are not introduced into the flame zone.	Maintain the 3-hour average[b] combustion zone temperature at or above the operating limit established during the performance test.
2. Flares	Meet the operating requirements specified in §63.11(b).
3. Control devices used to comply with the particulate matter standards.	a. Maintain the 3-hour average[b] inlet gas temperature at or below the operating limit established during the performance test; and b. Maintain the 3-hour average[b] pressure drop across the device[c] at or below the operating limit established during the performance test.
4. Control devices other than combustion devices or devices used to comply with the particulate matter emission standards.	Maintain the approved monitoring parameters within the operating limits established during the performance test.

[a] The operating limits specified in Table 2 are applicable if you are monitoring control device operating parameters to demonstrate continuous compliance. If you are using a CEMS or COMS, you must maintain emissions below the value established during the initial performance test.

[b] A 15-minute averaging period can be used as an alternative to the 3-hour averaging period for this parameter.

[c] As an alternative to monitoring the pressure drop across the control device, owners or operators using an ESP to achieve compliance with the emission limits specified in Table 1 of this subpart can monitor the voltage to the ESP. If this option is selected, the ESP voltage must be maintained at or above the operating limit established during the performance test.

TABLE 3 TO SUBPART LLLLL OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS[a] [b]

For—	You must—	Using—	According to the following requirements—
1. All particulate matter, total hydrocarbon, carbon monoxide, and carbon dioxide emission tests.	a. Select sampling port's location and the number of traverse points.	i. EPA test method 1 or 1A in appendix A to part 60 of this chapter.	A. For demonstrating compliance with the total hydrocarbon percent reduction standard, the sampling sites must be located at the inlet and outlet of the control device and prior to any releases to the atmosphere. B. For demonstrating compliance with the particulate matter mass emission rate, THC destruction efficiency, THC outlet concentration, or combustion efficiency standards, the sampling sites must be located at the outlet of the control device and prior to any releases to the atmosphere.
2. All particulate matter and total hydrocarbon tests.	Determine velocity and volumetric flow rate.	EPA test method 2, 2A, 2C, 2D, 2F, or 2G, as appropriate, in appendix A to part 60 of this chapter.	
3. All particulate matter and total hydrocarbon tests.	Determine the gas molecular weight used for flow rate determination.	EPA test method 3, 3A, 3B, as appropriate, in appendix A to part 60 of this chapter.	
4. All particulate matter, total hydrocarbon, carbon monoxide, and carbon dioxide emission tests.	Measure moisture content of the stack gas.	EPA test method 4 in appendix A to part 60 of this chapter.	

TABLE 3 TO SUBPART LLLLL OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS [a] [b]—Continued

For—	You must—	Using—	According to the following requirements—
5. All particulate matter emission tests.	Measure the asphalt processing rate or the asphalt roofing manufacturing rate and the asphalt content of the product manufactured, as appropriate.		
6. Each control device used to comply with the particulate matter emission standards.	Measure the concentration of particulate matter.	EPA test method 5A in appendix A to part 60 of this chapter.	For demonstrating compliance with the particulate matter standard, the performance tests must be conducted under normal operating conditions and while manufacturing the roofing product that is expected to result in the greatest amount of hazardous air pollutant emissions.
7. All opacity tests	Conduct opacity observations ..	EPA test method 9 in appendix A to part 60 of this chapter.	Conduct opacity observations for at least 3 hours and obtain 30, 6-minute averages.
8. All visible emission tests	Conduct visible emission observations.	EPA test method 22 in appendix A to part 60 of this chapter.	Modify EPA test method 22 such that readings are recorded every 15 seconds for a period of consecutive observations totaling 60 minutes.
9. Each combustion device used to comply with the combustion efficiency or THC standards.	a. Measure the concentration of carbon dioxide.	EPA test method 3A in appendix A to part 60 of this chapter.	
	b. Measure the concentration of carbon monoxide.	EPA test method 10 in appendix A to part 60 of this chapter.	
	c. Measure the concentration of total hydrocarbons.	EPA test method 25A in appendix A to part 60 of this chapter.	
10. Each control device used to comply with the THC reduction efficiency or outlet concentration standards.	Measure the concentration of total hydrocarbons.	EPA test method 25A in appendix A to part 60 of this chapter.	
11. Each combustion device	Establish a site-specific combustion zone temperature limit.	Data from the CPMS and the applicable performance test method(s).	You must collect combustion zone temperature data every 15 minutes during the entire period of the initial 3-hour performance test, and determine the average combustion zone temperature over the 3-hour performance test by computing the average of all of the 15-minute readings.
12. Each control device used to comply with the particulate matter emission standards.	Establish a site-specific inlet gas temperature limit; and establish a site-specific limit for the pressure drop across the device.	Data from the CPMS and the applicable performance test method(s).	You must collect the inlet gas temperature and pressure drop [b] data every 15 minutes during the entire period of the initial 3-hour performance test, and determine the average inlet gas temperature and pressure drop [c] over the 3-hour performance test by computing the average of all of the 15-minute readings.
13. Each control device other than a combustion device or device used to comply with the particulate matter emission standards.	Establish site-specific monitoring parameters.	Process data and data from the CPMS and the applicable performance test method(s).	You must collect monitoring parameter data every 15 minutes during the entire period of the initial 3-hour performance test, and determine the average monitoring parameter values over the 3-hour performance test by computing the average of all of the 15-minute readings.
14. Each flare used to comply with the THC percent reduction or PM emission limits.	Assure that the flare is operated and maintained in conformance with its design.	The requirements of § 63.11(b).	

[a] As specified in § 63.8687(e), you may request that data from a previously-conducted emission test serve as documentation of conformance with the emission standards and operating limits of this subpart.

[b] Performance tests are not required if: (1) The emissions are routed to a boiler or process heater with a design heat input capacity of 44 MW or greater; or (2) the emissions are introduced into the flame zone of a boiler or process heater.

[c] As an alternative to monitoring the pressure drop across the control device, owners or operators using an ESP to achieve compliance with the emission limits specified in Table 1 of this subpart can monitor the voltage to the ESP.

TABLE 4 TO SUBPART LLLLL TO PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS

For—	For the following emission limitation—	You have demonstrated initial compliance if—
1. Each blowing still, Group 1 asphalt loading rack, and Group 1 asphalt storage tank, at existing, new, and reconstructed asphalt processing facilities.	a. Reduce total hydrocarbon mass emissions by 95 percent or to a concentration of 20 ppmv, on a dry basis corrected to 3 percent oxygen.	i. The total hydrocarbon emissions, determined using the equations in §63.8687 and the test methods and procedures in Table 3 to this subpart, over the period of the performance test are reduced by at least 95 percent by weight or to a concentration of 20 ppmv, on a dry basis corrected to 3 percent oxygen; and ii. You have a record of the average control device operating parameters[a] over the performance test during which emissions were reduced according to 1.a.i. of this table.
	b. Route the emissions to a combustion device achieving a combustion efficiency of 99.5 percent.	i. The combustion efficiency of the combustion device, determined using the equations in §63.8687 and the test methods and procedures in Table 3 to this subpart, over the period of the performance test is at least 99.5 percent; and ii. You have a record of the average combustion zone temperature[a] and carbon monoxide, carbon dioxide, and total hydrocarbon outlet concentrations over the performance test during which the combustion efficiency was at least 99.5 percent.
	c. Route the emissions to a combustion device that does not use auxiliary fuel achieving a THC destruction efficiency of 95.8 percent.	i. The THC destruction efficiency of the combustion device, determined using the equations in §63.8687 and the test methods and procedures in Table 3 to this subpart, over the period of the performance test is at least 95.8 percent; and ii. You have a record of the average combustion zone temperature[a] and carbon monoxide, carbon dioxide, and total hydrocarbon outlet concentrations over the performance test during which the THC destruction efficiency was at least 95.8 percent.
	d. Route emissions to a boiler or process heater with a design heat input capacity of 44 MW or greater.	You have a record of the boiler or process heater design heat capacity.
	e. Introduce the emissions into the flame zone of a boiler or process heater.	You have a record that shows the emissions are being introduced into the boiler or process heater flame zone.
	f. Route emissions to a flare meeting the requirements of §63.11(b).	You have a record of the flare design and operating requirements.
2. Each coating mixer, saturator (including wet looper), coater, sealant applicator, adhesive applicator, and Group 1 asphalt storage tank at new and reconstructed asphalt roofing manufacturing lines.	a. Reduce total hydrocarbon mass emissions by 95 percent or to a concentration of 20 ppmv, on a dry basis corrected to 3 percent oxygen.	See 1.a.i. and ii. of this table.
	b. Route the emissions to a combustion device achieving a combustion efficiency of 99.5 percent.	See 1.b.i. and ii. of this table.
	c. Route the emissions to a combustion device that does not use auxiliary fuel achieving a THC destruction efficiency of 95.8 percent.	See 1.c.i. and ii. of this table.
	d. Route emissions to a boiler or process heater with a design heat input capacity of 44 MW or greater.	See 1.d. of this table.
	e. Introduce the emissions into the flame zone of a boiler or process heater.	See 1.e. of this table.
	f. Route emissions to a flare meeting the requirements of §63.11(b).	See 1.f. of this table.
3. The total emissions from the coating mixer, saturator (including wet looper), coater, sealant applicator, and adhesive applicator at each existing asphalt roofing manufacturing line.	a. Limit PM emissions to 0.04 kg/Mg (0.08 lb/ton) of asphalt shingle or mineral-surfaced roll roofing produced.	i. The PM emissions, determined using the equations in §63.8687 and the test methods and procedures in Table 3 to this subpart, over the period of the performance test are no greater than the applicable emission limitation; and ii. You have a record of the average control device[a] or process parameters over the performance test during which the particulate matter emissions were no greater than the applicable emission limitation.

TABLE 4 TO SUBPART LLLLL TO PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS—Continued

For—	For the following emission limitation—	You have demonstrated initial compliance if—
	b. Limit PM emissions to 0.4 kg/Mg (0.8 lb/ton) of saturated felt or smooth-surfaced roll roofing produced.	See 3.a.i. and ii. of this table.
4. Each saturator (including wet looper) and coater at an existing, new, or reconstructed asphalt roofing manufacturing line.	a. Limit visible emissions from the emissions capture system to 20 percent of any period of consecutive valid observations totaling 60 minutes.	The visible emissions, measured using EPA test method 22, for any period of consecutive valid observations totaling 60 minutes during the initial compliance period described in §63.8686(b) do not exceed 20 percent.
	b. Limit opacity emissions to 20 percent.	The opacity, measured using EPA test method 9, for each of the first 30 6-minute averages during the initial compliance period described in §63.8686(b) does not exceed 20 percent.
5. Each Group 2 asphalt storage tank at existing, new, and reconstructed asphalt processing facilities and asphalt roofing manufacturing lines.	Limit exhaust gases to 0 percent opacity.	The opacity, measured using EPA test method 9, for each of the first 30 6-minute averages during the initial compliance period described in §63.8686(b) does not exceed 0 percent.

[a] If you use a CEMS or COMS to demonstrate compliance with the emission limits, you are not required to record control device operating parameters.

TABLE 5 TO SUBPART LLLLL OF PART 63.—CONTINUOUS COMPLIANCE WITH OPERATING LIMITS [a]

For—	For the following operating limit—	You must demonstrate continuous compliance by—
1. Each non-flare combustion device.[b]	a. Maintain the 3-hour[c] average combustion zone temperature at or above the operating limit establishing during the performance test.	i. Passing the emissions through the control device; and ii. Collecting the combustion zone temperature data according to §63.8688(b); and iii. Reducing combustion zone temperature data to 3-hour[c] averages according to calculations in Table 3 to this subpart; and iv. Maintaining the 3-hour[c] average combustion zone temperature within the level established during the performance test.
2. Each flare	Meet the operating requirements specified in §63.11(b).	The flare pilot light must be present at all times and the flare must be operating at all times that emissions may be vented to it.
3. Control devices used to comply with the particulate matter emission standards.	a. Maintain the 3-hour[c] average inlet gas temperature and pressure drop across device[d] at or below the operating limits established during the performance test.	i. Passing the emissions through the control device; and ii. Collecting the inlet gas temperature and pressure drop[d] data according to §63.8688 (b) and (c); and iii. Reducing inlet gas temperature and pressure drop[d] data to 3-hour[c] averages according to calculations in Table 3 to this subpart; and iv. Maintaining the 3-hour[c] average inlet gas temperature and pressure drop[d] within the level established during the performance test.
4. Control devices other than combustion devices or devices used to comply with the particulate matter emission.	a. Maintain the monitoring parameters within the operating limits established during the performance test.	i. Passing the emissions through the devices; ii. Collecting the monitoring parameter data according to §63.8688(d); and iii. Reducing the monitoring parameter data to 3-hour[c] averages according to calculations in Table 3 to this subpart; and iv. Maintaining the monitoring parameters within the level established during the performance test.

[a] The operating limits specified in Table 2 and the requirements specified in Table 5 are applicable if you are monitoring control device operating parameters to demonstrate continuous compliance. If you use a CEMS or COMS to demonstrate compliance with the emission limits, you are not required to record control device operating parameters. However, you must maintain emissions below the value established during the initial performance test. Data from the CEMS and COMS must be reduced as specified in §63.9(g).

[b] Continuous parameter monitoring is not required if (1) the emissions are routed to a boiler or process heater with a with a design heat input capacity of 44 MW or greater; or (2) the emissions are introduced into the flame zone of a boiler or process heater.

[c] A 15-minute averaging period can be used as an alternative to the 3-hour averaging period for this parameter.

[d] As an alternative to monitoring the pressure drop across the control device, owners or operators using an ESP to achieve compliance with the emission limits specified in Table 1 of this subpart can monitor the voltage to the ESP. If this option is selected, the ESP voltage must be maintained at or above the operating limit established during the performance test.

TABLE 6 TO SUBPART LLLLL OF PART 63—REQUIREMENTS FOR REPORTS

You must submit—	The report must contain—	You must submit the report—
1. An initial notification	The information in §63.9(b)	According to the requirements in §63.9(b).
2. A notification of performance test	A written notification of the intent to conduct a performance test.	At least 60 calendar days before the performance test is scheduled to begin, as required in §63.9(e).
3. A notification of opacity and visible emission observations.	A written notification of the intent to conduct opacity and visible emission observations.	According to the requirements in §63.9(f).

TABLE 6 TO SUBPART LLLLL OF PART 63—REQUIREMENTS FOR REPORTS—Continued

You must submit—	The report must contain—	You must submit the report—
4. Notification of compliance status	The information in § 63.9(h)(2) through (5), as applicable	According to the requirements in § 63.9(h)(2) through (5), as applicable.
5. A compliance report	a. A statement that there were no deviations from the emission limitations during the reporting period, if there are no deviations from any emmission limitations (emission limit, operating limit, opacity limit, and visible emission limit) that apply to you.	Semiannually according to the requirements in § 63.8693(b).
	b. If there were no periods during which the CPMS, CEMS, or COMS was out-of-control as specified in § 63.8(c)(7), a statement that there were no periods during which the CPMS, CEMS, or COMS was out-of-control during the reporting period.	Semiannually according to the requirements in § 63.8693(b).
	c. If you have a deviation from any emission limitation (emission limit, operating limit, opacity limit, and visible emission limit), the report must contain the information in § 63.8693(c). If there were periods during which the CPMS, CEMS, or COMS was out-of-control, as specified in § 63.8(c)(7), the report must contain the information in § 63.8693(d).	Semiannually according to the requirements in § 63.8693(b).
	d. If you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your startup, shutdown, and malfunction plan, the compliance report must include the information in § 63.10(d)(5)(i).	Semiannually according to the requirements in § 63.8693(b).
6. An immediate startup, shutdown, and malfunction report if you have a startup, shutdown, or malfunction during the reporting period and actions taken were not consistent with your startup, shutdown, and malfunction plan.	The information in § 63.10(d)(5)(ii)	By fax or telephone within 2 working days after starting actions inconsistent with the plan followed by a letter within 7 working days after the end of the event unless you have made alternative arrangements with the permitting authority.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.1	Applicability	Initial Applicability Determination; Applicability After Standard Established; Permit Requirements; Extensions, Notifications.	Yes.
§ 63.2	Definitions	Definitions for part 63 standards	Yes.
§ 63.3	Units and Abbreviations	Units and abbreviations for part 63 standards	Yes.
§ 63.4	Prohibited Activities	Prohibited Activities; Compliance date; Circumvention, Severability.	Yes.
§ 63.5	Construction/Reconstruction	Applicability; applications; approvals	Yes.
§ 63.6(a)	Applicability	GP apply unless compliance extension GP apply to area sources that become major.	Yes.
§ 63.6(b)(1)–(4)	Compliance Dates for New and Reconstructed sources.	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for section 112(f).	Yes.
§ 63.6(b)(5)	Notification	Must notify if commenced construction or reconstruction after proposal.	Yes.
§ 63.6(b)(6)	[Reserved].		
§ 63.6(b)(7)	Compliance Dates for New and Reconstructed Area Sources That Become Major.	Area sources that become major must comply with major source standards immediately upon becoming major, regardless of whether required to comply when they were an area source.	Yes.
§ 63.6(c)(1)–(2)	Compliance Dates for Existing Sources	1. Comply according to date in subpart, which must be no later than 3 years after effective date. 2. For section 112(f) standards, comply within 90 days of effective date unless compliance extension has been granted.	Yes.
§ 63.6(c)(3)–(4)	[Reserved].		
§ 63.6(c)(5)	Compliance Dates for Existing Area Sources That Become Major.	Area sources that become major must comply with major source standards by date indicated in subpart or by equivalent time period (for example, 3 years).	Yes.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL—Continued

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.6(d)	[Reserved].		
§ 63.6(e)(1)	Operation & Maintenance	1. Operate to minimize emissions at all times ... 2. Correct malfunctions as soon as practicable 3. Operation and maintenance requirements independently enforceable; information Administrator will use to determine if operation and maintenance requirements were met.	Yes.
§ 63.6(e)(2)	[Reserved].		
§ 63.6(e)(3)	Startup, Shutdown, and Malfunction (SSM) Plan (SSMP).	1. Requirement for SSM and startup, shutdown, malfunction plan. 2. Content of SSMP	Yes.
§ 63.6(f)(1)	Compliance Except During SSM	You must comply with emission standards at all times except during SSM.	Yes.
§ 63.6(f)(2)–(3)	Methods for Determining Compliance	Compliance based on performance test, operation and maintenance plans, records, inspection.	Yes.
§ 63.6(g)(1)–(3)	Alternative Nonopacity Standard	Procedures for getting an alternative nonopacity standard.	Yes.
§ 63.6(h)	Opacity/Visible Emission (VE) Standards	Requirements for opacity and VE limits	Yes.
§ 63.6(h)(1)	Compliance with Opacity/VE Standards	You must comply with opacity/VE emission limitations at all times except during SSM.	Yes.
§ 63.6(h)(2)(i)	Determining Compliance with Opacity/VE Standards.	If standard does not state test method, use EPA test method 9, 40 CFR 60, appendix A for opacity and EPA test method 22, 40 CFR 60, appendix A for VE.	No. The test methods for opacity and visible emissions are specified in § 63.8687.
§ 63.6(h)(2)(ii)	[Reserved].		
§ 63.6(h)(2)(iii)	Using Previous Tests to Demonstrate Compliance with Opacity/VE Standards.	Criteria for when previous opacity/VE testing can be used to show compliance with this rule.	Yes.
§ 63.6(h)(3)	[Reserved].		
§ 63.6(h)(4)	Notification of Opacity/VE Observation Date	Must notify Administrator of anticipated date of observation.	Yes.
§ 63.6(h)(5)(i), (iii)–(v).	Conducting Opacity/VE Observations	Dates and Schedule for conducting opacity/VE observations.	Yes.
§ 63.6(h)(5)(ii)	Opacity Test Duration and Averaging Times	Must have at least 3 hours of observation with thirty 6-minute averages.	Yes.
§ 63.6(h)(6)	Records of Conditions During Opacity/VE Observations.	Must keep records available and allow Administrator to inspect.	Yes.
§ 63.6(h)(7)(i)	Report COMS Monitoring Data from Performance Test.	Must submit COMS data with other performance test data.	Yes, if COMS used.
§ 63.6(h)(7)(ii)	Using COMS instead of EPA test method 9, 40 CFR 60, appendix A.	Can submit COMS data instead of EPA test method 9, 40 CFR 60, appendix A results even if rule requires EPA test method 9, 40 CFR 60, appendix A, but must notify Administrator before performance test.	Yes, if COMS used.
§ 63.6(h)(7)(iii)	Averaging time for COMS during performance test.	To determine compliance, must reduce COMS data to 6-minute averages.	Yes, if COMS used.
§ 63.6(h)(7)(iv)	COMS requirements	Owner/operator must demonstrate that COMS performance evaluations are conducted according to § 63.8(e), COMS are properly maintained and operated according to § 63.8(c) and data quality as § 63.8(d).	Yes, if COMS used.
§ 63.6(h)(7)(v)	Determining Compliance with Opacity/VE Standards.	COMS is probative but not conclusive evidence of compliance with opacity standard, even if EPA test method 9, 40 CFR 60, appendix A observation shows otherwise. Requirements for COMS to be probative evidence, proper maintenance, meeting PS 1, and data have not been altered.	Yes, if COMS used.
§ 63.6(h)(8)	Determining Compliance with Opacity/VE Standards.	Administrator will use all COMS, EPA test method 9, 40 CFR 60, appendix A, and EPA test method 22, 40 CFR 60, appendix A results, as well as information about operation and maintenance to determine compliance.	Yes.
§ 63.6(h)(9)	Adjusted Opacity Standard	Procedures for Administrator to adjust an opacity standard.	Yes.
§ 63.6(i)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension.	Yes.
§ 63.6(j)	Presidential Compliance Exemption	President may exempt source category from requirement to comply with rule.	Yes.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL—Continued

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.7(a)(1)–(2) ...	Performance Test Dates	Dates for conducting initial performance testing and other compliance demonstrations. Must conduct 180 days after first subject to rule.	Yes.
§ 63.7(a)(3)	Section 114 Authority	Administrator may require a performance test under CAA section 114 at any time.	Yes.
§ 63.7(b)(1)	Notification of Performance Test	Must notify Administrator 60 days before the test.	Yes.
§ 63.7(b)(2)	Notification of Rescheduling	If rescheduling a performance test is necessary, must notify Administrator 5 days before scheduled date of rescheduled date.	Yes.
§ 63.7(c)	Quality Assurance/Test Plan	1. Requirement to submit site-specific test plan 60 days before the test or on date Administrator agrees with: 2. Test plan approval procedures ..... 3. Performance audit requirements ..... 4. Internal and external QA procedures for testing.	Yes.
§ 63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
§ 63.7(e)(1)	Conditions for Conducting Performance Tests ..	1. Performance tests must be conducted under representative conditions. Cannot conduct performance tests during SSM. 2. Not a violation to exceed standard during SSM.	Yes.
§ 63.7(e)(2)	Conditions for Conducting Performance Tests ..	Must conduct according to rule and EPA test methods unless Administrator approves alternative.	Yes.
§ 63.7(e)(3)	Test Run Duration	1. Must have three test runs of at least 1 hour each. 2. Compliance is based on arithmetic mean of three runs. 3. Conditions when data from an additional test run can be used.	Yes.
§ 63.7(f)	Alternative Test Method	Procedures by which Administrator can grant approval to use an alternative test method.	Yes.
§ 63.7(g)	Performance Test Data Analysis	1. Must include raw data in performance test report. 2. Must submit performance test data 60 days after end of test with the Notification of Compliance Status. 3. Keep data for 5 years	Yes.
§ 63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test.	Yes.
§ 63.8(a)(1)	Applicability of Monitoring Requirements	Subject to all monitoring requirements in standard.	Yes.
§ 63.8(a)(2)	Performance Specifications	Performance Specifications in appendix B of part 60 apply.	Yes, if CEMS used.
§ 63.8(a)(3)	[Reserved]		
§ 63.8(a)(4)	Monitoring with Flares	Unless your rule says otherwise, the requirements for flares in § 63.11 apply.	Yes.
§ 63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative.	Yes.
§ 63.8(b) (2)–(3) ..	Multiple Effluents and Multiple Monitoring Systems.	1. Specific requirements for installing monitoring systems. 2. Must install on each effluent before it is combined and before it is released to the atmosphere unless Administrator approves otherwise. 3. If more than one monitoring system on an emission point, must report all monitoring system results, unless one monitoring system is a backup.	Yes.
§ 63.8(c)(1)	Monitoring System Operation and Maintenance	Maintain monitoring system in a manner consistent with good air pollution control practices.	Yes.
§ 63.8(c)(1)(i)	Routine and Predictable CMS malfunction	1. Follow the SSM plan for routine repairs ..... 2. Keep parts for routine repairs readily available. 3. Reporting requirements for CMS malfunction when action is described in SSM plan.	Yes.
§ 63.8(c)(1)(ii)	CMS malfunction not in SSP plan	Reporting requirements for CMS malfunction when action is not described in SSM plan.	Yes.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL—Continued

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.8(c)(1)(iii)	Compliance with Operation and Maintenance Requirements.	1. How Administrator determines if source complying with operation and maintenance requirements. 2. Review of source O&M procedures, records, manufacturer's instructions, recommendations, and inspection of monitoring system.	Yes.
§ 63.8(c)(2)–(3)	Monitoring System Installation	1. Must install to get representative emission and parameter measurements. 2. Must verify operational status before or at performance test.	Yes.
§ 63.8(c)(4)	CMS Requirements	CMS must be operating except during breakdown, out-of-control, repair, maintenance, and high-level calibration drifts.	No; § 63.8690 specifies the CMS requirements.
§ 63.8(c)(4)(i)–(ii)	CMS Requirements	1. COMS must have a minimum of one cycle of sampling and analysis for each successive 10-second period and one cycle of data recording for each successive 6-minute period. 2. CEMS must have a minimum of one cycle of operation for each successive 15-minute period.	Yes, if COMS used.
§ 63.8(c)(5)	COMS Minimum Procedures	COMS minimum procedures	Yes.
§ 63.8(c)(6)	CMS Requirements	Zero and High level calibration check requirements.	No; § 63.8688 specifies the CMS requirements.
§ 63.8(c)(7)–(8)	CMS Requirements	Out-of-control periods, including reporting	Yes.
§ 63.8(d)	CMS Quality Control	1. Requirements for CMS quality control, including calibration, etc. 2. Must keep quality control plan on record for the life of the affected source. 3. Keep old versions for 5 years after revisions	No; § 63.8688 specifies the CMS requirements.
§ 63.8(e)	CMS Performance Evaluation	Notification, performance evaluation test plan, reports.	No; § 63.8688 specifies the CMS requirements.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method	Procedures for Administrator to approve alternative monitoring.	Yes.
§ 63.8(f)(6)	Alternative to Relative Accuracy Test	Procedures for Administrator to approve alternative relative accuracy tests for CEMS.	Yes, if CEMS used.
§ 63.8(g)(1)–(4)	Data Reduction	1. COMS 6-minute averages calculated over at least 36 evenly spaced data points. 2. CEMS 1-hour averages computed over at least 4 equally spaced data points.	Yes, if CEMS or COMS used.
§ 63.8(g)(5)	Data Reduction	Data that cannot be used in computing averages for CMS.	No; § 63.8690 specifies the CMS requirements.
§ 63.9(a)	Notification Requirements	Applicability and State Delegation	Yes.
§ 63.9(b)(1)–(5)	Initial Notifications	1. Submit notification 120 days after effective date. 2. Notification of intent to construct/reconstruct; notification of commencement of construct/reconstruct; notification of startup. 3. Contents of each	Yes.
§ 63.9(c)	Request for Compliance Extension	Can request if cannot comply by date or if installed Best Achievable Control Technology (BACT)/Lowest Achievable Emission Rate (LAER).	Yes.
§ 63.9(d)	Notification of Special Compliance Requirements for New Source.	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date.	Yes.
§ 63.9(e)	Notification of Performance Test	Notify Administrator 60 days prior	Yes.
§ 63.9(f)	Notification of VE/Opacity Test	Notify Administrator 30 days prior	Yes.
§ 63.9(g)	Additional Notifications When Using CMS	1. Notification of performance evaluation 2. Notification using COMS data 3. Notification that the criterion for use of alternative to relative accuracy testing was exceeded.	No; § 63.8692 specifies the CMS notification requirements.
§ 63.9(h)(1)–(6)	Notification of Compliance Status	1. Contents. 2. Due 60 days after end of performance test or other compliance demonstration, except for opacity/VE, which are due 30 days after. 3. When to submit to Federal vs. State authority	Yes.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL—Continued

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.9(i)	Adjustment of Submittal Deadlines	Procedures for Administrator to approve change in dates when notifications must be submitted.	Yes.
§ 63.9(j)	Change in Previous Information	Must submit within 15 days after the change	Yes.
§ 63.10(a)	Recordkeeping/Reporting	1. Applies to all, unless compliance extension 2. When to submit to Federal vs. State authority 3. Procedures for owners of more than 1 source.	Yes.
§ 63.10(b)(1)	Recordkeeping/Reporting	1. General Requirements 2. Keep all records readily available. 3. Keep for 5 years	Yes.
§ 63.10(b)(2)(i)–(v).	Records related to Startup, Shutdown, and Malfunction.	1. Occurrence of each of operation (process equipment). 2. Occurrence of each malfunction of air pollution equipment. 3. Maintenance on air pollution control equipment. 4. Actions during startup, shutdown, and malfunction.	Yes.
§ 63.10(b)(2)(vi) and (x–xi).	CMS Records	1. Malfunctions, inoperative, out-of-control 2. Calibration checks 3. Adjustments, maintenance	Yes.
§ 63.10(b)(2)(vii)–(ix).	Records	1. Measurements to demonstrate compliance with emission limitations. 2. Performance test, performance evaluation, and visible emission observation results. 3. Measurements to determine conditions of performance tests and performance evaluations.	Yes.
§ 63.10(b)(2)(xii)	Records	Records when under waiver	Yes
§ 63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test.	Yes.
§ 63.10(b)(2)(xiv)	Records	All documentation supporting Initial Notification and Notification of Compliance Status.	Yes.
§ 63.10(b)(3)	Records	Applicability determinations	Yes.
§ 63.10(c)(1)–(6), (9)–(15).	Records	Additional records for CMS	No; § 63.8694 specifies the CMS recordkeeping requirements.
§ 63.10(c)(7)–(8)	Records	Records of excess emissions and parameter monitoring exceeedances for CMS.	No; § 63.8694 specifies the CMS recordkeeping requirements.
§ 63.10(d)(1)	General Reporting Requirements	Requirement to report	Yes.
§ 63.10(d)(2)	Report of Performance Test Results	When to submit to Federal or State authority	Yes.
§ 63.10(d)(3)	Reporting Opacity or VE Observations	What to report and when	Yes.
§ 63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension.	Yes.
§ 63.10(d)(5)	Startup, Shutdown, and Malfunction Reports	Contents and submission	Yes.
§ 63.10(e)(1), (2)	Additional CMS Reports	1. Must report results for each CEM on a unit 2. Written copy of performance evaluation 3. Three copies of COMS performance evaluation.	Yes.
§ 63.10(e)(3)	Reports	Excess emission reports	No; § 63.8693 specifies the reporting requirements.
§ 63.10(e)(3)(i)–(iii).	Reports	Schedule for reporting excess emissions and parameter monitor exceedances (now defined as deviations).	No; § 63.8693 specifies the reporting requirements.
§ 63.10(e)(3)(iv)–(v).	Excess Emissions Reports	1. Requirement to revert to the frequency specified in the relevant standard if there is an excess emissions and parameter monitor exceedances (now defined as deviations). 2. Provision to request semiannual reporting after compliance for one year. 3. Submit report by 30th day following end of quarter or calendar half. 4. If there has not been an exceedance or excess emission (now defined as deviations), report content is a statement that there have been no deviations.	No; § 63.8693 specifies the reporting requirements.

TABLE 7 TO SUBPART LLLLL OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART LLLLL—Continued

Citation	Subject	Brief description	Applies to subpart LLLLL
§ 63.10(e)(3)(iv)–(v).	Excess Emissions Reports	Must submit report containing all of the information in § 63.10(c)(5)(13), § 63.8(c)(7)–(8).	No; § 63.8693 specifies the reporting requirements.
§ 63.10(e)(3)(vi)–(viii).	Excess Emissions Report and Summary Report	1. Requirements for reporting excess emissions for CMS (now called deviations). 2. Requires all of the information in § 63.10(c)(5)(13), § 63.8(c)(7)–(8).	No; § 63.8693 specifies the reporting requirements.
§ 63.10(e)(4)	Reporting COMS data	Must submit COMS data with performance test data.	Yes, if COMS used.
§ 63.10(f)	Waiver for Recordkeeping/Reporting	Procedures for Administrator to waive	Yes.
§ 63.11	Flares	Requirements for flares	Yes.
§ 63.12	Delegation	State authority to enforce standards	Yes.
§ 63.13	Addresses	Addresses where reports, notifications, and requests are sent.	Yes.
§ 63.14	Incorporation by Reference	Test methods incorporated by reference	Yes.
§ 63.15	Availability of Information	Public and confidential information	Yes.

National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills

AGENCY: Environmental Protection Agency (EPA).

ACTION: Correcting administrative amendments; change in effective date.

SUMMARY: On February 18, 2003, EPA published a direct final rule on the national emission standards for hazardous air pollutants (NESHAP) for chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills (68 FR 7706). The effective date of that direct final rule is May 19, 2003, and remain unchanged, except the amendment adding Incorporation by Reference (IBR) material which must, for administrative purposes, become effective prior to May 19, 2003. This correction moves up the effective date for that amendment, which affects the centralized IBR section for 40 CFR part 63. In addition, the IBR amendment included in the February 18 direct final rule added a new IBR addressing test method ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]; thus the effective date of this IBR material must also match the effective date of the centralized IBR section. This correction moves up the effective date in 40 CFR 63.865(b)(3) and 40 CFR 63.865(b)(5)(iii).

DATES: Effective Dates: The revision of 40 CFR 63.14(i) and the removal of 40 CFR 63.14(j), published on February 18, 2003 (68 FR 7713) are effective May 8, 2003. The IBR amendments to 40 CFR 63.865(b), published on February 18, 2003 (68 FR 7716) are effective May 8, 2003. The IBR of certain publications in the NESHAP is approved by the Director of the Office of the Federal Register on May 8, 2003.

FOR FURTHER INFORMATION CONTACT: For information regarding the administration of the IBR, contact Ms. Janet Eck, Coatings and Consumer Products Group, Emission Standards Division (C539–03), U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–7946, facsimile number (919) 541–5689, electronic mail (e-mail) address: *eck.janet@epa.gov*. All other inquiries regarding the NESHAP for chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills should be addressed to Mr. Jeff Telander, Minerals and Inorganic Chemicals Group, Emission Standards Division (C504–05), U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5427, facsimile number (919) 541–5600, e-mail address: *telander.jeff@epa.gov*.

SUPPLEMENTARY INFORMATION: An electronic copy of today's notice will be available on the Worldwide Web through the Technology Transfer Network (TTN). Following the Assistant Administrator's signature, a copy of this notice will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg*. In addition, an electronic version of all of the above mentioned promulgated NESHAP is currently available on the TTN at *http://www.epa.gov/ttn/oarpg/new.html*. The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Dated: April 29, 2003.

Robert Brenner,

Acting Assistant Administrator for Air and Radiation.

RIN 2137–AD58

Hazardous Materials: Requirements for Maintenance, Requalification, Repair and Use of DOT Specification Cylinders; Response to Appeals and Extension of Compliance Dates

AGENCY: Research and Special Programs Administration (RSPA), DOT.

ACTION: Final rule; response to appeals.

SUMMARY: On August 8, 2002, RSPA published a final rule under Docket No. RSPA–01–10373 (HM–220D) amending the requirements of the Hazardous Materials Regulations applicable to the maintenance, requalification, repair, and use of DOT specification cylinders. The revisions simplified the regulations, responded to petitions for rulemaking, addressed recommendations of the National Transportation Safety Board, and enhanced the safe transportation of hazardous materials in cylinders. In response to appeals submitted by persons affected by the August 8, 2002 final rule, this final rule amends certain requirements, extends certain compliance dates, and makes minor editorial corrections.

DATES: *Effective Date:* This rule is effective June 9, 2003.

Compliance Date: Delayed compliance dates for certain regulatory provisions are set forth in the regulatory text.

FOR FURTHER INFORMATION CONTACT: Sandra Webb, (202) 366–8553, Office of Hazardous Materials Standards or Mark Toughiry, 202–366–4545, Office of Hazardous Materials Technology, Research and Special Programs Administration, U.S. Department of Transportation, 400 Seventh Street, SW., Washington, DC 20590–0001.

SUPPLEMENTARY INFORMATION:

I. Background

On August 8, 2002, the Research and Special Programs Administration (RSPA, we) published a final rule under Docket No. 01–10373 (HM–220D) (67 FR 51625) amending the requirements of the Hazardous Materials Regulations (HMR; 49 CFR parts 171–180) applicable to the maintenance, requalification, repair, and use of DOT specification cylinders.

RIN 2060–A167 and 2060–A168

National Emission Standards for Hazardous Air Pollutants for Brick and Structural Clay Products Manufacturing; and National Emission Standards for Hazardous Air Pollutants for Clay Ceramics Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for new and existing sources at brick and structural clay products (BSCP) manufacturing facilities and NESHAP for new and existing sources at clay ceramics manufacturing facilities. This action will implement section 112(d) of the Clean Air Act (CAA) by requiring major sources to meet hazardous air pollutant (HAP) emission standards reflecting the application of the maximum achievable control technology (MACT). The two subparts will protect air quality and promote the public health by reducing emissions of several of the HAP listed in section 112(b)(1) of the CAA. The rules will reduce HAP emissions from existing sources by 2,300 tons per year nationwide, with hydrogen fluoride (HF) and hydrogen chloride (HCl) accounting for 2,290 tons per year (99.6 percent) of the total HAP emissions reductions from existing sources. The associated metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, mercury, manganese, nickel, lead, and selenium) reductions from existing sources account for approximately 6 tons per year nationwide (0.4 percent). Exposure to these substances has been demonstrated to cause adverse health effects such as irritation of the lung, skin, and mucus membranes, effects on the central nervous system, and kidney damage. The EPA has classified three of the HAP as known human carcinogens, four as probable human carcinogens, and one as a possible human carcinogen. We estimate that the two subparts will reduce nationwide emissions of HAP from these facilities by approximately 2,100 megagrams per year (Mg/yr)(2,300 tons per year (tpy)), a reduction of approximately 35 percent from the current level of emissions.

EFFECTIVE DATE: The final rule is effective May 16, 2003.

ADDRESSES: Docket No. OAR–2002–0054 contains supporting documentation used in developing the final BSCP rule. Docket No. OAR–2002–0055 contains supporting documentation used in developing the final clay ceramics rule. The dockets are located at the Air and Radiation Docket and Information Center in the EPA Docket Center, (EPA/DC) EPA West, Room B102, 1301 Constitution Avenue, NW., Washington, DC 20460, telephone (202) 566–1744. The dockets are available for public inspection from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding Federal holidays.

FOR FURTHER INFORMATION CONTACT: For further information concerning applicability and rule determinations, contact the appropriate State or local agency representative. If no State or local representative is available, contact the EPA Regional Office staff listed in 40 CFR 63.13. For information concerning the analyses performed in developing the final rules, contact Ms. Mary Johnson, Combustion Group, Emission Standards Division (MC–C439–01), U.S. EPA, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5025, e-mail address: *johnson.mary@epa.gov*.

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Entities potentially regulated by this action are those industrial facilities that manufacture BSCP and clay ceramics. Brick and structural clay products manufacturing is classified under Standard Industrial Classification (SIC) codes 3251, Brick and Structural Clay Tile; 3253, Ceramic Wall and Floor Tile; and 3259, Other Structural Clay Products. The North American Industry Classification System (NAICS) codes for BSCP manufacturing are 327121, Brick and Structural Clay Tile; 327122, Ceramic Wall and Floor Tile Manufacturing; and 327123, Other Structural Clay Products. Clay ceramics manufacturing is classified under SIC codes 3253, Ceramic Wall and Floor Tile; and 3261, Vitreous Plumbing Fixtures (Sanitaryware). The NAICS codes for clay ceramics manufacturing are 327122, Ceramic Wall and Floor Tile Manufacturing; and 327111, Vitreous China Plumbing Fixture and China and Earthenware Bathroom Accessories Manufacturing. Regulated categories and entities are shown in Table 1 of this preamble.

TABLE 1.—REGULATED CATEGORIES AND ENTITIES

Category	SIC	NAICS	Examples of potentially regulated entities
Industrial	3251	327121	Brick and structural clay tile manufacturing facilities (BSCP NESHAP)
Industrial	3253	327122	Ceramic wall and floor tile manufacturing facilities (Clay Ceramics NESHAP) and extruded tile manufacturing facilities (BSCP NESHAP).
Industrial	3259	327123	Other structural clay products manufacturing facilities (BSCP NESHAP)
Industrial	3261	327111	Vitreous plumbing fixtures (sanitaryware) manufacturing facilities (Clay Ceramics NESHAP).

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in § 63.8385 of today's final BSCP rule and § 63.8535 of today's final clay ceramics rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT SECTION.**

Electronic Docket (E-Docket). The EPA has established official public dockets for this action under Docket ID No. OAR–2002–0054 for the final BSCP rule and Docket ID No. OAR–2002–0055 for the final clay ceramics rule. The official public dockets are the collection of materials that is available for public viewing at the EPA Docket Center (Air Docket), EPA West, Room B102, 1301 Constitution Avenue, NW., Washington, DC 20460. The Docket Center is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Access. Electronic versions of the public dockets are available through EPA's electronic public docket

and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the indexes of the contents of the official public dockets, and to access those documents in the public dockets that are available electronically. Once in the system, select "search" and key in the appropriate docket identification number. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified in this document.

Worldwide Web (WWW). In addition to being available in the dockets, an electronic copy of today's document also will be available on the WWW. Following the Administrator's signature, a copy of this action will be posted at *www.epa.gov/ttn/oarpg* on EPA's Technology Transfer Network (TTN) policy and guidance page for newly proposed or promulgated rules. The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 15, 2003. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce the requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
  A. What Is the Source of Authority for Development of NESHAP?
  B. What Criteria Are Used in the Development of NESHAP?
  C. How Were the Final Rules Developed?
  D. What Are the Health Effects of Pollutants Emitted From the Brick and Structural Clay Products Manufacturing and Clay Ceramics Manufacturing Source Categories?
II. Summary of Responses to Major Comments and Changes to the Brick and Structural Clay Products Manufacturing Proposed NESHAP
  A. Air Pollution Control Devices
  B. Affected Source
  C. Existing Source MACT
  D. New Source MACT
  E. Cost and Economic Impacts
  F. Test Data and Emission Limits
  G. Monitoring Requirements
  H. Startup, Shutdown, and Malfunction
  I. Risk-Based Approaches
III. Summary of the Final Brick and Structural Clay Products Manufacturing NESHAP
  A. What Source Category Is Regulated by the Final Rule?
  B. What Are the Affected Sources?
  C. When Must I Comply With the Final Rule?
  D. What Are the Emission Limits?
  E. What Are the Operating Limits?
  F. What Are the Performance Test and Initial Compliance Requirements?
  G. What Are the Continuous Compliance Requirements?
  H. What Are the Notification, Recordkeeping, and Reporting Requirements?
IV. Summary of Environmental, Energy, and Economic Impacts for the Final Brick and Structural Clay Products Manufacturing NESHAP
  A. What Are the Air Quality Impacts?
  B. What Are the Water and Solid Waste Impacts?
  C. What Are the Energy Impacts?
  D. Are There any Additional Environmental and Health Impacts?

  I. National Technology Transfer and Advancement Act
  J. Congressional Review Act

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. Clay products manufacturing was listed as a category of major sources on the initial source category list published in the **Federal Register** on July 16, 1992 (57 FR 31576). In the July 22, 2002 **Federal Register** notice (67 FR 47894) that proposed NESHAP for BSCP manufacturing and clay ceramics manufacturing, the clay products manufacturing source category was replaced by the BSCP manufacturing source category and the clay ceramics manufacturing source category. Today's action contains final rules for the two source categories. Major sources of HAP are those stationary sources or groups of stationary sources that are located within a contiguous area and under common control that emit or have the potential to emit considering controls, in the aggregate, 9.07 Mg/yr (10 tpy) or more of any one HAP or 22.68 Mg/yr (25 tpy) or more of any combination of HAP. Area sources are those stationary sources that are not major sources.

B. What Criteria Are Used in the Development of NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new and existing major

sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as MACT.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the standards are set at a level that assures that all major sources achieve the level of control at least as stringent as that already achieved by the better-controlled and lower-emitting sources in each source category or subcategory. For new sources, the MACT floor cannot be less stringent than the emission control that is achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than standards for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory for which the Administrator has emissions information (or the best-performing 5 sources for which the Administrator has or could reasonably obtain emissions information for categories or subcategories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on the consideration of cost of achieving the emissions reductions, any health and environmental impacts, and energy requirements.

C. How Were the Final Rules Developed?

We proposed standards for BSCP manufacturing and clay ceramics manufacturing on July 22, 2002 (67 FR 47894). The preamble for the proposed standards described the rationale for the proposed standards. Public comments were solicited at the time of proposal. The public comment period lasted from July 22, 2002 to September 20, 2002. Industry representatives, regulatory agencies, environmental groups, and the general public were given the opportunity to comment on the proposed rules and to provide additional information during the public comment period. We also offered at proposal the opportunity for oral presentation of data, views, or arguments concerning the proposed rules. A public hearing on the proposed BSCP rule was held on August 21, 2002, during which 21 presentations were made. Following the public hearing, we met with representatives of industry and environmental groups on several occasions.

We received a total of 80 public comment letters on the proposed BSCP rule and 9 public comments letters on the proposed clay ceramics rule. Comments were submitted by industry trade associations, BSCP and clay ceramics manufacturing companies, State regulatory agencies and their representatives, and environmental groups. Today's final rules reflect our consideration of all of the comments received. Major public comments on the proposed rules, along with our responses to those comments, are summarized in this preamble.

D. What Are the Health Effects of Pollutants Emitted From the Brick and Structural Clay Products Manufacturing and Clay Ceramics Manufacturing Source Categories?

Today's proposed rules protect air quality and promote the public health by reducing emissions of some of the HAP listed in section 112(b)(1) of the CAA. Emissions data collected during development of the proposed rules show that HF, HCl, and small amounts of metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, mercury, manganese, nickel, lead, and selenium) are emitted from BSCP and clay ceramics manufacturing facilities. Exposure to these HAP is associated with a variety of adverse health effects. These adverse health effects include chronic health disorders (*e.g.*, irritation of the lung, skin, and mucus membranes, effects on the central nervous system, and damage to the kidneys), and acute health disorders (*e.g.*, lung irritation and congestion, alimentary effects such as nausea and vomiting, and effects on the kidney and central nervous system). We have classified three of the HAP as human carcinogens, four as probable human carcinogens, and one as a possible human carcinogen. We do not know the extent to which the adverse health effects described above occur, or if any adverse effects occur, in the populations surrounding these facilities. However, to the extent the adverse effects do occur, today's proposed rules would reduce emissions and subsequent exposures. The majority of the emissions reductions from this rule are HF (1900 tons per year nationwide) and HCl (390 tons per year nationwide), while the rule will only reduce emissions of the HAP metals listed below by a small amount (approximately 6 tons nationwide per year).

1. Hydrogen Fluoride

Acute (short-term) inhalation exposure to gaseous HF can cause severe respiratory damage in humans, including severe irritation and pulmonary edema. Chronic (long-term) exposure to fluoride at low levels has a beneficial effect of dental cavity prevention and may also be useful for the treatment of osteoporosis. Exposure to higher levels of fluoride may cause dental fluorosis or mottling, while very high exposures through drinking water or air can result in crippling skeletal fluorosis. One study reported menstrual irregularities in women occupationally exposed to fluoride. We have not classified HF for carcinogenicity.

2. Hydrogen Chloride

Hydrogen chloride, also called hydrochloric acid, is corrosive to the eyes, skin, and mucous membranes. Acute (short-term) inhalation exposure may cause eye, nose, and respiratory tract irritation and inflammation and pulmonary edema in humans. Chronic (long-term) occupational exposure to HCl has been reported to cause gastritis, bronchitis, and dermatitis in workers. Prolonged exposure to low concentrations may also cause dental discoloration and erosion. No information is available on the reproductive or developmental effects of HCl in humans. In rats exposed to HCl by inhalation, altered estrus cycles have been reported in females and increased fetal mortality and decreased fetal weight have been reported in offspring. We have not classified HCl for carcinogenicity.

3. Antimony

Acute (short-term) exposure to antimony by inhalation in humans results in effects on the skin and eyes. Respiratory effects, such as inflammation of the lungs, chronic bronchitis, and chronic emphysema, are the primary effects noted from chronic (long-term) exposure to antimony in humans via inhalation. Human studies are inconclusive regarding antimony exposure and cancer, while animal studies have reported lung tumors in rats exposed to antimony trioxide via inhalation. Effects of oral exposure to antimony are not well-described, but a single study has reported decreased longevity and changes in serum glucose and cholesterol in rats. We have not classified antimony for carcinogenicity.

4. Arsenic

Acute (short-term) high-level inhalation exposure to arsenic dust or fumes has resulted in gastrointestinal effects (nausea, diarrhea, abdominal

pain), and central and peripheral nervous system disorders. Chronic (long-term) inhalation exposure to inorganic arsenic in humans is associated with irritation of the skin and mucous membranes. Human data suggest a relationship between inhalation exposure of women working at or living near metal smelters and an increased risk of reproductive effects, such as spontaneous abortions. Inorganic arsenic exposure in humans by the inhalation route has been shown to be strongly associated with lung cancer, while ingestion of inorganic arsenic in humans has been linked to a form of skin cancer and also to bladder, liver, and lung cancer. We have classified inorganic arsenic as a Group A, human carcinogen.

5. Beryllium

Acute (short-term) inhalation exposure to high levels of beryllium has been observed to cause inflammation of the lungs or acute pneumonitis (reddening and swelling of the lungs) in humans; after exposure ends, these symptoms may be reversible. Chronic (long-term) inhalation exposure of humans to beryllium has been reported to cause chronic beryllium disease (berylliosis), in which granulomatous (noncancerous) lesions develop in the lung. Inhalation exposure to beryllium has been demonstrated to cause lung cancer in rats and monkeys. Human studies are limited, but suggest a causal relationship between beryllium exposure and an increased risk of lung cancer. Oral exposure to beryllium was found to cause stomach lesions in dogs, but effects on humans are not well-described. We have classified beryllium as a Group B1, probable human carcinogen, when inhaled; data are inadequate to determine whether beryllium is carcinogenic when ingested.

6. Cadmium

The acute (short-term) effects of cadmium inhalation in humans consist mainly of effects on the lung, such as pulmonary irritation. Chronic (long-term) inhalation or oral exposure to cadmium leads to a build-up of cadmium in the kidneys that can cause kidney disease. Cadmium has been shown to be a developmental toxicant in animals, resulting in fetal malformations and other effects, but no conclusive evidence exists in humans. An association between cadmium inhalation exposure and an increased risk of lung cancer has been reported from human studies, but these studies are inconclusive due to confounding factors. Animal studies have demonstrated an increase in lung cancer from long-term inhalation exposure to cadmium. We have classified cadmium as a Group B1, probable human carcinogen when inhaled; data are inadequate to determine whether cadmium is carcinogenic when ingested.

7. Chromium

Chromium may be emitted in two forms, trivalent chromium (chromium III) or hexavalent chromium (chromium VI). The respiratory tract is the major target organ for chromium VI toxicity, for acute (short-term) and chronic (long-term) inhalation exposures. Shortness of breath, coughing, and wheezing have been reported from acute exposure to chromium VI, while perforations and ulcerations of the septum, bronchitis, decreased pulmonary function, pneumonia, and other respiratory effects have been noted from chronic exposure. Limited human studies suggest that chromium VI inhalation exposure may be associated with complications during pregnancy and childbirth, while animal studies have not reported reproductive effects from inhalation exposure to chromium VI. Human and animal studies have clearly established that inhaled chromium VI is a carcinogen, resulting in an increased risk of lung cancer. We have classified chromium VI as a Group A, human carcinogen by the inhalation exposure route. Oral exposure of humans to chromium VI has been reported to cause sores in the mouth, gastrointestinal effects, and elevated white blood cell counts. Animal studies of oral chromium VI exposure have reported testicular degeneration and fetal damage in mice and rats. Chromium IV is also a potent contact sensitizer, producing allergic dermatitis in previously-exposed humans. Data are inadequate to determine if chromium VI is carcinogenic by oral exposure.

Chromium III is much less toxic than chromium VI. The respiratory tract is also the major target organ for chromium III toxicity, similar to chromium VI. Chromium III is an essential element in humans, with a daily oral intake of 50 to 200 micrograms per day (μg/d) recommended for an adult. Data on adverse effects of high oral exposures of chromium III are not available for humans, but a study with mice suggests possible damage to the male reproductive tract. We have not classified chromium III for carcinogenicity.

8. Cobalt

Acute (short-term) exposure to high levels of cobalt by inhalation in humans and animals results in respiratory effects such as a significant decrease in ventilatory function, congestion, edema, and hemorrhage of the lung. Respiratory effects are also the major effects noted from chronic (long-term) exposure to cobalt by inhalation, with respiratory irritation, wheezing, asthma, pneumonia, and fibrosis noted. Cardiac effects, congestion of the liver, kidneys, and conjunctiva, and immunological effects have also been associated with cobalt inhalation in humans. Cobalt is an essential element in humans, as a constituent of vitamin B12, but excessive oral intake has been reported to damage the heart, and to cause gastrointestinal effects and contact dermatitis. Human and animal studies are inconclusive with respect to potential carcinogenicity of cobalt. We have not classified cobalt for carcinogenicity.

9. Mercury

Mercury exists in three forms: Elemental mercury, inorganic mercury compounds (primarily mercuric chloride), and organic mercury compounds (primarily methylmercury). Each form exhibits different health effects. Brick, structural clay products, and clay ceramics manufacturing may release elemental or inorganic mercury, but not methylmercury. However, elemental and inorganic mercury are deposited on surface water, where they are converted to methylmercury, an important food contaminant.

Acute (short-term) exposure to high levels of elemental mercury in humans results in central nervous system (CNS) effects such as tremors, mood changes, and slowed sensory and motor nerve function. High inhalation exposures can also cause kidney damage and effects on the gastrointestinal tract and respiratory system. Chronic (long-term) inhalation exposure to elemental mercury in humans also affects the CNS, with effects such as increased excitability, irritability, excessive shyness, and tremors. Data on toxic effects of oral exposure to elemental mercury are sparse. We have not classified elemental mercury for carcinogenicity.

Acute exposure to inorganic mercury by the oral route may result in effects such as nausea, vomiting, and severe abdominal pain. The major effect from chronic exposure, either oral or inhalation, to inorganic mercury is kidney damage. Reproductive and developmental animal studies have reported effects such as alterations in

testicular tissue, increased embryo resorption rates, and abnormalities of development. Mercuric chloride (an inorganic mercury compound) exposure has been shown to result in forestomach, thyroid, and renal tumors in experimental animals. We have classified mercuric chloride as a Group C, possible human carcinogen.

Both acute and chronic oral exposure to methylmercury have been found to cause developmental damage to the central nervous system in fetuses and children, with effects including mental retardation, deafness, blindness, and cerebral palsy. Lower exposures may cause developmental delays and abnormal reflexes. The most important source of methylmercury exposure for most people is eating fish. Although fish is an important part of a balanced diet federal and state fish advisories recommend limiting intake of certain fish that contain elevated methylmercury levels.

10. Manganese

Health effects in humans have been associated with both deficiencies and excess intakes of manganese. Chronic (long-term) exposure to low levels of manganese in the diet is considered to be nutritionally essential in humans, with a recommended daily allowance of 2 to 5 milligrams per day (mg/d). Chronic inhalation exposure to high levels of manganese by inhalation in humans results primarily in CNS effects. Visual reaction time, hand steadiness, and eye-hand coordination were affected in chronically-exposed workers. Manganism, characterized by feelings of weakness and lethargy, tremors, a mask-like face, and psychological disturbances, may result from chronic exposure to higher levels. Impotence and loss of libido have been noted in male workers afflicted with manganism attributed to inhalation exposures. We have classified manganese as Group D, not classifiable as to human carcinogenicity.

11. Nickel

Nickel is an essential element in some animal species, and it has been suggested it may be essential for human nutrition. Nickel dermatitis, consisting of itching of the fingers, hands, and forearms, is the most common effect in humans from chronic (long-term) skin contact with nickel. Respiratory effects have also been reported in humans from inhalation exposure to nickel. No information is available regarding the reproductive or developmental effects of nickel in humans, but animal studies have reported such effects. Human and animal studies have reported an increased risk of lung and nasal cancers from exposure to nickel refinery dusts and nickel subsulfide. Animal inhalation studies of soluble nickel compounds (*i.e.*, nickel carbonyl) have reported lung tumors. Dermal exposure to nickel may produce contact dermatitis. Adverse effects of oral nickel exposure are not well-described. We have classified nickel refinery dust and nickel subsulfide as Group A, human carcinogens, and nickel carbonyl as a Group B2, probable human carcinogen, by inhalation exposure.

12. Lead

Lead is a very toxic element, causing a variety of effects at low oral or inhaled dose levels. Brain damage, kidney damage, and gastrointestinal distress may occur from acute (short-term) exposure to high levels of lead in humans. Chronic (long-term) exposure to lead in humans results in effects on the blood, CNS, blood pressure, and kidneys. Children are particularly sensitive to the chronic effects of lead, with slowed cognitive development, reduced growth, and other effects reported. Reproductive effects, such as decreased sperm count in men and spontaneous abortions in women, have been associated with lead exposure. The developing fetus is at particular risk from maternal lead exposure, with low birth weight and slowed postnatal neurobehavioral development noted. Human studies are inconclusive regarding lead exposure and cancer, while animal studies have reported an increase in kidney cancer from lead exposure by the oral route. We have classified lead as a Group B2, probable human carcinogen.

13. Selenium

Selenium is a naturally occurring substance that is toxic at high concentrations but is also a nutritionally essential element. Acute (short-term) exposure to elemental selenium, hydrogen selenide, and selenium dioxide by inhalation results primarily in respiratory effects, such as irritation of the mucous membranes, pulmonary edema, severe bronchitis, and bronchial pneumonia. Studies of humans chronically (long-term) exposed to high levels of selenium in food and water have reported discoloration of the skin, pathological deformation and loss of nails, loss of hair, excessive tooth decay and discoloration, lack of mental alertness, and listlessness. The consumption of high levels of selenium by pigs, sheep, and cattle has been shown to interfere with normal fetal development and to produce birth defects. Results of human and animal studies suggest that supplementation with some forms of selenium may result in a reduced incidence of several tumor types. One selenium compound, selenium sulfide, is carcinogenic in animals exposed orally. We have classified elemental selenium as a Group D, not classifiable as to human carcinogenicity, and selenium sulfide as a Group B2, probable human carcinogen.

II. Summary of Responses to Major Comments and Changes to the Brick and Structural Clay Products Manufacturing Proposed NESHAP

In response to the public comments received on the proposed BSCP rule, we made several changes in developing today's final BSCP rule. The major comments and our responses and rule changes are summarized in the following sections. A more detailed summary can be found in the Response-to-Comments document, which is available from several sources (see **SUPPLEMENTARY INFORMATION** section).

A. Air Pollution Control Devices

The most significant change to the proposed BSCP rule concerns our conclusions regarding the effective application of air pollution control devices (APCD) to existing kilns. The EPA received numerous comments from industry representatives, kiln manufacturers, and air pollution control device vendors on issues related to the application and performance of APCD. The MACT floor in the proposed rule was based on the use of dry lime injection fabric filters (DIFF), dry lime scrubber/fabric filters (DLS/FF), or wet scrubbers (WS). Another technology commonly used to control emissions from brick kilns, dry limestone adsorbers (DLA), was not considered to be a MACT floor technology at the time of proposal because we had concerns with monitoring options and our data indicated that the DLA could not achieve HAP emissions reductions equivalent to the reductions achieved by DIFF, DLS/FF, or WS technologies. However, as discussed in the paragraphs below, many commenters reported disadvantages of the DIFF, DLS/FF, and WS technologies for BSCP kilns and provided information to address our concerns about DLA technology. Consequently, the final rule allows some sources to use the DLA technology.

Several commenters argued that DIFF, DLS/FF, and WS technologies are not proven or commercially available for BSCP kilns. Commenters pointed out that, with the exception of one facility, full-scale WS have never been used on

BSCP kilns, although some short-term pilot tests of WS have been conducted. The commenters pointed out that injection systems (such as DIFF and DLS/FF) and wet control devices need a certain airflow to operate properly, and different products may require different airflows, some of which could be outside of the range within which the APCD operates properly. In addition, commenters pointed out that during kiln slowdowns (which could be caused by a situation such as an economic slowdown), the APCD may not be able to operate at all because of reduced kiln airflow.

Several commenters expressed concerns about waste disposal. Commenters stated that DIFF and DLS/FF systems produce large amounts of solid waste that is difficult and expensive to dispose of. Commenters stated that WS would not be viable options for many BSCP plants because of wastewater treatment issues (*e.g.*, limited or no sewer access, wastewater treatment costs). Commenters added that recycling of WS wastewater back into the brick body is not an option because of problems created by the soluble salts in the water (*e.g.*, scumming and efflorescence) and because the volume of wastewater generated would exceed process water needs even if recycling were possible.

Commenters also raised concerns about retrofitting existing BSCP kilns with DIFF, DLS/FF, and WS technologies. Commenters pointed out that brick color, the primary factor in brick sales, is affected by kiln airflow. Thus, retrofitting with an APCD that changes the kiln airflow would change the recipes for the manufacture of brick in a tunnel kiln. Thus, years of experience in the colors produced by the unique firing characteristics of a kiln would be lost. Implications are serious if a facility cannot match its existing product line.

The commenters also charged that we did not account for other retrofitting problems associated with installing DIFF, DLS/FF, or WS on older kilns, and the costs associated with these problems. Commenters also described how attempts at retrofitting kilns with these APCD have resulted in significant amounts of kiln downtime and permanent reductions in kiln production capacities. As stated by the commenters, none of the retrofits have been entirely successful in terms of reducing emissions while not disrupting the production process, and several have had dramatic negative impacts on the production process. At one facility that retrofitted two kilns with DIFF, the capacities of the two kilns decreased from 13.5 cars per day to 12.2 cars per day because of changes in the kiln airflow that resulted from the retrofit. This resulted in a loss of revenue of about $1 million per year. Another retrofit DIFF (multi-stage injection system) installation at a different facility was reported to be extremely problematic, and the cost of the APCD, which was originally estimated at $1 million, is now over $2 million and the system is still not operating correctly more than 2 years later. The facility has experienced numerous problems with the basic design of the unit, including improperly designed dampers and reagent feeding systems. A facility representative stated that the problems are largely due to the fact that few systems have been developed for brick kiln operations; therefore, vendors are still learning (often on the industry's nickel) how to design these systems. In the facility's public comments, they stated that they plan to never build another hot baghouse (DIFF or DLS/FF) due to the massive operating problems associated with them. A retrofit DLS/FF system, the only one that has been attempted in the U.S. to date, also was problematic. The facility stated that they have experienced maintenance and material quality problems that have resulted in kiln downtime. The facility added that the problems stem from the fact that the system is a prototype without a substantial operational, troubleshooting and maintenance history, which has left the facility in the position of having to diagnose and solve the problems as the system operates. In addition, the company that installed this system is no longer quoting systems to the BSCP industry.

Numerous commenters recommended that EPA allow use of DLA. The commenters described the operating benefits of DLA, including ease of operation, low operating cost, little down time, and the ability to handle kiln fluctuations with changing throughputs. Most importantly, DLA do not impact kiln operation. The commenters pointed out that DLA do not require a minimum airflow like DIFF, DLS/FF, or WS technologies. One commenter pointed out that once a DLA is designed for maximum airflow, any fluctuations below this maximum only create more contact time between the kiln exhaust gases and the limestone, which would likely increase the effectiveness of the DLA and would not impact the operation of the kiln. The commenters pointed out that DLA have been used extensively in Europe for many years and also are the most prevalent APCD used in the BSCP industry in the United States. Many commenters stated that DLA should be allowed if they can meet the BSCP standards. The commenters indicated that plants should not have to request site-specific monitoring parameters for DLA because they are the most prevalent technology. In addition, some commenters discussed the high costs and limited additional HAP reduction associated with replacing existing DLA with a DIFF system.

Several commenters felt that EPA disregarded or "bashed" DLA and disagreed with EPA's conclusions regarding DLA in the preamble to the proposed rule. Specifically, the commenters disagreed that: DLA generate particulate matter (PM) emissions; long-term test data that demonstrate DLA performance over the life of the sorbent are not available; DLA limestone is not continuously replaced; and the performance of DLA decreases as the sorbent is re-used because the ability of the sorbent to adsorb HF and HCl decreases.

We disagree with commenters that the use of DIFF has not been proven in the brick industry. The DIFF and DLS/FF systems are a proven control technology for kilns with a given minimum airflow rate. We do, however, believe that retrofitting existing kilns with DIFF or DLS/FF systems is not feasible in many cases. We recognize that WS may not be practical or low-cost for most facilities, but believe they could be a legitimate option for some facilities (*e.g.*, facilities with sewer access). We acknowledge that retrofitting existing BSCP kilns with certain APCD (particularly those that affect kiln airflow) can alter time-honored recipes for brick color, thereby changing the product. We acknowledge that DLA are used extensively around the world to control emissions from brick kilns. In developing the description of DLA technology for the preamble to the proposed rule, we used the technical data available to us at the time. We had no intention of "bashing" DLA but simply reported the data at hand.

After consideration of the comments received regarding DIFF, DLS/FF, WS, and DLA technologies, we have come to new conclusions regarding the effective application of these devices. We now believe that DLA are the only currently available technology that can be used to retrofit existing kilns without potentially significant impacts on the production process, and we have revised today's final rule accordingly. In addition, we believe that, because of the retrofit concerns that we have identified, it is not technologically and economically feasible for an existing

small tunnel kiln that would otherwise meet the criteria for reconstruction in 40 CFR 63.2 and whose design capacity is increased such that it is equal to or greater than 9.07 Mg/hr (10 tph) of fired product (for the remainder of this preamble, these sources will be referred to as "existing small kilns that are rebuilt such that they become large kilns") to meet the relevant standards (*i.e.*, new source MACT) by retrofitting with a DIFF, DLS/FF, or WS. In addition, we believe that it is not technologically and economically feasible for an existing large DLA-controlled kiln that would otherwise meet the criteria for reconstruction in 40 CFR 63.2 (for the remainder of this preamble, these sources will be referred to as "existing large DLA-controlled kilns that are rebuilt") to meet the relevant (*i.e.*, new source MACT) standards by retrofitting with a DIFF, DLS/FF, or WS. Accordingly, we have added regulatory language in 40 CFR 63.8390(i) to provide that an existing small kiln that is rebuilt such that it becomes a large kiln and an existing large DLA-controlled tunnel kiln that is rebuilt do not meet the definition of reconstruction in 40 CFR 63.2 and are not subject to the same requirements as new and reconstructed large tunnel kilns. However, it is technologically and economically feasible for both types of kilns described in 40 CFR 63.8390(i) to retrofit with a DLA (or to continue operating an existing DLA) and we have revised today's final rule to require that such kilns meet emission limits that correspond to the level of control provided by a DLA. We continue to believe that DIFF, DLS/FF, and WS are appropriate technologies for new large tunnel kilns and for reconstructed large tunnel kilns that were equipped with DIFF, DLS/FF, or WS prior to reconstruction. However, DLA are the only APCD that have been demonstrated on small tunnel kilns (which have smaller airflows than large tunnel kilns), and, therefore, the requirements for new and reconstructed small tunnel kilns are based on the level of control that can be achieved by a DLA. We note that facilities have the flexibility to select any control device or technique that ensures that emissions from their brick kilns are in compliance with the emission limits set forth in the final rule. Each of the APCD described above have advantages and disadvantages to their use, and the selection of the APCD to meet the requirements of the final rule will be dependent on site-specific parameters.

B. Affected Source

1. Production-Rate Limit

The proposed rule subcategorized tunnel kilns based on a 9.07 Mg/hr (10 tph) design capacity. We requested comment on the appropriate design capacity-based subcategorization level in the preamble to the proposed rule. We received numerous comments regarding subcategorization of tunnel kilns. While some commenters agreed with the 9.07 Mg/hr (10 tph) distinction among tunnel kiln subcategories, several commenters thought that the 9.07 Mg/hr (10 tph) limit was arbitrarily assigned. The commenters charged that EPA did not use all available data in determining the appropriate size cutoff. Many commenters argued that the design capacity limit should be higher based on available data (*i.e.*, 10.1 Mg/hr (11.1 tph) or 12.1 Mg/hr (13.3 tph)). The commenters disagreed that the cutoff should be rounded down from 10.1 Mg/hr (11.1 tph) to 9.07 Mg/hr (10 tph).

Some commenters noted that a design capacity distinction gives a competitive advantage to facilities operating smaller kilns. One commenter disagreed that there was a technological basis for differentiating among tunnel kilns producing above or below 9.07 Mg/hr (10 tph). The commenter stated that EPA may not subcategorize tunnel kilns to reduce costs.

Through subcategorization, we are able to define subsets of similar emission sources within a source category if differences in emissions characteristics, processes, APCD viability, or opportunities for pollution prevention exist within the source category. Section 112(d)(1) of the CAA states "the Administrator may distinguish among classes, types, and sizes of sources within a category or subcategory" in establishing emission standards. Thus, we have discretion in determining appropriate subcategories based on classes, types, and sizes of sources. We used this discretion in developing subcategories for the BSCP source category. We first subcategorized kilns based on type (*i.e.*, periodic kilns versus tunnel kilns). We then further subcategorized tunnel kilns based on kiln size. Our distinctions are based on technological differences in the equipment. For example, periodic kilns are smaller than tunnel kilns and operate in batch cycles, whereas tunnel kilns operate continuously. There are also differences in the effective application of air pollution controls. To our knowledge, HAP emissions from periodic kilns have not successfully been controlled. Similarly, we distinguished between tunnel kilns with design capacities above and below 9.07 Mg/hr (10 tph) at proposal in part because the APCD we believed to be the best performers (DIFF, DLS/FF, and WS) were not demonstrated on existing tunnel kilns with design capacities below roughly 9.07 Mg/hr (10 tph). For the reasons discussed below, we revisited the appropriate subcategorization level in response to comments on the proposal when developing today's final rule. While we continue to believe that 9.07 Mg/hr (10 tph) is the appropriate subcategorization level, our reasons for choosing that level have changed since proposal in light of new information that we received during the public comment period about DLA controls and the three proposed MACT controls (DIFF, DLS/FF, and WS).

As discussed earlier, numerous commenters pointed out serious concerns regarding retrofitting existing kilns with APCD such as DIFF, DLS/FF, and WS. Therefore, we now consider DLA to be the only currently available technology that can be used to retrofit existing kilns, including existing small kilns that are rebuilt such that they become large kilns and existing large DLA-controlled kilns that are rebuilt, without potentially significant impacts on the production process.

In response to comments suggesting that we include new data in our analyses, we updated our data base with information on new kilns, new APCD (except those controls that we consider to achieve the lowest achievable emission rate (LAER) as specified in section 112(d)(3)(A) of the CAA), changes in kiln capacities, and changes in facility ownership. We used the information submitted by commenters and made followup calls to States and individual facilities for additional clarification as necessary to update our data base.

We used our updated data base in reevaluating all aspects of the proposed standards. The smallest tunnel kiln with MACT floor controls (*i.e.*, with DLA controls reflecting the existing source MACT floor under today's final rule) in our updated database has a capacity of 8.3 Mg/hr (9.1 tph). Rounding up to the nearest integer, based on current application of APCD to BSCP tunnel kilns, we believe that 9.07 Mg/hr (10 tph) continues to be an appropriate subcategorization level. Commenters have stated that a smaller tunnel kiln (*e.g.*, 4.5 Mg/hr (5 tph) capacity) is dissimilar from a larger tunnel kiln (*e.g.*, 13.6 Mg/hr (15 tph) capacity), especially with regard to the airflow, which is a key operating parameter for APCD. Airflow is particularly important for

lime injection-type systems (DIFF and DLS/FF), because the injected lime is carried through the reaction chamber (or duct) by the kiln exhaust gas. For a given lime injection rate, if a minimum exhaust flow is not maintained, the sorbent can settle in the duct work and cause APCD malfunction. Furthermore, APCD malfunctions can affect the airflow within the kiln, and can destroy product that is in the kiln. We believe that DIFF and DLS/FF systems, if attempted on smaller kilns, would experience more difficulties with respect to airflow than systems on larger kilns because as the design airflow decreases, the acceptable operating range also would be expected to decrease. Any fluctuation in airflow would be expected to have a greater impact on APCD operation as the size of the system decreases. Given the technological concerns and the capacities of currently-controlled tunnel kilns, we maintain that a design capacity-based subcategorization level of 9.07 Mg/hr (10 tph) is appropriate for existing tunnel kilns.

We acknowledge the comments suggesting that 10.1 Mg/hr (11.1 tph) should be the size cutoff based on the smallest DIFF-controlled tunnel kiln. However, because we now consider that the performance of a DLA represents the MACT floor for existing sources (and DIFF, DLS/FF, and WS also can meet the emission limits), we considered the smallest non-LAER DLA-controlled kiln in setting the subcategorization level. We disagree that 12.1 Mg/hr (13.3 tph) would have been the proper level for proposal or for the final rule. We believe that consideration of technological differences and the effective application of APCD to kilns of different sizes is the appropriate method of selecting a subcategorization level. We maintain that 9.07 Mg/hr (10 tph) is appropriate.

We understand that, regardless of the particular subcategorization level selected, there will be facilities that operate kilns with throughputs slightly above the level and some that operate kilns at slightly below the level. Facilities operating kilns slightly above the subcategorization level have the option of accepting a federally enforceable permit limit to limit their throughput to below the level. Facilities operating just below the level must make careful decisions regarding expansion of their kilns. We acknowledge that facilities operating near the subcategorization level must make decisions regarding permit limits and expansions based on facility-specific considerations (*e.g.*, control costs, impact on revenue). However, as some commenters have pointed out, cost is not an appropriate criteria for us to use in establishing subcategories, because our discretion for establishing subcategories is limited, under the CAA, to distinguishing among classes, types, and sizes of sources.

2. R&D Kiln Definition

One commenter requested that we change the definition of research and development (R&D) kiln so that it is consistent with the definition of R&D in section 112(c)(7) of the CAA and most other NESHAP. Therefore, today's final rule includes a revised definition of research and development kiln that is consistent with section 112(c)(7) of the CAA and other NESHAP.

C. Existing Source MACT

1. Consideration of Synthetic Area Sources in the MACT Floor Determinations for Existing Sources

In the preamble to the proposed BSCP rule, we requested comment on inclusion of synthetic area sources (also called synthetic minor sources) in the MACT floor determinations for existing tunnel kilns. For the remainder of this preamble, we will refer to these sources as synthetic minor sources. Synthetic minor sources are those facilities that emit fewer than 10 tons per year of any HAP and fewer than 25 tons per year of any combination of HAP because they use some emission control device (or devices), the operation of which is required by a Federally Enforceable State Operating Permit (FESOP). In the absence of such controls, these sources would be major.

Inclusion of synthetic minor sources in the MACT floor determination was an issue prior to proposal because whether or not synthetic minor sources were included would affect the level of control represented by the floor determinations for existing large tunnel kilns (*i.e.*, tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph)). Had synthetic minor sources been excluded, the MACT floor for existing tunnel kilns would have been "no emissions reductions." With synthetic minor sources included (as we proposed), the MACT floor for existing tunnel kilns was based on a DIFF, DLS/FF or WS.

Industry representatives asserted, prior to proposal, that the BSCP MACT floor determination should not include synthetic minor sources. We rejected the idea of excluding synthetic minor sources from the MACT floor determination for several reasons discussed in the preamble to the proposed rule. (See 67 FR 47894, 47911–47912, July 22, 2002.) Nevertheless, because of the industry representatives' arguments, we requested comment from all interested parties on inclusion of synthetic minor sources in MACT floor determinations.

Following proposal, numerous industry representatives commented on the issue of whether to include synthetic minor sources in MACT floor determinations. The industry representatives commented that only major sources are included in the listed BSCP source category, and therefore, only major sources are to be used in the MACT floor determination. The commenters referenced section 112(a)(1) of the CAA, which defines major source as a source that "emits or has the potential to emit *considering controls* 10 tons per year * * *." (emphasis added), and stated that by definition, synthetic minor sources are not major sources. The commenters noted that EPA did not include true area sources (or minor sources) in the MACT floor determination and stated that synthetic minor sources should be treated similarly for purposes of establishing MACT floors.

An environmental group also commented on the issue of including synthetic minor sources in MACT floor determinations. The commenter supported EPA's decision to include synthetic minor sources in the MACT floor for BSCP. The commenter stated that the CAA requires EPA to include synthetic minor sources in MACT floor determinations. The commenter stated that excluding consideration of the best-controlled sources (which became synthetic minor sources as a result of effective controls) would contradict the CAA section 112(d) MACT floor methodology established by Congress. The commenter argued that such exclusion would weaken emission standards required for existing sources, and increase the levels of air toxics released into the environment.

Section 112(d) of the CAA directs us to establish emission standards for each category or subcategory of major sources and minor sources of HAP listed for regulation pursuant to section 112(c) of the CAA. Each such standard must reflect a minimum level of control known as the MACT floor. (See CAA section 112(d).) However, section 112 of the CAA does not specifically address synthetic minor or synthetic area sources, which include those sources that emit fewer than 10 tons per year of any HAP or fewer than 25 tons per year of any combination of HAP because they use some emission control device(s), pollution prevention techniques or other measures (collectively referred to as controls in this preamble) adopted

under Federal or State regulations. If not for the enforceable controls they have implemented, synthetic minor sources would be major sources under section 112 of the CAA.

We believe that the better interpretation of the CAA's plain language and legislative history requires that synthetic minor sources be included in MACT floor determinations. First, the plain language of the statute makes clear that our MACT floor determinations are to reflect the best sources in a category. For new sources in a category or subcategory, the MACT floor shall not be less stringent than the emission control that is achieved in practice by the *best-controlled* similar source, as determined by EPA. (See CAA section 112(d)(3), emphasis added.) For existing sources in a category or subcategory with 30 or more sources, the MACT floor may be less stringent than the floor for new sources in the same category or subcategory but shall not be less stringent than the average emission limitation achieved by the *best performing* 12 percent of the existing sources (for which the Administrator has emissions information). (See CAA section 112(d)(3)(A), emphasis added.[1]) Thus, section 112(d)(3) of the CAA requires that MACT floors reflect what the best-controlled new sources and the best-performing existing sources achieve in practice. These phrases contain no exemptions and are not limited by references to sources with or without controls. Therefore, they suggest that all of the best-controlled or best-performing sources should be considered in MACT floor determinations, regardless of whether or not such sources rely upon controls.

Furthermore, section 112(d)(3) of the CAA expressly excludes certain sources that meet LAER requirements from MACT floor determinations for existing sources. (See CAA section 112(d)(3)(A).) The fact that Congress expressly excluded such LAER sources but did not also exclude synthetic minor sources suggests that no exclusion was intended for synthetic minor sources. Indeed, nothing in the statute suggests that EPA should exclude a control technology from its consideration of the MACT floor because the technology is so effective that it reduces source emissions such that the source is no longer a major source of HAP. (See 67 FR 36,460 and 36,464, May 23, 2002, stating this rationale for including synthetic minor sources in the floor determination for the proposed NESHAP for municipal solid waste landfills.)

Some commenters argue that because the BSCP source category only includes major sources and synthetic minor sources are non-major by definition, synthetic minor sources (like true area sources) fall outside the regulated source category and should not be considered in MACT floor determinations. EPA agrees that the BSCP source category includes only major sources. (See 67 FR 47,894 and 47,898, July 22, 2002.) However, EPA disagrees that the CAA contemplates that synthetic minor sources must be treated like true area sources and excluded from MACT floor determinations. Section 112(a) of the CAA defines a major source as:

> any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit considering controls, in the aggregate, 10 tons per year or more of any hazardous air pollutant or 25 tons per year or more of any combination of hazardous air pollutants * * *.

(*See* CAA section 112(a)(1).) An area source is defined as any stationary source of hazardous air pollutants that is not a major source. (See CAA section 112(a)(1).) In the major source definition, the reference to a source's potential to emit considering controls allows the interpretation that a source's potential to emit before and after controls is relevant, such that synthetic minor sources may be considered within the meaning of this definition and included in MACT floor determinations for categories of major sources.[2] Some commenters appear to suggest that the reference to a source's potential to emit considering controls can only mean a source's potential to emit after controls have been implemented. While it is possible to read the phrase in this manner in isolation, this interpretation would have the effect of excluding the best-performing sources in a category from MACT floor determinations and therefore would be contrary to the statutory mandate that EPA set MACT floors based on the levels the best-controlled new sources and the best-performing existing sources achieve in practice. We believe the statutory reference to potential to emit considering controls should be read in a manner consistent with the other requirements of section 112(d) of the CAA to allow for the consideration of synthetic minor sources in MACT floor determinations for categories of major sources.

In addition, the legislative history suggests that synthetic minor sources should be included in MACT floor determinations. In a floor statement, Senator Durenberger stated that in implementing section 112(d)(3) of the CAA, "the [Senate] managers intend the Administrator to take whatever steps are necessary to assure that [the Administrator] has collected data on *all of the better-performing sources within each category.* [The Administrator] must have a data-gathering program sufficient to assure that [EPA] does not miss *any sources that have superior levels of emission control.*" (See Environment and Natural Resources Policy Division, Congressional Research Service, 103d Cong., S.Prt. 103–38 (prepared for the U.S. Senate Committee on Environment and Public Works), A Legislative History of the Clean Air Act Amendments of 1990 at 870, Nov. 1993, emphasis added.) This statement underscores that Congress intended for MACT floor determinations to reflect consideration of all of the sources in each category with the best emission controls. We believe it would be inconsistent with Congress's intent and the plain language of the CAA to exclude synthetic minor sources—those sources with superior controls which became synthetic minor sources by implementing such controls—from MACT floor determinations.

We believe that the inclusion of synthetic minor sources in MACT floor determinations is justified because of the reasons explained above. Even if the MACT floor determination had been "no emissions reductions" we believe that a departure from the MACT floor to a beyond-the-floor standard, based on DLA technology, is viable because the benefits associated with the emissions reductions will exceed the cost of installing and operating the technology.

2. MACT Floors for Existing Sources

Some commenters questioned how the MACT floor for existing sources was

[1] If a category or subcategory has fewer than 30 sources, the floor shall be "the average emission limitation achieved by the *best performing* 5 sources (for which the Administrator has or could reasonably obtain emissions information) in the category or subcategory." (See CAA section 112(d)(3)(B), emphasis added.)

[2] We believe this approach is not inconsistent with our policy that existing sources that limit their potential to emit to below the major source threshold prior to the first compliance deadline under a MACT standard will not be subject to the standard, as one commenter suggests. (See Memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, EPA, to EPA Regions, "Potential to Emit for MACT Standards—Guidance on Timing Issues," May 16, 1995.) Including synthetic minor sources in MACT floor determinations ensures that MACT floors reflect the best-performing sources, as the CAA requires. At the same time, our policy recognizes that sources that already achieve or perform better than the MACT floors need not be subject to the MACT standards.

set. Some commenters thought that control devices installed for sulfur oxides (SO_x) control (rather than for HAP control) should not be considered in the MACT floor. Other commenters felt that costs should be a consideration.

One commenter charged that EPA has simply set MACT floors based on control technology type and that EPA did not identify the relevant best performers and set floors reflecting their average emission level. The commenter noted that factors other than control device type affect emissions and that EPA must consider all non-negligible factors in setting MACT floors and considering beyond-the-floor measures. The commenter stated that if EPA believes it is unworkable to consider all factors, then perhaps EPA should base standards on actual emissions data which reflects all the factors influencing a source's performance. The commenter also noted that EPA picked the worst performance of any source that used the chosen technology to set the floor for PM.

A detailed discussion of how we determined the MACT floor for existing large tunnel kilns (*i.e.*, tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph)) is provided below. Although the discussion in the example below focuses on existing large tunnel kilns that exhaust directly to the atmosphere or to an APCD, the same MACT floor methodology was used for existing large tunnel kilns that exhaust to sawdust dryers prior to exhausting to the atmosphere, existing small tunnel kilns that exhaust directly to the atmosphere or to an APCD, existing small sawdust-fired tunnel kilns that duct to sawdust dryers, and existing periodic kilns. Details of these MACT floor determinations were discussed in the preamble to the proposed rule. (See 67 FR 47909–47912, July 22, 2002.) Section 112(d)(3) is the section of the CAA that dictates how we must establish MACT floors. Section 112(d)(3) of the CAA states that:

> The maximum degree of reduction in emissions that is deemed achievable for new sources in a category or subcategory shall not be less stringent than the emission control that is achieved in practice by the best controlled similar source, as determined by the Administrator. Emission standards promulgated under this subsection for existing sources in a category or subcategory may be less stringent than standards for new sources in the same category or subcategory but shall not be less stringent, and may be more stringent than—
>
> (A) Rhe average emission limitation achieved by the best performing 12 percent of the existing sources (for which the Administrator has emissions information), excluding those sources that have, within 18 months before the emission standard is proposed or within 30 months before such standard is promulgated, whichever is later, first achieved a level of emission rate or emission reduction which complies, or would comply if the source is not subject to such standard, with the lowest achievable emission rate (as defined by section 171) applicable to the source category and prevailing at the time, in the category or subcategory for categories and subcategories with 30 or more sources * * *.

With the exception of the LAER provisions in section 112(d)(3)(A) of the CAA, the CAA requires us to base the MACT floor on the best-performing sources without consideration of why facilities decided to control emissions. Therefore, if an APCD is reducing HAP emissions (*e.g.*, HF, HCl, or HAP metals), it is irrelevant if sources installed APCD for SO_X or visible emissions control for purposes of conducting MACT floor determinations.

We determined the MACT floor control level for existing sources using the following general procedure:

(1) We reviewed available data on pollution prevention techniques (including substitution of raw materials and/or fuels) and the performance of add-on control devices to determine the techniques that were viable for and effective at reducing HAP emissions;

(2) For each subcategory, we ranked the kilns from the best performing to the worst performing based on the emission reduction technique used on the kilns;

(3) For each subcategory, we then identified the 94th percentile kiln and the emission reduction technique that represented the MACT floor technology; and

(4) For each subcategory, we then selected production-based or percent-reduction emission limits that correspond to the 94th percentile kiln and emission reduction technique, and we based our selections on the available data while considering variability in the performance of a given emission reduction technique.

To identify the best-performing emission reduction techniques, we reviewed available data on pollution prevention techniques (*i.e.*,, substitution of raw materials and/or fuels) and the performance of add-on control devices. We determined that substitution of raw materials and/or fuels is not an option because substitution of raw materials and/or fuels could affect the ability of a facility to duplicate its current product line. In addition, it is impractical for facilities to import, from a distance of more than a few miles, the large amounts of raw material that are required (most facilities are located in close proximity to their raw material source). With respect to use of low-HAP fuels, our available test data for the BSCP industry do not show identifiable differences in emissions based on kiln fuel type; that is, the contribution of raw materials to HAP emissions far outweighs the contribution of the fuels. In addition, fuel type can impact the color of a product, and any requirement that would require a kiln to change fuel type could cause the kiln to be unable to match an existing product line. While we agree that factors other than APCD type can affect emissions, we do not have the data to determine the specific degree of the effect of factors other than APCD on emissions, and we believe that, for the BSCP industry, factors other than APCD use are not viable MACT floor or beyond-the-floor control options. Our data show that add-on APCD have a large effect on emissions, and further show that the presence or absence of an APCD is likely the greatest factor in determining a BSCP kiln's actual performance. It follows that the subset of BSCP kilns that are the best performers are those with add-on APCD. Therefore, our analysis focused on the performance of add-on control devices.

Prior to proposal we concluded that the best-performing add-on control devices were DIFF, DLS/FF, and WS. Based on the comments received following proposal (as discussed elsewhere in this preamble) regarding retrofit concerns with these technologies, we now believe that DLA are the only currently available technology that can be used to retrofit existing large kilns without potentially significant impacts on the production process. Thus, DLA are the best-performing APCD for existing large tunnel kilns.

We ranked the kilns within each subcategory according to APCD use. Information on the number of kilns and the types of APCD was based primarily on responses to a survey of the industry and additional information gathered following the survey including public comments on the proposed rule. Equipment in use at major sources and synthetic minor sources was used in the equipment ranking. In accordance with section 112(d)(3)(A) of the CAA, equipment at kilns that achieved LAER less than 18 months before proposal was not included in the equipment ranking. When we ranked the large tunnel kilns, we treated kilns equipped with DLA as the best-controlled sources, although DIFF, DLS/FF, and WS also can achieve the level of performance of a DLA. We ranked the kilns by APCD rather than actual unit-specific emissions reductions because we do not have emissions test data for all kilns.

Section 112(d)(3) of the CAA specifies that we set standards for existing sources that are no less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources (for which the Administrator has emissions information) where there are 30 or more sources in the category or subcategory. Our interpretation of average emission limitation is that it is a measure of central tendency, such as the arithmetic mean or the median. If the median is used when there are at least 30 sources, then the emission level achievable by the source and its APCD that is at the bottom of the top 6 percent of the best-performing sources (*i.e.*, the 94th percentile) represents the MACT floor control level. We based our MACT floors for each BSCP subcategory on this interpretation. Nineteen percent (22 of 115) of the existing large tunnel kilns located at synthetic minor sources or major sources are controlled by a DLA (12), DIFF (4), DLS/FF (4), or WS (2). Because more than 6 percent of the large tunnel kilns reduce emissions by some technique, emissions reductions from these kilns are required under the CAA. We then considered which of these controls are proven to be applicable to existing tunnel kilns, and we ranked these kilns to determine the appropriate MACT emission limits. We consider the 12 DLA to be equivalent and believe that this type of control can be applied to any existing large tunnel kiln without causing potentially significant production problems. We consider the performance of all of the DLA to be equivalent because there currently are two types of DLA in the industry (supplied by two manufacturers), and we have test data for both designs that show HF removal efficiencies that are within 1 percent of one another. We excluded DIFF and DLS/FF from our ranking of controls for existing sources because of the reported problems caused by applying DIFF and DLS/FF to existing kilns. We excluded WS from our ranking of controls for existing sources because many facilities do not have proven wastewater disposal options. Therefore, we only considered DLA in our ranking, and accordingly, the 94th percentile source (the 7th best-controlled source) is a DLA-controlled kiln. Therefore, the MACT floors for existing large tunnel kilns are based on the level of control achieved by a DLA. We have DLA outlet test data for 7 of the 12 existing large DLA-controlled tunnel kilns, and therefore, we are confident that our test data are within the best-controlled 6 percent of sources. Furthermore, the single best-performing source, based on our available DLA outlet data, is one of the three sources for which a control efficiency is available.

Section 112(d)(2) of the CAA dictates how we must establish MACT. The MACT can either be established at the MACT floor, or can be some control level more stringent than the MACT floor or beyond-the-floor. Section 112(d)(2) of the CAA states that:

> Emissions standards promulgated under this subsection and applicable to new or existing sources of hazardous air pollutants shall require the maximum degree of reduction in emissions of the hazardous air pollutants subject to this section (including a prohibition on such emissions, where achievable) that the Administrator, taking into consideration the cost of achieving such emission reduction, and any non-air quality health and environmental impacts and energy requirements, determines is achievable for new or existing sources in the category or subcategory to which such emission standard applies * * *.

Although section 112(d)(3) of the CAA does not allow us to consider cost when determining MACT floors, we do consider costs when we examine beyond-the-floor control options according to section 112(d)(2) of the CAA. We acknowledge the commenters' concerns regarding the cost of the proposed standards. We determined that beyond-the-floor control measures would not be appropriate for existing large BSCP kilns because of retrofit costs arising from technical difficulties in retrofitting DIFF, DLS/FF, or WS. Thus, the emission limits for existing large tunnel kilns in today's final rule are based on the level of control achievable with a DLA.

It is our goal to set emission standards that reflect the performance of the best-controlled sources. Once we identified the subset of the best-controlled BSCP sources (*i.e.*, DLA-controlled kilns), we used the highest emission level associated with these best performers to set the emission standard because it was our intent to set emission limits that reflect the performance that the best-controlled sources continually achieve considering variability. All sources, including the best-controlled sources, have variability in emissions. For example, data (individual test runs) from two tests conducted on one DLA-controlled kiln showed HF control efficiencies that ranged from 91.6 percent to 96.4 percent. This variability may result from APCD performance, and also could result from uncertainty associated with the test methods. Commenters have agreed with our approach to setting the production-based emission limits at or slightly higher than the highest data point, because this approach accounts for variability in the performance of individual sources, variability that could exist across the industry, and uncertainty in the test methods used to measure emissions. Furthermore, use of the highest emission level associated with the best performers prevents sources within the best-controlled subset from having to remove their existing APCD and replace it with a new one that may or may not achieve slightly better performance.

We believe and intend that a well-operated DLA will achieve the emission limits set forth in this rulemaking. However, concerns have recently been raised that if high concentrations of sulfur exist in the kiln exhaust gas stream, the ability of a well-operated DLA to reduce the target acid gas HAP emissions (*i.e.*, HF and HCl) may be compromised. The data we have does not suggest that these concerns are justified. If the EPA receives information showing that they are, EPA will take prompt action to resolve the issue through rulemaking and ensure that a facility with a well-operated DLA will be in compliance with the rule. The EPA will also work with any affected facilities to ensure that they are not subject to inappropriate sanctions before we are able to complete such a rulemaking.

D. New Source MACT

Several commenters disagreed that a large (design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product) tunnel kiln equipped with DIFF, DLS/FF or WS was the best-controlled similar source for all new tunnel kilns. The commenters expressed concern that the DIFF, DLS/FF or WS controls proposed for all new tunnel kilns have not been demonstrated on smaller kilns. The commenters argued that emissions from small (*e.g.*, less than 9.07 Mg/hr (10 tph)) and large tunnel kilns are different because the required airflow and pollutant loading is different. The commenters stated that controls such as DIFF, DLS/FF, or WS do not decrease in size or cost for kilns below 9.07 Mg/hr (10 tph) design capacity. The commenters thought that the proposed standards for new tunnel kilns would prevent future construction of and upgrades to smaller kilns. The commenters recommended that a throughput cutoff be provided for new and reconstructed kilns. One commenter suggested that EPA create a size-cutoff for new kilns, where the best-controlled similar source for smaller new kilns is a DLA-controlled kiln, and DLS/FF, DIFF, or WS for the larger

kilns. One commenter noted the potential of existing kilns triggering new source requirements during reconstruction. The commenter requested that the ability of small businesses to overhaul existing kilns be addressed in the final rule.

These commenters have addressed several related issues including the selection of the best-controlled similar source, differences between small and large tunnel kilns, the feasibility of the proposed MACT-level controls in controlling emissions from smaller tunnel kilns or reconstructed tunnel kilns, and the costs of new controls. In responding to these comments, we have re-evaluated our analysis of MACT for new and reconstructed tunnel kilns. In the original MACT analysis developed for the proposed rule, we recognized the inherent differences between small and large tunnel kilns and established a subcategorization level of 9.07 Mg/hr (10 tph). The proposed 9.07 Mg/hr (10 tph) subcategorization level applied to both existing and new tunnel kilns. For new and reconstructed sources, we selected the best-controlled similar source (DIFF, DLS/FF, WS) that would be applied to all new sources regardless of size. In re-evaluating this analysis and in light of several comments that described the inherent differences and issues with the application of DIFF, DLS/FF, and WS control technologies to small tunnel kilns or reconstructed tunnel kilns, we have revised MACT for new sources. We also have added language in 40 CFR 63.8390(i) to provide that it is not technologically and economically feasible for two types of existing kilns that would otherwise meet the criteria for reconstruction under 40 CFR 63.2 to meet the relevant standards—*i.e.*, new source MACT—and that such kilns do not fall within the definition of reconstruction and are not subject to new source MACT requirements. The two types of kilns are existing small kilns that are rebuilt such that they become large kilns and existing large DLA-controlled tunnel kilns that are rebuilt. Today's final emission limits for those kilns and for new and reconstructed small tunnel kilns are based on the performance of DLA control technology. The final emission limits for new large tunnel kilns are based on the performance of DIFF, DLS/FF, and WS control technology. In addition, existing large tunnel kilns equipped with DIFF, DLS/FF or WS are reconstructed sources subject to new source MACT requirements if they meet the criteria for reconstruction in 40 CFR 63.2. Such kilns must continue to meet new source MACT limits, which are based on the performance of DIFF, DLS/FF, and WS.

We agree with the commenters that DIFF, DLS/FF, and WS control technologies have not been demonstrated on small kilns. However, we believe that the 9.07 Mg/hr (10 tph) size represents the threshold where emission control using DIFF, DLS/FF, or WS is technically feasible and demonstrated. Smaller kilns have smaller airflow rates than larger kilns and any fluctuations in airflow rates can have a significant impact on the ability of DIFF, DLS/FF, or WS to operate correctly. For new and reconstructed small kilns, the DLA control technology has been demonstrated to perform adequately despite the lower airflow rates; DLA control systems are not as sensitive to airflow changes as DIFF, DLS/FF, or WS control systems. In addition, existing small kilns that are rebuilt such that they become large kilns and existing large DLA-controlled kilns that are rebuilt would experience the same types of retrofit problems that we described for existing tunnel kilns, and we believe that such tunnel kilns should be subject to requirements that can be met with a DLA. The DIFF, DLS/FF, and WS control systems have been demonstrated on new large kilns. Therefore, MACT for new and reconstructed large tunnel kilns is based on DIFF, DLS/FF, and WS control and is unchanged from proposal. Finally, the determination of MACT for new sources at the floor does not take the cost of control into consideration.

Our revised standards for new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled kilns that are rebuilt are based on the use of a DLA, which is considerably less expensive than the other MACT controls. The revised standards should minimize the commenters' concerns over the costs of reconstructing older kilns.

E. Cost and Economic Impacts

Numerous comments were received regarding costs of the proposed rule. Commenters contended that EPA did not consider the full costs of the rule (*e.g.*, costs associated with problems retrofitting existing kilns). In general, commenters indicated that the economic impacts to brick industry would be severe. Several commenters pointed out that the brick industry is losing market share to cheaper building materials (*e.g.*, vinyl) that are more detrimental to the environment. The commenters stated that the proposed rule would have a negative effect on the future of many small businesses and the communities where they are located. The commenters expressed concern that the proposed rule would limit the opportunity for continued operation or expansion of brick plants throughout the U.S. The commenters noted that increased production costs would increase brick prices, causing brick to become less competitive with other materials and brick imports to rise, putting small U.S. companies out of business. Several commenters stated that the costs of the rule as proposed would prevent their company from ever replacing, performing a major repair on, or upgrading their existing kiln. Some commenters stated that the rule as proposed would eventually cause their company to go out of business. Some commenters added that they live in an economically depressed area and other jobs are not readily available.

One commenter disagreed with the Administrator's certification that the proposed rule would not create a significant impact on a substantial number of small entities. The commenter submitted an Economic Impacts Analysis (EIA). The commenter calculated and presented the Sales Test, Cash Flow Test, and Profit Test criteria which the commenter believes shows a greater number of small businesses at risk than does EPA's EIA. In addition, the commenter provided several specific comments on EPA's EIA. The commenter argued that the rule as proposed is a significant rulemaking per Executive Order (E.O.) 12866. A few commenters provided specific comments on the monitoring, reporting, and recordkeeping costs in the Office of Management and Budget (OMB) 83–I form and supporting statement.

Commenters also questioned the environmental benefits of the BSCP rule as proposed. One commenter questioned why the BSCP rule is necessary if brick manufacturing emissions are not causing public health problems or adverse environmental effects. Another commenter argued that there is no epidemiological evidence that anyone in North America has been harmed by brick plant HF emissions and that cancer incidence in brick plant workers is not higher than for the general population.

As previously mentioned in this preamble, section 112(b) of the CAA contains a list of HAP identified by Congress and authorizes EPA to add to that list pollutants that present or may present a threat of adverse effects to human health or the environment. Section 112(c) of the CAA requires us to list all categories and subcategories of major and area sources of HAP and to

establish NESHAP for the listed source categories and subcategories under section 112(d) of the CAA. Because BSCP manufacturing is a listed source category containing major sources of HAP, we are required by the CAA to establish NESHAP for BSCP manufacturing.

As stated previously, MACT can either be established at the MACT floor, or can be some control level more stringent than the MACT floor or beyond the floor. Section 112(d)(3) of the CAA does not allow us to consider cost when determining MACT floors. We are only allowed to consider costs when we examine beyond-the-floor control options according to section 112(d)(2) of the CAA. We acknowledge the commenters' concerns regarding the cost of the proposed rule. At proposal, we determined that beyond-the-floor control measures would not be appropriate for the BSCP industry, in part because of costs.

Following proposal, we reevaluated the MACT floors for existing tunnel kilns and have revised the standards to incorporate use of DLA on existing large tunnel kilns. We also revised the MACT standards for new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled tunnel kilns that are rebuilt such that the standards are based on the level of performance that can be achieved by a DLA. (MACT requirements for existing small tunnel kilns and new and reconstructed large tunnel kilns remain unchanged.) We continue to agree that beyond-the-floor control measures are not warranted for the BSCP industry. The revised MACT standards for new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled kilns that are rebuilt are the same as the revised standards for existing large tunnel kilns. These revised standards are less costly and should reduce concerns regarding cost of retrofitting or rebuilding existing kilns and starting up new small kilns. Environmental benefits of today's final BSCP rule are discussed later in this preamble.

EPA reviewed the economic impact analysis report submitted by the commenter. We have revised our EIA to identify additional small businesses affected by the rule. We have also incorporated the lower revised cost estimates into the EIA. Impacts on small businesses are considerably lower in the revised analysis and prices are predicted to rise by less than one percent on average. The results of our revised EIA, as well as a discussion of the impact of today's final rule on small businesses, are presented later in this preamble.

Comments on the costs of monitoring, reporting, and recordkeeping were incorporated into the revised OMB 83–I form and supporting statement as appropriate. A discussion of the OMB 83–I form and supporting statement prepared in compliance with the Paperwork Reduction Act is presented later in this preamble.

F. Test Data and Emission Limits

1. HF and HCl Emission Limits

Commenters stated that the test data EPA used to set the HF and HCl limits are questionable. An independent consultant, hired by the BSCP industry, reviewed the data and determined that six of the seven test runs used the wrong filter media. A glass filter media was used instead of a Teflon filter. The commenter suggested that, as a result, the data could be biased. One commenter also charged that EPA removed high test runs without any technical basis even though all of these runs met the same quality control (QC) criteria as other runs. Finally, one commenter stated that EPA's use of both HF and total fluorides (TF) data to develop the average uncontrolled HF emission factor (which was used in developing the HF emission limit) was unsupported, and the commenter believes that EPA should use only the HF test data because HF is the regulated pollutant.

We have reviewed the emission tests mentioned by the commenter and agree that there are some problems with most of the available test data, and we have accounted for any potential bias by revising the emission limits. In consultation with EPA's Emission Measurement Center (EMC), we used a conservative approach to determine the possible impact of the bias on the percent reduction emission limits. The analysis showed that our available percent reduction data could be as much as about 5 percent high, and we, therefore, decreased the corresponding HF and HCl percent reduction requirements by 5 percent and adjusted the corresponding production-based emission limits accordingly. In response to the commenter's assertion that we dropped two test runs without a technical reason, we examined the test runs in question and incorporated one of the two runs back into the data set used for developing the standards. Finally, in response to the appropriateness of using TF data in calculating the average HF emission factor, while the average of the TF and HF data sets suggest that TF and HF measurements are similar, we recognize the inconsistencies between the few available side-by-side HF and TF tests and we, therefore, decided to remove the TF data from the HF emission factor calculation. Based on the three issues discussed above, we revised the emission limits for kilns where MACT is based on use of DIFF, DLS/FF, or WS (*i.e.*, for new large kilns). Today's final rule requires new large kilns to limit HF emissions to 0.029 kilograms per megagram (kg/Mg) (0.057 pounds per ton (lb/ton)) of fired product or reduce HF emissions by 90 percent; and limit HCl emissions to 0.028 kg/Mg (0.056 lb/ton) or reduce HCl emissions by 85 percent.

The revised HF and HCl emission limits for existing large tunnel kilns, new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled tunnel kilns that are rebuilt are based on the use of a DLA for HAP reduction. Two HF emission tests (both conducted on the same source) and two total fluorides emission test are available for DLA-controlled kilns, and the tests showed HF or TF control efficiencies of 92.3 percent (HF), 96.4 percent (HF), 93.3 percent (TF), and 93.5 percent (TF). Similar to the DIFF and DLS/FF tests, we identified problems with the two HF emission tests that could have biased the control efficiencies high. To account for this uncertain bias, and considering typical vendor guarantees for DLA systems (vendors will guarantee 90 percent HF reduction unless a lesser percentage meets the customer's need, in which case the vendors typically provide lower guarantees), we selected a percent reduction emission limit of 90 percent for HF. We applied this 90 percent reduction to the revised average HF emission factor of 0.29 kg/Mg (0.57 lb/ton) to calculate a production-based HF emission limit of 0.029 kg/Mg (0.057 lb/ton). Control efficiency data for HCl are available from two tests on a single DLA-controlled kiln. The tests averaged 30.7 percent control, and we selected a percent reduction HCl emission limit of 30 percent. We applied this 30 percent reduction to the average HCl emission factor of 0.19 kg/Mg (0.37 lb/ton) to calculate a production-based HCl emission limit of 0.13 kg/Mg (0.26 lb/ton).

Percent of HAP metals in PM. Several commenters noted that HAP metals and PM data from four facilities (0.16 percent, 0.99 percent, 2.8 percent, and 4.5 percent) were used to arrive at 1.9 percent of the PM is PM HAP. The

commenters stated that EPA included an invalid, high data point for manganese in developing the percentage of PM that is PM HAP. We have examined the test run mentioned by the commenters and agree that the run should be voided. Our revised analyses now indicate that the overall percentage of PM that is HAP metals is 0.72 percent.

PM limit. Other commenters argued that a PM limit for brick kilns is unnecessary. One commenter noted that metals occur naturally in clays or shales used to make bricks and that PM emissions from BSCP plants are clay dust. The commenter argued that metals are locked into the structure of the clay dust and are not bio-available to affect humans through respiratory adsorption, ingestion, or dermal contact. Some commenters noted that there is limited information on the amount of HAP metals in the PM emitted. Commenters pointed out that EPA is not setting a PM limit for clay refractory kilns. Some commenters disagreed that PM is an adequate surrogate for HAP metals emissions. Commenters also requested that a percent reduction alternative be allowed for the PM standard, similar to the percent reduction limits for HF and HCl.

We agree that PM emitted from BSCP facilities is largely clay dust, and that metals are naturally occurring in clays and shales used to make bricks. Many BSCP facilities apply surface coatings or body additives containing HAP metals to their products, and these coatings are another potential source of HAP metals emissions. These types of additives and coatings are not used in the manufacture of clay refractories.

We have four emission tests for HAP metals from tunnel kilns and all of these tests measured some level of HAP metals emissions including emissions of antimony, arsenic, beryllium, cadmium, chromium, cobalt, mercury, manganese, nickel, lead, and selenium. Based on these data, we believe that all kilns emit some level of HAP metals and, therefore, we are regulating HAP metals emissions. Test data for HAP metals are not available for clay refractories kilns.

We are unaware of any information to support the idea that the HAP metals are locked into the structure of the clay and are not bio-available to affect humans. In the absence of such information and in the interest of protecting public health, we assume conservatively that the HAP metals are bio-available and could affect human health. This assumption is consistent with the conservative approach embodied in the CAA section 112(b)(2) directive that EPA add pollutants to the statutory list of HAP that "may" present adverse risks to human health and the environment through various exposure routes.

We used PM as a surrogate for HAP metals so that individual emission limits would not be based on the limited and variable data. We examined the available HAP metals test data and calculated that about 95 percent of the HAP metals emissions are in particulate form. Furthermore, the types of control technologies used on BSCP kilns remove PM and would indiscriminately remove particulate HAP metals. The United States Court of Appeals for the District of Columbia Circuit stated in a December 15, 2000 decision (in response to the National Lime Association (NLA) challenge of the use of PM as a surrogate for HAP metals), "if HAP metals are invariably present in cement kiln PM, then even if the ratio of metals to PM is small and variable, or simply unknown, PM is a reasonable surrogate for the metals—assuming * * * that PM control technology indiscriminately captures HAP metals along with other particulates." Our use of PM as a surrogate for HAP metals in the final BSCP rule is consistent with this decision.

We typically do not include percent reduction as an alternative for PM because a percent reduction standard rewards those facilities that have high inlet PM loadings. We believe that this is different from the percent reduction standards for HF and HCl because facilities do not typically have options for reducing the uncontrolled levels of HF or HCl. Therefore, we are not providing an alternative percent reduction standard for PM.

The revised PM emission limit for existing large tunnel kilns, new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled tunnel kilns that are rebuilt is based on the use of a DLA. Data from four tests conducted at the outlets of DLA were available for establishing a production-based emission limit, and we selected the highest PM data point as the emission limit in order to account for variability. Today's final rule contains a PM emission limit of 0.21 kg/Mg (0.42 lb/ton) of fired product for existing large tunnel kilns, new and reconstructed small tunnel kilns, existing small kilns that are rebuilt such that they become large kilns, and existing large DLA-controlled tunnel kilns that are rebuilt. The PM emission limit for new and reconstructed large tunnel kilns is unchanged from proposal (0.060 kg/Mg (0.12 lb/ton) of fired product).

G. Monitoring Requirements

Numerous comments were received on the proposed monitoring requirements. Some commenters felt that the monitoring, reporting, and recordkeeping requirements were unreasonable. Commenters noted that the monitoring requirements would require additional and higher skilled personnel.

Under section 114(a)(3) of the CAA, owners or operators of major sources are required to conduct enhanced monitoring of affected sources to ensure compliance with applicable emission standards. In response to this mandate, we have incorporated continuous compliance requirements into all part 63 standards, generally in the form of continuous emissions monitoring or continuous parameter monitoring. We believe that continuous monitoring is needed to ensure that emission controls are operated properly. However, 40 CFR 63.8(f) allows owners and operators of affected sources to request approval for alternative monitoring procedures to demonstrate compliance with emission limitations.

Although we have eliminated some of the proposed monitoring requirements (such as fabric filter inlet temperature monitoring) from today's final rule, we have retained most of the proposed monitoring requirements. We believe that those monitoring requirements are the minimum needed to ensure continuous compliance with the emission limits.

1. Operation, Maintenance, and Monitoring (OM&M) Plan

Some commenters felt that development of an OM&M plan was overly burdensome. One commenter thought the requirement to include OM&M procedures for kiln operation was unjustified. Another commenter noted possible contradictions of OM&M plan requirements and Table 7 of the proposed BSCP rule (the table showing applicability of the General Provisions to part 63).

After reviewing these comments, we decided that OM&M plans do not have to include procedures for monitoring the operation and maintenance of tunnel kilns, and we have written the final rule accordingly. However, we continue to believe that site-specific OM&M plans are necessary to ensure continued proper operation of any control device that is used to comply with the final rule.

Regarding the apparent contradictions between 40 CFR 63.8425(b)(8) through (10) and Table 7 of the proposed rule, we did not cite the General Provisions

to part A in the proposed 40 CFR 63.8425 (b)(8) through (10), but specified that OM&M plans must include operation and maintenance, quality assurance, and reporting and recordkeeping procedures that are consistent with the General Provisions. Therefore, we believe there is no contradiction between 40 CFR 63.8425 (b)(8) through (10) and Table 7 of the proposed rule. However, we did clarify in Table 7 of the final rule that 40 CFR 63.8(c)(4) does not apply to subpart JJJJJ because 40 CFR 63.8425 and 63.8465 specify the requirements for continuous monitoring systems (CMS).

Some commenters requested clarification on whether OM&M plans (and startup, shutdown, and malfunction plans (SSMP)) are required for kilns that would not be subject to control requirements (*e.g.*, existing small tunnel kilns). Another commenter questioned if an OM&M plan would be required if compliance is achieved without a control device. The BSCP NESHAP applies only to affected sources. Under today's final rule, an existing small tunnel kiln is not an affected source. Therefore, the requirements for OM&M plans, SSMP, and other monitoring, notification, reporting, and recordkeeping requirements do not apply to those kilns. Owners or operators will be required to prepare an OM&M plan and SSMP for any kiln that is an affected source even if the kiln can meet the emission limits without the use of a control device.

2. Bag Leak Detectors

Commenters indicated that bag leak detectors are unnecessary, overly protective, and maintenance intensive. The commenters noted that bag failure is noticeable because PM emissions would be visible at the stack. Several commenters requested that opacity or visible emissions (VE) determinations be allowed as opposed to bag leak detectors.

We agree with the commenters that periodic VE checks should provide a reasonable alternative to bag leak detectors, and we have written the final rule accordingly. In today's final rule, owners and operators of affected kilns that are controlled with a DLS/FF or DIFF can choose between installing a bag leak detection system or performing daily VE checks. Today's final rule also includes a provision for decreasing the frequency of VE checks provided no VE are observed.

3. Water Injection Rate Monitoring on DLS/FF

Three commenters stated that DLS/FF water injection rate monitoring has nothing to do with HF or HCl removal (but is important for sulfur dioxide (SO_2) removal) and recommended that the provision for monitoring DLS/FF water injection rate be eliminated.

After reviewing the available information, we decided to eliminate the requirement for water injection rate monitoring on affected DLS/FF-controlled kilns. Water injection is used to enhance the removal of SO_2 by a DLS/FF, but has little effect on removal of HF and HCl.

4. Fabric Filter Inlet Temperature

Several commenters recommended that the requirement to monitor fabric filter inlet temperature be eliminated from the rule as proposed. The commenters explained that it would be impractical to hold the fabric filter inlet temperature to within 25 degrees below the average established during the performance test. The fabric filter inlet temperature varies frequently, much more than 25 degrees, because of many process factors. Other commenters noted that fabric filter inlet temperature has little relevancy to acid gas control. One commenter stated that control systems using hydrated lime are generally known to have increased HCl and HF removal when temperatures increase.

As a result of these comments, we have eliminated the requirement for monitoring fabric filter inlet temperatures on affected kilns that are controlled with a DLS/FF or DIFF. We believe that the other monitoring requirements (*e.g.*, lime feed rate monitoring and periodic VE checks) that we have incorporated into the final rule are adequate for ensuring continuous compliance with the emission limits.

5. DLA Parameter Monitoring

Many commenters suggested potential parametric monitoring requirements for DLA that could be used to demonstrate continuous compliance. Various commenters suggested documenting use, on a continuous basis, of the same limestone that was used during the performance test demonstrating compliance. Other suggestions included monitoring pressure drop (demonstrating airflow); limestone flow; and inlet and/or exhaust gas temperature.

We have incorporated parameter monitoring requirements for DLA into the final rule based on information provided by commenters and a recent site visit to a facility operating a DLA. Today's final rule will require owners and operators of affected kilns with DLA to continuously monitor the pressure drop across the DLA; perform a daily visual check of the limestone hopper and storage bin (located at the top of the DLA), and record the limestone feeder setting daily; and perform periodic VE observations. In addition, owners and operators will be required to document the source of the limestone used during the most recent performance test and maintain records that demonstrate that the source of limestone has not changed.

6. Continuous Emission Monitoring Systems

In the preamble to the proposed rule, we requested comment on requiring the application of PM continuous emission monitoring systems (CEMS) as a method to assure continuous compliance with the proposed PM emission limits for BSCP tunnel kilns. While we believe there is evidence that PM CEMS should work on BSCP tunnel kilns, we received no comments in support of requiring PM CEMS. Commenters opposed use of CEMS when less expensive, but effective, parametric monitoring alternatives are available. Therefore, today's final rule does not require use of PM CEMS or any other type of CEMS. We believe that the parameter monitoring requirements specified in the final rule are adequate for ensuring continuous compliance.

7. Establishing/Re-Establishing Production Rate

Several commenters requested that the process weight threshold be based on average annual throughput instead of hourly or monthly throughput. One commenter pointed out that the nature of brick production does not allow for spikes in emissions. Several commenters stated that the averaging period used to determine the MACT floor applicability to existing tunnel kilns must have the same production averaging basis as the data used in setting the subcategorization level. The commenters stated that it is not reasonable to base the standard on a 12-month averaging period and then enforce the floor on an instantaneous or 30-day rolling averaging period.

One commenter requested clarification as to whether EPA would require a retest if the maximum production level of a kiln would be higher than the level observed during the performance test. The commenter added that several States recognize that capacity and maximum production are difficult figures to calculate for a brick kiln because they are highly dependent

on the specific characteristics of a product (size, percent void).

We agree with the commenters that a kiln's process weight threshold (*e.g.*, design capacity level) should be based on average annual tonnage rather than on the proposed 30-day rolling average. We have revised the final BSCP rule accordingly to require the ton per hour production capacity of a kiln to be calculated based on the maximum amount of BSCP (in tons) that can be produced in a 12-month period divided by 8,760 hours per year.

Regarding the question of whether we will require a retest if the maximum production level of a kiln is higher than the level observed during the performance test, a retest will be required because an increase in production is likely to increase emissions, and the operating limits that are based on the performance test would no longer demonstrate continuous compliance with the emission limits.

8. Test Methods

One commenter requested that we allow any of the applicable EPA Method 5 variations to demonstrate compliance with the PM standard. The commenter pointed out that a facility with high SO_2 could reduce the potential for SO_2 to be counted as PM by using EPA Method 5B. We are not including EPA Method 5B as a test method because our emission limit is based on EPA Method 5 and includes tests on sources with high SO_2 emissions. Individual facilities will have the option of requesting an alternative test method.

One commenter on the proposed clay ceramics rule requested that the final rule provide facilities with the option to use either EPA Method 26A or EPA Method 320 for all required stack testing for HF and HCl. This comment applies for both BSCP and clay ceramics. Therefore, we have modified today's final BSCP rule to include EPA Method 320 as an alternative to EPA Method 26A.

H. Startup, Shutdown, and Malfunction

1. APCD Bypass

Several commenters stated that the BSCP rule, as proposed, would not allow the kiln control device to be bypassed at any time. Various commenters stated that the proposed MACT controls (DIFF, DLS/FF, or WS) must maintain a given flow to perform efficiently. Thus, the APCD would dictate how the kiln is operated. During initial kiln startup or subsequent kiln startups or shutdowns, airflow temperatures and volumes would be below APCD design volumes. The heat from the furnace zone could damage the kiln walls and cars if not vented. Therefore, the ability to bypass during startups, routine maintenance, and emergency shutdowns of the APCD is needed.

Several commenters noted that brick kilns are constant flow devices that cannot just be turned off without detrimental impact to large volumes of product (*e.g.*, character, color, and quality of brick) and the kiln itself. The commenters stated that days to weeks may be needed to properly shut down a brick kiln. One commenter noted that kilns operate continuously 2 to 3 years before being shut down for routine maintenance.

Commenters stated that short periods of bypass are necessary to conduct routine preventive maintenance inspections of APCD. Commenters pointed out that the control devices currently employed have and use bypass capability for routine maintenance and emergency repairs.

We generally agree with the commenters that some provision is needed to allow the control device on tunnel kilns to be bypassed for routine maintenance of the control device, and we have revised the rule accordingly. Under 40 CFR 63.8420(e) of today's final rule, owners and operators of an affected tunnel kiln can bypass the kiln control device for a cumulative period of up to 4 percent of the annual operating hours for the kiln. Based on the data and other information submitted by commenters on the proposed rule, we believe that the amount of time equating to 4 percent of annual kiln operating hours is adequate for completing routine maintenance on the types of controls that are likely to be used to comply with the BSCP NESHAP.

To comply with this bypass provision, owners or operators must submit a request to us for a routine control device maintenance exemption. The request must justify the need for the routine maintenance on the control device and the time required to complete the maintenance activities. The request also must describe the maintenance activities and the frequency of the maintenance activities, explain why the maintenance cannot be accomplished during kiln shutdowns, and describe how emissions will be minimized during the period when the kiln is operating and the control device is offline. Upon approval, the request for exemption must be incorporated by reference in, and attached to, the affected source's title V permit. During any period when the kiln is operating and the kiln control device is offline, the owner or operator must minimize HAP emissions. The duration of such periods also must be minimized.

We also note that the bypass provision included in today's final rule does not apply to startups, shutdowns, or malfunctions. 40 CFR 63.6(f)(1) explicitly states that nonopacity emission standards, such as the proposed emission limits for HF, HCl, and PM, "* * * apply at all times except during periods of startup, shutdown, and malfunction * * *" Startups, shutdowns, and malfunctions must be addressed in a facility's SSMP.

2. Initial Startup

Commenters stated that it is impractical to meet emission standards during initial startup of a tunnel kiln. The commenters indicated that it can take from weeks to a year to bring new BSCP kilns online. In addition, APCD such as DIFF, DLS/FF, or WS cannot be brought online until adequate temperature and airflow ranges are met. The commenters indicated that roughly 75 percent of design gas flow rate or kiln production rate must be obtained before a DIFF or DLS/FF could begin to operate properly. Another commenter stated that the proposed initial testing deadline (180 days following the compliance date) would not provide enough time for a new kiln to come up-to-speed.

We recognize that an extended period of time may be needed for the initial startup of a new kiln and have added a definition of initial startup to the BSCP final rule to address the concerns expressed by the commenters. The definition differentiates between DLA-controlled kilns and DIFF-, DLS/FF-, or WS-controlled kilns, because DLA are not sensitive to airflow and only require that the kiln gases are hot enough to avoid condensation in the DLA. Avoiding condensation is necessary because water and calcium carbonate (limestone) combine to make cement, and any introduction of water in the DLA reaction chamber could cause the limestone to be cemented together. In the final rule, we provided the following definition: "Initial startup" means: (1) For a new or reconstructed tunnel kiln controlled with a DLA, and for a tunnel kiln that would be considered reconstructed but for 40 CFR 63.8390(i)(1) or 40 CFR 63.8390(i)(2), the time at which the temperature in the kiln first reaches 260 °C (500 °F) and the kiln contains product; or (2) for a new or reconstructed tunnel kiln controlled with a DIFF, DLS/FF, or WS, the time at which the kiln first reaches a level of production that is equal to 75 percent of the kiln design capacity or 12 months

after the affected source begins firing BSCP, whichever is earlier. Although some commenters suggested that initial startup for DIFF-, DLS/FF-, and WS-controlled kilns be defined in terms of airflow, we defined initial startup in terms of production rate for DIFF-, DLS/FF-, and WS-controlled kilns because the final rule requires owners and operators of affected sources to monitor production rate, whereas flowrate monitoring is not required under today's final rule. We included the stipulation for DIFF-, DLS/FF-, and WS-controlled kilns that initial startup occurs no later than 12 months after the new kiln begins firing BSCP to prevent facilities from operating an affected new or reconstructed kiln at just less than 75 percent of the kiln design capacity long term to circumvent the final rule. A similar stipulation is not necessary for DLA-controlled kilns because the kiln temperature requirement is such that the kiln cannot produce BSCP until well after the temperature is reached.

By defining initial startup in today's final rule, we also have clarified the compliance date for new and reconstructed sources, which is specified in terms of the initial startup. Thus, new and reconstructed DIFF-, DLS/FF-, and WS-controlled tunnel kilns beginning operation after the promulgation date will be allowed to reach 75 percent of the kiln design capacity before initial startup is triggered and the APCD must come online. New and reconstructed DLA-controlled tunnel kilns, and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8390(i)(1) or 40 CFR 63.8390(i)(2), beginning operation after the promulgation date will trigger initial startup when the temperature in the kiln first reaches 260°C (500°F) and the kiln contains product. Performance testing is required 180 days following the compliance date (*i.e.*, 180 days following initial startup). Facilities wishing to conduct performance testing to determine the level of air pollution control necessary may conduct such testing prior to achieving initial startup.

3. Startup

Two commenters expressed concern with how startup is defined with respect to the proposed rule. The commenters stated that, under the proposed rule, a kiln could be considered to be operating if only one burner was operating. However, a kiln could have as many as 100 burners or more. To clarify what constitutes kiln startup we added to today's final rule a definition of "startup" that incorporates "starting the production process."

4. Deviations

One commenter felt that the requirement of reporting emissions as deviations during startup, shutdown, or malfunction (SSM) is inappropriate because facilities are not required to be in compliance with the emission limitations during SSM. Another commenter requested that EPA make it clear the deviations are not necessarily an indication of noncompliance or excess emissions.

The term deviation applies to events during which an affected source fails to meet an emission limitation or comply with another requirement of the final rule. Deviations are not synonymous with violations; depending on the circumstances, a deviation may or may not be a violation of an applicable requirement. We agree with the commenter that an affected source need not be in compliance with emission limits during periods of SSM. Although we consider non-compliance with emission limits during startup, shutdown, and malfunction to be deviations from the emission limits, we do not consider these deviations to be violations of the emission limits. 40 CFR 63.7(e)(1) specifies that, "Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test, nor shall emissions in excess of the level of the relevant standard during periods of startup, shutdown, and malfunction be considered a violation of the relevant standard unless otherwise specified in the relevant standard or a determination of noncompliance is made under 40 CFR 63.6(e)." As indicated in Table 7 of the final rule, this language of the general provisions to part 63 does apply to subpart JJJJJ. The definition of deviation included in today's final rule is consistent with how deviation is defined in other NESHAP, and has not been changed since proposal.

I. Risk-Based Approaches

The preamble to the proposed BSCP rule requested comment on whether there might be further ways to structure the BSCP rule to focus on the facilities which pose significant risks and avoid the imposition of high costs on facilities that pose little risk to public health and the environment. Specifically, we requested comment on the technical and legal viability of two risk-based approaches: (1) An applicability cutoff for threshold pollutants under the authority of CAA section 112(d)(4); and (2) subcategorization and delisting under the authority of CAA sections 112(c)(1) and 112(c)(9).[3] We indicated that we would evaluate all comments before determining whether either approach would be included in the final BSCP rule. Numerous commenters submitted detailed comments on these risk-based approaches. These comments are summarized in the BSCP Response-to-Comments document (see **SUPPLEMENTARY INFORMATION** section).

Based on our consideration of the comments received and other factors, we have decided not to include the risk-based approaches in today's final BSCP rule. The risk-based approaches described in the proposed BSCP rule and addressed in the comments we received raise a number of complex issues. In addition, we are under time pressure to complete the BSCP rule, because the statutory deadline for promulgation has passed and a deadline suit has been filed against EPA. (See Sierra Club v. Whitman, Civil Action No. 1:01CV01537 (D.D.C.).) Given the range of issues raised by the risk-based approaches and the need to promulgate a final rule expeditiously, we believe that it is appropriate not to include any risk-based approaches in today's final BSCP rule. Nonetheless, we expect to continue to consider risk-based approaches in connection with other proposed NESHAP where we have described and solicited comment on such approaches. Finally, while we are not including risk-based approaches in today's final BSCP rule, we have included a number of other measures that we expect will reduce the costs and burdens on the affected sources.

III. Summary of the Final Brick and Structural Clay Products Manufacturing NESHAP

A. What Source Category Is Regulated by the Final Rule?

Today's final rule for BSCP manufacturing applies to BSCP manufacturing facilities that are, are located at, or are part of, a major source of HAP emissions. The BSCP manufacturing source category includes those facilities that manufacture brick (including, but not limited to, face brick, structural brick, and brick pavers); clay pipe; roof tile; extruded floor and wall tile; and/or other extruded, dimensional clay products. Brick and structural clay products primarily are produced from common clay and shale. Production of BSCP typically consists of processing and handling the raw materials, forming

[3] See 68 FR 1276 (January 9, 2003) (Plywood and Composite Wood Products Proposed NESHAP) and docket number A–98–44, Item No. II–D–525 (White papers submitted to EPA outlining the risk-based approaches).

and cutting bricks and shapes, and drying and firing the bricks and shapes. One by-product of brick manufacturing is crushed brick, which is produced at some facilities by crushing reject bricks.

There are a total of 189 domestic BSCP manufacturing facilities; 170 of these facilities primarily produce brick, and 19 of these facilities primarily produce structural clay products. The 189 BSCP manufacturing facilities are located in 39 States and are owned by 89 companies. Seventy-six of the companies are small businesses, and these 76 companies own 92 of the BSCP manufacturing facilities. Thirteen of the companies are large businesses, and these 13 companies own 97 BSCP manufacturing facilities.

All BSCP are fired either in continuous (tunnel or roller) or batch (periodic) kilns. Because the vast majority of continuous kilns are tunnel kilns, continuous kilns, including roller kilns, will be referred to as tunnel kilns for the remainder of this preamble. A total of 314 permitted and operable tunnel kilns were reported by industry; 302 of these kilns are located at facilities that are estimated, based on uncontrolled emissions, to be major sources. Of the 302 tunnel kilns located at major sources, 275 are located at brick manufacturing facilities and 27 are located at structural clay products manufacturing facilities. A total of 227 permitted and operable periodic kilns were reported by industry; 164 of these kilns are located at facilities that are estimated to be major sources. Of the 164 periodic kilns located at major sources, 81 are located at brick manufacturing facilities and 83 are located at structural clay products manufacturing facilities.

The primary HAP emissions sources at BSCP manufacturing plants are tunnel kilns and periodic kilns, which emit HF, HCl, and HAP metals. Kilns also emit PM and SO_2. Other sources of HAP emissions at BSCP manufacturing plants are the raw material processing and handling equipment. The APCD that are used by the industry to control emissions from kilns include DIFF, DLS/FF, DLA, WS, and fabric filters.

B. What Are the Affected Sources?

The existing affected source, which is the portion of each source in the category for which we are setting emission standards, is any existing large tunnel kiln. Large tunnel kilns have a design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product. Such tunnel kilns may be fired by natural gas or other fuels, including sawdust. Sawdust firing typically involves the use of a sawdust dryer because sawdust typically is purchased wet and needs to be dried before it can be used as fuel. Consequently, some sawdust-fired tunnel kilns have two process streams, including: A process stream that exhausts directly to the atmosphere or to an APCD, and a process stream in which the kiln exhaust is ducted to a sawdust dryer where it is used to dry sawdust before being emitted to the atmosphere.

Today's final rule focuses on those process streams from existing large tunnel kilns that exhaust directly to the atmosphere or to an APCD. For existing large tunnel kilns that do not have sawdust dryers, the kiln exhaust process stream (*i.e.*, the only process stream) is subject to the requirements of today's final rule. In accordance with CAA section 112(d)(1), we have divided tunnel kilns that duct exhaust to sawdust dryers into two classes for purposes of regulation. For existing large tunnel kilns that ducted exhaust to sawdust dryers prior to July 22, 2002, only the process stream that is emitted directly to the atmosphere or to an APCD is subject to the requirements of today's final rule; any process stream from such kilns that is ducted to a sawdust dryer is not subject to those requirements.

By contrast, for existing large tunnel kilns that first duct exhaust to sawdust dryers on or after July 22, 2002, all of the exhaust (*i.e.*, both the process stream that is emitted directly to the atmosphere or to an APCD and the process stream that is ducted to a sawdust dryer) is subject to the same level of control requirement as a new tunnel kiln.

In addition, each new or reconstructed tunnel kiln is an affected source and all process streams from new or reconstructed tunnel kilns are subject to the requirements of today's final rule. The requirements of today's final rule for new and reconstructed tunnel kilns are different for small and large kilns. Small tunnel kilns have design capacities less than 9.07 Mg/hr (10 tph) of fired product, and large tunnel kilns have design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product. A source is a new affected source if construction began on or after July 22, 2002. An affected source is reconstructed if the criteria defined in 40 CFR 63.2 are met, as qualified by 40 CFR 63.8390(i). An affected source is existing if it is not new or reconstructed.

An existing tunnel kiln with a federally enforceable permit condition that restricts kiln operation to less than 9.07 Mg/hr (10 tph) of fired product on an annual average basis is not subject to the requirements of today's final rule. Kilns that are used exclusively for R&D and not used to manufacture products for commercial sale, except in a *de minimis* manner, are not subject to the requirements of today's final rule. Finally, kilns that are used exclusively for setting glazes on previously fired products are not subject to the requirements of today's final rule.

C. When Must I Comply With the Final Rule?

Existing affected sources must comply within 3 years of May 16, 2003. New and reconstructed affected sources with an initial startup before May 16, 2003 must comply no later than May 16, 2003. New and reconstructed affected sources with an initial startup after May 16, 2003 must comply upon initial startup. Existing area sources that subsequently become major sources have 3 years from the date they become major sources to come into compliance. Any portion of existing facilities that become new or reconstructed major sources and any new or reconstructed area sources that become major sources must be in compliance upon initial startup.

D. What Are the Emission Limits?

Today's final rule includes emission limits in the form of production-based mass emission limits and percent reduction requirements. In establishing the HAP emission limits, we selected PM as a surrogate for HAP metals (including mercury in particulate form). Today's final rule contains HF, HCl, and PM emission limits for existing, new, and reconstructed affected sources at BSCP manufacturing facilities, as well as for the following affected sources that would be considered reconstructed but for 40 CFR 63.8390(i): Existing small tunnel kilns whose design capacity is increased such that it is equal to or greater than 9.07 Mg/hr (10 tph) of fired product or existing large DLA-controlled kilns.

If you own or operate an existing large tunnel kiln, a new or reconstructed small tunnel kiln, an existing small kiln that is rebuilt such that it becomes a large kiln, or an existing large DLA-controlled kiln that is rebuilt, you must meet an HF emission limit of 0.029 kg/Mg (0.057 lb/ton) of fired product or reduce uncontrolled HF emissions by at least 90 percent for affected process streams. You must meet an HCl emission limit of 0.13 kg/Mg (0.26 lb/ton) of fired product or reduce uncontrolled HCl emissions by at least 30 percent. You are required to meet a PM emission limit of 0.21 kg/Mg (0.42 lb/ton) of fired product.

If you own or operate a new or reconstructed large tunnel kiln, you must meet an HF emission limit of 0.029 kg/Mg (0.057 lb/ton) of fired product or reduce uncontrolled HF emissions by at least 90 percent for all process streams. You must meet an HCl emission limit of 0.028 kg/Mg (0.056 lb/ton) of fired product or reduce uncontrolled HCl emissions by at least 85 percent. You are required to meet a PM emission limit of 0.060 kg/Mg (0.12 lb/ton) of fired product.

E. What Are the Operating Limits?

In addition to the emission limits, today's final rule includes operating limits that apply to APCD used to comply with the final rule. The operating limits require you to maintain certain process or APCD parameters within levels established during performance tests. Each facility affected by today's final rule is required to prepare, implement, and revise, as necessary, an OM&M plan. The OM&M plan generally specifies the operating parameters to be monitored; the frequency that parameter values will be determined; the limits for each parameter; procedures for proper operation and maintenance of APCD and monitoring equipment; procedures for responding to parameter deviations; and procedures for documenting compliance.

We have established operating limits for DLA, DIFF, DLS/FF, and WS. If you operate a DLA, you must maintain the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test. You also must maintain an adequate amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times. In addition, you must maintain the limestone feeder setting at or above the level established during the performance test and you must use the same grade of limestone from the same source as was used during the performance test. Finally, you must maintain no VE from the DLA stack.

If you operate a DIFF or DLS/FF, you must maintain free-flowing lime in the feed hopper or silo and to the APCD at all times and maintain the feeder setting at or above the level established during your performance test. In addition, you have the option of using a bag leak detection system or monitoring VE. If you use a bag leak detection system, you must initiate corrective action within 1 hour of a bag leak detection system alarm and complete corrective actions according to your OM&M plan, and operate and maintain the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month reporting period. If you monitor VE, you must maintain no VE from the DIFF or DLS/FF stack.

If you operate a WS, you are required to maintain the average scrubber pressure drop, the average scrubber liquid pH, the average scrubber liquid flow rate, and the average chemical addition rate, if applicable, for each 3-hour block period at or above the average values established during your performance test.

If you own or operate an affected source equipped with an alternative APCD or technique not listed in the rule, you must establish operating limits for the appropriate operating parameters subject to prior written approval by the Administrator as described in 40 CFR 63.8(f). You are required to submit a request for approval of alternative monitoring procedures that includes a description of the alternative APCD or technique, the type of monitoring device or procedure that you would use, the appropriate operating parameters that you would monitor, and the frequency that the operating parameter values would be determined and recorded. You must establish site-specific operating limits during your performance test based on the information included in the approved alternative monitoring procedures request. You are required to install, operate, and maintain the parameter monitoring system for the alternative APCD or technique according to your OM&M plan.

F. What Are the Performance Test and Initial Compliance Requirements?

We are requiring owners and operators of all affected sources to conduct an initial performance test using specified EPA test methods to demonstrate initial compliance with the emission limits. A performance test must be conducted before renewing your 40 CFR part 70 operating permit or at least every 5 years following the initial performance test, as well as when an operating limit parameter value is being revised. You must test at the outlet of the APCD and prior to any releases to the atmosphere for all affected sources. If meeting the percent reduction emission limits for HF or HCl, you must also test at the APCD inlet. You must conduct each test while operating at the maximum production level.

Under today's final rule, you are required to measure emissions of HF, HCl, and PM. You must measure HF and HCl emissions using EPA Method 26A, "Determination of Hydrogen Halide and Halogen Emissions from Stationary Sources-Isokinetic Method," 40 CFR part 60, appendix A, or any other alternative method that has been approved by the Administrator under 40 CFR 63.7(f) of the general provisions. The EPA Method 26, "Determination of Hydrogen Chloride Emissions from Stationary Sources," 40 CFR part 60, appendix A, may be used when no acid particulate matter (*e.g.*, HF or HCl dissolved in water droplets emitted by sources controlled by a WS) is present. As an alternative to using EPA Methods 26A or 26, you may measure HF and HCl emissions using EPA Method 320 "Measurement of Vapor Phase Organic and Inorganic Emission by Extractive FTIR" 40 CFR part 63, appendix A. When using EPA Method 320, you must follow the analyte spiking procedures of section 13 of Method 320 unless you can demonstrate that the complete spiking procedure has been conducted at a similar source. Particulate matter emissions must be measured using EPA Method 5, "Determination of Particulate Emissions from Stationary Sources," 40 CFR part 60, appendix A, or any other approved alternative method.

To determine initial compliance with the production-based mass emission limits for HF, HCl, and PM, you must calculate the mass emissions per unit of production for each test run using the mass emission rates of HF, HCl, and PM and the production rate (on a fired-product basis) measured during your performance test. To determine initial compliance with any of the percent reduction emission limits, you must calculate the percent reduction for each test run using the mass emission rates, measured during your performance test, of the specific HAP (HF or HCl) entering and exiting the APCD.

Prior to your initial performance test, you are required to install the CMS (*e.g.*, continuous parameter monitoring system) equipment to be used to demonstrate continuous compliance with the operating limits. During your initial test, you must use the CMS to establish site-specific operating parameter values that represent your operating limits.

If you operate a DLA, you must continuously measure the pressure drop across the DLA during the performance test and determine the 3-hour block average pressure drop. You also must maintain an adequate amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times. In addition, you must establish your limestone feeder setting one week prior to the performance test and maintain the feeder setting for the one-week period

that precedes the performance test and during the performance test. Finally, you are required to document the source and grade of the limestone used during the performance test.

If you operate a DIFF or DLS/FF, you are required to ensure that lime in the feed hopper or silo and to the APCD is free-flowing at all times during the performance test, and you are required to record the feeder setting for the three test runs. If the lime feed rate varies, you are required to determine the average feed rate from the three test runs. If you use a bag leak detection system, you must submit analyses and supporting documentation demonstrating conformance with EPA guidance and specifications for bag leak detection systems.

If you operate a WS, you are required to continuously measure the scrubber pressure drop, the scrubber liquid pH, the scrubber liquid flow rate, and the chemical addition rate (if applicable). For each WS parameter, you are required to determine and record the average values for the three test runs and the 3-hour block average value.

G. What Are the Continuous Compliance Requirements?

Today's final rule requires that you demonstrate continuous compliance with each emission limitation that applies to you. You must follow the requirements in your OM&M plan and document conformance with your OM&M plan. You are required to operate a CMS to monitor the operating parameters established during your initial performance test as described in the following paragraphs. The CMS must collect data at least every 15 minutes, and you need to have at least three of four equally spaced data values (or at least 75 percent if you collect more than four data values per hour) per hour (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption) to have a valid hour of data. You must operate the CMS at all times when the process is operating. You also have to conduct proper maintenance of the CMS, including inspections, calibrations, and validation checks, and maintain an inventory of necessary parts for routine repairs of the CMS. Using the recorded readings, you must calculate and record the 3-hour block average values of each operating parameter. To calculate the average for each 3-hour averaging period, you must have at least 75 percent of the recorded readings for that period (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption).

If you operate a DLA, you must collect and record data documenting the DLA pressure drop and reduce the data to 3-hour block averages. You must maintain the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test. You also must verify that the limestone hopper, storage bin (located at the top of the DLA), and DLA contain an adequate amount of limestone by performing a daily visual check of the limestone hopper and the storage bin, and if the hopper or storage bin do not contain adequate limestone you must promptly initiate and complete corrective actions according to your OM&M plan. You also must record the limestone feeder setting daily to verify that the feeder setting is being maintained at or above the level established during the performance test. You also must use the same grade of limestone from the same source as was used during the performance test and maintain records of the source and type of limestone. Finally, you must perform daily, 15-minute VE observations in accordance with the procedures of EPA Method 22, "Visual Determination of Fugitive Emissions from Material Sources and Smoke Emissions from Flares," 40 CFR part 60, appendix A. During the VE observations, the kiln must be operating under normal conditions. If VE are observed, you must promptly initiate and complete corrective actions according to your OM&M plan. If no VE are observed in 30 consecutive daily EPA Method 22 tests, you may decrease the frequency of EPA Method 22 testing from daily to weekly for that kiln stack. If VE are observed during any weekly test, you must promptly initiate and complete corrective actions according to your OM&M plan and you must resume EPA Method 22 testing of that kiln stack on a daily basis until no VE are observed in 30 consecutive daily tests, at which time you may again decrease the frequency of EPA Method 22 testing to a weekly basis.

For DIFF and DLS/FF systems, you must maintain free-flowing lime in the feed hopper or silo and to the APCD at all times. If lime is found not to be free flowing via the output of a load cell, carrier gas/lime flow indicator, carrier gas pressure drop measurement system, or other system, you must promptly initiate and complete corrective actions according to your OM&M plan. You also have to maintain the feeder setting at or above the level established during your performance test and record the feeder setting once each shift. If you use a bag leak detection system, you must initiate corrective action within 1 hour of a bag leak detection system alarm and complete corrective actions according to your OM&M plan. You also must operate and maintain the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month block reporting period. In calculating this operating time fraction, if inspection of the fabric filter demonstrates that no corrective action is required, no alarm time is counted. If corrective action is required, each alarm must be counted as a minimum of 1 hour, and if you take longer than 1 hour to initiate corrective action, the alarm time must be counted as the actual amount of time taken to initiate corrective action. As an alternative to using a bag leak detection system, you may monitor VE. If you choose to monitor VE, you must perform daily, 15-minute VE observations in accordance with the procedures of EPA Method 22. During the VE observations, the kiln must be operating under normal conditions. If VE are observed, you must promptly initiate and complete corrective actions according to your OM&M plan. If no VE are observed in 30 consecutive daily EPA Method 22 tests, you may decrease the frequency of EPA Method 22 testing from daily to weekly for that kiln stack. If VE are observed during any weekly test, you must promptly initiate and complete corrective actions according to your OM&M plan and you must resume EPA Method 22 testing of that kiln stack on a daily basis until no VE are observed in 30 consecutive daily tests, at which time you may again decrease the frequency of EPA Method 22 testing to a weekly basis.

For WS, you are required to continuously maintain the 3-hour block averages for scrubber pressure drop, scrubber liquid pH, scrubber liquid flow rate, and chemical addition rate (if applicable) at or above the minimum values established during your performance test.

H. What Are the Notification, Recordkeeping, and Reporting Requirements?

We are requiring owners and operators of all affected sources to submit initial notifications, notifications of performance tests, and notifications of compliance status by the specified dates in the final rule, which may vary depending on whether the affected source is new or existing. In addition to the information specified in 40 CFR

63.9(h)(2)(i), you are required to include the following in your notification of compliance status: (1) The operating limit parameter values established for each affected source (with supporting documentation) and a description of the procedure used to establish the values, and (2) if applicable, analysis and supporting documentation demonstrating conformance with EPA guidance and specifications for bag leak detection systems.

We are requiring owners and operators of all affected sources to submit semiannual compliance reports containing statements and information concerning emission limitation deviations, out-of-control CMS, periods of startup, shutdown, or malfunction, when actions consistent with your approved SSMP were taken, and periods of routine control device maintenance for facilities obtaining a routine control device maintenance exemption. In addition, if you undertake an action that is inconsistent with your approved SSMP, then you are required to submit a startup, shutdown, and malfunction report within 2 working days of starting such action and within 7 working days of ending such action unless you have made alternative arrangements with the permitting authority.

We are requiring owners and operators of all affected sources to maintain records for at least 5 years from the date of each record. You must retain the records onsite for at least the first 2 years but may retain the records offsite for the remaining 3 years. You are required to keep a copy of each notification and report, along with supporting documentation. You are required to keep records related to the following: (1) Records of startup, shutdown, or malfunction; (2) records of performance tests; (3) records to show continuous compliance with each emission limitation; (4) if a bag leak detection system is used, records of each bag leak detection system alarm, including the time of the alarm, the time corrective action was initiated and completed, and a description of the cause of the alarm and the corrective action taken; (5) if VE measurements are taken, records of VE observations; (6) records of each operating limit parameter value deviation, including the date, time, and duration of the deviation, a description of the cause of the deviation and the corrective action taken, and whether the deviation occurred during a period of startup, shutdown, or malfunction; (7) records of routine control device maintenance for facilities obtaining a routine control device maintenance exemption, including a copy of the approved request for a routine control device maintenance exemption; (8) records of production rate; (9) records for any approved alternative monitoring or test procedures; and (10) current copies of your SSMP and OM&M plan, including any revisions, with records documenting conformance.

IV. Summary of Environmental, Energy, and Economic Impacts for the Final Brick and Structural Clay Products Manufacturing NESHAP

A. What Are the Air Quality Impacts?

At the current level of control and 1996 production levels, nationwide emissions of HAP from the 169 BSCP facilities estimated to be major sources are about 6,000 Mg/yr (6,600 tpy). Under today's final rule, it is assumed that DLA will be installed on 89 tunnel kilns with production capacities equal to or greater than 9.07 Mg (10 tph)(that currently are not controlled with a DLA, DIFF, DLS/FF, or WS). This will result in an estimated reduction in nationwide HAP emissions of 2,100 Mg/yr (2,300 tpy).

Hydrogen fluoride emissions account for approximately 60 percent of the baseline HAP emissions. Hydrogen chloride emissions account for approximately 40 percent, with HAP metals comprising less than 1 percent of the baseline HAP emissions. Estimated nationwide emissions of HF, HCl, and HAP metals from existing major source BSCP facilities at the current level of control are 3,500 Mg/yr (3,900 tpy), 2,400 Mg/yr (2,600 tpy), and 24 Mg/yr (26 tpy), respectively. Implementation of today's final rule is estimated to reduce nationwide HF emissions from existing tunnel kilns by about 1,700 Mg/yr (1,900 tpy), and HCl will be reduced by 350 Mg/yr (390 tpy). Emissions of HAP metals are estimated to be reduced by 5.4 Mg/yr (5.9 tpy). Implementation of today's final rule also is estimated to reduce PM and SO_2 emissions by 740 Mg/yr (820 tpy) and 2,500 Mg/yr (2,800 tpy), respectively.

To project air quality impacts for new sources, we assumed that two large model tunnel kilns (each with a 13.6 Mg/hr (15 tph) capacity and equipped with DIFF) and one medium model tunnel kiln (with an 8.2 Mg/hr (9 tph) capacity and equipped with a DLA), will begin operation at the beginning of the first year following promulgation. We estimate that by implementing today's final rule, HF emissions from new sources will be reduced by 87 Mg/yr (96 tpy), HCl emissions will be reduced by 47 Mg/yr (52 tpy), and HAP metals emissions will be reduced by 0.48 Mg/yr (0.53 tpy). We also estimate that PM and SO_2 emissions from the new kilns will be reduced by 67 Mg/yr (74 tpy) and 170 Mg/yr (190 tpy), respectively.

Secondary air impacts associated with today's final BSCP rule are direct impacts that result from the operation of any new or additional APCD. The generation of electricity required to operate the APCD on new and existing kilns will result in 11 Mg/yr (12 tpy) of nitrogen oxides (NO_X) emissions in the first year following compliance with today's final rule. The electricity is assumed to be generated by natural gas-fired turbines.

B. What Are the Water and Solid Waste Impacts?

Because compliance with today's final rule is based on the use of DLA or DIFF, no water pollution impacts are estimated. However, facilities with available wastewater disposal options may choose to use wet scrubbers. Based on available information, each scrubber-controlled kiln could generate as much as about 5 million gallons per year of waste water (based on a 10 gallon per minute scrubber blowdown, which is the maximum permitted amount in the industry).

The solid waste disposal impacts that result from the use of DLA include the disposal of the spent limestone that is discharged from the DLA. We calculated the solid waste by taking the difference between the amount of limestone charged into the DLA and the amount of reacted limestone and then adding the amount of reaction products and PM captured. Implementation of today's final rule is estimated to increase solid waste from existing sources by 65,200 Mg/yr (71,900 tpy).

To project solid waste impacts for new sources, we assumed that two large model tunnel kilns (equipped with DIFF) and one medium model tunnel kiln (equipped with a DLA) will begin operation at the beginning of the first year following promulgation of the final rule. The analysis of solid waste from DLA is discussed in the previous paragraph. The solid waste disposal impacts that result from the use of DIFF include the disposal of the spent lime (or other sorbent) that is injected into the kiln exhaust stream and subsequently captured by a fabric filter. We calculated the solid waste by taking the difference between the amount of lime injected into the system and the amount of reacted lime, and then adding the amount of reaction products and PM captured. Stoichiometric ratios of 1.0 to 2.0 have been reported for the DIFF and DLS/FF in use in the brick manufacturing industry. The average

stoichiometric ratio of 1.35 was used in this analysis. We estimate that implementing today's final rule will result in the generation of 1,410 Mg/yr (1,550 tpy) of solid waste from new sources.

C. What Are the Energy Impacts?

Energy impacts consist of the electricity needed to operate the APCD. Electricity requirements are driven primarily by the size of the fan needed in the APCD. We estimate the increase in electricity consumption that will result from implementation of the final rule to be 89 terajoules per year (84 billion British thermal units (Btu) per year) for existing sources.

To project energy impacts for new sources, we assumed that two large model tunnel kilns (equipped with DIFF) and one medium model tunnel kiln (equipped with a DLA) will begin operation at the beginning of the first year following promulgation of the final rule. We estimate the increase in energy consumption that will result from implementation of today's final rule to be 7.8 terajoules per year (7.4 billion Btu per year) for new sources.

D. Are There Any Additional Environmental and Health Impacts?

Reducing HAP emissions under today's final rule will lower occupational HAP exposure levels. The operation of APCD may increase occupational noise levels.

E. What Are the Cost Impacts?

For existing sources, nationwide total capital costs to implement today's final rule are estimated at $63 million, with total annualized costs of $24 million. The capital costs include the purchase and installation of DLA and monitoring equipment on 89 existing large tunnel kilns. The annualized costs include annualized capital costs of the control and monitoring equipment, operation and maintenance expenses, emission testing costs, and recordkeeping and reporting costs associated with installing and operating these 89 DLA, as well as the monitoring, recordkeeping and reporting, and emission testing costs on 20 additional APCD that currently are installed on existing large tunnel kilns.

To project costs for new sources, we assumed that two large model tunnel kilns (equipped with DIFF) and one medium model tunnel kiln (equipped with a DLA) will begin operation at the beginning of the first year following promulgation of the final rule. We estimate the capital costs associated with implementation of today's final rule to be $2.8 million for these three new sources. We estimate the annualized costs associated with implementation of today's final rule to be $1.14 million per year for new sources in the first year following promulgation of the rule.

We calculated the cost estimates using cost algorithms that are based on procedures from EPA's Office of Air Quality Planning and Standards (OAQPS) Control Cost Manual (EPA 450/3–90–006, January 1990) and cost information provided by the BSCP industry. We estimated costs by developing model process units that correspond to the various sizes of kilns found at BSCP manufacturing facilities and assigning the model process units to each facility based on the kiln sizes at each facility. The facility costs were summed to determine total industry costs.

F. What Are the Economic Impacts?

We conducted a detailed economic impact analysis to determine the market- and industry-level impacts associated with today's final rule. The compliance costs of today's final rule are expected to increase the price of brick and reduce their domestic production and consumption. We project the price of brick to increase by just less than 1 percent and project no change in price for structural clay products. Domestic production of brick is expected to decline by close to 1 percent. In addition, foreign brick imports are estimated to increase while exports decrease, both by just under 1 percent. Since there is no expected change in the price of structural clay products, we predict no change in domestic production or foreign imports of structural clay products.

In terms of industry impacts, the brick producers are projected to experience a decrease in operating profits of about 10 percent, which reflects the compliance costs associated with brick production and the resulting reductions in revenues due to the increase in the price of brick and the reduced quantity purchased. Through the market impacts described above, today's final rule would create both positive and negative financial impacts on facilities within the BSCP manufacturing industry. The majority of facilities, almost 71 percent, are expected to experience profit increases with today's final rule; however, there are some facilities projected to lose profits (about 29 percent). Furthermore, the economic impact analysis indicates that of the 189 BSCP manufacturing facilities, two brick facilities are at risk of closure because of today's final rule, while none of the structural clay products facilities are at risk to close.

Based on the market analysis, the annual social costs of today's final rule are projected to be $23.3 million. This differs from the annual engineering costs of today's final rule because the social costs account for producer and consumer behavior. These social costs are distributed across the many consumers and producers of brick. Since there are no price changes occurring in the structural clay products market, the social costs of today's final rule are confined to the brick industry. The consumers of brick are expected to incur $14.7 million in costs associated with today's final rule, with domestic consumers bearing $14.6 million and foreign consumers bearing $0.07 million. Brick producers, in aggregate, are expected to bear the remaining $8.6 million annually in costs. Domestic producers incur $8.67 million while foreign producers gain $0.04 million annually.

We estimate that 15 new kilns will be built during the 5 years after promulgation of today's final rule. The total compliance costs associated with these kilns are projected to be less than 0.6 percent of the industry's value of shipments. The economic impact analysis estimated the impact of today's final rule on these new sources through a sensitivity analysis. According to that analysis, it is projected that anywhere from three to six of these new kilns will be delayed in coming on-line in the BSCP manufacturing industry due to today's final rule.

V. Summary of Responses to Major Comments and Changes to the Clay Ceramics Manufacturing Proposed NESHAP

In response to the public comments received on the proposed clay ceramics rule, we made several changes in developing today's final clay ceramics rule. The major comments and our responses and rule changes are summarized in the following sections. A more detailed summary can be found in the Response-to-Comments document, which is available from several sources (see **SUPPLEMENTARY INFORMATION** section).

A. Affected Source

1. Subcategories of Clay Ceramics Kilns

We proposed two subcategories of clay ceramics kilns: Continuous (tunnel or roller) kilns and batch (periodic) kilns. Based on the public comments received regarding APCD applicability, as described in section V.C of this preamble, we revised the subcategorization structure for today's final rule. Today's final rule is based on

four subcategories of clay ceramics kilns: Ceramic tile or sanitaryware tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product, ceramic tile or sanitaryware tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product, ceramic tile roller kilns, and periodic kilns.

2. R&D Kiln Definition

One commenter requested that we change the definition of research and development kiln so that it is consistent with the definition of R&D in section 112(c)(7) of the CAA and most other NESHAP. Therefore, today's final rule includes a revised definition of research and development kiln that is consistent with section 112(c)(7) of the CAA and other NESHAP.

3. Facilities Co-Located With Major Sources

Commenters indicated that considering a clay ceramics facility a major source because it is co-located with a major source (under a separate NESHAP) puts those facilities at a competitive disadvantage with competitors operating facilities that are not co-located. We understand these commenters' concerns. However, section 112 of the CAA requires us to regulate HAP emissions from all major source facilities, regardless of the processes or operations that make those facilities major sources. Thus, today's final rule applies for both co-located and stand-alone clay ceramics manufacturing facilities that are major sources.

B. Existing Source MACT

Four commenters concurred with the existing MACT floor of "no emissions reductions" for existing clay ceramics sources. To the contrary, one commenter charged that EPA has simply set MACT floors based on control technology type and that EPA did not identify the relevant best performers and set floors reflecting their average emission level. The commenter noted that factors other than control device type affect emissions and that EPA must consider all non-negligible factors in setting MACT floors and considering beyond-the-floor measures. The commenter stated that if EPA believes it is unworkable to consider all factors, then perhaps EPA should base standards on actual emissions data which reflects all the factors influencing a source's performance.

We reevaluated our existing source MACT determinations following proposal based on consideration of factors other than APCD type. We agree that factors other than APCD type (*e.g.*, kiln design, fuel type, raw materials, additives and surface coatings) can affect emissions from clay ceramics kilns. We acknowledged the effect of kiln design on emissions by creating separate subcategories for periodic, roller, and tunnel kilns. We maintain that low-HAP raw material use is not a viable MACT option because, similar to the BSCP industry, all facilities use product-specific raw materials that are integral to the various products. Changes in raw materials would change the end products, and because of this, it would not be feasible for facilities to meet requirements based on the use of low-HAP raw materials. With respect to requiring kilns to fire low-HAP fuels, all clay ceramics kilns for which we have information are fired with natural gas or propane. Therefore, we are not concerned that a requirement to use natural gas (or equivalent fuel) to fire all existing kilns would have any impact on the end products of existing kilns, as would be the case in the BSCP industry. Therefore, the MACT floor for all existing clay ceramics periodic kilns, tunnel kilns, and roller kilns is based on firing the kilns with natural gas or an equivalent fuel (such as propane or other clean-burning fuel), and we added a work practice standard to the final rule that covers this requirement. We considered developing emission limitations based on firing natural gas, but the available data are insufficient for us to determine the contribution of kiln fuel to HAP emissions, and we believe that a work practice standard is the only feasible means of addressing the commenter's concern that we did not consider options besides APCD use.

C. New Source MACT

At proposal, we concluded that MACT for new and reconstructed periodic kilns was "no emissions reductions." We concluded that MACT for new and reconstructed tunnel and roller kilns was the level of control achievable with a DIFF, DLS/FF, or WS because the best-controlled similar source (a BSCP tunnel kiln) had this level of control.

Following proposal, several commenters argued that clay ceramics kilns are different from BSCP kilns, and that EPA should not consider BSCP tunnel kilns to be the best-controlled similar source. The commenters noted that clay ceramics kilns typically have much lower throughput than BSCP kilns and that the exhaust from clay ceramics kilns contains lower pollutant concentrations than BSCP kiln exhaust. Commenters stated that the lower pollutant concentrations in clay ceramics kiln exhaust would result in the inability to achieve high removal efficiencies. The commenters suggested that the proposed control technologies are not transferable to clay ceramics kilns and noted that none of the technologies are currently in use on domestic clay ceramics kilns. The commenters suggested that the best-controlled similar source should come from the sources in the clay ceramics source category, which would result in a new source MACT floor of "no emissions reductions" for clay ceramics kilns.

One commenter stated that, whereas brick products are fired unglazed, most sanitaryware products have a ceramic glaze applied before firing, which melts in the kiln, evenly covering the surface of the piece, helping to seal the surface and hinder the emission of by-products typically associated with the clay raw material.

One commenter suggested that MACT for new clay ceramics kilns be applied only to large kilns (*i.e.*, kilns with a design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product). The commenter suggested (based on their conversation with an APCD vendor) that DIFF systems may not be readily available for small (less than 9.07 Mg/hr (10 tph)) clay ceramics kilns.

One commenter requested that EPA distinguish between ceramic tile tunnel and roller kilns. The commenter stated that the two major design differences between BSCP periodic and new BSCP tunnel kilns are the same dissimilarities exhibited between clay ceramics tunnel and roller kilns. The commenter also provided reasons why clay ceramics roller kilns are different from BSCP tunnel kilns. The commenter stated that BSCP tunnel kilns are made of brick lined with refractory materials, have a high profile (tall) design, and require setting and stacking product on rail cars which move on floor rails. Bricks are fired on a 15 to 24 hour cycle. Ceramic tile roller kilns are designed in modular units with a low (short) profile (which affects the excess airflow), have different firing curves and flow characteristics, process a single row of tile moved by roller, and utilize high velocity burners for turbulent airflow. The tiles are not stacked and are fired on a 40 to 60 minute cycle. The commenter stated that firing time has a significant effect on the evolution of HF emissions (roller kilns exhibit significantly lower HF emissions) and provided detail of firing curves/emission estimates for the two types of kilns. In addition, the commenter stated that APCD available for BSCP tunnel

kilns are not readily available for roller kilns.

We acknowledge that the control technologies (DIFF, DLS/FF, and WS) that formed the basis for the proposed emission limits for new and reconstructed clay ceramics kilns are not currently in use on any domestic clay ceramics kiln. However, section 112(d) of the CAA requires us to establish emission limits for new sources based on the performance of the best-controlled similar source. The CAA does not specify that the similar source must be within the same source category. To the contrary, our interpretation of section 112(d) of the CAA is that we are obligated to consider similar sources from other source categories in determining the best-controlled similar source for establishing MACT for new sources.

We have reevaluated our subcategory and best-controlled similar source determinations for new and reconstructed clay ceramics kilns. We maintain that MACT for new and reconstructed periodic kilns does not require use of add-on APCD because the best-controlled similar source is uncontrolled. In addition, based on the comments received and other information, we have concluded that there are significant differences between clay ceramics tunnel kilns and roller kilns. We believe that differences in the operation of BSCP tunnel kilns and tile roller kilns, particularly with respect to the duration of firing, result in emission characteristics that are likely to be very dissimilar. As a result, we cannot assume that APCD that have been demonstrated to be effective for reducing HF and HCl emissions from BSCP tunnel kilns are feasible for tile roller kilns. Therefore, we have concluded that BSCP tunnel kilns cannot be considered similar sources to tile roller kilns, and we have determined that MACT for new and reconstructed clay ceramics tile roller kilns does not include control with an add-on APCD.

We disagree that there are technological differences between clay ceramics tunnel kilns and BSCP tunnel kilns. Some tunnel kilns actually produce both ceramic tile and structural clay tile (a structural clay product). Regarding the effect of glazing on emissions, we cannot refute that the glazes applied to sanitaryware form a seal that could prevent further release of certain pollutants from the body of the ware. However, we have no information that indicates that the sealing becomes effective before HF and HCl are released. To the contrary, we have data from several tests on sanitaryware kilns that quantify HF emissions, and the tests indicate that uncontrolled emissions are within the range emitted from BSCP kilns.

We maintain that the best-controlled similar source for a clay ceramics tunnel kiln is a BSCP tunnel kiln. As discussed in section II.D of this preamble, MACT for new and reconstructed BSCP tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product is based on use of a DLA, while MACT for new and reconstructed BSCP tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product is based on use of DIFF, DLS/FF, or WS. Thus, we have adopted the same requirements for new and reconstructed clay ceramics tunnel kilns. New and reconstructed clay ceramics tile and sanitaryware tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product will be required to meet emission limits based on the levels of control that can be achieved by a kiln controlled with a DLA. The emission limits for HF are 0.029 kg/Mg (0.057 lb/ton) or at least 90 percent reduction. For HCl, the emission limits are 0.13 kg/Mg (0.26 lb/ton) or at least 30 percent reduction. For PM, which is used as a surrogate for HAP metals, the emission limit is 0.21 kg/Mg (0.42 lb/ton). For new and reconstructed clay ceramics tile and sanitaryware tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product, we have revised the emission limits (based on the levels of control that can be achieved by a kiln controlled with a DIFF, DLS/FF, or WS) to reflect new data that were considered in the development of the final BSCP rule, as discussed in section II.F of this preamble. The revised HF emission limits are 0.029 kg/Mg (0.057 lb/ton) or at least 90 percent reduction. The revised HCl emission limits are 0.028 kg/Mg (0.056 lb/ton) or at least 85 percent reduction. The PM emission limit remains unchanged (from proposal) at 0.060 kg/Mg (0.12 lb/ton).

Similar to the requirements for existing sources, we added a work practice standard that requires facilities to use natural gas, or an equivalent fuel, to fire all new or reconstructed clay ceramics periodic kilns, tunnel kilns, and roller kilns, except during periods of natural gas curtailment or other periods when natural gas is not available.

Similar to the requirements for BSCP tunnel kilns, two types of clay ceramics tunnel kilns that would otherwise be considered reconstructed do not meet the definition of reconstruction in 40 CFR 63.2. We have added language in 40 CFR 63.8450(f) to provide that it is not technologically and economically feasible for these two types of existing kilns that would otherwise meet the criteria for reconstruction under 40 CFR 63.2 to meet the relevant standards—*i.e.*, new source MACT. The two types of kilns are existing tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product whose design capacities are increased such that they are equal to or greater than 9.07 Mg/hr (10 tph) of fired product, and existing DLA-controlled tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product. These sources will be required to meet emission limits based on the levels of control that can be achieved by a kiln controlled with a DLA. They also will be subject to the work practice standard that requires facilities to use natural gas, or an equivalent fuel, to fire all kilns, except during periods of natural gas curtailment or other periods when natural gas is not available.

We acknowledge that the higher airflow rates that are characteristic of clay ceramics kilns result in lower pollutant concentrations in the exhaust stream, and that control efficiency limits (or percentage reduction limits) are more difficult to achieve when exhaust gas concentrations are lower. For that reason, we proposed and are promulgating today production-based mass emission limits as alternatives to the HF and HCl percentage reduction limits. Exhaust gas concentrations have no effect on mass emission rates, provided the concentrations are above the test method detection limit. The mass emission rate (*e.g.*, pounds of pollutant emitted per hour) for a source is unchanged regardless of how much dilution air is introduced. Therefore, even though a clay ceramics kiln with a diluted exhaust stream may not be able to meet the percentage HF and HCl reduction limits, the available data indicate that a kiln that is controlled to the new source MACT level will be able to meet the production-based emission limits for HF and HCl, as well as the production-based limit for PM.

D. Cost and Economic Impacts

Several commenters stated that EPA underestimated the cost per ton of pollutant removed at proposal. In general, the commenters felt the costs were unreasonable. Commenters questioned the public health benefits of the proposed clay ceramics rule.

One commenter stated that EPA entirely misunderstood the economic state of the ceramic tile industry in the U.S., and therefore, grossly underestimated the economic impact of

the proposed rule on the industry. The commenter challenged the assumptions presented in the algorithms on which the cost analysis is based, charging that they bear no reasonable relationship to reality in the industry and that the APCD strategies are not actually feasible for implementation. The commenter also argued that the economic analysis of the MACT floor for reconstructed and new ceramic clay roller kilns does not support DIFF-, DLS/FF- or WS-based controls.

We acknowledge the commenters' statements about the high cost effectiveness of the proposed rule. As discussed previously, we have revised the rule, as proposed, such that it is now less costly. Under today's final rule, new clay ceramic roller kilns will not be subject to emission limits. In addition, we have subcategorized clay ceramics tunnel kilns by design capacity. New and reconstructed tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) will be required to meet emission limits based on the levels of control that can be achieved by a DLA. In addition to the changes mentioned above, we have added a work practice standard that requires facilities to use natural gas, or an equivalent fuel, to fire all clay ceramics kilns, except during periods of natural gas curtailment or other periods when natural gas is not available. The costs associated with this change are minimal. Based on these changes, there will be no control cost for new roller kilns and the control cost for new and reconstructed tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) will be lower than at proposal. Most of the new tunnel kilns constructed will likely be in this smaller size category. New clay ceramics tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) are still required to meet emission limits based on the use of DIFF, DLS/FF or WS technologies. However, the HF and HCl emission limits are slightly less stringent than at proposal (due to the inclusion of new test data). The PM emission limit for new clay ceramics tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) is unchanged from the proposed requirements for all new kilns.

Public health benefits are likely to be realized due to the reduced emissions and reduced exposures to emissions as a result of today's final rule. However, we have not quantified these public health benefits because we are not required to do so under the CAA.

We disagree with the commenter's statement that the economic impacts of the rule on the ceramic tile industry have been grossly underestimated. Based on revisions to the final rule as described above, we expect minimal impacts on existing sources, based on recordkeeping and reporting costs associated with the work practice standard for existing kilns, and we estimate that only one new source will be impacted by the final rule in the first five years following promulgation. Therefore, the EIA at proposal overestimated the impacts on the industry. Thus, it is very unlikely that the one new source affected by the rule or the addition of a work practice standard that requires all kilns to be fired with natural gas (or equivalent fuel) will be able to influence industry prices or foreign competition.

E. Test Data and Emission Limits

One commenter implied that there are no data to suggest that HCl is emitted from ceramic tile kilns. Another commenter stated that limits for HCl and PM are irrelevant and that we should only set an emission limit for HF (the largest single HAP emitted from the kilns). The commenter believes that there is no need to establish an emission limitation for HCl or PM because any control system designed to achieve the required HF reduction will also reduce HCl and PM. One commenter disagreed that PM is an adequate surrogate for HAP metals emissions.

We are required by section 112(d) of the CAA to establish emission limits for listed HAP emitted from major sources. Section 112(b) of the CAA lists HCl and various HAP metals. We believe that PM is an adequate surrogate for HAP metals for the reasons discussed in section II.F of this preamble.

We acknowledge that we have no test data that demonstrate that HCl is emitted from clay ceramics kilns. However, we do have data that show that chlorides are present in many clay materials, and that HCl is emitted from various types of clays when heated above a minimum temperature. The data include raw material analyses and emission test reports of HCl emissions for the BSCP manufacturing, lightweight aggregate manufacturing, and kaolin processing industries. Because of the similarities in raw materials used in those industries and the raw materials used to manufacture clay ceramics, we assume that clay ceramics kilns also emit HCl.

We agree that HF emission rates from clay ceramics kilns generally are greater than the corresponding emission rates for HCl or metal HAP. We also agree that emission controls that are used to meet the emission limits for HF are likely to reduce emissions of HCl and SO_x as well. However, as stated previously, the CAA requires us to set emission limits for all listed HAP based on MACT. The data indicated that there are existing controls on similar sources that achieve significant reductions in emissions of HCl and PM (as a surrogate for metal HAP). Therefore, we are required to establish emission limits for HCl and metal HAP. We also note that, if HCl and PM emissions from any affected source are negligible or are automatically controlled by HF control devices, complying with the HCl and PM emission limits should not present a problem.

F. Monitoring Requirements

1. Fabric Filter Inlet Temperature

Two commenters disagreed with the proposed fabric filter inlet temperature monitoring requirement. One commenter stated that control systems using hydrated lime are generally known to have increased HCl and HF removal when temperatures increase. The other commenter suggested that the only limit on fabric filter inlet temperature should be based on manufacturer's specifications for protection of the equipment.

We have eliminated the requirement for monitoring fabric filter inlet temperatures on affected kilns that are controlled with a DLS/FF or DIFF. We believe that the other monitoring requirements (*e.g.*, lime feed rate monitoring and periodic VE checks) that we have incorporated into today's final rule are adequate for ensuring continuous compliance with the emission limits.

2. Bag Leak Detection Systems and Visible Emissions

One commenter suggested changes to the amount of bag leak detector alarm time that must be recorded. We have not changed the requirements for recording bag leak detection system downtime. However, we have incorporated into today's final rule an option for owners and operators of affected kilns that are controlled with a DLS/FF, or DIFF to perform daily VE checks rather than using bag leak detection systems. Visible emissions checks are required for DLA-controlled kilns. Today's final rule also includes a provision for decreasing the frequency of VE checks provided no VE are observed.

3. Continuous Emissions Monitoring Systems

In the preamble to the proposed rule, we requested comment on requiring the application of PM CEMS as a method to assure continuous compliance with the proposed PM emission limits. Commenters opposed use of CEMS when less expensive, but effective, parametric monitoring alternatives are available. Therefore, today's final rule does not require use of PM CEMS or any other type of CEMS. We believe that the parameter monitoring requirements specified in the final rule are adequate for ensuring continuous compliance.

4. Test Methods

One commenter requested that the final clay ceramics rule provide facilities with the option to use either EPA Method 26A or EPA Method 320 for all required stack testing for HF emissions, HCl emissions, or both. Because EPA Method 320 will provide accurate HF and HCl measurements, we have modified today's final clay ceramics rule to include EPA Method 320 as an alternative to EPA Method 26A.

G. Startup, Shutdown, and Malfunction

1. Bypass

One commenter requested that EPA allow for use of the bypass stack during periods of APCD maintenance. Similar comments were received on the proposed BSCP rule. Therefore, today's final clay ceramics rule allows for bypass of the APCD during periods of routine control device maintenance for up to 4 percent of the annual kiln operating hours. Section II.H of this preamble presents details on use of this routine control device maintenance exemption.

2. Initial Startup

Commenters on both the proposed BSCP rule and clay ceramics rule pointed out that it is impractical to meet emission standards during initial startup of a tunnel kiln. Thus, as discussed in section II.H of this preamble, we have added a definition of initial startup to today's final clay ceramics rule to address the concerns expressed by the commenters.

VI. Summary of the Final Clay Ceramics Manufacturing NESHAP

A. What Source Category Is Regulated by the Final Rule?

Today's final rule for clay ceramics manufacturing applies to clay ceramics manufacturing facilities that are, are located at, or are part of, a major source of HAP emissions. The clay ceramics manufacturing source category includes those facilities that manufacture pressed floor tile, pressed wall tile, and other pressed tile; or sanitaryware (toilets and sinks). Clay ceramics are primarily composed of clay and shale, and may include many different additives, including silica, talc, and various high purity powders produced by chemical synthesis. Clay ceramics manufacturing generally includes raw material processing and handling and forming of the tile or sanitaryware shapes, followed by drying, glazing, and firing. Most clay ceramics are coated with a glaze prior to firing. The clay ceramics industry also includes dinnerware and pottery manufacturing, but these industry segments are not covered by today's final rule because we determined that there are no dinnerware or pottery manufacturing facilities that are major sources of HAP.

Available information shows a total of 58 facilities that produce clay ceramics. Thirty-two of these facilities, located in 16 States, primarily produce pressed tile, while 26 of these facilities, located in 15 States, primarily produce sanitaryware. Eight of the 58 clay ceramics manufacturing facilities are estimated to be major sources. Thirteen clay ceramics facilities are owned by small businesses, and none of the small business-owned facilities are estimated to be major sources.

All clay ceramics are fired in kilns. Firing may be performed in one or more stages. Tile can be fired in either continuous (tunnel or roller) or batch (periodic) kilns, but most facilities use either tunnel or roller kilns for tile production. Periodic kilns are usually used at smaller facilities or are used primarily for second-firing a product after a glaze has been applied.

The sanitaryware industry uses either tunnel kilns or periodic kilns for firing. Tunnel kilns account for most sanitaryware firing; periodic kilns are used primarily for refiring rejected pieces that have been repaired and re-glazed. Some smaller facilities use periodic kilns for all firing operations.

The primary HAP emission sources at clay ceramics manufacturing plants are roller, tunnel, and periodic kilns which emit HF, HCl, and HAP metals. Kilns also emit PM and SO_2. Currently, no APCD are used by the clay ceramics industry to control emission from kilns, although the industry's emissions are minimized because the kilns fire clean-burning fuels. Other sources of HAP emissions at clay ceramics manufacturing plants are the raw material processing and handling equipment.

B. What Are the Affected Sources?

The affected sources, which are the portions of each source in the category for which we are setting emission standards, include each existing, new, or reconstructed periodic kiln, tunnel kiln, and roller kiln. Each tunnel kiln that meets the description in 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) also is an affected source. All affected sources are subject to the work practice standard in today's final rule. In addition, today's final rule contains different emission limits, based on design capacity, for new and reconstructed tunnel kilns, and also includes emission limits for tunnel kilns that would otherwise meet the criteria for reconstruction but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2). The tunnel kiln subcategories are tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product and tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product. Kilns that are used exclusively for R&D and not used to manufacture products for commercial sale, except in a *de minimis* manner, are not subject to the requirements of today's final rule. Kilns that are used exclusively for refiring or for setting glazes on previously fired products are not subject to the requirements of today's final rule.

A source is a new affected source if construction began on or after July 22, 2002. An affected source is reconstructed if the criteria defined in 40 CFR 63.2 are met, as qualified by 40 CFR 63.8540(f). An affected source is existing if it is not new or reconstructed and does not meet the descriptions in 40 CFR 63.8540(f). As indicated, affected sources described in 40 CFR 63.8540(f) also are subject to today's final rule.

C. When Must I Comply With the Final Rule?

New and reconstructed affected sources and affected sources that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) with an initial startup before May 16, 2003 must comply no later than May 16, 2003. New and reconstructed affected sources and affected sources that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) with an initial startup after May 16, 2003 must comply upon initial startup. Any portion of existing facilities that become new or reconstructed major sources and any new or reconstructed area sources that become major sources must be in compliance upon initial startup.

If you have an existing affected source, you must comply with the work practice standards within 3 years of May 16, 2003.

D. What Are the Emission Limits?

Today's final rule includes emission limits in the form of production-based mass emission limits and percent reduction requirements. In establishing the HAP emission limits, we selected PM as a surrogate for HAP metals, including mercury in particulate form. Today's final rule includes HF, HCl, and PM emission limits for new and reconstructed affected sources at clay ceramics manufacturing facilities, as well as for the following affected sources that would be considered reconstructed but for 40 CFR 63.8540(f): Existing tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) of fired product whose design capacities are increased such that they are equal to or greater than 9.07 Mg/hr (10 tph) of fired product, and existing DLA-controlled tunnel kilns with design capacities equal to or greater than 9.07 Mg/hr (10 tph) of fired product.

If you own or operate a new or reconstructed tunnel kiln with a design capacity less than 9.07 Mg/hr (10 tph) of fired product or a tunnel kiln that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2), you are required to meet an HF emission limit of 0.029 kg/Mg (0.057 lb/ton) of fired product or reduce uncontrolled HF emissions by at least 90 percent. You also are required to meet an HCl emission limit of 0.13 kg/Mg (0.26 lb/ton) of fired product or reduce uncontrolled HCl emissions by at least 30 percent. Finally, you are required to meet a PM emission limit of 0.21 kg/Mg (0.42 lb/ton) of fired product.

If you own or operate a new or reconstructed tunnel kiln with a design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product, you are required to meet an HF emission limit of 0.029 kg/Mg (0.057 lb/ton) of fired product or reduce uncontrolled HF emissions by at least 90 percent. You also are required to meet an HCl emission limit of 0.028 kg/Mg (0.056 lb/ton) of fired product or reduce uncontrolled HCl emissions by at least 85 percent. Finally, you are required to meet a PM emission limit of 0.06 kg/Mg (0.12 lb/ton) of fired product.

E. What Are the Operating Limits?

The operating limits for new and reconstructed clay ceramics tunnel kilns and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) are the same as those for new and reconstructed BSCP tunnel kilns. These operating limits are presented in section III.E of this preamble.

F. What Are the Work Practice Standards?

If you have an existing, new, or reconstructed clay ceramics periodic kiln, tunnel kiln, or roller kiln, or a tunnel kiln that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2), you must use natural gas, or an equivalent fuel, as the kiln fuel at all times except during periods of natural gas curtailment or other periods when natural gas is not available.

G. What Are the Performance Test and Initial Compliance Requirements for Sources Subject to Emission Limits?

The performance test and initial compliance requirements for new and reconstructed clay ceramics tunnel kilns and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) are the same as those for new and reconstructed BSCP tunnel kilns. These requirements are presented in section III.F of this preamble.

H. What Are the Initial Compliance Requirements for Sources Subject to a Work Practice Standard?

For each existing, new, or reconstructed clay ceramics periodic kiln, tunnel kiln, or roller kiln, and each tunnel kiln that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2), you must indicate, in your initial notification, that you use natural gas, or an equivalent fuel, as the kiln fuel, and certify that such information is true, accurate, and complete.

I. What Are the Continuous Compliance Requirements for Sources Subject to Emission Limits?

The continuous compliance requirements for new and reconstructed clay ceramics tunnel kilns and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) are the same as those for new and reconstructed BSCP tunnel kilns. These requirements are presented in section III.G of this preamble.

J. What Are the Continuous Compliance Requirements for Sources Subject to a Work Practice Standard?

For each existing, new, or reconstructed clay ceramics periodic kiln, tunnel kiln, or roller kiln, and each tunnel kiln that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2), you must use natural gas, or an equivalent fuel, as the kiln fuel, and document the type of fuel used. The type of fuel used, along with other compliance information, must be certified as part of your compliance reports. During periods of natural gas curtailment or other periods when natural gas is unavailable, you are allowed to use an alternative fuel. However, if you use an alternative fuel, you must meet the notification requirements specified in 40 CFR 63.8630(g) and the reporting requirements specified in 40 CFR 63.8635(g).

K. What Are the Notification, Recordkeeping, and Reporting Requirements for Sources Subject to Emission Limits?

The notification, recordkeeping, and reporting requirements for new and reconstructed clay ceramics tunnel kilns and tunnel kilns that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2) are the same as those for new and reconstructed BSCP tunnel kilns. These requirements are presented in section III.H of this preamble.

L. What Are the Notification, Recordkeeping, and Reporting Requirements for Sources Subject to a Work Practice Standard?

If you operate an existing, new, or reconstructed clay ceramics periodic kiln, tunnel kiln, or roller kiln, or a tunnel kiln that would be considered reconstructed but for 40 CFR 63.8540(f)(1) or 40 CFR 63.8540(f)(2), you must submit an initial notification that indicates that you use natural gas, or an equivalent fuel, as the kiln fuel. You must keep records that document your kiln fuel, and if you must use an alternative fuel due to a natural gas curtailment or other interruption of natural gas supply, you must submit a notification of alternative fuel use that includes the information specified in 40 CFR 63.8630(g). You must submit a report of alternative fuel use within 10 working days after terminating the use of the alternative fuel. The report must include the information specified in 40 CFR 63.8635(g).

VII. Summary of Environmental, Energy, and Economic Impacts for the Final Clay Ceramics Manufacturing NESHAP

A. What Are the Air Quality Impacts?

Because the only requirements for existing sources under today's final rule

are work practice standards that we believe that all facilities are already meeting, no air quality impacts are projected for existing sources. To project air quality impacts for new sources, we assumed that one sanitaryware tunnel kiln (3.6 Mg/hr (4 tph) capacity) equipped with a DLA will begin operation at the beginning of the first year following promulgation of the rule. We estimate that by implementing the rule, HF emissions from this new source will be reduced by 4.9 Mg/yr (5.4 tpy), HCl emissions will be reduced by 1.0 Mg/yr (1.1 tpy), and HAP metals emissions will be reduced by 0.028 Mg/yr (0.031 tpy). We also estimate that PM and SO_2 emissions from the new kiln will be reduced by 3.9 Mg/yr (4.3 tpy) and 13 Mg/yr (14 tpy), respectively.

Secondary air impacts associated with today's final clay ceramics rule are direct impacts that result from the operation of any new APCD. The generation of electricity required to operate the control device on the projected new kiln will result in 0.09 tpy of NO_x emissions in the first year following promulgation of the rule. The electricity was assumed to be generated by natural gas-fired turbines.

B. What Are the Water and Solid Waste Impacts?

Because the only requirements for existing sources under today's final rule are work practice standards that we believe that all facilities are already meeting, no water and solid waste impacts are projected for existing sources. Our analyses are based on the use of DLA for controlling new kilns and, therefore, no water impacts are projected for new sources. To project solid waste impacts for new sources, we assumed that one sanitaryware tunnel kiln equipped with a DLA will begin operation at the beginning of the first year following promulgation of the rule. The solid waste disposal impacts that result from the use of DLA will include the disposal of spent limestone. We calculated the solid waste by taking the difference between the amount of limestone charged into the DLA and the amount of reacted limestone and then adding the amount of reaction products and PM captured. We estimate that implementing the rule will result in the generation of 290 Mg/yr (320 tpy) of solid waste from the new source.

C. What Are the Energy Impacts?

Because the only requirements for existing sources under today's final rule are work practice standards that we believe that all facilities are already meeting, no energy impacts are projected for existing sources. To project energy impacts for new sources, we assumed that one sanitaryware tunnel kiln equipped with a DLA will begin operation at the beginning of the first year following promulgation of the rule. Energy impacts consist of the electricity needed to operate the DLA. Electricity requirements are driven primarily by the size of the fan needed in the control device. We estimate the increase in energy consumption that would result from implementation of the rule to be 710 gigajoules per year (670 million Btu per year).

D. Are There Any Additional Environmental and Health Impacts?

Reducing HAP emissions under today's final rule will lower occupational HAP exposure levels. The operation of APCD may increase occupational noise levels.

E. What Are the Cost Impacts?

Because the only requirements for existing sources under today's final rule are work practice standards that we believe that all facilities are already meeting, cost impacts projected for existing sources are based only on recordkeeping and reporting requirements associated with the work practice standard. These costs are $1,193 per year for each of the eight major source facilities, and the total annual cost to the industry for existing sources is $9,533. To project costs for new sources, we assumed that one sanitaryware tunnel kiln, equipped with a DLA, will be built during the first year following promulgation. We estimate the capital costs associated with implementation of the rule to be $510,000 for new sources. The capital costs include the purchase and installation of DLA and monitoring equipment. We estimate the annualized costs associated with implementation of the rule to be $170,000 per year for new sources. The annualized costs include annualized capital costs of the control and monitoring equipment, operation and maintenance expenses, emission testing costs, and recordkeeping and reporting costs associated with installing and operating the DLA.

We calculated the cost estimates using cost algorithms that are based on procedures from EPA's OAQPS Control Cost Manual (EPA 450/3–90–006, January 1990) and cost information provided by the BSCP industry and control device vendors. We estimated costs by developing model process units that correspond to the various sizes of kilns found at clay ceramics manufacturing facilities.

F. What Are the Economic Impacts?

We did not prepare a revised economic impact analysis for the clay ceramics industry because the requirements of the final rule will result in a decrease in cost impacts on the industry. Specifically, new and reconstructed roller kilns, which would have been subject to emission limits in the rule as proposed, are not subject to emission limits in the final rule. In addition, the requirements for clay ceramics tunnel kilns with design capacities less than 9.07 Mg/hr (10 tph) are based on control with a DLA rather than the more costly DIFF, DLS/FF, or WS systems on which the proposed rule was based.

The goal of the economic impact analysis is to estimate the market response of clay ceramics manufacturing producers to today's final rule and to determine the economic effects that may result due to the final rule. Because the MACT floor for existing clay ceramics kilns is based on firing natural gas, or an equivalent fuel, and all clay ceramics kilns for which we have data are fired by natural gas or propane, the compliance costs for existing sources associated with today's final rule consist only of recordkeeping and reporting costs and are minimal. The aggregate price of ceramic products is, therefore, expected to remain the same. Because the prices of ceramic products are not expected to change due to today's final rule, there are no projected changes in domestic production, domestic consumption, or foreign trade. Therefore, no economic impacts on existing major sources are expected from today's final rule.

Unlike existing sources, new and reconstructed tunnel kilns used to produce clay ceramics will face positive compliance costs associated with the installation and operation of APCD. We estimate that one new 3.6 Mg/hr (4 tph) capacity tunnel kiln will be constructed in the sanitaryware industry during the first 5 years after the rule is promulgated. Industry compliance costs associated with this kiln are expected to be less than 0.1 percent of industry value of shipments for the sanitaryware industry. No level of cost-to-sales for sanitaryware kilns could be developed due to the diversity of product types that they produce.

VIII. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action

is "significant" and, therefore, subject to review by the OMB and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that today's BSCP final rule is a "significant regulatory action" because it raises novel legal or policy issues within the meaning of paragraph (4) above. Consequently, today's final BSCP rule was submitted to OMB for review under Executive Order 12866. Any written comments from OMB and written EPA responses are available in the docket (see **ADDRESSES** section of this preamble).

Pursuant to the terms of Executive Order 12866, it has been determined that the clay ceramics final rule does not constitute a "significant regulatory action" because it does not meet any of the above criteria. Consequently, today's final clay ceramics rule was not submitted to OMB for review under Executive Order 12866.

B. Paperwork Reduction Act

The information collection requirements in today's final rules will be submitted for approval to OMB under the requirements of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* The EPA has prepared an Information Collection Request (ICR) document for each of the rules (ICR No. 2022.01 for BSCP manufacturing and ICR No. 2023.01 for clay ceramics manufacturing), and a copy of either document may be obtained from Susan Auby by mail at Office of Environmental Information, Collection Strategies Division (2822T), U.S. EPA, 1200 Pennsylvania Avenue, NW, Washington, DC 20460; by e-mail at *auby.susan@epa.gov*; or by calling (202) 566–1672. You may also download a copy off the Internet at *http://www.epa.gov/icr*. The information requirements are not enforceable until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to EPA's policies set forth in 40 CFR part 2, subpart B.

Today's final BSCP rule will not require any notifications or reports beyond those required by the NESHAP General Provisions. The recordkeeping requirements require only the specific information needed to assure compliance.

With one exception, today's final clay ceramics rule will not require any notifications or reports beyond those required by the NESHAP General Provisions. The exception applies to affected sources that are subject to limits on the type of fuel used. In such cases, the owner or operator may use an alternative fuel under certain conditions but must submit a notification before using the alternative fuel and must report on alternative fuel use after terminating use of the alternative fuel. The recordkeeping requirements require only the specific information needed to assure compliance.

The annual monitoring, reporting, and recordkeeping burden for the collection of information required by today's final BSCP manufacturing rule (averaged over the first 3 years after the effective date of the final rule) is estimated to be 17,471 labor hours per year at a total annual labor cost of $900,328. This burden estimate includes a one-time submission of an OM&M plan; one-time submission of a SSMP, with immediate reports for any event when the procedures in the plan were not followed; semiannual compliance reports; maintenance inspections; notifications; and recordkeeping. Total annualized capital/startup costs associated with the monitoring requirements over the 3-year period of the ICR are estimated at $115,111, with operation and maintenance costs of $4,853/yr.

The annual monitoring, reporting, and recordkeeping burden for the collection of information required by today's final clay ceramics manufacturing rule (averaged over the first 3 years after the effective date of the final rule) is estimated to be 185 labor hours per year at a total annual labor cost of $9,533. This burden estimate includes a one-time submission of an OM&M plan; one-time submission of a SSMP, with immediate reports for any event when the procedures in the plan were not followed; semiannual compliance reports; maintenance inspections; notifications; and recordkeeping. Total annualized capital/startup costs associated with the monitoring requirements over the 3-year period of the ICR are estimated at $1,824, with operation and maintenance costs of $358/yr.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15. The OMB control numbers for the information collection requirements in the final rules will be listed in an amendment to 40 CFR part 9 in a subsequent **Federal Register** document after OMB approves the ICRs.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with this action. After considering the economic impacts of today's final rule on small entities in the two source categories, the EPA has determined that this action will not have a significant economic impact on a substantial number of small entities. Although today's final rule will not have a significant economic impact on a substantial number of small entities, we have nonetheless tried to minimize the impact of the final rule on small entities. For both the BSCP manufacturing and clay ceramics

manufacturing source categories, we exercised flexibility in minimizing impacts on small entities through subcategorization of tunnel kilns by size, which still benefits the environment by requiring greater emissions reductions from the larger kilns. In addition, for the BSCP manufacturing source category, we contacted the small entities estimated to incur impacts in excess of 1 percent of sales to explain the rule's regulatory approach, as well as a potential alternative to installing an APCD. Facilities with existing tunnel kilns operating at or near 10 tph could accept a permit condition that restricts kiln production to less than 10 tph and, therefore, places the kiln in the subcategory unaffected by the standards for existing kilns.

For purposes of assessing the impact of today's action on small entities, small entities are defined as: (1) A small business according to Small Business Administration (SBA) size standards; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. The following two sections provide descriptions of the small business assessments for the two categories of sources addressed by today's action.

1. Brick and Structural Clay Products (BSCP) Manufacturing

Small Business Administration size standards for BSCP manufacturing, by NAICS code, are shown in Table 2 of this preamble.

TABLE 2.—SMALL BUSINESS SIZE STANDARDS FOR BSCP MANUFACTURING

NAICS code	Size standard, number of employees
327121	500
327122	500
327123	500
327125	750
327993	750

We have determined that 76 of the 89 companies owning BSCP manufacturing facilities are small businesses. Although small businesses represent 86 percent of the companies within the source category, they are expected to incur about 21 percent of the total industry engineering compliance costs of $24 million. Additionally, 61 of the 76 small businesses will incur no costs. Under the final rule, we estimate that three small firms in this source category may experience an impact less 1 percent of sales, nine small firms in this source category may experience an impact between 1 percent and 3 percent of sales, and 3 small businesses (or 20 percent) may experience an impact greater than 3 percent of sales.

We also conducted an economic impact analysis that accounted for firm behavior to provide an estimate of the facility and market impacts of the proposed rule. The analysis projected that of the 189 facilities in this source category, two facilities are at risk of closure. Neither of these facilities is owned by a small business. The median compliance cost is below 1 percent of sales for both small and large firms affected by the proposed rule (0.0 and 0.1 percent for small and large firms, respectively).

Fifteen new BSCP manufacturing sources are projected to be constructed during the five years after promulgation of the rule. Industry compliance costs associated with these sources are anticipated to be less than 0.6 percent of the BSCP manufacturing industry's value of shipments. According to the new source economic impact analysis, three to six of these new sources may be delayed in coming on-line due to the compliance costs they would face. We cannot determine with certainty whether these new sources will be built by large or small companies. Regardless, impacts at the company level are not expected to be significant for a substantial number of small entities.

2. Clay Ceramics Manufacturing

Small Business Administration size standards for clay ceramics manufacturing, by NAICS code, are shown in Table 3 of this preamble.

TABLE 3.—SMALL BUSINESS SIZE STANDARDS FOR CLAY CERAMICS MANUFACTURING

NAICS code	Size standard, number of employees
326191	500
327111	750
327112	500
327122	500
327123	500
327125	750
335121	500
421220	100
421320	100

The EPA identified 13 of the 29 companies owning clay ceramics manufacturing facilities as small businesses. Because the clay ceramics manufacturing final rule does not include emissions limits for existing kilns and includes only a work practice standard that requires that existing kilns are fired with natural gas, a firm's existing kilns will be minimally impacted by the final rule. One new sanitaryware manufacturing source is projected to be constructed in the first five years following promulgation of the rule. Industry compliance costs associated with this source are expected to be less than 0.1 percent of industry value of shipments for the sanitaryware industry segments. No level of cost-to-sales for the new sanitaryware manufacturing source could be developed due to the diversity of product types produced. Thus, new clay ceramics manufacturing sources are expected to face positive compliance costs; however, we cannot determine with certainty whether these sources will be built by large or small companies. Regardless, impacts at the company level are not expected to be significant for a substantial number of small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Pub. L. 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, the EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed,

under section 203 of the UMRA, a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA's regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that today's final rules do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The total annual cost for today's final BSCP rule for any 1 year is estimated at $24 million. The total annual cost for today's final clay ceramics rule for any 1 year is estimated at $9,500. Thus, today's final rules are not subject to the requirements of sections 202 and 205 of the UMRA. In addition, the EPA has determined that today's final rules contain no regulatory requirements that might significantly or uniquely affect small governments because they contain no regulatory requirements that apply to such governments or impose obligations upon them. Therefore, today's final rules are not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government." Under Executive Order 13132, the EPA may not issue a regulation that has federalism implications, that imposes substantial direct compliance costs, and that is not required by statute, unless the Federal government provides the funds necessary to pay the direct compliance costs incurred by State and local governments, or EPA consults with State and local officials early in the process of developing the proposed regulation. The EPA also may not issue a regulation that has federalism implications and that preempts State law unless EPA consults with State and local officials early in the process of developing the proposed regulation.

If EPA complies by consulting, Executive Order 13132 requires EPA to provide to OMB, in a separately identified section of the preamble to the rule, a federalism summary impact statement (FSIS). The FSIS must include a description of the extent of EPA's prior consultation with State and local officials, a summary of the nature of their concerns and EPA's position supporting the need to issue the regulation, and a statement of the extent to which the concerns of State and local officials have been met. Also, when EPA transmits a draft final rule with federalism implications to OMB for review pursuant to Executive Order 12866, it must include a certification from EPA's Federalism Official stating that EPA has met the requirements of Executive Order 13132 in a meaningful and timely manner.

Today's final rules do not have federalism implications. They will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments, and the final rule requirements will not supercede State regulations that are more stringent. Thus, the requirements of Executive Order 13132 do not apply to the final rules.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 6, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" are defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and the Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

Today's final rules do not have tribal implications. They will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. No tribal governments are known to own or operate BSCP or clay ceramics manufacturing facilities. Thus, Executive Order 13175 does not apply to the final rules.

G. Executive Order 13045, Protection of Children From Environmental Health & Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns the environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the rule. Today's final rules are not subject to Executive Order 13045 because they are based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

Executive Order 13211 (66 FR 28355, May 22, 2001) provides that agencies shall prepare and submit to the Administrator of the Office of Information and Regulatory Affairs, OMB, a Statement of Energy Effects for certain actions identified as "significant energy actions." Section 4(b) of Executive Order 13211 defines "significant energy actions" as "any action by an agency (normally published in the **Federal Register**) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of proposed rulemaking, and notices of proposed rulemaking: (1)(i) That is a significant regulatory action under Executive Order 12866 or any successor order, and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) that is designated by the Administrator of the Office of Information and Regulatory Affairs as a significant energy action." Today's final clay ceramics manufacturing rule is not subject to Executive Order 13211

because it is not a significant regulatory action under Executive Order 12866. Although today's final BSCP rule is considered to be a significant regulatory action under Executive Order 12866, it is not a "significant energy action" because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. The basis for the determination is as follows.

Today's final BSCP rule affects manufacturers in the BSCP (NAICS 327121), extruded tile (NAICS 327122), and other structural clay products (NAICS 327123) industries. There is no crude oil, fuel, or coal production from these industries. Hence, there is no direct effect on such energy production related to implementation of the BSCP rule. In fact, as previously mentioned in this preamble, there will be an increase in energy consumption, and hence an increase in energy production, resulting from installation of APCD likely needed for sources to meet the requirements of the final BSCP rule. This increase in energy consumption is equal to approximately 27 million kilowatt-hours/year (kWh/yr) for electricity. The electricity increase is considered negligible, equivalent to 0.0007 percent of 1999 U.S. electricity production.[4] There is no expected increase in natural gas consumption. It should be noted, however, that the estimated decrease in BSCP production resulting from producer's and consumer's reactions to the final BSCP rule will offset this effect on such energy production. It is likely that the output reduction in the industries will lead to less energy use by these industries and thus some reduction in overall energy production.

Given the negligible change in energy consumption resulting from the final BSCP rule, we do not expect any price increase for any energy type. The cost of energy distribution should not be affected by the final BSCP rule at all since the final rule does not affect energy distribution facilities. Finally, with changes in net exports being a minimal percentage of domestic output from the affected industries, there will be only a negligible change in international trade, and hence in dependence on foreign energy supplies. No other adverse outcomes are expected to occur with regards to energy supplies.

Therefore, we conclude that today's final BSCP rule is not likely to have a significant adverse effect on the supply, distribution, or use of energy.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. No. 104–113; 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs EPA to provide Congress, through annual reports to OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

The final rules involve technical standards. The EPA cites the following standards in the final rules: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 4, 5, 22, 26, 26A, and 320 of 40 CFR part 60, appendix A. Consistent with the NTTAA, EPA conducted searches to identify voluntary consensus standards in addition to these EPA methods. No applicable voluntary consensus standards were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, and 22. The search and review results have been documented and are in the dockets for the final rules.

The search for emissions measurement procedures identified 11 voluntary consensus standards. The EPA determined that eight of these 11 standards identified for measuring emissions of the HAPs or surrogates subject to emission standards in the final rules were impractical alternatives to EPA test methods for the purposes of the final rules. Therefore, EPA does not intend to adopt these standards at this time. The reasons for this determination for the 11 methods are discussed in the dockets for the final rules.

Two of the 11 voluntary consensus standards identified in this search were not available at the time the review was conducted for the purposes of the final rules because they are under development by a voluntary consensus body: ASME/BSR MFC 13M, "Flow Measurement by Velocity Traverse," for EPA Method 2 (and possibly 1); and ASME/BSR MFC 12M, "Flow in Closed Conduits Using Multiport Averaging Pitot Primary Flowmeters," for EPA Method 2.

In response to public comments received, we considered and decided to include EPA Method 320 as an option for measuring HF and HCl. The voluntary consensus standard ASTM D6348–98, "Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform (FTIR) Spectroscopy," has been reviewed by the EPA as a potential alternative to EPA Method 320. Suggested revisions to ASTM D6348–98 that would allow the EPA to accept ASTM D6348–98 as an acceptable alternative were sent to ASTM by the EPA. The ASTM Subcommittee D22–03 is currently undertaking a revision of ASTM D6348–98. Because of this, we are not citing this standard as an acceptable alternative for EPA Method 320 in the final rules today. However, upon successful ASTM balloting and demonstration of technical equivalency with the EPA FTIR methods, the revised ASTM standard could be incorporated by reference for EPA regulatory applicability. In the interim, facilities have the option to request ASTM D6348–98 as an alternative test method under 40 CFR 63.7(f) and 40 CFR 63.8(f) on a case-by-case basis.

Table 3 of the final BSCP rule and Table 4 of the final clay ceramics rule list the EPA testing methods included in the rules. Under 40 CFR 63.7(f) and 40 CFR 63.8(f), a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any of the EPA testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing today's final rules and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rules in the **Federal Register**. Neither of today's rules are "major rules" as defined by 5 U.S.C. 804(2). The final rules will be effective on May 16, 2003.

List of Subjects in 40 CFR Part 63

Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Part 63 is amended by adding subpart JJJJJ to read as follows:

Subpart JJJJJ—National Emission Standards for Hazardous Air Pollutants for Brick and Structural Clay Products Manufacturing

Sec.

What This Subpart Covers

63.8380 What is the purpose of this subpart?
63.8385 Am I subject to this subpart?
63.8390 What parts of my plant does this subpart cover?
63.8395 When do I have to comply with this subpart?

Emission Limitations

63.8405 What emission limitations must I meet?
63.8410 What are my options for meeting the emission limitations?

General Compliance Requirements

63.8420 What are my general requirements for complying with this subpart?
63.8425 What do I need to know about operation, maintenance, and monitoring plans?

Testing and Initial Compliance Requirements

63.8435 By what date must I conduct performance tests?
63.8440 When must I conduct subsequent performance tests?
63.8445 How do I conduct performance tests and establish operating limits?
63.8450 What are my monitoring installation, operation, and maintenance requirements?
63.8455 How do I demonstrate initial compliance with the emission limitations?

Continuous Compliance Requirements

63.8465 How do I monitor and collect data to demonstrate continuous compliance?
63.8470 How do I demonstrate continuous compliance with the emission limitations?

Notifications, Reports, and Records

63.8480 What notifications must I submit and when?
63.8485 What reports must I submit and when?
63.8490 What records must I keep?
63.8495 In what form and for how long must I keep my records?

Other Requirements and Information

63.8505 What parts of the General Provisions apply to me?
63.8510 Who implements and enforces this subpart?
63.8515 What definitions apply to this subpart?

Tables to Subpart JJJJJ of Part 63

Table 1 to Subpart JJJJJ of Part 63—Emission Limits
Table 2 to Subpart JJJJJ of Part 63—Operating Limits
Table 3 to Subpart JJJJJ of Part 63—Requirements for Performance Tests
Table 4 to Subpart JJJJJ of Part 63—Initial Compliance with Emission Limitations
Table 5 to Subpart JJJJJ of Part 63—Continuous Compliance with Emission Limits and Operating Limits
Table 6 to Subpart JJJJJ of Part 63—Requirements for Reports
Table 7 to Subpart JJJJJ of Part 63—Applicability of General Provisions to Subpart JJJJJ

What This Subpart Covers

§ 63.8380 What is the purpose of this subpart?

This subpart establishes national emission limitations for hazardous air pollutants (HAP) emitted from brick and structural clay products (BSCP) manufacturing facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§ 63.8385 Am I subject to this subpart?

You are subject to this subpart if you own or operate a BSCP manufacturing facility that is, is located at, or is part of, a major source of HAP emissions according to the criteria in paragraphs (a) and (b) of this section.

(a) A BSCP manufacturing facility is a plant site that manufactures brick (including, but not limited to, face brick, structural brick, and brick pavers); clay pipe; roof tile; extruded floor and wall tile; and/or other extruded, dimensional clay products. Brick and structural clay products manufacturing facilities typically process raw clay and shale, form the processed materials into bricks or shapes, and dry and fire the bricks or shapes.

(b) A major source of HAP emissions is any stationary source or group of stationary sources within a contiguous area under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (10 tons) or more per year or any combination of HAP at a rate of 22.68 megagrams (25 tons) or more per year.

§ 63.8390 What parts of my plant does this subpart cover?

(a) This subpart applies to each existing, new, or reconstructed affected source at a BSCP manufacturing facility.

(b) The existing affected source is an existing tunnel kiln with a design capacity equal to or greater than 9.07 megagrams per hour (Mg/hr) (10 tons per hour (tph)) of fired product according to paragraphs (b)(1) through (3) of this section. For the remainder of this subpart, a tunnel kiln with a design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product will be called a large tunnel kiln, and a tunnel kiln with a design capacity less than 9.07 Mg/hr (10 tph) of fired product will be called a small tunnel kiln.

(1) For existing tunnel kilns that do not have sawdust dryers, the kiln exhaust process stream (*i.e.*, the only process stream) is subject to the requirements of this subpart.

(2) For existing tunnel kilns that ducted exhaust to sawdust dryers prior to July 22, 2002, only the kiln exhaust process stream (*i.e.*, the process stream that exhausts directly to the atmosphere or to an air pollution control device (APCD)) is subject to the requirements of this subpart. As such, any process stream that is ducted to a sawdust dryer is not subject to these requirements.

(3) For existing tunnel kilns that first ducted exhaust to sawdust dryers on or after July 22, 2002, all of the exhaust (*i.e.*, all process streams) is subject to the requirements of this subpart.

(c) An existing small tunnel kiln whose design capacity is increased such that it is equal to or greater than 9.07 Mg/hr (10 tph) of fired product is subject to the requirements of this subpart.

(d) An existing tunnel kiln with a federally enforceable permit condition that restricts kiln operation to less than 9.07 Mg/hr (10 tph) of fired product on a 12-month rolling average basis is not subject to the requirements of this subpart.

(e) Each new or reconstructed tunnel kiln is an affected source regardless of design capacity. All process streams from each new or reconstructed tunnel kiln are subject to the requirements of this subpart.

(f) Kilns that are used exclusively for research and development (R&D) and are not used to manufacture products for commercial sale, except in a de minimis manner, are not subject to the requirements of this subpart.

(g) Kilns that are used exclusively for setting glazes on previously fired products are not subject to the requirements of this subpart.

(h) A source is a new affected source if construction of the affected source began after July 22, 2002, and you met the applicability criteria at the time you began construction.

(i) An affected source is reconstructed if you meet the criteria as defined in § 63.2, except as provided in paragraphs (i)(1) and (i)(2) of this section.

(1) It is not technologically and economically feasible for an existing small tunnel kiln whose design capacity is increased such that it is equal to or greater than 9.07 Mg/hr (10 tph) of fired product to meet the relevant standards (*i.e.*, new source maximum achievable control technology (MACT)) by retrofitting with a dry lime injection fabric filter (DIFF), dry lime scrubber/fabric filter (DLS/FF), or wet scrubber (WS).

(2) It is not technologically and economically feasible for an existing large dry limestone adsorber (DLA)-controlled kiln to meet the relevant standards by retrofitting with a DIFF, DLS/FF, or WS.

(j) An affected source is existing if it is not new or reconstructed.

§ 63.8395 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source, you must comply with this subpart according to paragraphs (a)(1) and (2) of this section.

(1) If the initial startup of your affected source is before May 16, 2003, then you must comply with the applicable emission limitations in Tables 1 and 2 to this subpart no later than May 16, 2003.

(2) If the initial startup of your affected source is after May 16, 2003, then you must comply with the applicable emission limitations in Tables 1 and 2 to this subpart upon initial startup of your affected source.

(b) If you have an existing affected source, you must comply with the applicable emission limitations in Tables 1 and 2 to this subpart no later than May 16, 2003.

(c) If you have an existing area source that increases its emissions or its potential to emit such that it becomes a major source of HAP, you must be in compliance with this subpart according to paragraphs (c)(1) and (2) of this section.

(1) Any portion of the existing facility that is a new affected source or a new reconstructed source must be in compliance with this subpart upon startup.

(2) All other parts of the existing facility must be in compliance with this subpart by 3 years after the date the area source becomes a major source.

(d) If you have a new area source (*i.e.*, an area source for which construction or reconstruction commenced after July 22, 2002) that increases its emissions or its potential to emit such that it becomes a major source of HAP, you must be in compliance with this subpart upon initial startup of your affected source as a major source.

(e) You must meet the notification requirements in § 63.8480 according to the schedule in § 63.8480 and in 40 CFR part 63, subpart A. Some of the notifications must be submitted before you are required to comply with the emission limitations in this subpart.

Emission Limitations

§ 63.8405 What emission limitations must I meet?

(a) You must meet each emission limit in Table 1 to this subpart that applies to you.

(b) You must meet each operating limit in Table 2 to this subpart that applies to you.

§ 63.8410 What are my options for meeting the emission limitations?

To meet the emission limitations in Tables 1 and 2 to this subpart, you must use one or more of the options listed in paragraphs (a) and (b) of this section.

(a) *Emissions control system.* Use an emissions capture and collection system and an APCD and demonstrate that the resulting emissions or emissions reductions meet the emission limits in Table 1 to this subpart, and that the capture and collection system and APCD meet the applicable operating limits in Table 2 to this subpart.

(b) *Process changes.* Use low-HAP raw materials or implement manufacturing process changes and demonstrate that the resulting emissions or emissions reductions meet the emission limits in Table 1 to this subpart.

General Compliance Requirements

§ 63.8420 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations (including operating limits) in this subpart at all times, except during periods of startup, shutdown, and malfunction and during periods of routine control device maintenance as specified in paragraph (e) of this section.

(b) Except as specified in paragraph (e) of this section, you must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i). During the period between the compliance date specified for your affected source in § 63.8395 and the date upon which continuous monitoring systems (CMS) (*e.g.*, continuous parameter monitoring systems) have been installed and verified and any applicable operating limits have been set, you must maintain a log detailing the operation and maintenance of the process and emissions control equipment.

(c) You must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

(d) You must prepare and implement a written operation, maintenance, and monitoring (OM&M) plan according to the requirements in § 63.8425.

(e) If you own or operate an affected kiln and must perform routine maintenance on the control device for that kiln, you may bypass the kiln control device and continue operating the kiln upon approval by the Administrator provided you satisfy the conditions listed in paragraphs (e)(1) through (5) of this section.

(1) You must request a routine control device maintenance exemption from the Administrator. Your request must justify the need for the routine maintenance on the control device and the time required to accomplish the maintenance activities, describe the maintenance activities and the frequency of the maintenance activities, explain why the maintenance cannot be accomplished during kiln shutdowns, describe how you plan to minimize emissions to the greatest extent possible during the maintenance, and provide any other documentation required by the Administrator.

(2) The routine control device maintenance exemption must not exceed 4 percent of the annual operating uptime for each kiln.

(3) The request for the routine control device maintenance exemption, if approved by the Administrator, must be incorporated by reference in and attached to the affected source's title V permit.

(4) You must minimize HAP emissions during the period when the kiln is operating and the control device is offline.

(5) You must minimize the time period during which the kiln is operating and the control device is offline.

(f) You must be in compliance with the provisions of subpart A of this part, except as noted in Table 7 to this subpart.

§ 63.8425 What do I need to know about operation, maintenance, and monitoring plans?

(a) You must prepare, implement, and revise as necessary an OM&M plan that includes the information in paragraph (b) of this section. Your OM&M plan must be available for inspection by the permitting authority upon request.

(b) Your OM&M plan must include, as a minimum, the information in paragraphs (b)(1) through (13) of this section.

(1) Each process and APCD to be monitored, the type of monitoring device that will be used, and the operating parameters that will be monitored.

(2) A monitoring schedule that specifies the frequency that the parameter values will be determined and recorded.

(3) The limits for each parameter that represent continuous compliance with the emission limitations in § 63.8405. The limits must be based on values of the monitored parameters recorded during performance tests.

(4) Procedures for the proper operation and routine and long-term maintenance of each APCD, including a maintenance and inspection schedule that is consistent with the manufacturer's recommendations.

(5) Procedures for installing the CMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last APCD).

(6) Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system.

(7) Continuous monitoring system performance evaluation procedures and acceptance criteria (*e.g.*, calibrations).

(8) Procedures for the proper operation and maintenance of monitoring equipment consistent with the requirements in §§ 63.8450 and 63.8(c)(1), (3), (4)(ii), (7), and (8).

(9) Continuous monitoring system data quality assurance procedures consistent with the requirements in § 63.8(d).

(10) Continuous monitoring system recordkeeping and reporting procedures consistent with the requirements in § 63.10(c), (e)(1), and (e)(2)(i).

(11) Procedures for responding to operating parameter deviations, including the procedures in paragraphs (b)(11)(i) through (iii) of this section.

(i) Procedures for determining the cause of the operating parameter deviation.

(ii) Actions for correcting the deviation and returning the operating parameters to the allowable limits.

(iii) Procedures for recording the times that the deviation began and ended and corrective actions were initiated and completed.

(12) Procedures for keeping records to document compliance.

(13) If you operate an affected kiln and you plan to take the kiln control device out of service for routine maintenance, as specified in § 63.8420(e), the procedures specified in paragraphs (b)(13)(i) and (ii) of this section.

(i) Procedures for minimizing HAP emissions from the kiln during periods of routine maintenance of the kiln control device when the kiln is operating and the control device is offline.

(ii) Procedures for minimizing the duration of any period of routine maintenance on the kiln control device when the kiln is operating and the control device is offline.

(c) Changes to the operating limits in your OM&M plan require a new performance test. If you are revising an operating limit parameter value, you must meet the requirements in paragraphs (c)(1) and (2) of this section.

(1) Submit a notification of performance test to the Administrator as specified in § 63.7(b).

(2) After completing the performance tests to demonstrate that compliance with the emission limits can be achieved at the revised operating limit parameter value, you must submit the performance test results and the revised operating limits as part of the Notification of Compliance Status required under § 63.9(h).

(d) If you are revising the inspection and maintenance procedures in your OM&M plan, you do not need to conduct a new performance test.

Testing and Initial Compliance Requirements

§ 63.8435 By what date must I conduct performance tests?

You must conduct performance tests within 180 calendar days after the compliance date that is specified for your source in § 63.8395 and according to the provisions in § 63.7(a)(2).

§ 63.8440 When must I conduct subsequent performance tests?

(a) You must conduct a performance test before renewing your 40 CFR part 70 operating permit or at least every 5 years following the initial performance test.

(b) You must conduct a performance test when you want to change the parameter value for any operating limit specified in your OM&M plan.

§ 63.8445 How do I conduct performance tests and establish operating limits?

(a) You must conduct each performance test in Table 3 to this subpart that applies to you.

(b) Before conducting the performance test, you must install and calibrate all monitoring equipment.

(c) Each performance test must be conducted according to the requirements in § 63.7 and under the specific conditions in Table 3 to this subpart.

(d) You must test while operating at the maximum production level.

(e) You may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in § 63.7(e)(1).

(f) You must conduct at least three separate test runs for each performance test required in this section, as specified in § 63.7(e)(3). Each test run must last at least 1 hour.

(g) You must use the data gathered during the performance test and the equations in paragraphs (g)(1) and (2) of this section to determine compliance with the emission limitations.

(1) To determine compliance with the production-based hydrogen fluoride (HF), hydrogen chloride (HCl), and particulate matter (PM) emission limits in Table 1 to this subpart, you must calculate your mass emissions per unit of production for each test run using Equation 1 of this section:

$$MP = \frac{ER}{P} \qquad \text{(Eq. 1)}$$

Where:

MP=mass per unit of production, kilograms (pounds) of pollutant per megagram (ton) of fired product

ER=mass emission rate of pollutant (HF, HCl, or PM) during each performance test run, kilograms (pounds) per hour

P=production rate during each performance test run, megagrams (tons) of fired product per hour.

(2) To determine compliance with the percent reduction HF and HCl emission limits in Table 1 to this subpart, you must calculate the percent reduction for each test run using Equation 2 of this section:

$$PR = \frac{ER_i - ER_o}{ER_i}\ (100) \qquad \text{(Eq. 2)}$$

Where:

PR=percent reduction, percent

ER_i=mass emission rate of specific HAP (HF or HCl) entering the

APCD, kilograms (pounds) per hour
ER_o=mass emission rate of specific HAP (HF or HCl) exiting the APCD, kilograms (pounds) per hour.

(h) You must establish each site-specific operating limit in Table 2 to this subpart that applies to you as specified in Table 3 to this subpart.

(i) For each affected kiln that is equipped with an APCD that is not addressed in Table 2 to this subpart or that is using process changes as a means of meeting the emission limits in Table 1 to this subpart, you must meet the requirements in § 63.8(f) and paragraphs (i)(1) and (2) of this section.

(1) Submit a request for approval of alternative monitoring procedures to the Administrator no later than the notification of intent to conduct a performance test. The request must contain the information specified in paragraphs (i)(1)(i) through (iv) of this section.

(i) A description of the alternative APCD or process changes.

(ii) The type of monitoring device or procedure that will be used.

(iii) The operating parameters that will be monitored.

(iv) The frequency that the operating parameter values will be determined and recorded to establish continuous compliance with the operating limits.

(2) Establish site-specific operating limits during the performance test based on the information included in the approved alternative monitoring procedures request and, as applicable, as specified in Table 3 to this subpart.

§ 63.8450 What are my monitoring installation, operation, and maintenance requirements?

(a) You must install, operate, and maintain each CMS according to your OM&M plan and the requirements in paragraphs (a)(1) through (5) of this section.

(1) Conduct a performance evaluation of each CMS according to your OM&M plan.

(2) The CMS must complete a minimum of one cycle of operation for each successive 15-minute period. To have a valid hour of data, you must have at least three of four equally spaced data values (or at least 75 percent if you collect more than four data values per hour) for that hour (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption as specified in § 63.8420(e)).

(3) Determine and record the 3-hour block averages of all recorded readings, calculated after every 3 hours of operation as the average of the previous 3 operating hours. To calculate the average for each 3-hour average period, you must have at least 75 percent of the recorded readings for that period (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption as specified in § 63.8420(e)).

(4) Record the results of each inspection, calibration, and validation check.

(5) At all times, maintain the monitoring equipment including, but not limited to, maintaining necessary parts for routine repairs of the monitoring equipment.

(b) For each liquid flow measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (b)(1) through (3) of this section.

(1) Locate the flow sensor in a position that provides a representative flowrate.

(2) Use a flow sensor with a minimum measurement sensitivity of 2 percent of the liquid flowrate.

(3) At least semiannually, conduct a flow sensor calibration check.

(c) For each pressure measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (c)(1) through (7) of this section.

(1) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure.

(2) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion.

(3) Use a gauge with a minimum measurement sensitivity of 0.5 inch of water or a transducer with a minimum measurement sensitivity of 1 percent of the pressure range.

(4) Check the pressure tap daily to ensure that it is not plugged.

(5) Using a manometer, check gauge calibration quarterly and transducer calibration monthly.

(6) Any time the sensor exceeds the manufacturer's specified maximum operating pressure range, conduct calibration checks or install a new pressure sensor.

(7) At least monthly, inspect all components for integrity, all electrical connections for continuity, and all mechanical connections for leakage.

(d) For each pH measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (d)(1) through (4) of this section.

(1) Locate the pH sensor in a position that provides a representative measurement of pH.

(2) Ensure the sample is properly mixed and representative of the fluid to be measured.

(3) Check the pH meter's calibration on at least two points every 8 hours of process operation.

(4) At least monthly, inspect all components for integrity and all electrical connections for continuity.

(e) For each bag leak detection system, you must meet the requirements in paragraphs (e)(1) through (11) of this section.

(1) Each triboelectric bag leak detection system must be installed, calibrated, operated, and maintained according to the "Fabric Filter Bag Leak Detection Guidance," (EPA–454/R–98–015, September 1997). This document is available from the U.S. Environmental Protection Agency (U.S. EPA); Office of Air Quality Planning and Standards; Emissions, Monitoring and Analysis Division; Emission Measurement Center (MD–19), Research Triangle Park, NC 27711. This document is also available on the Technology Transfer Network (TTN) under Emission Measurement Center Continuous Emission Monitoring. Other types of bag leak detection systems must be installed, operated, calibrated, and maintained in a manner consistent with the manufacturer's written specifications and recommendations.

(2) The bag leak detection system must be certified by the manufacturer to be capable of detecting PM emissions at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

(3) The bag leak detection system sensor must provide an output of relative PM loadings.

(4) The bag leak detection system must be equipped with a device to continuously record the output signal from the sensor.

(5) The bag leak detection system must be equipped with an audible alarm system that will sound automatically when an increase in relative PM emissions over a preset level is detected. The alarm must be located where it is easily heard by plant operating personnel.

(6) For positive pressure fabric filter systems, a bag leak detector must be installed in each baghouse compartment or cell.

(7) For negative pressure or induced air fabric filters, the bag leak detector must be installed downstream of the fabric filter.

(8) Where multiple detectors are required, the system's instrumentation and alarm may be shared among detectors.

(9) The baseline output must be established by adjusting the range and the averaging period of the device and establishing the alarm set points and the alarm delay time according to section 5.0 of the "Fabric Filter Bag Leak Detection Guidance."

(10) Following initial adjustment of the system, the sensitivity or range, averaging period, alarm set points, or alarm delay time may not be adjusted except as detailed in your OM&M plan. In no case may the sensitivity be increased by more than 100 percent or decreased more than 50 percent over a 365-day period unless such adjustment follows a complete fabric filter inspection that demonstrates that the fabric filter is in good operating condition. Record each adjustment.

(11) Record the results of each inspection, calibration, and validation check.

(f) For each lime or chemical feed rate measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (f)(1) and (2) of this section.

(1) Locate the measurement device in a position that provides a representative feed rate measurement.

(2) At least semiannually, conduct a calibration check.

(g) For each limestone feed system on a DLA, you must meet the requirements in paragraphs (a)(1),(4), and (5) of this section and must ensure on a monthly basis that the feed system replaces limestone at least as frequently as the schedule set during the performance test.

(h) Requests for approval of alternate monitoring procedures must meet the requirements in §§ 63.8445(i) and 63.8(f).

§ 63.8455 How do I demonstrate initial compliance with the emission limitations?

(a) You must demonstrate initial compliance with each emission limitation that applies to you according to Table 4 to this subpart.

(b) You must establish each site-specific operating limit in Table 2 to this subpart that applies to you according to the requirements in § 63.8445 and Table 3 to this subpart.

(c) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in § 63.8480(e).

Continuous Compliance Requirements

§ 63.8465 How do I monitor and collect data to demonstrate continuous compliance?

(a) You must monitor and collect data according to this section.

(b) Except for periods of monitor malfunctions, associated repairs, and required quality assurance or control activities (including, as applicable, calibration checks and required zero and span adjustments), you must monitor continuously (or collect data at all required intervals) at all times that the affected source is operating. This includes periods of startup, shutdown, malfunction, and routine control device maintenance as specified in § 63.8420(e) when the affected source is operating.

(c) You may not use data recorded during monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities for purposes of calculating data averages. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. You must use all the valid data collected during all other periods in assessing compliance. Any averaging period for which you do not have valid monitoring data and such data are required constitutes a deviation from the monitoring requirements.

§ 63.8470 How do I demonstrate continuous compliance with the emission limitations?

(a) You must demonstrate continuous compliance with each emission limit and operating limit in Tables 1 and 2 to this subpart that applies to you according to the methods specified in Table 5 to this subpart.

(b) For each affected kiln that is equipped with an APCD that is not addressed in Table 2 to this subpart, or that is using process changes as a means of meeting the emission limits in Table 1 to this subpart, you must demonstrate continuous compliance with each emission limit in Table 1 to this subpart, and each operating limit established as required in § 63.8445(i)(2) according to the methods specified in your approved alternative monitoring procedures request, as described in §§ 63.8445(i)(1) and 63.8(f).

(c) You must report each instance in which you did not meet each emission limit and each operating limit in this subpart that applies to you. This includes periods of startup, shutdown, malfunction, and routine control device maintenance. These instances are deviations from the emission limitations in this subpart. These deviations must be reported according to the requirements in § 63.8485.

(d) During periods of startup, shutdown, and malfunction, you must operate according to your SSMP.

(e) Consistent with §§ 63.6(e)and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating according to an SSMP that satisfies the requirements of § 63.6(e) and your OM&M plan. The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

(f) Deviations that occur during periods of control device maintenance covered by an approved routine control device maintenance exemption according to § 63.8420(e) are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the approved routine control device maintenance exemption.

(g) You must demonstrate continuous compliance with the operating limits in Table 2 to this subpart for visible emissions (VE) from tunnel kilns equipped with DLA, DIFF, or DLS/FF by monitoring VE at each kiln stack according to the requirements in paragraphs (g)(1) through (3) of this section.

(1) Perform daily VE observations of each kiln stack according to the procedures of Method 22 of 40 CFR part 60, appendix A. You must conduct the Method 22 test while the affected source is operating under normal conditions. The duration of each Method 22 test must be at least 15 minutes.

(2) If VE are observed during any daily test conducted using Method 22 of 40 CFR part 60, appendix A, you must promptly initiate and complete corrective actions according to your OM&M plan. If no VE are observed in 30 consecutive daily Method 22 tests for any kiln stack, you may decrease the frequency of Method 22 testing from daily to weekly for that kiln stack. If VE are observed during any weekly test, you must promptly initiate and complete corrective actions according to your OM&M plan, resume Method 22 testing of that kiln stack on a daily basis, and maintain that schedule until no VE are observed in 30 consecutive daily tests, at which time you may again decrease the frequency of Method 22 testing to a weekly basis.

(3) If VE are observed during any test conducted using Method 22 of 40 CFR part 60, appendix A, you must report these deviations by following the requirements in § 63.8485.

Notifications, Reports, and Records

§ 63.8480 What notifications must I submit and when?

(a) You must submit all of the notifications in §§ 63.7(b) and (c), 63.8(f)(4), and 63.9 (b) through (e), (g)(1), and (h) that apply to you, by the dates specified.

(b) As specified in § 63.9(b)(2) and (3), if you start up your affected source before May 16, 2003, you must submit an Initial Notification not later than 120 calendar days after May 16, 2003.

(c) As specified in § 63.9(b)(3), if you start up your new or reconstructed affected source on or after May 16, 2003, you must submit an Initial Notification not later than 120 calendar days after you become subject to this subpart.

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin, as required in § 63.7(b)(1).

(e) If you are required to conduct a performance test as specified in Table 3 to this subpart, you must submit a Notification of Compliance Status as specified in § 63.9(h) and paragraphs (e)(1) and (2) of this section.

(1) For each compliance demonstration that includes a performance test conducted according to the requirements in Table 3 to this subpart, you must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test, according to § 63.10(d)(2).

(2) In addition to the requirements in § 63.9(h)(2)(i), you must include the information in paragraphs (e)(2)(i) and (ii) of this section in your Notification of Compliance Status.

(i) The operating limit parameter values established for each affected source with supporting documentation and a description of the procedure used to establish the values.

(ii) For each APCD that includes a fabric filter, if a bag leak detection system is used, analysis and supporting documentation demonstrating conformance with EPA guidance and specifications for bag leak detection systems in § 63.8450(e).

(f) If you request a routine control device maintenance exemption according to § 63.8420(e), you must submit your request for the exemption no later than 30 days before the compliance date.

§ 63.8485 What reports must I submit and when?

(a) You must submit each report in Table 6 to this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report by the date in Table 6 to this subpart and as specified in paragraphs (b)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in § 63.8395 and ending on June 30 or December 31, and lasting at least 6 months, but less than 12 months. For example, if your compliance date is March 1, then the first semiannual reporting period would begin on March 1 and end on December 31.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31 for compliance periods ending on June 30 and December 31, respectively.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31 for compliance periods ending on June 30 and December 31, respectively.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) The compliance report must contain the information in paragraphs (c)(1) through (7) of this section.

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying that, based on information and belief formed after reasonable inquiry, the statements and information in the report are true, accurate, and complete.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP and OM&M plan, the compliance report must include the information specified in § 63.10(d)(5)(i).

(5) A description of control device maintenance performed while the control device was offline and the kiln controlled by the control device was operating, including the information specified in paragraphs (c)(5)(i) through (iii) of this section.

(i) The date and time when the control device was shutdown and restarted.

(ii) Identification of the kiln that was operating and the number of hours that the kiln operated while the control device was offline.

(iii) A statement of whether or not the control device maintenance was included in your approved routine control device maintenance exemption developed as specified in § 63.8420(e). If the control device maintenance was included in your approved routine control device maintenance exemption, then you must report the information in paragraphs (c)(5)(iii)(A) through (C) of this section.

(A) The total amount of time that the kiln controlled by the control device operated during the current semiannual compliance period and during the previous semiannual compliance period.

(B) The amount of time that each kiln controlled by the control device operated while the control device was offline for maintenance covered under the routine control device maintenance exemption during the current semiannual compliance period and during the previous semiannual compliance period.

(C) Based on the information recorded under paragraphs (c)(5)(iii)(A) and (B) of this section, compute the annual percent of kiln operating uptime during which the control device was offline for routine maintenance using Equation 1 of this section.

$$RM = \frac{DT_p + DT_c}{KU_p + KU_c} (100) \qquad \text{(Eq. 1)}$$

Where:

RM=Annual percentage of kiln uptime during which control device was offline for routine control device maintenance

DT_p=Control device downtime claimed under the routine control device maintenance exemption for the previous semiannual compliance period

DT_c=Control device downtime claimed under the routine control device maintenance exemption for the current semiannual compliance period

KU_p=Kiln uptime for the previous semiannual compliance period
KU_c=Kiln uptime for the current semiannual compliance period

(6) If there are no deviations from any emission limitations (emission limits or operating limits) that apply to you, the compliance report must contain a statement that there were no deviations from the emission limitations during the reporting period.

(7) If there were no periods during which the CMS was out-of-control as specified in your OM&M plan, the compliance report must contain a statement that there were no periods during which the CMS was out-of-control during the reporting period.

(d) For each deviation from an emission limitation (emission limit or operating limit) that occurs at an affected source where you are not using a CMS to comply with the emission limitations in this subpart, the compliance report must contain the information in paragraphs (c)(1) through (5) and paragraphs (d)(1) and (2) of this section. This includes periods of startup, shutdown, malfunction, and routine control device maintenance.

(1) The total operating time of each affected source during the reporting period.

(2) Information on the number, duration, and cause of deviations (including unknown cause, if applicable), as applicable, and the corrective action taken.

(e) For each deviation from an emission limitation (emission limit or operating limit) occurring at an affected source where you are using a CMS to comply with the emission limitations in this subpart, you must include the information in paragraphs (c)(1) through (5) and paragraphs (e)(1) through (13) of this section. This includes periods of startup, shutdown, malfunction, and routine control device maintenance.

(1) The total operating time of each affected source during the reporting period.

(2) The date and time that each malfunction started and stopped.

(3) The date and time that each CMS was inoperative, except for zero (low-level) and high-level checks.

(4) The date, time, and duration that each CMS was out-of-control, including the pertinent information in your OM&M plan.

(5) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction; during routine control device maintenance covered in your approved routine control device maintenance exemption; or during another period.

(6) A description of corrective action taken in response to a deviation.

(7) A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

(8) A breakdown of the total duration of the deviations during the reporting period into those that were due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(9) A summary of the total duration of CMS downtime during the reporting period and the total duration of CMS downtime as a percent of the total source operating time during that reporting period.

(10) A brief description of the process units.

(11) A brief description of the CMS.

(12) The date of the latest CMS certification or audit.

(13) A description of any changes in CMS, processes, or control equipment since the last reporting period.

(f) If you have obtained a title V operating permit according to 40 CFR part 70 or 40 CFR part 71, you must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If you submit a compliance report according to Table 6 to this subpart along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report includes all required information concerning deviations from any emission limitation (including any operating limit), then submitting the compliance report will satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submitting a compliance report will not otherwise affect any obligation you may have to report deviations from permit requirements to the permitting authority.

§ 63.8490 What records must I keep?

(a) You must keep the records listed in paragraphs (a)(1) through (4) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) Records of performance tests as required in § 63.10(b)(2)(viii).

(4) Records relating to control device maintenance and documentation of your approved routine control device maintenance exemption, if you request such an exemption under § 63.8420(e).

(b) You must keep the records required in Table 5 to this subpart to show continuous compliance with each emission limitation that applies to you.

(c) You must also maintain the records listed in paragraphs (c)(1) through (6) of this section.

(1) For each bag leak detection system, records of each alarm, the time of the alarm, the time corrective action was initiated and completed, and a brief description of the cause of the alarm and the corrective action taken.

(2) For each deviation of an operating limit parameter value, the date, time, and duration of the deviation, a brief explanation of the cause of the deviation and the corrective action taken, and whether the deviation occurred during a period of startup, shutdown, or malfunction.

(3) For each affected source, records of production rates on a fired-product basis.

(4) Records for any approved alternative monitoring or test procedures.

(5) Records of maintenance and inspections performed on the APCD.

(6) Current copies of your SSMP and OM&M plan, including any revisions, with records documenting conformance.

§ 63.8495 In what form and for how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record onsite for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You may keep the records offsite for the remaining 3 years.

Other Requirements and Information

§ 63.8505 What parts of the General Provisions apply to me?

Table 7 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

§ 63.8510 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the U.S. EPA, has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under section 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that cannot be delegated to State, local, or tribal agencies are as specified in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the applicability requirements in §§ 63.8385 and 63.8390, the compliance date requirements in § 63.8395, and the non-opacity emission limitations in § 63.8405.

(2) Approval of major changes to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major changes to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.8515 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in § 63.2, and in this section as follows:

Air pollution control device (APCD) means any equipment that reduces the quantity of a pollutant that is emitted to the air.

Bag leak detection system means an instrument that is capable of monitoring PM loadings in the exhaust of a fabric filter in order to detect bag failures. A bag leak detection system includes, but is not limited to, an instrument that operates on triboelectric, light-scattering, light-transmittance, or other effects to monitor relative PM loadings.

Brick and structural clay products (BSCP) manufacturing facility means a plant site that manufactures brick (including, but not limited to, face brick, structural brick, and brick pavers); clay pipe; roof tile; extruded floor and wall tile; and/or other extruded, dimensional clay products. Brick and structural clay products manufacturing facilities typically process raw clay and shale, form the processed materials into bricks or shapes, and dry and fire the bricks or shapes.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limitation (including any operating limit) or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation (including any operating limit) or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Dry lime injection fabric filter (DIFF) means an APCD that includes continuous injection of hydrated lime or other sorbent into a duct or reaction chamber followed by a fabric filter.

Dry lime scrubber/fabric filter (DLS/FF) means an APCD that includes continuous injection of humidified hydrated lime or other sorbent into a reaction chamber followed by a fabric filter. These systems typically include recirculation of some of the sorbent.

Dry limestone adsorber (DLA) means an APCD that includes a limestone storage bin, a reaction chamber that is essentially a packed tower filled with limestone, and may or may not include a peeling drum that mechanically scrapes reacted limestone to regenerate the stone for reuse.

Emission limitation means any emission limit or operating limit.

Fabric filter means an APCD used to capture PM by filtering a gas stream through filter media; also known as a baghouse.

Initial startup means:

(1) For a new or reconstructed tunnel kiln controlled with a DLA, and for a tunnel kiln that would be considered reconstructed but for § 63.8390(i)(1) or § 63.8390(i)(2), the time at which the temperature in the kiln first reaches 260 °C (500 °F) and the kiln contains product; or

(2) For a new or reconstructed tunnel kiln controlled with a DIFF, DLS/FF, or WS, the time at which the kiln first reaches a level of production that is equal to 75 percent of the kiln design capacity or 12 months after the affected source begins firing BSCP, whichever is earlier.

Kiln exhaust process stream means the portion of the exhaust from a tunnel kiln that exhausts directly to the atmosphere (or to an APCD), rather than to a sawdust dryer.

Large tunnel kiln means a tunnel kiln (existing, new, or reconstructed) with a design capacity equal to or greater than 9.07 Mg/hr (10 tph) of fired product.

Particulate matter (PM) means, for purposes of this subpart, emissions of PM that serve as a measure of total particulate emissions, as measured by Method 5 (40 CFR part 60, appendix A), and as a surrogate for metal HAP contained in the particulates including, but not limited to, antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, nickel, and selenium.

Plant site means all contiguous or adjoining property that is under common control, including properties that are separated only by a road or other public right-of-way. Common control includes properties that are owned, leased, or operated by the same entity, parent entity, subsidiary, or any combination thereof.

Research and development kiln means any kiln whose purpose is to conduct research and development for new processes and products and is not engaged in the manufacture of products for commercial sale, except in a de minimis manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Small tunnel kiln means a tunnel kiln (existing, new, or reconstructed) with a design capacity less than 9.07 Mg/hr (10 tph) of fired product.

Startup means the setting in operation of an affected source and starting the production process.

Tunnel kiln means any continuous kiln that is used to fire BSCP. Some tunnel kilns have two process streams, including a process stream that exhausts directly to the atmosphere or to an APCD, and a process stream in which the kiln exhaust is ducted to a sawdust dryer where it is used to dry sawdust before being emitted to the atmosphere.

Tunnel kiln design capacity means the maximum amount of brick, in Mg (tons), that a kiln is designed to produce in one year divided by the number of hours in a year (8,760 hours). If a kiln is modified to increase the capacity, the design capacity is considered to be the capacity following modifications.

Wet scrubber (WS) means an APCD that uses water, which may include caustic additives or other chemicals, as the sorbent. Wet scrubbers may use any

of various design mechanisms to increase the contact between exhaust gases and the sorbent.

Tables to Subpart JJJJJ of Part 63

As stated in § 63.8405, you must meet each emission limit in the following table that applies to you:

TABLE 1 TO SUBPART JJJJJ OF PART 63.—EMISSION LIMITS

For each . . .	You must meet the following emission limits . . .	Or you must comply with the following . . .
1. Existing large tunnel kiln (design capacity ≥10 tph of fired product), excluding any process stream that is ducted to a sawdust dryer prior to July 22, 2002; or including any process stream that exhausts directly to the atmosphere or to an APCD and any process stream that is first ducted to a sawdust on or after July 22, 2002; each new or reconstructed small tunnel kiln (design capacity <10 tph of fired product), including all process streams; each tunnel kiln that would be considered reconstructed but for § 63.8390(i)(1), including all process streams; and each large tunnel kiln previously equipped with a DLA that would be considered reconstructed but for § 63.8390(i)(2), including all process streams.	a. HF emissions must not exceed 0.029 kilograms per megagram (kg/Mg) (0.057 pounds per ton (lb/ton)) of fired product.	Reduce uncontrolled HF emissions by at least 90 percent.
	b. HCl emissions must not exceed 0.13 kg/Mg (0.26 lb/ton) of fired product.	Reduce uncontrolled HCl emissions by at least 30 percent.
	c. PM emissions must not exceed 0.21 kg/Mg (0.42 lb/ton) of fired product.	Not applicable.
2. New or reconstructed large tunnel kiln, including all process streams.	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product.	Reduce uncontrolled HF emissions by at least 90 percent.
	b. HCl emissions must not exceed 0.028 kg/Mg (0.056 lb/ton) of fired product.	Reduce uncontrolled HCl emissions by at least 85 percent.
	c. PM emissions must not exceed 0.060 kg/Mg (0.12 lb/ton) of fired product.	Not applicable.

As stated in § 63.8405, you must meet each operating limit in the following table that applies to you:

TABLE 2 TO SUBPART JJJJJ OF PART 63.—OPERATING LIMITS

For each . . .	You must . . .
1. Kiln equipped with a DLA	a. Maintain the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test; and
	b. Maintain an adequate amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times; maintain the limestone feeder setting at or above the level established during the performance test; and
	c. Use the same grade of limestone from the same source as was used during the performance test; maintain records of the source and grade of limestone; and
	d. Maintain no VE from the DLA stack.
2. Kiln equipped with a DIFF or DLS/FF	a. If you use a bag leak detection system, initiate corrective action within 1 hour of a bag leak detection system alarm and complete corrective actions in accordance with your OM&M plan; operate and maintain the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month block reporting period; or maintain no VE from the DIFF or DLS/FF stack; and
	b. Maintain free-flowing lime in the feed hopper or silo and to the APCD at all times for continuous injection systems; maintain the feeder setting at or above the level established during the performance test for continuous injection systems.
3. Kiln equipped with a WS	a. Maintain the average scrubber pressure drop for each 3-hour block period at or above the average pressure drop established during the performance test; and
	b. Maintain the average scrubber liquid pH for each 3-hour block period at or above the average scrubber liquid pH established during the performance test; and
	c. Maintain the average scrubber liquid flow rate for each 3-hour block period at or above the average scrubber liquid flow rate established during the performance test; and
	d. If chemicals are added to the scrubber water, maintain the average scrubber chemical feed rate for each 3-hour block period at or above the average scrubber chemical feed rate established during the performance test.

As stated in § 63.8445, you must conduct each performance test in the following table that applies to you:

TABLE 3 TO SUBPART JJJJJ OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS

For each . . .	You must . . .	Using . . .	According to the following requirements . . .
1. Kiln	a. Select locations of sampling ports and the number of traverse points.	Method 1 or 1A of 40 CFR part 60, appendix A.	Sampling sites must be located at the outlet of the APCD and prior to any releases to the atmosphere for all affected sources. If you choose to meet the percent emission reduction requirements for HF or HCl, a sampling site must also be located at the APCD inlet.
	b. Determine velocities and volumetric flow rate.	Method 2 of 40 CFR part 60, appendix A.	You may use Method 2A, 2C, 2D, 2F, or 2G of 40 CFR part 60, appendix A, as appropriate, as an alternative to using Method 2 of 40 CFR part 60, appendix A.
	c. Conduct gas molecular weight analysis.	Method 3 of 40 CFR part 60, appendix A.	You may use Method 3A or 3B of 40 CFR part 60, appendix A, as appropriate, as an alternative to using Method 3 of 40 CFR part 60, appendix A.
	d. Measure moisture content of the stack gas.	Method 4 of 40 CFR part 60, appendix A.	
	e. Measure HF and HCl emissions.	Method 26A of 40 CFR part 60, appendix A; or	Conduct the test while operating at the maximum production level. You may use Method 26 of 40 CFR part 60, appendix A, as an alternative to using Method 26A of 40 CFR part 60, appendix A, when no acid PM (*e.g.*, HF or HCl dissolved in water droplets emitted by sources controlled by a WS) is present.
		Method 320 of 40 CFR part 63, appendix A.	Conduct the test while operating at the maximum production level. When using Method 320 of 40 CFR part 63, appendix A, you must follow the analyte spiking procedures of section 13 of Method 320 of 40 CFR part 63, appendix A, unless you can demonstrate that the complete spiking procedure has been conducted at a similar source.
	f. Measure PM emissions.	Method 5 of 40 CFR part 60, appendix A.	Conduct the test while operating at the maximum production level.
2. Kiln that is complying with production-based emission limits.	Determine the production rate during each test run in order to determine compliance with production-based emission limits.	Production data collected during the performance tests (*e.g.*, no. of pushes per hour, no. of bricks per kiln car, weight of a typical fired brick).	You must measure and record the production rate, on a fired-product basis, of the affected source for each of the three test runs.
3. Kiln equipped with a DLA	a. Establish the operating limit for the average pressure drop across the DLA.	Data from the pressure drop measurement device during the performance test.	You must continuously measure the pressure drop across the DLA, determine and record the block average pressure drop values for the three test runs, and determine and record the 3-hour block average of the recorded pressure drop measurements for the three test runs.

TABLE 3 TO SUBPART JJJJJ OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS—Continued

For each . . .	You must . . .	Using . . .	According to the following requirements . . .
	b. Establish the operating limit for the limestone feeder setting.	Data from the limestone feeder during the performance test.	You must ensure that you maintain an adequate amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times during the performance test. You must establish your limestone feeder setting one week prior to the performance test and maintain the feeder setting for the one-week period that precedes the performance test and during the performance test.
	c. Document the source and grade of limestone used.	Records of limestone purchase.	
4. Kiln equipped with a DIFF or DLS/FF.	Establish the operating limit for the lime feeder setting.	Data from the lime feeder during the performance test.	For continuous lime injection systems, you must ensure that lime in the feed hopper or silo and to the APCD is free-flowing at all times during the performance test and record the feeder setting for the three test runs. If the feed rate setting varies during the three test runs, determine and record the average feed rate from the three test runs.
5. Kiln equipped with a WS	a. Establish the operating limit for the average scrubber pressure drop.	Data from the pressure drop measurement device during the performance test.	You must continuously measure the scrubber pressure drop, determine and record the block average pressure drop values for the three test runs, and determine and record the 3-hour block average of the recorded pressure drop measurements for the three test runs.
	b. Establish the operating limit for the average scrubber liquid pH.	Data from the pH measurement device during the performace test.	You must continuously measure the scrubber liquid pH, determine and record the block average pH values for the three test runs, and determine and record the 3-hour block average of the recorded pH measurements for the three test runs.
	c. Establish the operating limit for the average scrubber liquid flow rate.	Data from the flow rate measurement device during the performance test.	You must continuously measure the scrubber liquid flow rate, determine and record the block average flow rate values for the three test runs, and determine and record the 3-hour block average of the recorded flow rate measurements for the three test runs.
6. Kiln equipped with a WS that includes chemical addition to the water.	Establish the operating limit for the average scrubber chemical feed rate.	Data from the chemical feed rate measurement device during the performance test.	You must continuously measure the scrubber chemical feed rate, determine and record the block average chemical feed rate values for the three test runs, and determine and record the 3-hour block average of the recorded chemical feed rate measurements for the three test runs.

As stated in § 63.8455, you must demonstrate initial compliance with each emission limitation that applies to you according to the following table:

TABLE 4 TO SUBPART JJJJJ OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS

For each . . .	For the following emission limitation . . .	You have demonstrated initial compliance if . . .
1. Existing large tunnel kiln (design capacity ≥10 tph of fired product), excluding any process stream that is ducted to a sawdust dryer prior to July 22, 2002; or including any process stream that exhausts directly to the atmosphere or to an APCD and any process stream that is first ducted to a sawdust dryer on or after July 22, 2002; each new or reconstructed small tunnel kiln (design capacity <10 tph of fired product), including all process streams; each tunnel kiln that would be considered reconstructed but for §63.8390(i)(1), including all process streams; and each large tunnel kiln previously equipped with a DLA that would be considered reconstructed but for §63.8390(i)(2), including all process streams.	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product; or uncontrolled HF emissions must be reduced by at least 90 percent; and	i. The HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.029 kg/Mg (0.057 lb/ton); or uncontrolled HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 90 percent, according to the calculations in §63.8445(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HF emissions did not exceed 0.029 kg/Mg (0.057 lb/ton) or uncontrolled HF emissions were reduced by at least 90 percent.
	b. HCl emissions must not exceed 0.13 kg/Mg (0.26 lb/ton) of fired product; or uncontrolled HCl emissions must be reduced by at least 30 percent; and	i. The HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.13 kg/Mg (0.26 lb/ton); or uncontrolled HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 30 percent, according to the calculations in §63.8445(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HCl emissions did not exceed 0.13 kg/Mg (0.26 lb/ton) or uncontrolled HCl emissions were reduced by at least 30 percent.
	c. PM emissions must not exceed 0.21 kg/Mg (0.42 lb/ton) of fired product.	i. The PM emissions measured using Method 5 of 40 CFR part 60, appendix A, over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.21 kg/Mg (0.42 lb/ton); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which PM emissions did not exceed 0.21 kg/Mg (0.42 lb/ton).
2. New or reconstructed large tunnel kiln, including all process streams.	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product; or uncontrolled HF emissions must be reduced by at least 90 percent; and	i. The HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.029 kg/Mg (0.057 lb/ton); or uncontrolled HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 90 percent, according to the calculations in §63.8445(g)(2); and

TABLE 4 TO SUBPART JJJJJ OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS—Continued

For each . . .	For the following emission limitation . . .	You have demonstrated initial compliance if . . .
		ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HF emissions did not exceed 0.029 kg/Mg (0.057 lb/ton) or uncontrolled HF emissions were reduced by at least 90 percent.
	b. HCl emissions must not exceed 0.028 kg/Mg (0.056 lb/ton) of fired product; or uncontrolled HCl emissions must be reduced by at least 85 percent; and	i. The HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.028 kg/Mg (0.056 lb/ton); or uncontrolled HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 85 percent, according to the calculations in §63.8445(g)(2); and
		ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HCl emissions did not exceed 0.028 kg/Mg (0.056 lb/ton) or uncontrolled HCl emissions were reduced by at least 85 percent.
	c. PM emissions must not exceed 0.060 kg/Mg (0.12 lb/ton) of fired product.	i. The PM emissions measured using Method 5 of 40 CFR part 60, appendix A, over the period of the initial performance test, according to the calculations in §63.8445(g)(1), do not exceed 0.060 kg/Mg (0.12 lb/ton); and
		ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which PM emissions did not exceed 0.060 kg/Mg (0.12 lb/ton).

As stated in §63.8470, you must demonstrate continuous compliance with each emission limit and operating limit that applies to you according to the following table:

TABLE 5 TO SUBPART JJJJJ OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITS AND OPERATING LIMITS

For each . . .	For the following emission limits and operating limits . . .	You must demonstrate continuous compliance by . . .
1. Kiln equipped with a DLA	Each emission limit in Table 1 to this subpart and each operating limit in Item 1 of Table 2 to this subpart for kilns equipped with a DLA.	i. Collecting the DLA pressure drop data according to §63.8450(a); reducing the DLA pressure drop data to 3-hour block averages according to §63.8450(a); maintaining the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test; and
		ii. Verifying that the limestone hopper and storage bin (located at the top of the DLA) contain adequate limestone by performing a daily visual check; and
		iii. Recording the limestone feeder setting daily to verify that the feeder setting is being maintained at or above the level established during the performance test; and
		iv. Using the same grade of limestone from the same source as was used during the performance test; maintaining records of the source and type of limestone; and
		v. Performing VE observations of the DLA stack at the frequency specified in §63.8470(g) using Method 22 of 40 CFR part 60, appendix A; maintaining no VE from the DLA stack.

TABLE 5 TO SUBPART JJJJJ OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITS AND OPERATING LIMITS—Continued

For each . . .	For the following emission limits and operating limits . . .	You must demonstrate continuous compliance by . . .
2. Kiln equipped with a DIFF or DLS/FF.	Each emission limit in Table 1 to this subpart and each operating limit in Item 2 of Table 2 to this subpart for kilns equipped with DIFF or DLS/FF.	i. If you use a bag leak detection system, initiating corrective action within 1 hour of a bag leak detection system alarm and completing corrective actions in accordance with your OM&M plan; operating and maintaining the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month block reporting period; in calculating this operating time fraction, if inspection of the fabric filter demonstrates that no corrective action is required, no alarm time is counted; if corrective action is required, each alarm is counted as a minimum of 1 hour; if you take longer than 1 hour to initiate corrective action, the alarm time is counted as the actual amount of time taken by you to initiate corrective action; or performing VE observations of the DIFF or DLS/FF stack at the frequency specified in §63.8470(g) using Method 22 of 40 CFR part 60, appendix A; maintaining no VE from the DIFF or DLS/FF stack; and ii. Verifying that lime is free-flowing via a load cell, carrier gas/lime flow indicator, carrier gas pressure drop measurement system, or other system; recording all monitor or sensor output, and if lime is found not to be free flowing, promptly initiating and completing corrective actions in accordance with your OM&M plan; recording the feeder setting once during each shift of operation to verify that the feeder setting is being maintained at or above the level established during the performance test.
3. Kiln equipped with a WS	Each emission limit in Table 1 to this subpart and each operating limit in Item 3 of Table 2 to this subpart for kilns equipped with WS.	i. Collecting the scrubber pressure drop data according to §63.8450(a); reducing the scrubber pressure drop data to 3-hour block averages according to §63.8450(a); maintaining the average scrubber pressure drop for each 3-hour block period at or above the average pressure drop established during the performance test; and ii. Collecting the scrubber liquid pH data according to §63.8450(a); reducing the scrubber liquid pH data to 3-hour block averages according to §63.8450(a); maintaining the average scrubber liquid pH for each 3-hour block period at or above the average scrubber liquid pH established during the performance test; and iii. Collecting the scrubber liquid flow rate data according to §63.8450(a); reducing the scrubber liquid flow rate data to 3-hour block averages according to §63.8450(a); maintaining the average scrubber liquid flow rate for each 3-hour block period at or above the average scrubber liquid flow rate established during the performance test; and iv. If chemicals are added to the scrubber water, collecting the scrubber chemical feed rate data according to §63.8450(a); reducing the scrubber chemical feed rate data to 3-hour block averages according to §63.8450(a); maintaining the average scrubber chemical feed rate for each 3-hour block period at or above the average scrubber chemical feed rate established during the performance test.

As stated in §63.8485, you must submit each report that applies to you according to the following table:

TABLE 6 TO SUBPART JJJJJ OF PART 63.—REQUIREMENTS FOR REPORTS

You must submit . . .	The report must contain . . .	You must submit the report . . .
1. A compliance report	a. If there are no deviations from any emission limitations (emission limits, operating limits) that apply to you, a statement that there were no deviations from the emission limitations during the reporting period. If there were no periods during which the CMS was out-of-control as specified in your OM&M plan, a statement that there were no periods during which the CMS was out- of-control during the reporting period.	Semiannually according to the requirements in §63.8485(b).

TABLE 6 TO SUBPART JJJJJ OF PART 63.—REQUIREMENTS FOR REPORTS—Continued

You must submit . . .	The report must contain . . .	You must submit the report . . .
	b. If you have a deviation from any emission limitation (emission limit, operating limit) during the reporting period, the report must contain the information in § 63.8485(d) or (e). If there were periods during which the CMS was out-of-control, as specified in your OM&M plan, the report must contain the information in § 63.8485(e).	Semiannually according to the requirements in § 63.8485(b).
	c. If you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in § 63.10(d)(5)(i).	Semiannually according to the requirements in § 63.8485(b).
2. An immediate startup, shutdown, and malfunction report if you took actions during a startup, shutdown, or malfunction during the reporting period that are not consistent with your SSMP.	a. Actions taken for the event according to the requirements in § 63.10(d)(5)(ii).	By fax or telephone within 2 working days after starting actions inconsistent with the plan.
	b. The information in § 63.10(d)(5)(ii)	By letter within 7 working days after the end of the event unless you have made alternative arrangements with the permitting authority.

As stated in § 63.8505, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

TABLE 7 TO SUBPART JJJJJ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART JJJJJ

Citation	Subject	Brief description	Applies to subpart JJJJJ
§ 63.1	Applicability	Initial applicability determination; applicability after standard established; permit requirements; extensions, notifications.	Yes.
§ 63.2	Definitions	Definitions for part 63 standards	Yes.
§ 63.3	Units and Abbreviations	Units and abbreviations for part 63 standards	Yes.
§ 63.4	Prohibited Activities	Compliance date; circumvention; severability	Yes.
§ 63.5	Construction/Reconstruction	Applicability; applications; approvals	Yes.
§ 63.6(a)	Applicability	General Provisions (GP) apply unless compliance extension; GP apply to area sources that become major.	Yes.
§ 63.6(b)(1)–(4)	Compliance Dates for New and Reconstructed sources.	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for section 112(f).	Yes.
§ 63.6(b)(5)	Notification	Must notify if commenced construction or reconstruction after proposal.	Yes.
§ 63.6(b)(6)	[Reserved].		
§ 63.6(b)(7)	Compliance Dates for New and Reconstructed area Sources That Become Major.	Area sources that become major must comply with major source standards immediately upon becoming major, regardless of whether required to comply when they were area sources.	Yes.
§ 63.6(c)(1)–(2)	Compliance Dates for Existing Sources	Comply according to date in subpart, which must be no later than 3 years after effective date; for section 112(f) standards, comply within 90 days of effective date unless compliance extension.	Yes.
§ 63.6(c)(3)–(4)	[Reserved]..		
§ 63.6(c)(5)	Compliance Dates for Existing area Sources That Become Major.	Area sources that become major must comply with major source standards by date indicated in subpart or by equivalent time period (for example, 3 years).	Yes.
§ 63.6(d)	[Reserved].		
§ 63.6(e)(1)–(2)	Operation & Maintenance	Operate to minimize emissions at all times; correct malfunctions as soon as practicable; requirements independently enforceable; information Administrator will use to determine if operation and maintenance requirements were met.	Yes.
§ 63.6(e)(3)	Startup, Shutdown, and Malfunction Plan (SSMP).	Requirement for startup, shutdown, and malfunction (SSM) and SSMP; content of SSMP.	Yes.
§ 63.6(f)(1)	Compliance Except During SSM	You must comply with emission standards at all times except during SSM.	Yes.
§ 63.6(f)(2)–(3)	Methods for Determining Compliance	Compliance based on performance test, operation and maintenance plans, records, inspection.	Yes.
§ 63.6(g)	Alternative Standard	Procedures for getting an alternative standard	Yes.
§ 63.6(h)	Opacity/VE Standards	Requirements for opacity and VE standards	No, not applicable.

TABLE 7 TO SUBPART JJJJJ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART JJJJJ—Continued

Citation	Subject	Brief description	Applies to subpart JJJJJ
§ 63.6(i)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension.	Yes.
§ 63.6(j)	Presidential Compliance Exemption	President may exempt source category	Yes.
§ 63.7(a)(1)–(2)	Performance Test Dates	Dates for conducting initial performance testing and other compliance demonstrations; must conduct 180 days after first subject to rule.	Yes.
§ 63.7(a)(3)	Section 114 Authority	Administrator may require a performance test under CAA section 114 at any time.	Yes.
§ 63.7(b)(1)	Notification of Performance Test	Must notify Administrator 60 days before the test	Yes.
§ 63.7(b)(2)	Notification of Rescheduling	Must notify Administrator 5 days before scheduled date of rescheduled date.	Yes.
§ 63.7(c)	Quality Assurance(QA)/Test Plan	Requirements; test plan approval procedures; performance audit requirements; internal and external QA procedures for testing.	Yes.
§ 63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
§ 63.7(e)(1)	Conditions for Conducting Performance Tests.	Performance tests must be conducted under representative conditions.	No, § 63.8445 specifies requirements.
		Cannot conduct performance tests during SSM; not a violation to exceed standard during SSM.	Yes.
§ 63.7(e)(2)–(3)	Conditions for Conducting Performance Tests.	Must conduct according to subpart and EPA test methods unless Administrator approves alternative; must have at least three test runs of at least 1 hour each; compliance is based on arithmetic mean of three runs; conditions when data from an additional test run can be used.	Yes.
§ 63.7(f)	Alternative Test Method	Procedures by which Administrator can grant approval to use an alternative test method.	Yes.
§ 63.7(g)	Performance Test Data Analysis	Must include raw data in performance test report; must submit performance test data 60 days after end of test with the notification of compliance status.	Yes.
§ 63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test	Yes.
§ 63.8(a)(1)	Applicability of Monitoring Requirements.	Subject to all monitoring requirements in subpart	Yes.
§ 63.8(a)(2)	Performance Specifications	Performance Specifications in appendix B of 40 CFR part 60 apply.	Yes.
§ 63.8(a)(3)	[Reserved].		
§ 63.8(a)(4)	Monitoring with Flares	Requirements for flares in § 63.11 apply	No, not applicable.
§ 63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative.	Yes.
§ 63.8(b)(2)–(3)	Multiple Effluents and Multiple Monitoring Systems.	Specific requirements for installing and reporting on monitoring systems.	Yes.
§ 63.8(c)(1)	Monitoring System Operation and Maintenance.	Maintenance consistent with good air pollution control practices.	Yes.
§ 63.8(c)(1)(i)	Routine and Predictable SSM	Reporting requirements for SSM when action is described in SSMP.	Yes.
§ 63.8(c)(1)(ii)	SSM not in SSMP	Reporting requirements for SSM when action is not described in SSMP.	Yes.
§ 63.8(c)(1)(iii)	Compliance with Operation and Maintenance Requirements.	How Administrator determines if source complying with operation and maintenance requirements.	Yes.
§ 63.8(c)(2)–(3)	Monitoring System Installation	Must install to get representative emission and parameter measurements.	Yes.
§ 63.8(c)(4)	CMS Requirements	Requirements for CMS	No, §§ 63.8425 and 63.8465 specify requirements.
§ 63.8(c)(5)	Continuous Opacity Monitoring System (COMS) Minimum Procedures.	COMS minimum procedures	No, not applicable.
§ 63.8(c)(6)	CMS Requirements	Zero and high level calibration check requirements	No, § 63.8425 specifies requirements.
§ 63.8(c)(7)–(8)	CMS Requirements	Out-of-control periods	No, § 63.8425 specifies requirements.
§ 63.8(d)	CMS Quality Control	Requirements for CMS quality control	No, § 63.8425 specifies requirements.
§ 63.8(e)	CMS Performance Evaluation	Requirements for CMS performance evaluation	No, § 63.8425 specifies requirements.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method	Procedures for Administrator to approve alternative monitoring.	Yes.

TABLE 7 TO SUBPART JJJJJ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART JJJJJ—Continued

Citation	Subject	Brief description	Applies to subpart JJJJJ
§ 63.8(f)(6)	Alternative to Relative Accuracy Test	Procedures for Administrator to approve alternative relative accuracy test for continuous emissions monitoring systems (CEMS).	No, not applicable.
§ 63.8(g)	Data Reduction	COMS and CEMS data reduction requirements	No, not applicable.
§ 63.9(a)	Notification Requirements	Applicability; State delegation	Yes.
§ 63.9(b)	Initial Notifications	Requirements for initial notifications	Yes.
§ 63.9(c)	Request for Compliance Extension	Can request if cannot comply by date or if installed BACT/LAER.	Yes.
§ 63.9(d)	Notification of Special Compliance Requirements for New Source.	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date.	Yes.
§ 63.9(e)	Notification of Performance Test	Notify Administrator 60 days prior	Yes.
§ 63.9(f)	Notification of VE/Opacity Test	Notify Administrator 30 days prior	No, not applicable.
§ 63.9(g)(1)	Additional Notifications When Using CMS.	Notification of performance evaluation	Yes.
§ 63.9(g)(2)–(3)	Additional Notifications When Using CMS.	Notification of COMS data use; notification that relative accuracy alternative criterion were exceeded.	No, not applicable.
§ 63.9(h)	Notification of Compliance Status	Contents; submittal requirements	Yes.
§ 63.9(i)	Adjustment of Submittal Deadlines	Procedures for Administrator to approve change in when notifications must be submitted.	Yes.
§ 63.9(j)	Change in Previous Information	Must submit within 15 days after the change	Yes.
§ 63.10(a)	Recordkeeping/Reporting	Applicability; general information	Yes.
§ 63.10(b)(1)	General Recordkeeping Requirements	General requirements	Yes.
§ 63.10(b)(2)(i)–(v)	Records Related to SSM	Requirements for SSM records	Yes.
§ 63.10(b)(2)(vi)–(xii) and (xiv).	CMS Records	Records when CMS is malfunctioning, inoperative or out-of-control.	Yes.
§ 63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test	No, not applicable.
§ 63.10(b)(3)	Records	Applicability Determinations	Yes.
§ 63.10(c)(1)–(15)	Records	Additional records for CMS	No, §§ 63.8425 and 63.8490 specify requirements.
§ 63.10(d)(1) and (2).	General Reporting Requirements	Requirements for and reporting; performance test results reporting.	Yes.
§ 63.10(d)(3)	Reporting Opacity or VE Observations	Requirements for reporting opacity and VE	No, not applicable.
§ 63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension.	Yes.
§ 63.10(d)(5)	SSM Reports	Contents and submission	Yes.
§ 63.10(e)(1)–(3)	Additional CMS Reports	Requirements for CMS reporting	No, §§ 63.8425 and 63.8485 specify requirements.
§ 63.10(e)(4)	Reporting COMS data	Requirements for reporting COMS data with performance test data.	No, not applicable.
§ 63.10(f)	Waiver for Recordkeeping/Reporting	Procedures for Administrator to waive	Yes.
§ 63.11	Flares	Requirement for flares	No, not applicable.
§ 63.12	Delegation	State authority to enforce standards	Yes.
§ 63.13	Addresses	Addresses for reports, notifications, requests	Yes.
§ 63.14	Incorporation by Reference	Materials incorporated by reference	Yes.
§ 63.15	Availability of Information	Information availability; confidential information	Yes.

3. Part 63 is amended by adding subpart KKKKK to read as follows:

Subpart KKKKK—National Emission Standards for Hazardous Air Pollutants for Clay Ceramics Manufacturing

Sec.

What This Subpart Covers

63.8530 What is the purpose of this subpart?
63.8535 Am I subject to this subpart?
63.8540 What parts of my plant does this subpart cover?
63.8545 When do I have to comply with this subpart?

Emission Limitations and Work Practice Standards

63.8555 What emission limitations and work practice standards must I meet?
63.8560 What are my options for meeting the emission limitations and work practice standards?

General Compliance Requirements

63.8570 What are my general requirements for complying with this subpart?
63.8575 What do I need to know about operation, maintenance, and monitoring plans?

Testing and Initial Compliance Requirements

63.8585 By what date must I conduct performance tests?
63.8590 When must I conduct subsequent performance tests?
63.8595 How do I conduct performance tests and establish operating limits?
63.8600 What are my monitoring installation, operation, and maintenance requirements?
63.8605 How do I demonstrate initial compliance with the emission limitations and work practice standards?

Continuous Compliance Requirements

63.8615 How do I monitor and collect data to demonstrate continuous compliance?
63.8620 How do I demonstrate continuous compliance with the emission limitations and work practice standards?

Notifications, Reports, and Records

63.8630 What notifications must I submit and when?
63.8635 What reports must I submit and when?
63.8640 What records must I keep?
63.8645 In what form and for how long must I keep my records?

Other Requirements and Information

63.8655 What parts of the General Provisions apply to me?
63.8660 Who implements and enforces this subpart?
63.8665 What definitions apply to this subpart?

Table 8 to Subpart KKKKK of Part 63—Applicability of General Provisions to Subpart KKKKK

What This Subpart Covers

§ 63.8530 What is the purpose of this subpart?

This subpart establishes national emission limitations and work practice standards for hazardous air pollutants (HAP) emitted from clay ceramics manufacturing facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations and work practice standards.

§ 63.8535 Am I subject to this subpart?

You are subject to this subpart if you own or operate a clay ceramics manufacturing facility that is, is located at, or is part of a major source of HAP emissions according to the criteria in paragraphs (a) and (b) of this section.

(a) A clay ceramics manufacturing facility is a plant site that manufactures pressed floor tile, pressed wall tile, other pressed tile, or sanitaryware (*e.g.*, sinks and toilets). Clay ceramics manufacturing facilities typically process clay, shale, and various additives; form the processed materials into tile or sanitaryware shapes; and dry and fire the ceramic products. Glazes are applied to many tile and sanitaryware products.

(b) A major source of HAP emissions is any stationary source or group of stationary sources within a contiguous area under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (10 tons) or more per year or any combination of HAP at a rate of 22.68 megagrams (25 tons) or more per year.

§ 63.8540 What parts of my plant does this subpart cover?

(a) This subpart applies to each existing, new, or reconstructed affected source at a clay ceramics manufacturing facility and to each affected source described in paragraphs (f)(1) or (f)(2) of this section.

(b) Each existing, new, or reconstructed periodic kiln, tunnel kiln, and roller kiln is an affected source regardless of design capacity. Each source that meets the description in paragraphs (f)(1) or (f)(2) also is an affected source.

(c) Kilns that are used exclusively for research and development (R&D) and are not used to manufacture products for commercial sale, except in a *de minimis* manner, are not subject to the requirements of this subpart.

(d) Kilns that are used exclusively for setting glazes on previously fired products or for refiring are not subject to the requirements of this subpart.

(e) A source is a new affected source if construction of the affected source began after July 22, 2002, and you met the applicability criteria at the time you began construction.

(f) An affected source is reconstructed if you meet the criteria as defined in § 63.2, except as provided in paragraphs (f)(1) and (f)(2) of this section.

(1) It is not technologically and economically feasible for an existing tunnel kiln whose design capacity is less than 9.07 megagrams per hour (Mg/hr) (10 tons per hour (tph)) of fired product but is increased such that it is equal to or greater than 9.07 Mg/hr (10 tph) of fired product to meet the relevant standards (*i.e.*, new source maximum achievable control technology (MACT)) by retrofitting with a dry lime injection fabric filter (DIFF), dry lime scrubber/fabric filter (DLS/FF), or wet scrubber (WS).

(2) It is not technologically and economically feasible for an existing dry limestone adsorber (DLA)-controlled kiln whose design capacity is equal to or greater than 9.07 Mg/hr (10 tph) of fired product to meet the relevant standards by retrofitting with a DIFF, DLS/FF, or WS.

(g) An affected source is existing if it is not new or reconstructed and does not meet the descriptions provided in paragraphs (f)(1) and (f)(2) of this section.

§ 63.8545 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source or an affected source described in § 63.8540(f)(1) or § 63.8540(f)(2), you must comply with this subpart according to paragraphs (a)(1) and (2) of this section.

(1) If the initial startup of your affected source is before May 16, 2003, then you must comply with the applicable emission limitations and work practice standards in Tables 1, 2, and 3 to this subpart no later than May 16, 2003.

(2) If the initial startup of your affected source is after May 16, 2003, then you must comply with the applicable emission limitations and work practice standards in Tables 1, 2, and 3 to this subpart upon initial startup of your affected source.

(b) If you have an existing affected source, you must comply with the work practice standards for existing sources in Table 3 to this subpart no later than May 16, 2003.

(c) If you have an existing area source that increases its emissions or its potential to emit such that it becomes a major source of HAP by adding a new affected source or by reconstructing, you must be in compliance with this subpart upon initial startup of your affected source as a major source.

(d) If you have a new area source (*i.e.*, an area source for which construction or reconstruction was commenced after July 22, 2002) that increases its emissions or its potential to emit such that it becomes a major source of HAP, you must be in compliance with this subpart upon initial startup of your affected source as a major source.

(e) You must meet the notification requirements in § 63.8630 according to the schedule in § 63.8630 and in 40 CFR part 63, subpart A. Some of the notifications must be submitted before you are required to comply with the emission limitations in this subpart.

Emission Limitations and Work Practice Standards

§ 63.8555 What emission limitations and work practice standards must I meet?

(a) You must meet each emission limit in Table 1 to this subpart that applies to you.

(b) You must meet each operating limit in Table 2 to this subpart that applies to you.

(c) You must meet each work practice standard in Table 3 to this subpart that applies to you.

§ 63.8560 What are my options for meeting the emission limitations and work practice standards?

(a) To meet the emission limitations in Tables 1 and 2 to this subpart, you must use one or more of the options listed in paragraphs (a)(1) and (2) of this section.

(1) *Emissions control system.* Use an emissions capture and collection system and an air pollution control device (APCD) and demonstrate that the resulting emissions or emissions reductions meet the emission limits in Table 1 to this subpart, and that the capture and collection system and APCD meet the applicable operating limits in Table 2 to this subpart.

(2) *Process changes.* Use low-HAP raw materials or implement manufacturing process changes and demonstrate that the resulting emissions or emissions reductions meet the emission limits in Table 1 to this subpart.

(b) To meet the work practice standards in Table 3 to this subpart, for each affected kiln, you must use natural gas, or an equivalent fuel (such as propane or other clean burning fuel), as the kiln fuel at all times except during periods of natural gas curtailment or other periods when natural gas is not available.

General Compliance Requirements

§ 63.8570 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations (including operating limits) in this subpart at all times, except during periods of startup, shutdown, and malfunction and during periods of routine control device maintenance as specified in paragraph (e) of this section.

(b) Except as specified in paragraph (e) of this section, you must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i). During the period between the compliance date specified for your affected source in § 63.8545 and the date upon which continuous monitoring systems (CMS) (*e.g.*, continuous parameter monitoring systems) have been installed and verified and any applicable operating limits have been set, you must maintain a log detailing the operation and maintenance of the process and emissions control equipment.

(c) For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

(d) For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must prepare and implement a written operation, maintenance, and monitoring (OM&M) plan according to the requirements in § 63.8575.

(e) If you own or operate a kiln that is subject to the emission limits specified in Table 1 to this subpart and must perform routine maintenance on the control device for that kiln, you may bypass the kiln control device and continue operating the kiln upon approval by the Administrator provided you satisfy the conditions listed in paragraphs (e)(1) through (5) of this section.

(1) You must request a routine control device maintenance exemption from the Administrator. Your request must justify the need for the routine maintenance on the control device and the time required to accomplish the maintenance activities, describe the maintenance activities and the frequency of the maintenance activities, explain why the maintenance cannot be accomplished during kiln shutdowns, describe how you plan to minimize emissions to the greatest extent possible during the maintenance, and provide any other documentation required by the Administrator.

(2) The routine control device maintenance exemption must not exceed 4 percent of the annual operating uptime for each kiln.

(3) The request for the routine control device maintenance exemption, if approved by the Administrator, must be incorporated by reference in and attached to the affected source's title V permit.

(4) You must minimize HAP emissions during the period when the kiln is operating and the control device is offline.

(5) You must minimize the time period during which the kiln is operating and the control device is offline.

(f) You must be in compliance with the work practice standards in this subpart at all times, except during periods of natural gas curtailment or other periods when natural gas is not available.

(g) You must be in compliance with the provisions of subpart A of this part, except as noted in Table 8 to this subpart.

§ 63.8575 What do I need to know about operation, maintenance, and monitoring plans?

(a) For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must prepare, implement, and revise as necessary an OM&M plan that includes the information in paragraph (b) of this section. Your OM&M plan must be available for inspection by the permitting authority upon request.

(b) Your OM&M plan must include, as a minimum, the information in paragraphs (b)(1) through (13) of this section.

(1) Each process and APCD to be monitored, the type of monitoring device that will be used, and the operating parameters that will be monitored.

(2) A monitoring schedule that specifies the frequency that the parameter values will be determined and recorded.

(3) The limits for each parameter that represent continuous compliance with the emission limitations in § 63.8555. The limits must be based on values of the monitored parameters recorded during performance tests.

(4) Procedures for the proper operation and routine and long-term maintenance of each APCD, including a maintenance and inspection schedule that is consistent with the manufacturer's recommendations.

(5) Procedures for installing the CMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last APCD).

(6) Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system.

(7) Continuous monitoring system performance evaluation procedures and acceptance criteria (*e.g.*, calibrations).

(8) Procedures for the proper operation and maintenance of monitoring equipment consistent with the requirements in §§ 63.8600 and 63.8(c)(1), (3), (4)(ii), (7), and (8).

(9) Continuous monitoring system data quality assurance procedures consistent with the requirements in § 63.8(d).

(10) Continuous monitoring system recordkeeping and reporting procedures consistent with the requirements in § 63.10(c), (e)(1), and (e)(2)(i).

(11) Procedures for responding to operating parameter deviations, including the procedures in paragraphs (b)(11)(i) through (iii) of this section.

(i) Procedures for determining the cause of the operating parameter deviation.

(ii) Actions for correcting the deviation and returning the operating parameters to the allowable limits.

(iii) Procedures for recording the times that the deviation began and ended, and corrective actions were initiated and completed.

(12) Procedures for keeping records to document compliance.

(13) If you operate an affected kiln and you plan to take the kiln control device out of service for routine maintenance, as specified in § 63.8570(e), the procedures specified in paragraphs (b)(13)(i) and (ii) of this section.

(i) Procedures for minimizing HAP emissions from the kiln during periods of routine maintenance of the kiln control device when the kiln is operating and the control device is offline.

(ii) Procedures for minimizing the duration of any period of routine maintenance on the kiln control device when the kiln is operating and the control device is offline.

(c) Changes to the operating limits in your OM&M plan require a new performance test. If you are revising an operating limit parameter value, you must meet the requirements in paragraphs (c)(1) and (2) of this section.

(1) Submit a notification of performance test to the Administrator as specified in § 63.7(b).

(2) After completing the performance test to demonstrate that compliance with the emission limits can be achieved at the revised operating limit parameter value, you must submit the performance test results and the revised operating limits as part of the Notification of Compliance Status required under § 63.9(h).

(d) If you are revising the inspection and maintenance procedures in your OM&M plan, you do not need to conduct a new performance test.

Testing and Initial Compliance Requirements

§ 63.8585 By what date must I conduct performance tests?

For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must conduct performance tests within 180 calendar days after the compliance date that is specified for your source in § 63.8545 and according to the provisions in § 63.7(a)(2).

§ 63.8590 When must I conduct subsequent performance tests?

(a) For each kiln that is subject to the emission limits specified in Table 1 to this subpart, you must conduct a performance test before renewing your 40 CFR part 70 operating permit or at least every 5 years following the initial performance test.

(b) You must conduct a performance test when you want to change the parameter value for any operating limit specified in your OM&M plan.

§ 63.8595 How do I conduct performance tests and establish operating limits?

(a) You must conduct each performance test in Table 4 to this subpart that applies to you.

(b) Before conducting the performance test, you must install and calibrate all monitoring equipment.

(c) Each performance test must be conducted according to the requirements in § 63.7 and under the specific conditions in Table 4 to this subpart.

(d) You must test while operating at the maximum production level.

(e) You may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in § 63.7(e)(1).

(f) You must conduct at least three separate test runs for each performance test required in this section, as specified in § 63.7(e)(3). Each test run must last at least 1 hour.

(g) You must use the data gathered during the performance test and the equations in paragraphs (g)(1) and (2) of this section to determine compliance with the emission limitations.

(1) To determine compliance with the production-based hydrogen fluoride (HF), hydrogen chloride (HCl), and particulate matter (PM) emission limits in Table 1 to this subpart, you must calculate your mass emissions per unit of production for each test run using Equation 1 of this section:

$$MP = \frac{ER}{P} \qquad \text{(Eq. 1)}$$

Where:

MP=mass per unit production, kilograms (pounds) of pollutant per megagram (ton) of fired product

ER=mass emission rate of pollutant (HF, HCl, or PM) during each performance test run, kilograms (pounds) per hour

P=production rate during each performance test run, megagrams (tons) of fired product per hour.

(2) To determine compliance with the percent reduction HF and HCl emission limits in Table 1 to this subpart, you must calculate the percent reduction for each test run using Equation 2 of this section:

$$PR = \frac{ER_i - ER_o}{ER_i}\ (100) \qquad \text{(Eq. 2)}$$

Where:

PR=percent reduction, percent

ER_i=mass emission rate of specific HAP (HF or HCl) entering the APCD, kilograms (pounds) per hour

ER_o=mass emission rate of specific HAP (HF or HCl) exiting the APCD, kilograms (pounds) per hour.

(h) You must establish each site-specific operating limit in Table 2 to this subpart that applies to you as specified in Table 4 to this subpart.

(i) For each kiln that is subject to the emission limits specified in Table 1 to this subpart and is equipped with an APCD that is not addressed in Table 2 to this subpart or that is using process changes as a means of meeting the emission limits in Table 1 to this subpart, you must meet the requirements in § 63.8(f) and paragraphs (i)(1) and (2) of this section.

(1) Submit a request for approval of alternative monitoring procedures to the Administrator no later than the notification of intent to conduct a performance test. The request must contain the information specified in paragraphs (i)(1)(i) through (iv) of this section.

(i) A description of the alternative APCD or process changes.

(ii) The type of monitoring device or procedure that will be used.

(iii) The operating parameters that will be monitored.

(iv) The frequency that the operating parameter values will be determined and recorded to establish continuous compliance with the operating limits.

(2) Establish site-specific operating limits during the performance test based on the information included in the approved alternative monitoring procedures request and, as applicable, as specified in Table 4 to this subpart.

§ 63.8600 What are my monitoring installation, operation, and maintenance requirements?

(a) You must install, operate, and maintain each CMS according to your OM&M plan and the requirements in paragraphs (a)(1) through (5) of this section.

(1) Conduct a performance evaluation of each CMS according to your OM&M plan.

(2) The CMS must complete a minimum of one cycle of operation for each successive 15-minute period. To have a valid hour of data, you must have

at least three of four equally spaced data values (or at least 75 percent if you collect more than four data values per hour) for that hour (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption as specified in § 63.8570(e)).

(3) Determine and record the 3-hour block averages of all recorded readings, calculated after every 3 hours of operation as the average of the previous 3 operating hours. To calculate the average for each 3-hour average period, you must have at least 75 percent of the recorded readings for that period (not including startup, shutdown, malfunction, out-of-control periods, or periods of routine control device maintenance covered by a routine control device maintenance exemption as specified in § 63.8570(e)).

(4) Record the results of each inspection, calibration, and validation check.

(5) At all times, maintain the monitoring equipment including, but not limited to, maintaining necessary parts for routine repairs of the monitoring equipment.

(b) For each liquid flow measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (b)(1) through (3) of this section.

(1) Locate the flow sensor in a position that provides a representative flowrate.

(2) Use a flow sensor with a minimum measurement sensitivity of 2 percent of the liquid flowrate.

(3) At least semiannually, conduct a flow sensor calibration check.

(c) For each pressure measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (c)(1) through (7) of this section.

(1) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure.

(2) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion.

(3) Use a gauge with a minimum measurement sensitivity of 0.5 inch of water or a transducer with a minimum measurement sensitivity of 1 percent of the pressure range.

(4) Check the pressure tap daily to ensure that it is not plugged.

(5) Using a manometer, check gauge calibration quarterly and transducer calibration monthly.

(6) Any time the sensor exceeds the manufacturer's specified maximum operating pressure range, conduct calibration checks or install a new pressure sensor.

(7) At least monthly, inspect all components for integrity, all electrical connections for continuity, and all mechanical connections for leakage.

(d) For each pH measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (d)(1) through (4) of this section.

(1) Locate the pH sensor in a position that provides a representative measurement of pH.

(2) Ensure the sample is properly mixed and representative of the fluid to be measured.

(3) Check the pH meter's calibration on at least two points every 8 hours of process operation.

(4) At least monthly, inspect all components for integrity and all electrical connections for continuity.

(e) For each bag leak detection system, you must meet the requirements in paragraphs (e)(1) through (11) of this section.

(1) Each triboelectric bag leak detection system must be installed, calibrated, operated, and maintained according to the "Fabric Filter Bag Leak Detection Guidance," (EPA–454/R–98–015, September 1997). This document is available from the U.S. Environmental Protection Agency (U.S. EPA); Office of Air Quality Planning and Standards; Emissions, Monitoring and Analysis Division; Emission Measurement Center (MD–19), Research Triangle Park, NC 27711. This document is also available on the Technology Transfer Network (TTN) under Emission Measurement Center, Continuous Emission Monitoring. Other types of bag leak detection systems must be installed, operated, calibrated, and maintained in a manner consistent with the manufacturer's written specifications and recommendations.

(2) The bag leak detection system must be certified by the manufacturer to be capable of detecting PM emissions at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

(3) The bag leak detection system sensor must provide an output of relative PM loadings.

(4) The bag leak detection system must be equipped with a device to continuously record the output signal from the sensor.

(5) The bag leak detection system must be equipped with an audible alarm system that will sound automatically when an increase in relative PM emissions over a preset level is detected. The alarm must be located where it is easily heard by plant operating personnel.

(6) For positive pressure fabric filter systems, a bag leak detector must be installed in each baghouse compartment or cell.

(7) For negative pressure or induced air fabric filters, the bag leak detector must be installed downstream of the fabric filter.

(8) Where multiple detectors are required, the system's instrumentation and alarm may be shared among detectors.

(9) The baseline output must be established by adjusting the range and the averaging period of the device and establishing the alarm set points and the alarm delay time according to section 5.0 of the "Fabric Filter Bag Leak Detection Guidance."

(10) Following initial adjustment of the system, the sensitivity or range, averaging period, alarm set points, or alarm delay time may not be adjusted except as detailed in your OM&M plan. In no case may the sensitivity be increased by more than 100 percent or decreased more than 50 percent over a 365-day period unless such adjustment follows a complete fabric filter inspection which demonstrates that the fabric filter is in good operating condition. Record each adjustment.

(11) Record the results of each inspection, calibration, and validation check.

(f) For each lime or chemical feed rate measurement device, you must meet the requirements in paragraphs (a)(1) through (5) and paragraphs (f)(1) and (2) of this section.

(1) Locate the measurement device in a position that provides a representative feed rate measurement.

(2) At least semiannually, conduct a calibration check.

(g) For each limestone feed system on a DLA, you must meet the requirements in paragraphs (a)(1), (4), and (5) of this section and must ensure on a monthly basis that the feed system replaces limestone at least as frequently as the schedule set during the performance test.

(h) Requests for approval of alternate monitoring procedures must meet the requirements in §§ 63.8595(i) and 63.8(f).

§ 63.8605 How do I demonstrate initial compliance with the emission limitations and work practice standards?

(a) You must demonstrate initial compliance with each emission limitation and work practice standard that applies to you according to Table 5 to this subpart.

(b) You must establish each site-specific operating limit in Table 2 to

this subpart that applies to you according to the requirements in § 63.8595 and Table 4 to this subpart.

(c) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in § 63.8630(e).

Continuous Compliance Requirements

§ 63.8615 How do I monitor and collect data to demonstrate continuous compliance?

(a) You must monitor and collect data according to this section.

(b) Except for periods of monitor malfunctions, associated repairs, and required quality assurance or control activities (including, as applicable, calibration checks and required zero and span adjustments), you must monitor continuously (or collect data at all required intervals) at all times that the affected source is operating. This includes periods of startup, shutdown, malfunction, and routine control device maintenance as specified in § 63.8570(e) when the affected source is operating.

(c) You may not use data recorded during monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities for purposes of calculating data averages. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. You must use all the valid data collected during all other periods in assessing compliance. Any averaging period for which you do not have valid monitoring data and such data are required constitutes a deviation from the monitoring requirements.

§ 63.8620 How do I demonstrate continuous compliance with the emission limitations and work practice standards?

(a) You must demonstrate continuous compliance with each emission limit, operating limit, and work practice standard in Tables 1, 2, and 3 to this subpart that applies to you according to the methods specified in Table 6 to this subpart.

(b) For each kiln that is subject to the emission limits specified in Table 1 to this subpart and is equipped with an APCD that is not addressed in Table 2 to this subpart, or that is using process changes as a means of meeting the emission limits in Table 1 to this subpart, you must demonstrate continuous compliance with each emission limit in Table 1 to this subpart, and each operating limit established as required in § 63.8595(i)(2) according to the methods specified in your approved alternative monitoring procedures request, as described in §§ 63.8595(i)(1) and 63.8(f).

(c) You must report each instance in which you did not meet each emission limit and operating limit in this subpart that applies to you. This includes periods of startup, shutdown, malfunction, and routine control device maintenance. These instances are deviations from the emission limitations in this subpart. These deviations must be reported according to the requirements in § 63.8635.

(d) During periods of startup, shutdown, and malfunction, you must operate according to your SSMP.

(e) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating according to an SSMP that satisfies the requirements of § 63.6(e) and your OM&M plan. The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

(f) Deviations that occur during periods of control device maintenance covered by an approved routine control device maintenance exemption according to § 63.8570(e) are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the approved routine control device maintenance exemption.

(g) You must demonstrate continuous compliance with the operating limits in Table 2 to this subpart for visible emissions (VE) from tunnel kilns equipped with DLA, DIFF, or DLS/FF by monitoring VE at each kiln stack according to the requirements in paragraphs (g)(1) through (3) of this section.

(1) Perform daily VE observations of each kiln stack according to the procedures of Method 22 of 40 CFR part 60, appendix A. You must conduct the Method 22 test while the affected source is operating under normal conditions. The duration of each Method 22 test must be at least 15 minutes.

(2) If VE are observed during any daily test conducted using Method 22 of 40 CFR part 60, appendix A, you must promptly initiate and complete corrective actions according to your OM&M plan. If no VE are observed in 30 consecutive daily Method 22 tests for any kiln stack, you may decrease the frequency of Method 22 testing from daily to weekly for that kiln stack. If VE are observed during any weekly test, you must promptly initiate and complete corrective actions according to your OM&M plan, resume Method 22 testing of that kiln stack on a daily basis, and maintain that schedule until no VE are observed in 30 consecutive daily tests, at which time you may again decrease the frequency of Method 22 testing to a weekly basis.

(3) If VE are observed during any test conducted using Method 22 of 40 CFR part 60, appendix A, you must report these deviations by following the requirements in § 63.8635.

Notifications, Reports, and Records

§ 63.8630 What notifications must I submit and when?

(a) You must submit all of the notifications in §§ 63.7(b) and (c), 63.8(f)(4), and 63.9 (b) through (e), (g)(1), and (h) that apply to you, by the dates specified.

(b) As specified in § 63.9(b)(2) and (3), if you start up your affected source before May 16, 2003, you must submit an Initial Notification not later than 120 calendar days after May 16, 2003.

(c) As specified in § 63.9(b)(3), if you start up your new or reconstructed affected source or affected source described in § 63.8540(f)(1) or § 63.8540(f)(2) on or after May 16, 2003, you must submit an Initial Notification not later than 120 calendar days after you become subject to this subpart.

(d) If you are required to conduct a performance test, you must submit a written notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin, as required in § 63.7(b)(1).

(e) If you are required to conduct a performance test or other initial compliance demonstration as specified in Tables 4 and 5 to this subpart, you must submit a Notification of Compliance Status as specified in § 63.9(h) and paragraphs (e)(1) through (3) of this section.

(1) For each compliance demonstration that includes a performance test conducted according to the requirements in Table 4 to this subpart, you must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test, according to § 63.10(d)(2).

(2) In addition to the requirements in § 63.9(h)(2)(i), you must include the information in paragraphs (e)(2)(i) and (ii) of this section in your Notification of Compliance Status:

(i) The operating limit parameter values established for each affected source with supporting documentation and a description of the procedure used to establish the values.

(ii) For each APCD that includes a fabric filter, if a bag leak detection system is used, analysis and supporting documentation demonstrating conformance with EPA guidance and specifications for bag leak detection systems in § 63.8600(e).

(3) For each compliance demonstration required in Table 5 to this subpart that does not include a performance test (*i.e.*, compliance demonstration for the work practice standard), you must submit the Notification of Compliance Status before the close of business on the 30th calendar day following the completion of the compliance demonstration.

(f) If you request a routine control device maintenance exemption according to § 63.8570(e), you must submit your request for the exemption no later than 30 days before the compliance date.

(g) If you own or operate an affected kiln that is subject to the work practice standards specified in Table 3 to this subpart, and you intend to use a fuel other than natural gas or equivalent to fire the affected kiln, you must submit a notification of alternative fuel use within 48 hours of the declaration of a period of natural gas curtailment or supply interruption, as defined in § 63.8665. The notification must include the information specified in paragraphs (g)(1) through (5) of this section.

(1) Company name and address.

(2) Identification of the affected kiln.

(3) Reason you are unable to use natural gas or equivalent fuel, including the date when the natural gas curtailment was declared or the natural gas supply interruption began.

(4) Type of alternative fuel that you intend to use.

(5) Dates when the alternative fuel use is expected to begin and end.

§ 63.8635 What reports must I submit and when?

(a) You must submit each report in Table 7 to this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report by the date in Table 7 to this subpart and as specified in paragraphs (b)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in § 63.8545 and ending on June 30 or December 31, and lasting at least 6 months, but less than 12 months. For example, if your compliance date is March 1, then the first semiannual reporting period would begin on March 1 and end on December 31.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31 for compliance periods ending on June 30 and December 31, respectively.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31 for compliance periods ending on June 30 and December 31, respectively.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) The compliance report must contain the information in paragraphs (c)(1) through (7) of this section.

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying that, based on information and belief formed after reasonable inquiry, the statements and information in the report are true, accurate, and complete.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP and OM&M plan, the compliance report must include the information specified in § 63.10(d)(5)(i).

(5) A description of control device maintenance performed while the control device was offline and the kiln controlled by the control device was operating, including the information specified in paragraphs (c)(5)(i) through (iii) of this section.

(i) The date and time when the control device was shutdown and restarted.

(ii) Identification of the kiln that was operating and the number of hours that the kiln operated while the control device was offline.

(iii) A statement of whether or not the control device maintenance was included in your approved routine control device maintenance exemption developed as specified in § 63.8570(e). If the control device maintenance was included in your approved routine control device maintenance exemption, then you must report the information in paragraphs (c)(5)(iii)(A) through (C) of this section.

(A) The total amount of time that the kiln controlled by the control device operated during the current semiannual compliance period and during the previous semiannual compliance period.

(B) The amount of time that each kiln controlled by the control device operated while the control device was offline for maintenance covered under the routine control device maintenance exemption during the current semiannual compliance period and during the previous semiannual compliance period.

(C) Based on the information recorded under paragraphs (c)(5)(iii)(A) and (B) of this section, compute the annual percent of kiln operating uptime during which the control device was offline for routine maintenance using Equation 1 of this section.

$$RM = \frac{DT_p + DT_c}{KU_p + KU_c}\ (100) \qquad \text{(Eq. 1)}$$

Where:

RM=Annual percentage of kiln uptime during which control device is down for routine control device maintenance

DT_p=Control device downtime claimed under the routine control device maintenance exemption for the previous semiannual compliance period

DT_c=Control device downtime claimed under the routine control device maintenance exemption for the current semiannual compliance period

KU_p=Kiln uptime for the previous semiannual compliance period

KU_c=Kiln uptime for the current semiannual compliance period

(6) If there are no deviations from any emission limitations (emission limits or operating limits) or work practice standards that apply to you, the compliance report must contain a statement that there were no deviations from the emission limitations or work practice standards during the reporting period.

(7) If there were no periods during which the CMS was out-of-control as specified in your OM&M plan, the

compliance report must contain a statement that there were no periods during which the CMS was out-of-control during the reporting period.

(d) For each deviation from an emission limitation (emission limit or operating limit) that occurs at an affected source where you are not using a CMS to comply with the emission limitations in this subpart, the compliance report must contain the information in paragraphs (c)(1) through (5) and paragraphs (d)(1) and (2) of this section. This includes periods of startup, shutdown, malfunction, and routine control device maintenance.

(1) The total operating time of each affected source during the reporting period.

(2) Information on the number, duration, and cause of deviations (including unknown cause, if applicable), as applicable, and the corrective action taken.

(e) For each deviation from an emission limitation (emission limit or operating limit) occurring at an affected source where you are using a CMS to comply with the emission limitations in this subpart, you must include the information in paragraphs (c)(1) through (5) and paragraphs (e)(1) through (13) of this section. This includes periods of startup, shutdown, malfunction, and routine control device maintenance.

(1) The total operating time of each affected source during the reporting period.

(2) The date and time that each malfunction started and stopped.

(3) The date and time that each CMS was inoperative, except for zero (low-level) and high-level checks.

(4) The date, time, and duration that each CMS was out-of-control, including the pertinent information in your OM&M plan.

(5) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction; during routine control device maintenance covered in your approved routine control device maintenance exemption; or during another period.

(6) A description of corrective action taken in response to a deviation.

(7) A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

(8) A breakdown of the total duration of the deviations during the reporting period into those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(9) A summary of the total duration of CMS downtime during the reporting period and the total duration of CMS downtime as a percent of the total source operating time during that reporting period.

(10) A brief description of the process units.

(11) A brief description of the CMS.

(12) The date of the latest CMS certification or audit.

(13) A description of any changes in CMS, processes, or control equipment since the last reporting period.

(f) If you have obtained a title V operating permit according to 40 CFR part 70 or 40 CFR part 71, you must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If you submit a compliance report according to Table 7 to this subpart along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report includes all required information concerning deviations from any emission limitation (including any operating limit), then submitting the compliance report will satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submitting a compliance report will not otherwise affect any obligation you may have to report deviations from permit requirements to the permitting authority.

(g) If you own or operate an affected kiln that is subject to the work practice standard specified in Table 3 to this subpart, and you use a fuel other than natural gas or equivalent to fire the affected kiln, you must submit a report of alternative fuel use within 10 working days after terminating the use of the alternative fuel. The report must include the information in paragraphs (g)(1) through (6) of this section.

(1) Company name and address.

(2) Identification of the affected kiln.

(3) Reason for using the alternative fuel.

(4) Type of alternative fuel used to fire the affected kiln.

(5) Dates that the use of the alternative fuel started and ended.

(6) Amount of alternative fuel used.

§ 63.8640 What records must I keep?

(a) You must keep the records listed in paragraphs (a)(1) through (4) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) Records of performance tests as required in § 63.10(b)(2)(viii).

(4) Records relating to control device maintenance and documentation of your approved routine control device maintenance exemption, if you request such an exemption under § 63.8570(e).

(b) You must keep the records required in Table 6 to this subpart to show continuous compliance with each emission limitation that applies to you.

(c) You must also maintain the records listed in paragraphs (c)(1) through (7) of this section.

(1) For each bag leak detection system, records of each alarm, the time of the alarm, the time corrective action was initiated and completed, and a brief description of the cause of the alarm and the corrective action taken.

(2) For each deviation of an operating limit parameter value, the date, time, and duration of the deviation, a brief explanation of the cause of the deviation and the corrective action taken, and whether the deviation occurred during a period of startup, shutdown, or malfunction.

(3) For each kiln that is subject to the emission limits in Table 1, records of production rates on a fired-product weight basis.

(4) For each kiln that is subject to the emission limits in Table 1, records for any approved alternative monitoring or test procedures.

(5) For each kiln that is subject to the emission limits in Table 1, records of maintenance and inspections performed on the APCD.

(6) For each kiln that is subject to the emission limits in Table 1, current copies of your SSMP and OM&M plan, including any revisions, with records documenting conformance.

(7) Records that document compliance with any work practice standard that applies to you.

§ 63.8645 In what form and for how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record onsite for at least 2 years after the date of each occurrence, measurement, maintenance,

corrective action, report, or record, according to § 63.10(b)(1). You may keep the records offsite for the remaining 3 years.

Other Requirements and Information

§ 63.8655 What parts of the General Provisions apply to me?

Table 8 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

§ 63.8660 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the U.S. EPA, has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under section 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that cannot be delegated to State, local, or tribal agencies are as specified in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the applicability requirements in §§ 63.8535 and 63.8540, the compliance date requirements in § 63.8545, and the non-opacity emission limitations in § 63.8555.

(2) Approval of major changes to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major changes to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.8665 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in § 63.2, and in this section as follows:

Air pollution control device (APCD) means any equipment that reduces the quantity of a pollutant that is emitted to the air.

Bag leak detection system means an instrument that is capable of monitoring PM loadings in the exhaust of a fabric filter in order to detect bag failures. A bag leak detection system includes, but is not limited to, an instrument that operates on triboelectric, light-scattering, light-transmittance, or other effects to monitor relative PM loadings.

Clay ceramics manufacturing facility means a plant site that manufactures pressed floor tile, pressed wall tile, other pressed tile, or sanitaryware (*e.g.*, sinks and toilets). Clay ceramics manufacturing facilities typically process clay, shale, and various additives, form the processed materials into tile or sanitaryware shapes, and dry and fire the ceramic products. Glazes are applied to many tile and sanitaryware products.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limitation (including any operating limit) or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation (including any operating limit) or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Dry lime injection fabric filter (DIFF) means an APCD that includes continuous injection of hydrated lime or other sorbent into a duct or reaction chamber followed by a fabric filter.

Dry lime scrubber/fabric filter (DLS/FF) means an APCD that includes continuous injection of humidified hydrated lime or other sorbent into a reaction chamber followed by a fabric filter. These systems typically include recirculation of some of the sorbent.

Dry limestone adsorber (DLA) means an APCD that includes a limestone storage bin, a reaction chamber that is essentially a packed tower filled with limestone, and may or may not include a peeling drum that mechanically scrapes reacted limestone to regenerate the stone for reuse.

Emission limitation means any emission limit or operating limit.

Fabric filter means an APCD used to capture PM by filtering a gas stream through filter media; also known as a baghouse.

Initial startup means:

(1) For a new or reconstructed tunnel kiln controlled with a DLA, and for a tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1) or § 63.8540(f)(2), the time at which the temperature in the kiln first reaches 260 °C (500 °F) and the kiln contains product; or

(2) For a new or reconstructed tunnel kiln controlled with a DIFF, DLS/FF, or WS, the time at which the kiln first reaches a level of production that is equal to 75 percent of the kiln design capacity or 12 months after the affected source begins firing clay ceramics, whichever is earlier.

Particulate matter (PM) means, for purposes of this subpart, emissions of PM that serve as a measure of total particulate emissions, as measured by Method 5 (40 CFR part 60, appendix A), and as a surrogate for metal HAP contained in the particulates including, but not limited to, antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, nickel, and selenium.

Period of natural gas curtailment or supply interruption means a period of time during which the supply of natural gas to an affected facility is halted for reasons beyond the control of the facility. An increase in the cost or unit price of natural gas does not constitute a period of natural gas curtailment or supply interruption.

Plant site means all contiguous or adjoining property that is under common control, including properties that are separated only by a road or other public right-of-way. Common control includes properties that are owned, leased, or operated by the same entity, parent entity, subsidiary, or any combination thereof.

Research and development kiln means any kiln whose purpose is to conduct research and development for new processes and products and is not engaged in the manufacture of products for commercial sale, except in a *de minimis* manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Startup means the setting in operation of an affected source and starting the production process.

Tunnel kiln means any continuous kiln that is not a roller kiln that is used to fire clay ceramics.

Tunnel kiln design capacity means the maximum amount of clay ceramics, in Mg (tons), that a kiln is designed to produce in one year divided by the number of hours in a year (8,760 hours). If a kiln is modified to increase the capacity, the design capacity is considered to be the capacity following modifications.

Wet scrubber (WS) means an APCD that uses water, which may include

caustic additives or other chemicals, as the sorbent. Wet scrubbers may use any of various design mechanisms to increase the contact between exhaust gases and the sorbent.

Work practice standard means any design, equipment, work practice, operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the Clean Air Act.

Tables to Subpart KKKKK of Part 63

As stated in § 63.8555, you must meet each emission limit in the following table that applies to you:

TABLE 1 TO SUBPART KKKKK OF PART 63.—EMISSION LIMITS

For each . . .	You must meet the following emission limits . . .	Or you must comply with the following . . .
1. New or reconstructed tunnel kiln with a design capacity less than 9.07 Mg/hr (10 tph) of fired product; each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1); and each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(2).	a. HF emissions must not exceed 0.029 kilograms per megagram (kg/Mg) (0.057 pounds per ton (lb/ton)) of fired product.	Reduce uncontrolled HF emissions by at least 90 percent.
	b. HCl emissions must not exceed 0.13 kg/Mg (0.26 lb/ton) of fired product.	Reduce uncontrolled HCl emissions by at least 30 percent.
	c. PM emissions must not exceed 0.21 kg/Mg (0.42 lb/ton) of fired product.	Not applicable.
2. New or reconstructed tunnel kiln with a design capacity equal to or greater than 10 tph of fired product.	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product.	Reduce uncontrolled HF emissions by at least 90 percent.
	b. HCl emissions must not exceed 0.028 kg/Mg (0.056 lb/ton) of fired product.	Reduce uncontrolled HCl emissions by at least 85 percent.
	c. PM emissions must not exceed 0.060 kg/Mg (0.12 lb/ton) of fired product.	Not applicable.

As stated in § 63.8555, you must meet each operating limit in the following table that applies to you:

TABLE 2 TO SUBPART KKKKK OF PART 63.—OPERATING LIMITS

For each . . .	You must . . .
1. Kiln equipped with a DLA	a. Maintain the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test; and b. Maintain a sufficient amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times; maintain the limestone feeder setting at or above the level established during the performance test; and c. Use the same grade of limestone from the same source as was used during the performance test; maintain records of the source and grade of limestone; and d. Maintain no VE from the DLA stack.
2. Kiln equipped with a DIFF or DLS/FF.	a. If you use a bag leak detection system, initiate corrective action within 1 hour of a bag leak detection system alarm and complete corrective actions in accordance with your OM&M plan; operate and maintain the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month block reporting period; or maintain no VE from the DIFF or DLS/FF stack; and b. Maintain free-flowing lime in the feed hopper or silo and to the APCD at all times for continuous injection systems; maintain the feeder setting at or above the level established during the performance test for continuous injection systems.
3. Kiln equipped with a WS	a. Maintain the average scrubber pressure drop for each 3-hour block period at or above the average pressure drop established during the performance test; and b. Maintain the average scrubber liquid pH for each 3-hour block period at or above the average scrubber liquid pH established during the performance test; and c. Maintain the average scrubber liquid flow rate for each 3-hour block period at or above the average scrubber liquid flow rate established during the performance test; and d. If chemicals are added to the scrubber water, maintain the average scrubber chemical feed rate for each 3-hour block period at or above the average scrubber chemical feed rate established during the performance test.

As stated in § 63.8555, you must comply with each work practice standard in the following table that applies to you:

TABLE 3 TO SUBPART KKKKK OF PART 63.—WORK PRACTICE STANDARDS

For . . .	You must . . .	According to one of the following requirements . . .
Each existing, new, or reconstructed periodic kiln, tunnel kiln, or roller kiln; each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1); and each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(2).	Minimize fuel-based HAP emissions.	Use natural gas, or equivalent, as the kiln fuel, except during periods of natural gas curtailment or supply interruption, as defined in § 63.8665.

As stated in § 63.8595, you must conduct each performance test in the following table that applies to you:

TABLE 4 TO SUBPART KKKKK OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS

For each . . .	You must . . .	Using . . .	According to the following requirements . . .
1. New or reconstructed tunnel kiln; each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1); and each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(2).	a. Select locations of sampling ports and the number of traverse points.	Method 1 or 1A of 40 CFR part 60, appendix A.	Sampling sites must be located at the outlet of the APCD and prior to any releases to the atmosphere for all affected sources. If you choose to meet the percent emission reduction requirements for HF or HCl, a sampling site must also be located at the APCD inlet.
	b. Determine velocities and volumetric flow rate.	Method 2 of 40 CFR part 60, appendix A.	You may use Method 2A, 2C, 2D, 2F, or 2G of 40 CFR part 60, appendix A, as appropriate, as an alternative to using Method 2 of 40 CFR part 60, appendix A.
	c. Conduct gas molecular weight analysis.	Method 3 of 40 CFR part 60, appendix A.	You may use Method 3A or 3B of 40 CFR part 60, appendix A, as appropriate, as an alternative to using Method 3 of 40 CFR part 60, appendix A.
	d. Measure moisture content of the stack gas.	Method 4 of 40 CFR part 60, appendix A.	
	e. Measure HF and HCl emissions.	Method 26A of 40 CFR part 60, appendix A; or	Conduct the test while operating at the maximum production level. You may use Method 26 of 40 CFR part 60, appendix A, as an alternative to using Method 26A of 40 CFR part 60, appendix A, when no acid PM (*e.g.*, HF or HCl dissolved in water droplets emitted by sources controlled by a WS) is present.
		Method 320 of 40 CFR part 63, appendix A.	Conduct the test while operating at the maximum production level. When using Method 320 of 40 CFR part 63, appendix A, you must follow the analyte spiking procedures of section 13 of Method 320 of 40 CFR part 63, appendix A, unless you can demonstrate that the complete spiking procedure has been conducted at a similar source.
	f. Measure PM emissions	Method 5 of 40 CFR part 60, appendix A.	Conduct the test while operating at the maximum production level.
2. Kiln that is complying with production-based emission limits.	Determine the production rate during each test run in order to determine compliance with production-based emission limits.	Production data collected during the performance tests (*e.g.*, the number of ceramic pieces and weight per piece in the kiln during a test run divided by the amount of time to fire a piece).	You must measure and record the production rate, on a fired-product weight basis, of the affected kiln for each of the three test runs.
3. Kiln equipped with a DLA.	a. Establish the operating limit for the average pressure drop across the DLA.	Data from the pressure drop measurement device during the performance test.	You must continuously measure the pressure drop across the DLA, determine and record the block average pressure drop values for the three test runs, and determine and record the 3-hour block average of the recorded pressure drop measurements for the three test runs.

TABLE 4 TO SUBPART KKKKK OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS—Continued

For each . . .	You must . . .	Using . . .	According to the following requirements . . .
	b. Establish the operating limit for the limestone feeder setting.	Data from the limestone feeder during the performance test.	You must ensure that you maintain an adequate amount of limestone in the limestone hopper, storage bin (located at the top of the DLA), and DLA at all times during the performance test. You must establish your limestone feeder setting one week prior to the performance test and maintain the feeder setting for the one-week period that precedes the performance test and during the performance test.
	c. Document the source and grade of limestone used.	Records of limestone purchase.	
4. Kiln equipped with a DIFF or DLS/FF	Establish the operating limit for the lime feeder setting.	Data from the lime feeder during the performance test.	For continuous lime injection systems, you must ensure that lime in the feed hopper or silo and to the APCD is free-flowing at all times during the performance test and record the feeder setting for the three test runs. If the feed rate setting varies during the three test runs, determine and record the average feed rate from the three test runs.
5. Kiln equipped with a WS	a. Establish the operating limit for the average scrubber pressure drop.	Data from the pressure drop measurement device during the performance test.	You must continuously measure the scrubber pressure drop, determine and record the block average pressure drop values for the three test runs, and determine and record the 3-hour block average of the recorded pressure drop measurements for the three test runs.
	b. Establish the operating limit for the average scrubber liquid pH.	Data from the pH measurement device during the performance test.	You must continuously measure the scrubber liquid pH, determine and record the block average pH values for the three test runs, and determine and record the 3-hour block average of the recorded pH measurements for the three test runs.
	c. Establish the operating limit for the average scrubber liquid flow rate.	Data from the flow rate measurement device during the performance test.	You must continuously measure the scrubber liquid flow rate, determine and record the block average flow rate values for the three test runs, and determine and record the 3-hour block average of the recorded flow rate measurements for the three test runs.
6. Kiln equipped with a WS that includes chemical addition to the water.	Establish the operating limit for the average scrubber chemical feed rate.	Data from the chemical feed rate measurement device during the performance test.	You must continuously measure the scrubber chemical feed rate, determine and record the block average chemical feed rate values for the three test runs, and determine and record the 3-hour block average of the recorded chemical feed rate measurements for the three test runs.

As stated in § 63.8605, you must demonstrate initial compliance with each emission limitation that applies to you according to the following table:

TABLE 5 TO SUBPART KKKKK OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS AND WORK PRACTICE STANDARDS

For each . . .	For the following . . .	You have demonstrated initial compliance if . . .
1. New or reconstructed tunnel kiln with a design capacity less than 9.07 Mg/hr (10 tph) of fired product; each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1); and each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(2).	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product; or uncontrolled HF emissions must be reduced by at least 90 percent; and.	i. The HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in § 63.8595(g)(1), do not exceed 0.029 kg/Mg (0.057 lb/ton); or uncontrolled HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 90 percent, according to the calculations in § 63.8595(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HF emissions did not exceed 0.029 kg/Mg (0.057 lb/ton) or uncontrolled HF emissions were reduced by at least 90 percent.
	b. HCl emissions must not exceed 0.13 kg/Mg (0.26 lb/ton) of fired product; or uncontrolled HCl emissions must be reduced by at least 30 percent; and	i. The HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in § 63.8595(g)(1), do not exceed 0.13 kg/Mg (0.26 lb/ton); or uncontrolled HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 30 percent, according to the calculations in § 63.8595(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HCl emissions did not exceed 0.13 kg/Mg (0.26 lb/ton) or uncontrolled HCl emissions were reduced by at least 30 percent.
	c. PM emissions must not exceed 0.21 kg/Mg (0.42 lb/ton) of fired product.	i. The PM emissions measured using Method 5 of 40 CFR part 60, appendix A, over the period of the initial performance test, according to the calculations in § 63.8595(g)(1), do not exceed 0.21 kg/Mg (0.42 lb/ton); and ii. You establish and have a record of the operating limits listed in Table 2 to this supbart over the 3-hour performance test during which PM emissions did not exceed 0.21 kg/Mg (0.42 lb/ton).
2. New or reconstructed tunnel kiln with a design capacity equal to or greater than 10 tph of fired product.	a. HF emissions must not exceed 0.029 kg/Mg (0.057 lb/ton) of fired product; or uncontrolled HF emissions must be reduced by at least 90 percent; and	i. The HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in § 63.8595(g)(1), do not exceed 0.029 kg/Mg (0.057 lb/ton); or uncontrolled HF emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 90 percent, according to the calculations in § 63.8595(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HF emissions did not exceed 0.029 kg/Mg (0.057 lb/ton) or uncontrolled HF emissions were reduced by at least 90 percent.
	b. HCl emissions must not exceed 0.028 kg/Mg (0.056 lb.ton) of fired product; or uncontrolled HCl emissions must be reduced by at least 85 percent; and	i. The HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test, according to the calculations in § 63.8595(g)(1), do not exceed 0.028 kg/Mg (0.056 lb/ton); or uncontrolled HCl emissions measured using Method 26A of 40 CFR part 60, appendix A or Method 320 of 40 CFR part 63, appendix A over the period of the initial performance test are reduced by at least 85 percent, according to the calculations in § 63.8595(g)(2); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which HCl emissions did not exceed 0.028 kg/Mg (0.056 lb/ton) or uncontrolled HCl emissions were reduced by at least 85 percent.
	c. PM emissions must not exceed 0.060 kg/Mg (0.12 lb/ton) of fired product.	i. The PM emissions measured using Method 5 of 40 CFR part 60, appendix A, over the period of the initial performance test, according to the calculations on § 63.8595(g)(1), do not exceed 0.060 kg/Mg (0.12 lb/ton); and ii. You establish and have a record of the operating limits listed in Table 2 to this subpart over the 3-hour performance test during which PM emissions did not exceed 0.060 kg/Mg (0.12 lb/ton).

TABLE 5 TO SUBPART KKKKK OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS AND WORK PRACTICE STANDARDS—Continued

For each . . .	For the following . . .	You have demonstrated initial compliance if . . .
3. Existing, new, or reconstructed periodic kiln, tunel kiln, or roller kiln; each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(1); and each tunnel kiln that would be considered reconstructed but for § 63.8540(f)(2).	Minimize fuel-based HAP emissions.	You use natural gas, or equivalent, as the kiln fuel.

As stated in § 63.8620, you must demonstrate continuous compliance with each emission limit and operating limit that applies to you according to the following table:

TABLE 6 TO SUBPART KKKKK OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITATIONS AND WORK PRACTICE STANDARDS

For each . . .	For the following . . .	You must demonstrate continuous compliance by . . .
1. Kiln equipped with a DLA	a. Each emission limit in Table 1 to this subpart and each operating limit in Item 1 of Table 2 to this subpart for kilns equipped with a DLA.	i. Collecting the DLA pressure drop data according to § 63.8600(a); reducing the DLA pressure drop data to 3-hour block averages according to § 63.8600(a); maintaining the average pressure drop across the DLA for each 3-hour block period at or above the average pressure drop established during the performance test; and ii. Verifying that the limestone hopper and storage bin (located at the top of the DLA) contain adequate limestone by performing a daily visual check; and iii. Recording the limestone feeder setting daily to verify that the feeder setting is being maintained at or above the level established during the performance test; and iv. Using the same grade of limestone from the same source as was used during the performance test; maintaining records of the source and type of limestone; and v. Performing VE observations of the DLA stack at the frequency specified in § 63.8620(g) using Method 22 of 40 CFR part 60, appendix A; maintaining no VE from the DLA stack.
2. Kiln equipped with a DIFF or DLS/FF.	a. Each emission limit in Table 1 to this subpart and each operating limit in Item 2 of Table 2 to this subpart for kilns equipped with DIFF or DLS/FF.	i. If you use a bag leak detection system, initiating corrective action within 1 hour of a bag leak detection system alarm and completing corrective actions in accordance with your OM&M plan; operating and maintaining the fabric filter such that the alarm is not engaged for more than 5 percent of the total operating time in a 6-month block reporting period; in calculating this operating time fraction, if inspection of the fabric filter demonstrates that no corrective action is required, no alarm time is counted; if corrective action is required, each alarm is counted as a minimum of 1 hour; if you take longer than 1 hour to initiate corrective action, the alarm time is counted as the actual amount of time taken by you to initiate corrective action; or performing VE observations of the DIFF or DLS/FF stack at the frequency specified in § 63.8620(g) using Method 22 of 40 CFR part 60, appendix A; maintaining no VE from the DIFF or DLS/FF stack; and ii. Verifying that lime is free-flowing via a load cell, carrier gas/lime flow indicator, carrier gas pressure drop measurement system, or other system; recording all monitor or sensor output, and if lime is found not to be free flowing, promptly initiating and completing corrective actions in accordance with your OM&M plan; recording the feeder setting once each shift of operation to verify that the feeder setting is being maintained at or above the level established during the performance test.
3. Kiln equipped with a WS	a. Each emission limit in Table 1 to this subpart and each operating limit in Item 3 of Table 2 to this subpart for kilns equipped with WS.	i. Collecting the scrubber pressure drop data according to § 63.8600(a); reducing the scrubber pressure drop data to 3-hour block averages according to § 63.8600(a); maintaining the average scrubber pressure drop for each 3-hour block period at or above the average pressure drop established during the performance test; and ii. Collecting the scrubber liquid pH data according to § 63.8600(a); reducing the scrubber liquid pH data to 3-hour block averages according to § 63.8600(a); maintaining the average scrubber liquid pH for each 3-hour block period at or above the average scrubber liquid pH established during the performance test; and

TABLE 6 TO SUBPART KKKKK OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITATIONS AND WORK PRACTICE STANDARDS—Continued

For each . . .	For the following . . .	You must demonstrate continuous compliance by . . .
		iii. Collecting the scrubber liquid flow rate data according to §63.8600(a); reducing the scrubber liquid flow rate data to 3-hour block averages according to §63.8600(a); maintaining the average scrubber liquid flow rate for each 3-hour block period at or above the average scrubber liquid flow rate established during the performance test; and iv. If chemicals are added to the scrubber water, collecting the scrubber chemical feed rate data according to §63.8600(a); reducing the scrubber chemical feed rate data to 3-hour block averages according to §63.8600(a); maintaining the average scrubber chemical feed rate for each 3-hour block period at or above the average scrubber chemical feed rate established during the performance test.
4. Existing, new, or reconstructed periodic kiln, tunnel kiln, or roller kiln; each tunnel kiln that would be considered reconstructed but for §63.8540 (f)(1); and each tunnel kiln that would be considered reconstructed but for §63.8540(f)(2).	Minimize fuel-based HAP emissions.	i. Maintaining records documenting your use of natural gas, or an equivalent fuel, as the kiln fuel at all times except during periods of natural gas curtailment or supply interruption; and ii. If you intend to use an alternative fuel, submitting a notification of alternative fuel use within 48 hours of the declaration of a period of natural gas curtailment or supply interruption, as defined in §63.8665; and iii. Submitting a report of alternative fuel use within 10 working days after terminating the use of the alternative fuel, as specified in §63.8635(g).

As stated in §63.8635, you must submit each report that applies to you according to the following table:

TABLE 7 TO SUBPART KKKKK OF PART 63.—REQUIREMENTS FOR REPORTS

You must submit . . .	The report must contain . . .	You must submit the report . . .
1. A compliance report	a. If there are no deviations from any emission limitations or work practice standards that apply to you, a statement that there were no deviations from the emission limitations or work practice standards during the reporting period. If there were no periods during which the CMS was out-of-control as specified in your OM&M plan, a statement that there were no periods during which the CMS was out-of-control during the reporting period.	Semiannually according to the requirements in §63.8635(b).
	b. If you have a deviation from any emission limitation (emission limit, operating limit) during the reporting period, the report must contain the information in §63.8635(d) or (e). If there were periods during which the CMS was out-of-control, as specified in your OM&M plan, the report must contain the information in §63.8635(e).	Semiannually according to the requirements in §63.8635(b).
	c. If you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in §63.10(d)(5)(i).	Semiannually according to the requirements in §63.8635(b).
2. An immediate startup, shutdown, and malfunction report if you took actions during a startup, shutdown, or malfunction during the reporting period that are not consistent with your SSMP.	a. Actions taken for the event according to the requirements in §63.10(d)(5)(ii).	By fax or telephone within 2 working days after starting actions inconsistent with the plan.
	b. The information in §63.10(d)(5)(ii)	By letter within 7 working days after the end of the event unless you have made alternative arrangements with the permitting authority.
3. A report of alternative fuel use	The information in §63.8635(g)	If you are subject to the work practice standards specified in Table 3 to this subpart, and you use an alternative fuel to fire an affected kiln, by letter within 10 working days after terminating the use of the alternative fuel.

As stated in §63.8655, you must comply with the General Provisions in §§63.1 through 63.15 that apply to you according to the following table:

TABLE 8 TO SUBPART KKKKK OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART KKKKK

Citation	Subject	Brief description	Applies to subpart KKKKK
§ 63.1	Applicability	Initial applicability determination; applicability after standard established; permit requirements; extensions, notifications..	Yes.
§ 63.2	Definitions	Definitions for part 63 standards	Yes.
§ 63.3	Units and Abbreviations	Units and abbreviations for part 63 standards	Yes.
§ 63.4	Prohibited Activities	Compliance date; circumvention; severability	Yes.
§ 63.5	Construction/Reconstruction	Applicability; applications; approvals	Yes.
§ 63.6(a)	Applicability	General Provisions (GP) apply unless compliance extension; GP apply to area sources that become major.	Yes.
§ 63.6(b)(1)–(4)	Compliance Dates for New and Reconstructed Sources.	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for section 112(f).	Yes.
§ 63.6(b)(5)	Notification	Must notify if commenced construction or reconstruction after proposal.	Yes.
§ 63.6(b)(6)	[Reserved].		
§ 63.6(b)(7)	Compliance Dates for New and Reconstructed area Sources That Become Major.	Area sources that become major must comply with major source standards immediately upon becoming major, regardless of whether required to comply when they were area sources.	Yes.
§ 63.6(c)(1)–(2)	Compliance Dates for Existing Sources	Comply according to date in subpart, which must be no later than 3 years after effective date; for section 112(f) standards, comply within 90 days of effective date unless compliance extension.	Yes.
§ 63.6(c)(3)–(4)	[Reserved].		
§ 63.6(c)(5)	Compliance Dates for Existing Area Sources That Become Major.	Area sources that become major must comply with major source standards by date indicated in subpart or by equivalent time period (for example, 3 years).	Yes.
§ 63.6(d)	[Reserved].		
§ 63.6(e)(1)–(2)	Operation & Maintenance	Operate to minimize emissions at all times; correct malfunctions as soon as practicable; requirements independently enforceable; information Administrator will use to determine if operation and maintenance requirements were met.	Yes.
§ 63.6(e)(3)	Startup, Shutdown, and Malfunction Plan (SSMP).	Requirement for startup, shutdown, and malfunction (SSM) and SSMP; content of SSMP.	Yes.
§ 63.6(f)(1)	Compliance Except During SSM	You must comply with emission standards at all times except during SSM.	Yes.
§ 63.6(f)(2)–(3)	Methods for Determining Compliance	Compliance based on performance test, operation and maintenance plans, records, inspection.	Yes.
§ 63.6(g)	Alternative Standard	Procedures for getting an alternative standard	Yes.
§ 63.6(h)	Opacity/VE Standards	Requirements for opacity and VE standards	No, not applicable.
§ 63.6(i)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension.	Yes.
§ 63.6(j)	Presidential Compliance Exemption	President may exempt source category	Yes.
§ 63.7(a)(1)–(2)	Performance Test Dates	Dates for conducting initial performance testing and other compliance demonstrations; must conduct 180 days after first subject to rule.	Yes.
§ 63.7(a)(3)	Section 114 Authority	Administrator may require a performance test under CAA section 114 at any time.	Yes.
§ 63.7(b)(1)	Notification of Performance Test	Must notify Administrator 60 days before the test.	Yes.
§ 63.7(b)(2)	Notification of Rescheduling	Must notify Administrator 5 days before scheduled date of rescheduled date.	Yes.
§ 63.7(c)	Quality Assurance (QA)/Test Plan	Requirements; test plan approval procedures; performance audit requirements; internal and external QA procedures for testing.	Yes.
§ 63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
§ 63.7(e)(1)	Conditions for Conducting Performance Tests	Performance tests must be conducted under representative conditions.	No, § 63.8595 specifies requirements.
		Cannot conduct performance tests during SSM; not a violation to exceed standard during SSM.	Yes.

TABLE 8 TO SUBPART KKKKK OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART KKKKK—Continued

Citation	Subject	Brief description	Applies to subpart KKKKK
§ 63.7(e)(2)–(3)	Conditions for Conducting Performance Tests	Must conduct according to subpart and EPA test methods unless Administrator approves alternative; must have at least three test runs of at least 1 hour each; compliance is based on arithmetic mean of three runs; conditions when data from an additional test run can be used.	Yes.
§ 63.7(f)	Alternative Test Method	Procedures by which Administrator can grant approval to use an alternative test method.	Yes.
§ 63.7(g)	Performance Test Data Analysis	Must include raw data in performance test report; must submit performance test data 60 days after end of test with the notification of compliance status.	Yes.
§ 63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test.	Yes.
§ 63.8(a)(1)	Applicability of Monitoring Requirements	Subject to all monitoring requirements in subpart	Yes.
§ 63.8(a)(2)	Performance Specifications	Performance Specifications in appendix B of 40 CFR part 60 apply.	Yes.
§ 63.8(a)(3)	[Reserved].		
§ 63.8(a)(4)	Monitoring with Flares	Requirements for flares in § 63.11 apply	No, not applicable.
§ 63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative.	Yes.
§ 63.8(b)(2)–(3)	Multiple Effluents and Multiple Monitoring Systems.	Specific requirements for installing and reporting on monitoring systems.	Yes.
§ 63.8(c)(1)	Monitoring System Operation and Maintenance	Maintenance consistent with good air pollution control practices.	Yes.
§ 63.8(c)(1)(i)	Routine and Predictable SSM	Reporting requirements for SSM when action is described in SSMP.	Yes.
§ 63.8(c)(1)(ii)	SSM not in SSMP	Reporting requirements for SSM when action is not described in SSMP.	Yes.
§ 63.8(c)(1)(iii)	Compliance with Operation and Maintenance Requirements.	How Administrator determines if source complying with operation and maintenance requirements.	Yes.
§ 63.8(c)(2)–(3)	Monitoring System Installation	Must install to get representative emission and parameter measurements.	Yes.
§ 63.8(c)(4)	CMS Requirements	Requirements for CMS	No, §§ 63.8575 and 63.8615 specify requirements.
§ 63.8(c)(5)	Continuous Opacity Monitoring System (COMS) Minimum Procedures.	COMS minimum procedures	No, not applicable.
§ 63.8(c)(6)	CMS Requirements	Zero and high level calibration check requirements.	No, § 63.8575 specifies requirements.
§ 63.8(c)(7)–(8)	CMS Requirements	Out-of-control periods	No, § 63.8575 specifies requirements.
§ 63.8(d)	CMS Quality Control	Requirements for CMS quality control	No, § 63.8575 specifies requirements.
§ 63.8(e)	CMS Performance Evaluation	Requirements for CMS performance evaluation	No, § 63.8575 specifies requirements.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method	Procedures for Administrator to approve alternative monitoring.	Yes.
§ 63.8(f)(6)	Alternative to Relative Accuracy Test	Procedures for Administrator to approve alternative relative accuracy test for continuous emission monitoring systems (CEMS).	No, not applicable.
§ 63.8(g)	Data Reduction	COMS and CEMS data reduction requirements	No, not applicable.
§ 63.9(a)	Notification Requirements	Applicability; State delegation	Yes.
§ 63.9(b)	Initial Notifications	Requirements for initial notifications	Yes.
§ 63.9(c)	Request for Compliance Extension	Can request if cannot comply by date or if installed BACT/LAER.	Yes.
§ 63.9(d)	Notification of Special Compliance Requirements for New Source.	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date.	Yes.
§ 63.9(e)	Notification of Performance Test	Notify Administrator 60 days prior	Yes.
§ 63.9(f)	Notification of VE/Opacity Test	Notify Administrator 30 days prior	No, not applicable.
§ 63.9(g)(1)	Additional Notifications When Using CMS	Notification of performance evaluation	Yes.
§ 63.9(g)(2)–(3)	Additional Notifications When Using CMS	Notification of COMS data use; notification that relative accuracy alternative criterion were exceeded..	No, not applicable.

TABLE 8 TO SUBPART KKKKK OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART KKKKK—Continued

Citation	Subject	Brief description	Applies to subpart KKKKK
§ 63.9(h)	Notification of Compliance Status	Contents; submittal requirements	Yes.
§ 63.9(i)	Adjustment of Submittal Deadlines	Procedures for Administrator to approve change in when notifications must be submitted.	Yes.
§ 63.9(j)	Change in Previous Information	Must submit within 15 days after the change	Yes.
§ 63.10(a)	Recordkeeping/Reporting	Applicability; general information	Yes.
§ 63.10(b)(1)	General Recordkeeping Requirements	General requirements	Yes.
§ 63.10(b)(2)(i)–(v)	Records Related to SSM	Requirements for SSM records	Yes.
§ 63.10(b)(2)(vi)–(xii) and (xiv).	CMS Records	Records when CMS is malfunctioning, inoperative or out-of-control.	Yes.
§ 63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test.	No, not applicable.
§ 63.10(b)(3)	Records	Applicability Determinations	Yes.
§ 63.10(c)(1)–(15)	Records	Additional records for CMS	No, §§ 63.8575 and 63.8640 specify requirements.
§ 63.10(d)(1) and (2)	General Reporting Requirements	Requirements for reporting; performance test results reporting.	Yes.
§ 63.10(d)(3)	Reporting Opacity or VE Observations	Requirements for reporting opacity and VE	No, not applicable.
§ 63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension.	Yes.
§ 63.10(d)(5)	SSM Reports	Contents and submission	Yes.
§ 63.10(e)(1)–(3)	Additional CMS Reports	Requirements for CMS reporting	No, §§ 63.8575 and 63.8635 specify requirements.
§ 63.10(e)(4)	Reporting COMS data	Requirements for reporting COMS data with performance test data.	No, not applicable.
§ 63.10(f)	Waiver for Recordkeeping/Reporting	Procedures for Administrator to waive	Yes.
§ 63.11	Flares	Requirement for flares	No, not applicable.
§ 63.12	Delegation	State authority to enforce standards	Yes.
§ 63.13	Addresses	Addresses for reports, notifications, requests	Yes.
§ 63.14	Incorporation by Reference	Materials incorporated by reference	Yes.
§ 63.15	Availability of Information	Information availability; confidential information	Yes.

Part II

Environmental Protection Agency

40 CFR Part 63
National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR 2002–0083; FRL–7460–2]

RIN 2060–AE48

National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for integrated iron and steel manufacturing facilities. The final standards establish emission limitations for hazardous air pollutants (HAP) emitted from new and existing sinter plants, blast furnaces, and basic oxygen process furnace (BOPF) shops. The final standards will implement section 112(d) of the Clean Air Act (CAA) by requiring all major sources to meet HAP emission standards reflecting application of the maximum achievable control technology (MACT).

The HAP emitted by integrated iron and steel manufacturing facilities include metals (primarily manganese and lead with small quantities of other metals) and trace amounts of organic HAP (such as polycyclic organic matter, benzene, and carbon disulfide). Exposure to these substances has been demonstrated to cause adverse health effects, including chronic and acute disorders of the blood, heart, kidneys, reproductive system, and central nervous system.

EFFECTIVE DATE: May 20, 2003. The incorporation by reference of certain publications listed in the final rule is approved by the Director of the Federal Register as of May 20, 2003.

ADDRESSES: *Docket.* The official public docket is the collection of materials used in developing the final rule and is available for public viewing at the EPA Docket Center (EPA/DC), EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC 20004.

FOR FURTHER INFORMATION CONTACT: Phil Mulrine, Metals Group (C439–02), Emission Standards Division, U.S. EPA, Research Triangle Park, NC 27711, telephone number (919) 541–5289, electronic mail (e-mail) address, *mulrine.phil@epa.gov.*

SUPPLEMENTARY INFORMATION:

Regulated Entities. Categories and entities potentially regulated by this action include:

Category	NAICS code*	Example of regulated entities
Industry	331111	Integrated iron and steel mills, steel companies, sinter plants, blast furnaces, BOPF shops.
Federal government	.....	Not affected.
State/local/tribal government	.....	Not affected.

*North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your facility is regulated by this action, you should examine the applicability criteria in § 63.7781 of the final rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section. *Docket.* The EPA has established an official public docket for this action under Docket ID No. OAR–2002–0083. The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the Air Docket in the EPA Docket Center (EPA/DC), EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC. The EPA Docket Center Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742. *Electronic Docket Access.* You may access the final rule electronically through the EPA Internet under the "**Federal Register**" listings at *http://www.epa.gov/fedrgstr/.*

An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility in the above paragraph entitled "Docket." Once in the system, select "search," then key in the appropriate docket identification number. *Worldwide Web (WWW).* In addition to being available in the docket, an electronic copy of the final rule will also be available on the WWW through the Technology Transfer Network (TTN). Following signature, a copy of the final rule will be placed on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. This action constitutes final administrative action on the proposed NESHAP for integrated iron and steel manufacturing facilities (66 FR 36836, July 13, 2001). Under CAA section 307(b)(1), judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 21, 2003. Under CAA section 307(b)(2), the requirements that are the subject of this document may not be challenged later in civil or criminal proceedings brought by the EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
II. Summary of Final Rule
A. Who must comply with the final rule?
B. What are the affected sources and emission points?
C. What are the emission limitations?
D. What are the operation and maintenance requirements?
E. What are the general compliance requirements?
F. What are the initial compliance requirements?
G. What are the continuous compliance requirements?

H. What are the notification, recordkeeping, and reporting requirements?
I. What are the compliance deadlines?
III. Summary of Responses to Major Comments
A. How did we develop the MACT floors?
B. What surrogates did we use for HAP?
C. Is a risk analysis warranted?
D. How did we revise the emission limitations?
E. How did we revise the performance test requirements?
F. How did we revise the cost estimates and economic analysis?
IV. Summary of Environmental, Energy, and Economic Impacts
A. What are the air emission impacts?
B. What are the cost impacts?
C. What are the economic impacts?
D. What are the non-air health, environmental and energy impacts?
V. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism
F. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments
G. Executive Order 13045: Protection of Children from Environmental Health & Safety Risks
H. Executive Order 13211: Actions that Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

Section 112(d) of the CAA requires us (the EPA) to establish national emission standards for all categories and subcategories of major sources of HAP and for area sources listed for regulation under section 112(c). Major sources are those that emit or have the potential to emit at least 10 tons per year (tpy) of any single HAP or 25 tpy of any combination of HAP. Area sources are stationary sources of HAP that are not major sources. Additional information on the NESHAP development process can be found in the preamble to the proposed rule (66 FR 36836).

We received a total of 16 comment letters on the proposed NESHAP from industry and trade association representatives, State agencies, industry experts, environmental groups, universities, and private citizens. We offered to provide interested individuals the opportunity for oral presentations of data, views, or arguments concerning the proposed rule, but a public hearing was not requested.

Today's final rule reflects our full consideration of all the comments we received. Major public comments on the proposed rule along with our responses to these comments are summarized in section III of this document. A detailed response to all the comments is included in the Background Information Document (BID) for the Promulgated Standards (Docket ID No. OAR–2002–0083).

II. Summary of Final Rule

A. Who Must Comply With the Final Rule?

Each owner or operator of an affected source at an integrated iron and steel manufacturing facility that is (or is part of) a major source of HAP emissions must comply with the final rule.

B. What Are the Affected Sources and Emission Points?

The affected sources are each new or existing sinter plant, blast furnace, and BOPF shop at an integrated iron and steel manufacturing facility that is (or is part of) a major source of HAP emissions. Emission limitations apply to the sinter plant windbox exhaust, discharge end, and sinter cooler; the blast furnace casthouse; and the BOPF shop including each furnace and ancillary operations (hot metal transfer, hot metal desulfurization, slag skimming, and ladle metallurgy). These processes, as well as their emissions and controls, are described in the preamble to the proposed rule (66 FR 36838–36839).

C. What Are the Emission Limitations?

The final rule includes particulate matter (PM) emission limits and opacity limits as well as operating limits for capture systems and control devices. An operating limit also applies either to the oil content of the sinter plant feedstock or to the volatile organic compound (VOC) emissions from the sinter plant windbox exhaust stream. Particulate matter and opacity serve as surrogate measures of HAP emissions.

1. Sinter Plants

The PM emission limits for a windbox exhaust stream are 0.4 pounds per ton (lb/ton) of product sinter for an existing sinter plant and 0.3 lb/ton for a new sinter plant. The final rule limits PM emissions from a discharge end to 0.02 grains per dry standard cubic foot (gr/dscf) for an existing plant and 0.01 gr/dscf for a new plant. The discharge end PM limits are a flow-weighted average when multiple control devices are operated in parallel. A 20 percent opacity limit applies to fugitive emissions from a discharge end at an existing sinter plant; a 10 percent opacity limit applies to a new sinter plant (both are 6-minute averages). The PM emission limits for sinter cooler stacks are 0.03 gr/dscf for an existing plant and 0.01 gr/dscf for a new plant. If the sinter cooler is vented to the same control device as the discharge end, the PM limit is 0.02 gr/dscf for an existing plant and 0.01 gr/dscf for a new plant.

2. Blast Furnaces

The PM emission limits for a control device applied to emissions from a casthouse are 0.01 gr/dscf for an existing blast furnace and 0.003 gr/dscf for a new blast furnace. The opacity limits for fugitive emissions from a casthouse are 20 percent for an existing blast furnace and 15 percent for a new blast furnace (both are 6-minute averages).

3. BOPF Shops

For primary emissions from BOPF, different PM emission limits apply based on the type of hood system (closed or open). For BOPF with closed hood systems at a new or existing BOPF shop, the PM emission limit is 0.03 gr/dscf, and it only applies during periods of primary oxygen blow. The primary oxygen blow is the period in which oxygen is initially blown into the furnace and does not include any subsequent reblows. For BOPF with open hood systems, the PM emission limits are 0.02 gr/dscf for an existing BOPF shop and 0.01 gr/dscf for a new BOPF shop. These emission limits apply during all periods of the steel production cycle. The steel production cycle begins when the furnace is first charged with scrap and ends 3 minutes after slag is removed. The BOPF limits are a flow-weighted average when multiple control devices are operated in parallel.

The PM emission limits for a control device applied solely to secondary emissions from a BOPF are 0.01 gr/dscf for an existing BOPF shop and 0.0052 gr/dscf for a new BOPF shop. Secondary emissions are those not controlled by the primary emission control system, including emissions that escape from open and closed hoods and openings in the ductwork to the primary control system.

For the BOPF shop, the PM emission limit for a control device applied to emissions from ancillary operations (hot metal transfer, skimming, and desulfurization) is 0.01 gr/dscf for an existing BOPF shop and 0.003 for a new BOPF shop. The PM emission limits for ladle metallurgy operations are 0.01 gr/dscf for an existing BOPF shop and 0.004 gr/dscf for a new BOPF shop.

For the BOPF roof monitor, a 20 percent opacity limit applies to fugitive emissions from the BOPF or BOPF shop operations in an existing BOPF shop. This opacity limit is based on 3-minute

averages. For a new BOPF shop housing a bottom-blown furnace, a 10 percent opacity limit applies (6-minute average) except that one 6-minute period not to exceed 20 percent may occur once during each steel production cycle. For a new BOPF shop housing a top-blown furnace, a 10 percent opacity limit applies (3-minute average) except that one 3-minute period greater than 10 percent but less than 20 percent may occur once during each steel production cycle.

4. Capture Systems

We revised the requirements for capture systems to allow plants to choose operating parameters appropriate for assessing capture system performance, establish the values or settings for the parameters, and designate monitoring requirements. At a minimum, the limits must indicate the level of the ventilation draft and damper position settings. Plants must include information to support their selected parameter(s) in their operation and maintenance plan (including other process configurations that may be used) and certify in their performance test report that during the tests, the capture system operated at the limit(s) established in their plan.

5. Operating Limits

For bag leak detection systems, we require that corrective actions be initiated within 1 hour of a bag leak detection system alarm. For a venturi scrubber, the hourly average pressure drop and scrubber water flow rate must remain at or above the level established during the initial performance test. Plants using an electrostatic precipitator (ESP) must install and operate a continuous opacity monitoring system (COMS) according to Performance Specification 1 in 40 CFR part 60, appendix B. The average opacity for each 6-minute period must remain at or below the site-specific limit. The final rule uses a statistical approach, requiring that the limit be based on the COMS average corresponding to the 99 percent upper confidence limit on the mean of a normal distribution of average opacity values established during the initial performance test. Plants must submit information on monitoring parameters if another type of control device is used.

The final rule requires sinter plants to maintain the oil content of the feedstock at or below 0.02 percent. This limit is based on a 30-day rolling average. We are including an alternative VOC limit of 0.2 pound of VOC per ton (lb/ton) of sinter produced. This limit is also based on a 30-day rolling average.

D. What Are the Operation and Maintenance Requirements?

All plants subject to the final rule must prepare and implement a written startup, shutdown, and malfunction plan according to the requirements in 40 CFR 63.6(e). A written operation and maintenance plan is also required for capture systems and control devices subject to an operating limit. This plan must describe procedures for monthly inspections of capture systems, preventative maintenance requirements for control devices, and corrective action requirements for baghouses. To avoid potential implementation issues, we have added specific descriptions of the equipment to be inspected and a requirement to correct any deficiency or defect as soon as practicable. In the event of a bag leak detection system alarm, the plan must include specific requirements for initiating corrective action to determine the cause of the problem within 1 hour, initiating corrective action to fix the problem within 24 hours, and completing all corrective actions needed to fix the problem as soon as practicable. If applicable, the plan also must include procedures for determining and recording the sinter plant production rate.

E. What Are the General Compliance Requirements?

The final rule requires compliance with the emission limitations and operation and maintenance requirements at all times, except during periods of startup, shutdown, and malfunction as defined in 40 CFR 63.2. The owner or operator must develop and implement a written startup, shutdown, and malfunction plan according to the requirements in 40 CFR 63.6(e)(3).

The final rule also requires keeping a log detailing the operation and maintenance of the process and emission control equipment. This requirement applies during the period between the compliance date and the date that continuous monitoring systems are installed and any operating limits set.

F. What Are the Initial Compliance Requirements?

The final rule requires performance tests to demonstrate that each affected source meets all applicable emission and opacity limits. The final rule allows the owner or operator to conduct representative sampling of stacks where there are more than three stacks associated with a process (subject to approval by the permitting authority). The PM concentration (front-half filterable catch only) is to be measured using EPA Method 5, 5D, or 17 in 40 CFR part 60, appendix A. The EPA Method 9 in 40 CFR part 60, appendix A, is required for determining the opacity of emissions, with instructions for computing 6-minute and 3-minute block averages.

The final rule also includes procedures for establishing site-specific operating limits for control devices during the performance test. We have also included procedures to be followed during opacity tests to ensure capture systems operate at the limits established in the operation and maintenance plan.

The final rule requires a performance test to demonstrate initial compliance with the operating limit for the oil content of the sinter plant feedstock using OSW 846 Method 9071B (Revision 2, April 1998). Plants must sample for 30 consecutive days and compute the 30-day rolling average for each operating day. Plants electing the alternative operating limit must conduct a performance test by sampling VOC emissions and analyzing the samples according to EPA Method 25 in 40 CFR part 60, appendix A. Plants may use an alternative method that has been previously approved by the permitting authority in lieu of OSW 846 Method 9071B for oil content or EPA Method 25 for VOC emissions.

To demonstrate initial compliance with the operation and maintenance requirements, owners or operators must prepare the operation and maintenance plan, certify in the performance test report that capture systems operated at the limits established in the operation and maintenance plan, and submit their notification of compliance status. In the notification of compliance status, the owner or operator must certify that the capture systems will be operated at the limits established in the plan.

G. What Are the Continuous Compliance Requirements?

Plant owners or operators must conduct PM and opacity performance tests at least twice during each title V operating permit term (at midterm and renewal). Owners or operators also must monitor operating parameters for capture systems and control devices subject to operating limits, and carry out the procedures in their operation and maintenance plan.

To demonstrate continuous compliance with the operating limit for the oil content of sinter plant feedstock, owners or operators must determine the oil content every 24 hours (from the composite of at least three samples taken at 8-hour intervals) and compute

and record the 30-day rolling average percent oil content of sinter feed for each operating day. Plants electing the alternative limit must determine VOC emissions every 24 hours (from at least three samples taken at 8-hour intervals) and compute and record the 30-day rolling average emissions (in lb/ton of sinter) for each operating day.

The final rule requires a continuous parameter monitoring system (CPMS) to measure and record operating parameters for capture systems subject to an operating limit. Dampers that are manually set and remain in the same position are exempt from the CPMS requirement. For dampers that are not manually set and remain in the same position, the final rule requires a daily visual check (every 24 hours) to verify they are in the correct positions.

For baghouses, owners or operators are required to monitor the relative change in PM loading using a bag leak detection system and make inspections at specified intervals. The bag leak detection system must be installed and operated according to the EPA guidance document "Fabric Filter Bag Leak Detection Guidance," EPA 454/R–98–015, September 1997. The document is available on the TTN at *http://www.epa.gov/ttnemc01/cem/tribo.pdf*. If the system does not work based on the triboelectric effect, it must be installed and operated consistent with the manufacturer's written specifications and recommendations. The basic inspection requirements include daily, weekly, monthly, or quarterly inspections of specified parameters or mechanisms with monitoring of bag cleaning cycles by an appropriate method. To demonstrate continuous compliance, the final rule requires records documenting conformance with the operation and maintenance plan, as well as the inspection and maintenance procedures.

For venturi scrubbers, owners or operators must use CPMS to measure and record the hourly average pressure drop and scrubber water flow rate. For ESP, owners or operators must use COMS to measure and record the average opacity of emissions exiting each stack of the control device for each 6-minute period. Owners or operators must operate and maintain the COMS according to the requirements in 40 CFR 63.8 and Performance Specification 1 in 40 CFR part 60, appendix B. These requirements include a quality control program including a daily calibration drift assessment, quarterly performance audit, and annual zero alignment.

The final rule requires owners or operators to prepare a site-specific monitoring plan for CPMS that addresses installation, performance, operation and maintenance, quality assurance, and recordkeeping and reporting procedures. These requirements replace the more detailed performance specifications contained in the proposed rule.

To demonstrate continuous compliance, owners or operators must keep records documenting compliance with the monitoring requirements (including installation, operation, and maintenance requirements for monitoring systems) and the operation and maintenance plan.

H. What Are the Notification, Recordkeeping, and Reporting Requirements?

The notification, recordkeeping, and reporting requirements are based on the NESHAP General Provisions in 40 CFR part 63, subpart A. Table 4 to subpart FFFFF lists each of the requirements in the General Provisions (§§ 63.2 through 63.15) with an indication of whether they apply.

The plant owner or operator must submit each initial notification required in the NESHAP General Provisions that applies to their facility. These include an initial notification of applicability with general information about the facility and notifications of performance tests, performance evaluations, and compliance status.

Owners or operators are required to maintain the records required by the NESHAP General Provisions that are needed to document compliance, such as performance test results; copies of startup, shutdown, and malfunction plans and associated corrective action records; monitoring data; and inspection records. Except for the operation and maintenance plan for capture systems and control devices, all records must be kept for a total of 5 years, with the records from the most recent 2 years kept onsite. The final rule requires that the operation and maintenance plan for capture systems and control devices subject to an operating limit be kept onsite and available for inspection upon request for the life of the affected source or until the affected source is no longer subject to the final rule requirements.

We clarified the recordkeeping requirements required to demonstrate compliance with the operating limit for sinter plants. The final rule requires records of the sampling date and time, sampling values (oil content or VOC measurements), sinter produced (tons/day), and the 30-day rolling average for each operating day.

Semiannual reports are required for any deviation from an emission limitation (including an operating limit) or operation and maintenance requirement. Each report is due no later than 30 days after the end of the reporting period. If no deviation occurs, only a summary report is required. If a deviation does occur, more detailed information is required.

An immediate report is required if actions taken during a startup, shutdown, or malfunction are not consistent with the startup, shutdown, and malfunction plan. Deviations that occur during a period of startup, shutdown, or malfunction are not violations if the owner or operator demonstrates to the authority with delegation for enforcement that the source was operating in accordance with the startup, shutdown, and malfunction plan.

I. What Are the Compliance Deadlines?

The owner or operator of an existing affected source must comply by May 22, 2006. An existing affected source is one constructed or reconstructed before July 13, 2001. We changed the compliance date for existing affected sources from 2 years to 3 years after the effective date because some plants must install new capture and control systems and perform significant upgrades of primary emission control systems.

In the final rule, we have corrected a printing error that incorrectly listed the date defining a new affected source as July 23, 2001. A new affected source is one constructed or reconstructed on or after July 13, 2001. New or reconstructed sources that startup on or before the effective date of today's final rule must comply by May 20, 2003. New or reconstructed sources that startup after the effective date of the final rule must comply upon initial startup.

III. Summary of Responses to Major Comments

A. How Did We Develop the MACT Floors?

We stated in the proposal preamble that we may take alternative approaches to establish a MACT floor, depending on the type, quality, and applicability of available data. The three approaches most commonly used involve: (1) Reliance on State regulations or permit limits in conjunction with emission test data; (2) use of emissions test data alone to estimate actual emissions; and (3) use of control technology information in conjunction with emission test data to estimate actual emissions performance. In practice, regardless of what approach we select, we attempt to ensure that our emissions performance estimates reasonably characterize the level of performance that the relevant sources

consistently achieve, considering normal operational variability.

Comment. One commenter contends that EPA may use State regulations or permit limits to set floors only to the extent that such regulations and limits provide a demonstrably accurate picture of the relevant best source's actual performance. The commenter also states that EPA may only use the performance of a chosen floor technology to set floors if such technology is the only factor influencing the relevant best sources' actual performance. In addition, the floor must reflect actual performance, not what EPA thinks is achievable with a particular technology. The commenter concludes that all of EPA's floors suffer from the same basic defect in that ". . . they do not represent the actual performance of the relevant best sources."

Response. While EPA may use any reasonable approach to estimate the emissions control achieved in practice by the best-controlled similar source and the average emissions limitation achieved by the best-performing 12 percent of units in a category (or best 5 units for categories of less that 30 sources), we generally agree with the commenter that it is preferable to use actual performance test data to determine the MACT floor when there are adequate such data available to reasonably characterize the level of performance of the relevant sources. Our approach to identifying the MACT floors and establishing emission limits for the various emission points at integrated iron and steel facilities is consistent with this preference. Nonetheless, we did use State regulations and permit limits in some instances to help us estimate the MACT floor level of performance for certain emission points for which we have limited emission test data. However, in each case where we used such information, we also evaluated the available emission test data and other factors (such as type of control technology and the design parameters that affect performance) to confirm that the State limits reasonably reflect the actual performance of the best units.

In those instances where we had a sufficient quantity of emission test data to reasonably estimate the performance of the relevant best units, we applied a statistical approach to confirm and refine the emission estimates from proposal. This process involved application of a statistical approach to determine the average emission limitation achieved and account for normal operational variability. As described below, this approach ensures that the emissions estimates used to identify the MACT floors reasonably reflect the level of control that is actually achieved by the relevant units over time, and under the most adverse foreseeable circumstances. (The full supplemental analysis is documented in the docket.) We had adequate test data to apply this approach to the emission limits for the sinter plant windboxes, casthouse control devices, primary control systems on open and closed hood BOPF, and control devices applied to hot metal transfer, desulfurization, and ladle metallurgy.

For each of these emission points we confirmed and refined our earlier estimates of the performance of the relevant best-performing units used to identify the MACT floors. At proposal, we estimated the performance of the best-controlled sources by identifying the best control technology that had been demonstrated for each source. We then evaluated the available data for sources using the best control technology and established emission limits for new and existing sources based on the level of control that sources with the technology had achieved.

Conceptually, our approach to estimating the performance of the best-controlled units is relatively straightforward. While we believe each emissions source test gives a good indication of the level of control achieved by the control device during the time of the emissions test, we do not believe a single emissions source test can be used as an estimate of the long term emissions performance achieved by that source. Normal variations in process and control device performance and other factors, such as the inherent imprecision of sampling and analysis, which cannot be controlled, will result in variability in the performance of every source over time, including the best-performing sources. We believe that the MACT floor performance level must reasonably account for the ordinary variability in the performance of the best-controlled sources over time and under the most adverse circumstances which can reasonably be expected to occur. As such, the MACT floor performance limit must include a consideration for the variability inherent in the process operations and the control device performance.

For today's final rule, when emissions source test data were available, we used a statistical method to confirm and refine the emission estimates used at proposal to identify the MACT floors for the relevant units. For each case where emissions source test data were available, we estimated the emissions limitation achieved for each source at the 95th percentile using the one-sided z-statistic test (*i.e.*, the emission limitation which the emission point is estimated to be able to achieve 95 percent of the time). Assuming a normal distribution, the 95th percentile is 1.645 standard deviations above the mean. We chose the median of the 95th percentiles of the top-performing sources as the MACT floor. We used the median as the most representative estimate of the average emission limitation achieved by the best-performing five sources because the median points to the performance of an actual unit, with a specific combination of process operations and control device performance.

We evaluated several options to estimate the standard deviation that is needed to perform the analysis. We decided not to estimate the standard deviation for each source based on the available emissions data for just that one source since we have only three data points for most sources to use in estimating the standard deviation-one data point for each run in a three run emissions source test. Instead, we calculated a relative standard deviation (RSD) for each test and then averaged the RSD to provide our best estimate of the variability of the test data. The RSD is the standard deviation divided by the mean. The RSD provides a way to estimate the standard deviation for different values of the mean when there are too few data points to calculate the standard deviation directly. We believe this method adequately accounts for the normal variability in emissions source test data and provides a reasonable estimate of the long term emissions limitation achieved.

For new sources, the MACT floor is the emissions control that is achieved in practice by the best-controlled similar source. In order to confirm and refine our emissions estimates for new sources, we identified the best-controlled source based on test data and applied the same statistical techniques to determine the emission limitation achieved in practice for new sources. We calculated the upper 95th percentile of performance for the best-controlled source, and we chose this value as the emission limitation that can be achieved by new sources.

We believe the statistical technique used to account for general variability is appropriate and reasonable. However, we also recognize that some of the empirical test data may imply a level of accuracy that is not present throughout the entire data set. As a result, we have some reservations about identifying a MACT floor with a level of accuracy that is not warranted by the underlying data. Accordingly, we have concluded

that it is appropriate in some instances to round the results to two decimal places. This approach encompasses the specific statistically-derived numbers, while acknowledging that there is some residual uncertainty about the representativeness of the data. Thus, while we believe generally that our use of the 95th percentile adequately identifies the range of actual performance of individual facilities, our rounding approach should alleviate any concerns regarding whether the statistics sufficiently capture the full range of ordinary performance of the best-performing units over time and under the most adverse circumstances that can be reasonably expected to occur.

Changes resulting from rounding will have no practical effect on how industry responds to the emission limitations. That is, the control technology needed is exactly the same and the equipment must be operated in the same manner regardless of whether the numbers are rounded or not. A properly designed and operated control device will still be required to meet the rounded emission limit. Today's final rule has provisions for operating parameters and operation and maintenance plans to ensure proper operation. Thus, other than serving to better reflect uncertainties in the underlying data, the rounding has no practical impact on the stringency of the requirements.

Additional information on the statistical analysis used to confirm and refine our emissions estimates, including the data used and the complete ranking of sources, is available in the docket.

The objective of both the MACT floor methodology used at proposal, and the methodology used here to confirm and refine the proposed estimates of performance, is exactly the same. For each relevant operation at integrated iron and steel facilities, both approaches expressly are intended to provide a quantified estimate of the emission performance of the best-controlled similar source, or of the average emission limitation achieved by the relevant best-performing sources in the category, taking into consideration the ordinary and unavoidable variations in process operations and performance of the emissions control equipment.

Moreover, the conclusions growing from the supplemental statistical analysis, regarding the levels of performance that reflect the MACT floor for both new and existing units, in large measure simply confirm that the analysis underlying the proposal provided a reasonable estimation of performance.

Indeed, none of the refinements to our performance estimates will have any practical effect on how industry responds to the emission limitations. As is the case with our decision to round the emission estimates, any changes in the emission limitations in the final rule will require the same control technology as would have been needed to meet the proposed limits, and the control equipment will need to be operated in the same manner as would have been the case with the proposed emission limitations.

For three emission points (sinter cooler, sinter plant discharge end, and control devices for BOPF fugitive emissions), we had only one or two test results. Consequently, we did not have an adequate set of emissions test data to directly estimate the actual performance of the top-performing sources. Consequently, we developed the floors for these three emission points based on the facilities subject to the most stringent State regulations or permit limits, and we used the available emissions information (emissions data and a characterization of the operational processes and emissions controls) to confirm that the identified State limits reasonably reflect the actual performance of the relevant best-performing units. That is, the best units are able to achieve the required State limits but are not consistently achieving a level of emissions performance that is more stringent than the State limits. The EPA may use State limits as long as we demonstrate that such limits provide a reasonable estimate of the actual performance of the best-performing sources.

For floors based on State opacity regulations that limit fugitive emissions, we collected additional data and found that sources are achieving a level of performance that is within the current limits, but they are not consistently achieving a level of control more stringent than the identified State limits. Consequently, we believe these State limits provide an accurate picture of the best sources' actual performance considering inherent and unavoidable variability. We used this approach to develop the MACT floor for opacity from the sinter plant discharge end, blast furnace casthouse, and BOPF shop.

We provide additional rationale in the following sections where we discuss in detail the development of the MACT floors for each emission point.

1. Sinter Plant Windbox Exhaust

Comment. One commenter stated that EPA proposed an emission limitation of 0.3 lb/ton of PM based on the performance of either a baghouse or scrubber. According to the commenter, EPA's floor does not reflect the actual performance of the relevant best sources—the average emission limitation achieved by the top five sources. As shown in the BID, the average emission limitation achieved by the best-performing five sources is 0.079 pound per ton (lb/ton), not the proposed limit of 0.3 lb/ton. Second, floor reflects what EPA believed to be achievable with the control technologies and not the actual performance of the relevant best sources. Third, EPA admits that several factors other than the performance of the technologies influence emissions.

Response. As we documented in appendix B of the BID, the floor for sinter plant windboxes was based on actual source test data and the five best-performing sources. We collected test data and verified that EPA Method 5 (40 CFR part 60, appendix A) was used. We ranked the results (in lb/ton of sinter) and calculated the average of the five best-performing sources (0.3 lb/ton). Contrary to the commenter's assertion, we did not rely on control technology to identify the best-performing units or to estimate the performance of the best units. In this particular case, we had adequate test data to directly estimate the average emission limitation achieved by the five best-performing sources.

The calculation performed by the commenter is inappropriate and does not provide an accurate estimate of the emission limitation achieved by the plants. The commenter misinterpreted the information in the BID, which is not source test data, but is simply a best estimate of annual average emissions based on approximate emissions factors and the assumption that all plants operate continuously at their design capacity. Such an estimate cannot be used to represent actual performance in a MACT floor calculation.

After proposal, we reviewed our approach for developing the MACT floor and concluded that our original analysis did not sufficiently account for the normal and unavoidable variability inherent in the process operations and emission control equipment (as demonstrated by the emission test data). The average performance of the five best-performing sinter plants ranged from 0.26 to 0.32 lb/ton of sinter. To account for inherent variability, we applied the z-statistic to estimate the 95th percentile of a normal distribution for each source. The median of the 95th percentiles of the five best-performing sources is 0.4 lb/ton, which we chose to represent the MACT floor. This level of performance reasonably reflects the

average emission limitation achieved by the five best-performing sources considering inherent variability. The best-controlled source averaged 0.26 lb/ton with a 95th percentile of 0.3 lb/ton, which represents the MACT floor for new sources.

2. Sinter Plant Limit on Oil Content

Comment. Two commenters stated that the proposed limit on oil content of 0.025 percent was based on the highest oil percentage of any of the four plants for which EPA had oil percentage data. They claim this is not a valid approach because it does not represent the actual performance of the relevant best sources. One commenter recommended that EPA consider beyond-the-floor technologies for dioxin emissions, such as elimination of rolling mill scale from sinter feed, de-greasing of sinter plant feed, quality control of water used in sinter plant feed preparation, and use of low-organic waterborne rolling mill lubricants.

Response. Our research indicates that emissions of organic compounds from sinter plant windboxes are controlled by limiting the amount of oil in the sinter feed. Emission control devices applied to sinter plants are designed primarily for the removal of PM and not for the various organic compounds that are formed from the oil. We believe that oil content is the most significant factor affecting organic compound HAP emissions. Consequently, we identified the MACT floor for organic HAP emissions from sinter plants based on the level of oil content that we observed for the sinter plants with the best programs to control oil in the sinter feed.

We obtained data from four sinter plants that have implemented a program to control the oil content of the sinter feed. We then examined the data and evaluated the variability to determine the level of control that has been achieved. The average results for oil content for each plant ranged from 0.014 to 0.025 percent. These are the best-performing plants because they were the only ones that routinely sample for oil content. We applied the z-statistic and estimated the 95th percentile for each plant. (The statistical analysis considered that the limit is based on a 30-day rolling average, which reduces the inherent variability as indicated by a lower standard deviation than that associated with a single analysis of oil content.) The median of the 95th percentiles for the top-performing plants is 0.022 percent. We rounded this value to 0.02 percent, and this level represents the MACT floor for existing units. The best-performing source averaged 0.014 percent oil with a 95th percentile of 0.015 percent. We rounded this value to 0.02 percent, and this level represents the MACT floor for new units.

We reviewed opportunities for control beyond the floor. We do not believe it is practical or feasible to eliminate rolling mill scale from the sinter feed. The sinter plant provides the only opportunity to recycle and recover the raw material value. Otherwise, the mill scale would be landfilled. De-greasing or de-oiling the sinter feed has been investigated by the industry, but there is no demonstrated technology in use at any sinter plant that has proven to be successful. There is no indication that the water used in preparing the sinter feed contributes to the oil content; therefore, water quality control is not expected to have an impact on emissions of organic compounds. Waterborne lubricants may have some advantages in certain applications. However, they are problematic in some applications in the demanding environment of steel rolling mills. We could find no indication that the practices cited by the commenter have been demonstrated to reduce dioxin or other organic compound emissions. Consequently, we selected a limit on oil content as the MACT floor. We believe it is more appropriate to set a performance standard that limits oil content rather than mandating a technology that an owner or operator must use to reduce oil content. The performance standard for oil content will encourage owners or operators to investigate technologies that reduce oil content to find the most effective approach for their specific situation.

Comment. Six commenters object to the proposed limit on oil content because EPA has not shown that it is achievable by the best-performing sinter plants under the most adverse anticipated circumstances over time.

Response. As we discussed in our previous response, we confirmed and refined the MACT floor estimates using a statistical approach to account for inherent variability. Based on this approach, we believe the MACT floor has been achieved on a continuing basis by the best-performing units. In addition, the limit is enforced based on a 30-day rolling average, which further enhances achievability because it allows an occasional high daily value to be averaged with lower values on other days to achieve compliance. A 30-day rolling average also provides time to take corrective action and lower the oil content before the limit is exceeded.

3. PM Standard for Blast Furnace Casthouse Control Device

Comment. One commenter stated that the technology approach used to develop the floor does not reflect the actual performance of the relevant best sources. The commenter further states that EPA admits that there are factors other than the type of control technology that affect the actual emission control performance of blast furnace casthouse control devices. Specifically, factors affecting emissions include duration of tapping, exposed surface area of metal and slag, length of runners, and the presence or absence of runner covers or flame suppression. Thus, the performance of a baghouse cannot be representative of the best sources's actual performance.

Response. We proposed a PM standard of 0.009 gr/dscf for blast furnace casthouse control devices based on the performance of existing units using baghouses. We re-evaluated the emissions test data for blast furnace casthouses based on the statistical approach previously discussed in order to confirm and refine our emissions estimates for the best-performing units. We have test data for fugitive emissions from source tests at four casthouses. The available data clearly indicate that a baghouse is the best technology for controlling emissions from blast furnace casthouses. We reviewed the test data and the design features of these baghouses (such as air-to-cloth ratio), and we concluded that the baghouses that had been tested were among the best-performing units. The test results ranged from 0.002 to 0.0072 gr/dscf. We calculated the 95th percentile for each plant. The median of the 95th percentiles for the top-performing plants is 0.005 gr/dscf. We rounded this value to two decimal places and chose 0.01 gr/dscf to represent the MACT floor level of control for existing sources.

The best-controlled source averaged 0.002 gr/dscf with a 95th percentile of 0.0034 gr/dscf. We rounded the 95th percentile to 0.003 gr/dscf to represent the MACT floor for new sources.

4. PM Standard for BOPF Primary Control Devices

Comment. One commenter stated that the chosen floor technologies do not represent the actual performance of the relevant best sources.

Response. We proposed a PM limit of 0.019 gr/dscf for new and existing open hood BOPF primary control systems based on the performance of existing units using ESP. We re-evaluated the emissions test data for open hood BOPF using the statistical approach previously

discussed, in order to confirm and refine our emissions estimates for the best-performing units. The available data clearly indicate that ESP perform better than venturi scrubbers in controlling emissions from open hood shops. We have test data for five ESP that are similar in design, each of which, based on design and operating data, are among the best-performing units at open hood shops. The data include multiple tests at some plants, and these data indicate there is variability in performance from test to test and from run to run. The plant averages ranged from 0.007 to 0.019 gr/dscf, and individual tests (three-run averages) ranged from 0.004 to 0.019 gr/dscf. We calculated the 95th percentile for each plant. The median of the 95th percentiles for the top-performing plants is 0.019 gr/dscf. We rounded this value to two decimal places and chose 0.02 gr/dscf to represent the MACT floor for existing units.

The best-controlled open hood shop averaged 0.0066 gr/dscf with a 95th percentile of 0.01 gr/dscf, which we chose to represent the MACT floor for new sources.

We proposed a limit of 0.024 gr/dscf for new and existing closed hood BOPF primary control systems based on the performance of existing units using venturi scrubbers. All of the closed hood shops use venturi scrubbers as the primary control device. The test data and design information indicated that shops having high-energy venturi scrubbers with a pressure drop of 50 inches of water or more are the best-performing sources. We have recent test data for only one closed hood shop. However, we have data from 1971 to 1978 for high-energy venturi scrubbers on closed hood shops. These data include four BOPF shops that are currently operating. The test results range from 0.021 to 0.024 gr/dscf. For purposes of today's final rule, we did not include Kaiser Steel because the plant has been closed for several years. We calculated the 95th percentile for each plant. The median of the 95th percentiles for the top-performing plants is 0.027 gr/dscf. We rounded this value to two decimal places and chose 0.03 gr/dscf to represent the MACT floor for existing sources.

The best-controlled closed hood shop averaged 0.021 gr/dscf with a 95th percentile of 0.027 gr/dscf. We rounded the 95th percentile to two decimal places and chose 0.03 gr/dscf to represent the MACT floor for new sources.

Comment. Six commenters said EPA used test data dating from 1971 through 1978 to establish the limit for closed hood systems. These commenters believe the data do not reflect current configurations or actual performance and cannot be used to establish the floor. Many systems have been upgraded to increase capture efficiency (including some furnaces used to establish the standard). Because there are little or no data for these sources, the commenters recommend that EPA use existing State implementation plans (SIP) to determine the floor. Another commenter agrees, adding that the test data used to support the 0.024 gr/dscf limit ranged up to 0.031 gr/dscf and represent the minimum anticipated variation of emissions from a MACT floor technology source. The proposed limit is more stringent than existing SIP and may not be achievable by plants using MACT floor controls. The analysis does not consider the current PM limit of 0.03 gr/dscf for plants in Ohio, which the commenter believes should be the limit.

Response. The test data for closed hood shops are not just from tests in 1971 to 1978—there is a 1992 test for Geneva Steel. The commenters did not provide any information on the nature of the upgrades or rationale as to their effect on emissions. For closed hood systems, testing is performed only during the oxygen blow with the capture hood tightly fitted to the furnace. Our understanding is that capture system upgrades have been made primarily to improve the capture of fugitive emissions from charging and tapping, which are not included in the performance testing for closed hood furnaces. In addition, the operating conditions of the scrubbers during the tests (*e.g.*, pressure drops of 50 inches of water or more) are representative of the way these scrubbers are currently operated. Data for venturi scrubbers in other similar processes indicate that high-pressure drop scrubbers can achieve control levels of 0.03 gr/dscf or less. We believe the statistical approach that we used to confirm and refine emissions estimates for the floor analysis accounts for inherent variability over time. We believe that source test data provide a better picture of actual performance than the use of State limits as the commenter suggests. Moreover, based on our analysis of the emission tests, we have identified as MACT an emissions limit of 0.03 gr/dscf which is consistent with the emissions limits that the commenters identified as appropriate.

5. PM Standards for Ancillary Operations at BOPF Shops

Comment. According to eight commenters, the three data points for hot metal transfer and desulfurization are not sufficient to define the floor, accurately represent current operating conditions, or reflect a level that is consistently achievable under the most adverse foreseeable circumstances over time. If sufficient data are not available, EPA should use existing State limits, if it can show that the level of control is realistically achievable under the most adverse anticipated circumstances over time. The commenters also question that the data used for characterizing performance were collected using the same test procedures specified in the proposed rule (average of three 1-hour tests during actual operation of the processes). Using data from a test method other than the required compliance method to set a standard does not meet CAA requirements.

Response. We proposed a PM standard of 0.007 gr/dscf for a control device serving BOPF ancillary processes based on the performance of existing units using baghouses. We reviewed the emissions data and confirmed the tests were conducted using EPA Method 5 (40 CFR part 60, appendix A). Every test result was presented as the average of three runs, which is consistent with our performance test requirements. Several test reports confirmed that sampling was conducted under normal operating conditions, and none of the reports indicated conditions were not normal. The tests used a sampling time of 1 hour or more to ensure an adequate sample volume was collected. As explained earlier, in response to another comment, EPA believes that it is preferable to use actual performance test data to determine the MACT floor when there are adequate such data available to reasonably characterize the level of performance of the relevant sources. The commenters did not provide us with any additional facts or data to show that any of the data we relied upon are invalid. For the reasons described above, we believe that these data are adequate to reasonably estimate the performance of the best sources for purposes of establishing a MACT floor, and these estimates more accurately reflect the actual performance of the best-performing sources than would estimates based on State permit data. Moreover, the approach that we used to confirm and refine the emissions estimates for the top-performing sources assures that we have adequately accounted for variability over time, and, therefore, addresses the concerns of the commenter.

We re-evaluated the emissions test data for ancillary operations based on the statistical approach previously discussed, in order to confirm and

refine our earlier analysis. At proposal, we considered the combined data for hot metal transfer/desulfurization and ladle metallurgy. However, we believe it is necessary to separate the two operations because hot metal transfer/desulfurization is performed on molten iron before charging to the BOPF. Ladle metallurgy is performed on molten steel from the BOPF. Consequently, the two processes have different emission characteristics which suggests each should have a separate MACT floor determination.

We have test data from three source tests of desulfurization and hot metal transfer. The control device used in these source tests, and the only type of control used for these processes, is a baghouse. We reviewed the test data and the design features of these baghouses (such as air-to-cloth ratio), and we concluded that the baghouses that had been tested were among the best-performing units. The three tests ranged from 0.0016 to 0.012 gr/dscf. We calculated the 95th percentile for each plant. The median of the 95th percentiles for the top-performing plants is 0.006 gr/dscf. We rounded this value to two decimal places and chose 0.01 gr/dscf to represent the MACT floor for existing units.

The best-controlled source averaged 0.0016 gr/dscf with a 95th percentile of 0.003 gr/dscf, which we chose to represent the MACT floor for new sources.

We have test results for six source tests of typical ladle metallurgy operations. As with desulfurization, the control device used in these source tests, and the only type of control used for these processes, is a baghouse. We reviewed the test data and the design features of these baghouses (such as air-to-cloth ratio), and we concluded that the baghouses that had been tested were among the best-performing units. The five best-performing units ranged from 0.0021 to 0.0047 gr/dscf. We calculated the 95th percentile for each plant. The median of the 95th percentiles for the top-performing plants is 0.006 gr/dscf. We rounded this value to two decimal places and chose 0.01 gr/dscf to represent the MACT floor for existing units.

The best-controlled source with typical ladle metallurgy operations (lance injection, electromagnetic stirring, and alloy addition), averaged 0.0021 gr/dscf with a 95th percentile of 0.004 gr/dscf, which we chose to represent the MACT floor for ladle metallurgy for new sources.

6. Opacity Standard for Sinter Plant Discharge End

Comment. According to one commenter, EPA does not explain how the floor determination represents an accurate picture of the relevant best sources' actual performance, or how it knows that the best sources are not doing better than their permits require.

Response. We proposed an opacity limit of 20 percent for the sinter plant discharge end based on the five sources subject to the most stringent existing State regulations or permit limits. One plant has a 10 percent opacity limit, and four plants have a 20 percent opacity limit. We chose the median (20 percent) to represent the MACT floor.

A total of six of the seven operating plants use a capture and control system vented to a baghouse for the discharge end, and engineering knowledge of their design features and the nature of emissions indicate that these baghouses are the best demonstrated control technology for the discharge end. Following the end of the comment period, in order to confirm the appropriateness of the proposed opacity limit, we surveyed the industry to obtain additional opacity data for the discharge end. The only substantive data we obtained was from Ispat-Inland, which submitted the results of 1,745 hours of observations by EPA Method 9 (40 CFR part 60, appendix A) conducted over 4 years (1997 to 2000). Ispat-Inland is among the better-performing plants because it controls the discharge end, crusher, and hot screen by capturing emissions using local hooding and ventilation and venting them to a baghouse for collection. Consequently, we believe that the control system at Ispat-Inland is representative of the best-performing sources.

At Ispat-Inland, approximately one percent of the hourly opacity observations had a 6-minute average that exceeded 20 percent opacity, and the plant met the proposed limit 99 percent of the time. Although many of the observations were below 20 percent opacity, the limit accommodates the normal variability in the process operations and control equipment. The data clearly show that Ispat-Inland is not consistently performing substantially better than what their permit requires and that our proposed limit is a reasonable picture of what the best-controlled sources can achieve.

Comment. Seven commenters contend that EPA has not shown that existing State limits are consistently achievable under the worst foreseeable conditions over time. The commenters claimed that opacity data they submitted to EPA demonstrates that the limits are not consistently achievable by well-operated and maintained sinter plants. The EPA must reevaluate the achievability of the proposed opacity standard.

Response. None of the commenters provided evidence that facilities subject to the identified State limits have been unable to meet those limits (*e.g.*, in the form of reported violations). Moreover, as discussed in the previous response, approximately 99 percent of the hourly opacity observations at Ispat-Inland never had a 6-minute average in excess of 20 percent opacity. Performance improved to 99.9 percent compliance for more recent, 1998 to 2000, observations. As stated previously, these data show that the opacity limit based on existing State limits is achievable because it has been achieved on a continuing basis. Our analysis considered all of the data that we could obtain, and the only data available was that for Ispat-Inland which we discussed in detail.

7. Opacity Standard for Blast Furnace Casthouse

Comment. One commenter states that we failed to explain how the floor we selected reflects the best-performing 12 percent of the blast furnace casthouses. The commenter further states that we failed to pursue and collect from the affected sources or State and local agencies available opacity data, and we undermined the floor-setting process of the CAA.

Response. For blast furnace casthouses, we established the MACT floor as a 20 percent opacity limit based on the five sources subject to the most stringent existing State regulations or permit limits. Two casthouses are subject to a 15 percent opacity limit, and the next most stringent limit is 20 percent, which is applied to 22 of the 37 blast furnace casthouses.

Following the end of the comment period, in order to confirm the appropriateness of the proposed opacity limit, we obtained additional opacity data for operating blast furnace casthouses to supplement the limited data we had available at proposal. We now have opacity data for 25 of the 37 existing blast furnace casthouses, and the data range in coverage from a 1-hour test to several years of observations. (Although there were 39 blast furnace casthouses at proposal, two have subsequently shut down.) We closely examined the data that covered a reasonably long period of time (*e.g.*, at least 1 year to capture seasonal variations), which included 12 of the 25 casthouses for which we had data. We

believe it is important to account for seasonal variations and examine data covering 1 year or more to account for variability due to differences in ventilation rates, weather conditions, and changes in the process over time. We found that the casthouses with the lowest opacities were those with secondary capture and control systems. For some casthouses, most of the 6-minute averages were routinely below the proposed 20 percent limit with occasional readings that approached or exceeded 20 percent. The blast furnace casthouses at U.S. Steel (Gary) achieved the 20 percent opacity limit 99 to 100 percent of the time. One blast furnace casthouse had a maximum 6-minute average of 21 percent opacity, and another casthouse had a maximum of 20 percent opacity. At Ispat-Inland, the casthouses achieved 20 percent opacity 98 to 99.6 percent of the time. At LTV Steel, the casthouses achieved 20 percent opacity 99.5 to 99.8 percent of the time. These blast furnaces were achieving the 20 percent limit, but they were not demonstrably able to consistently achieve a level of performance more stringent than this limit. Consequently, the opacity data confirm that the 20 percent opacity limit based on the median value of the sources with the five most stringent emission limits is an accurate reflection of the MACT floor.

Comment. Eight commenters contend that the limits are not consistently achievable under the worst foreseeable conditions over time even by the casthouses used to establish the MACT floor. In support, the commenters claimed they had provided opacity data showing that the limits have not been consistently achieved by well-operated and maintained casthouses. Achievability of the opacity limit for blast furnace casthouses is of particular concern because the process is subject to infrequent but significant swings in emission rates. The commenters recommend that EPA collect and analyze all available opacity data from States, Regions, and industry and determine the standard based on achievability. They recommend using a statistically-derived limit based on a high confidence level (the 99.97th percentile) to avoid an unachievable standard that would result in many violations.

Response. Following proposal, in order to confirm the appropriateness of the proposed opacity limit, we collected additional opacity data and identified the best-performing sources in terms of low opacity. Our analysis considered all of the opacity data submitted by the commenters and data obtained from other sources. For the five best-performing blast furnace casthouses (*i.e.*, lowest opacities) with observations over at least 1 year, a 20 percent opacity limit was achieved for 99 to 99.8 percent of the time. We believe the data clearly show that an opacity limit of 20 percent represents what has been achieved by the best-performing sources and that it can be achieved on a continuing basis.

8. Opacity Standards for BOPF Shops

Comment. Eight commenters contend that the limits are not consistently achievable under the worst foreseeable conditions over time. They claim that opacity data submitted to EPA by the industry demonstrate that the limits are not consistently achieved by well-operated and maintained BOPF shops, and as a result, EPA must reevaluate the achievability of the proposed opacity standards.

Response. Following proposal, in order to confirm the appropriateness of the proposed 20 percent opacity limit, we obtained additional opacity data for operating BOPF shops to supplement the limited data we had available at proposal. We now have opacity data for 19 of the 23 existing BOPF shops ranging in coverage from a single 2-hour test to multiple tests covering several years of observations. Our analysis considered all of the opacity data submitted by the commenters and data obtained from other sources. We examined the data and found that the best-controlled BOPF shops were those with secondary capture and control systems. In contrast, several BOPF shops without secondary controls experienced frequent exceedances of the 20 percent opacity limit. A total of eight BOPF shops have capture systems for secondary emissions that are vented to baghouses. We re-evaluated the data to determine the appropriateness and achievability of the proposed 20 percent opacity limit. We focused on BOPF shops for which we had a reasonable amount of long-term data. Specifically, we examined opacity data only from shops for which we had 12 months or more of observations (*i.e.*, all seasons of the year), which included observations for 11 of the 23 existing shops. The five best-performing shops achieved the limit 99.5 to 99.98 percent of the time. These data clearly indicate that the best-performing units in the category achieve the proposed opacity limit (but do not achieve a more stringent level of control), and, therefore, that the State limits are a good proxy for actual best performance. Thus, we are confident that the proposed opacity limit of 20 percent is achievable and that it provides an accurate picture of the actual performance achieved by the best-performing sources.

Our analysis of the opacity data for BOPF shops indicated that opacity observations are routinely made over several consecutive steel production cycles. In the proposal, we had included a provision that the opacity observations during the performance test did not have to be consecutive. In today's final rule, we have removed the provision which allowed non-consecutive observations. This is consistent with the opacity data used to support the opacity limit and with the procedures routinely used to make opacity observations for BOPF.

9. Sinter Cooler Stack

Comment. Six commenters note that one of the plants used to calculate the MACT floor is permanently shut down. Consequently, the floor analysis does not reflect the SIP requirements for actual operating sources. In addition, EPA has not shown that the proposed standard is achievable by the best-performing sources under the foreseeable range of operating conditions.

Response. Our investigation into this comment indicates that all five of the sinter plants listed in Table B–11 of the BID are operating (Ispat-Inland at East Chicago, IN; WCI Steel at Youngstown, OH; Bethlehem Steel at Sparrows Point, MD; U.S. Steel at Gary, IN; and AK Steel at Middletown, OH). Because we had only limited test data, we based the MACT floor on the average of the top five sources subject to the most stringent existing State regulations or permit limits. One plant has a limit of 0.01 gr/dscf (for one-half of its cooler), three of the five best-performing plants are subject to a limit of 0.03 gr/dscf, and one plant has a lb/hr limit that is equivalent to about 0.05 gr/dscf. The average and median limit applied to the top five plants is 0.03 gr/dscf. Although our data are limited, they show that the proposed emission limit is achievable and has been achieved based on the available test results. Nationwide, baghouses are used at three plants, a cyclone at one plant, and three plants are uncontrolled. Consequently, the best-performing plants and the median of the top five would be a plant with a baghouse. A test at WCI Steel, which controls these emissions with a baghouse, ranged from 0.005 to 0.02 gr/dscf and averaged 0.009 gr/dscf. The results for WCI show significant variability in the run-to-run results, which range up to 0.02 gr/dscf. The test results indicate that the better-controlled plants can achieve the limit

of 0.03 gr/dscf; however, considering the high variability from run to run, the plant is not substantially overachieving the limit.

No commenters provided any evidence that the existing State limits were not being achieved on a continuing basis (*e.g.*, in the form of violation reports), and we have no evidence that any facility has been in violation of the existing State limits. Consequently, we believe the floor based on State limits represents a reasonably accurate picture of what the best-performing sources have and continue to achieve. For new sources, we chose a limit of 0.01 gr/dscf based on the most stringent State limit. The average test results for WCI Steel (0.009 gr/dscf) show that this limit is achievable by a properly-designed and operated baghouse.

10. PM Standard for Sinter Discharge End Control Device

Comment. According to one commenter, EPA claims it has PM test data from six plants, but asserts in the preamble that it has credible test data for only one plant and never explains why data for only one plant is credible. The EPA does not explain how this represents an accurate picture of the relevant best sources' actual performance, or how it knows that the best sources are not doing better than their permits require.

Response. The reference to test data in the BID is correct; however, use of the term "test data" in the BID was not correct. We had estimates of PM emissions from the discharge end from several plants based on emission factors that they supplied in a survey questionnaire. However, these estimates were not supported by the use of reference methods for sampling and analysis or substantiated by emission test reports. For units in this category, it is not feasible to use estimates based on typical emission factors to identify the level of control that a plant routinely achieves. Therefore, this information is of no practical value for purposes of identifying the best-performing sinter discharge ends. We found the only test data we could validate for the discharge end was for the EPA test conducted at WCI Steel. The results of this test support our conclusion that the existing State limits reasonably approximate actual emissions and performance. However, we have no indication or expectation that the best-performing plants are achieving a level of control more stringent than the proposed emission limit. Consequently, we based the floor on the most stringent State limits.

Comment. Seven commenters state that three of the nine sinter plants in the existing population are now shut down, including one of the five plants used to calculate the floor for the discharge end. The commenters assert that EPA must recalculate the floor to reflect only operating sources. Also, EPA must show that the standard is consistently achievable by the best-performing sources under the foreseeable range of operating conditions.

Response. We agree that one of the five best-performing plants (Wheeling-Pittsburgh Steel) used to determine the floor was shut down at the time of the floor analysis. We elected to re-calculate the floor and exclude this plant. We determined that the floor based on the average of the five best-performing sources remains the same (0.02 gr/dscf). One plant is subject to a limit of 0.01 gr/dscf, two plants are subject to a limit of 0.02 gr/dscf, one is subject to 0.03 gr/dscf, and the fifth plant has a mass rate limit that is equivalent to about 0.04 gr/dscf. The average and median value associated with the top five limits is 0.02 gr/dscf. We have detailed design information for the baghouses applied to the discharge end, and our engineering analysis of the design information, coupled with test data for baghouses in similar applications, indicates that these controls can achieve 0.02 gr/dscf under the foreseeable range of operating conditions. Although we have test data for only one baghouse, the test averaged 0.006 gr/dscf and further supports the achievability of the MACT floor. We based the MACT floor for new sources on the most stringent State limit of 0.01 gr/dscf. Again, the available test data indicate that this limit can be achieved by a properly-designed and operated baghouse.

11. PM Standard for BOPF Fugitive Emissions

Comment. One commenter stated that EPA does not explain how the floor determination represents an accurate picture of the relevant best sources' actual performance, or how it knows that the best sources are not doing better than their permits require.

Response. We have test data for only one baghouse applied to BOPF fugitive emissions, and because of the nature of the test, the results are not useful for determining the MACT floor. During the test, sampling was performed continuously over a 3-hour period, even when the furnace was not operating and when fugitive emissions were not occurring. Consequently, the reported concentrations for the baghouse outlet are unrepresentative of the concentrations that would be measured when fugitive emissions from charging and tapping are occurring. Because of the lack of data, we based the floor on existing State limits and have made no changes to the proposed emission limits. We chose 0.01 gr/dscf as the floor from the median of the five sources with the most stringent limits (one at 0.0052, one at 0.006, two at 0.01, and one at 0.012 gr/dscf). One unit is subject to the most stringent State limit of 0.0052 gr/dscf, and we selected this limit as the MACT floor for new sources. These limits are achieved by using a capture system vented to a baghouse, and these levels are consistent with the performance of well-designed and operated baghouses. We have no evidence that plants are violating their current limits, and we have no indication they are achieving a level of control more stringent than the identified State limits. This observation is consistent with an EPA design manual for baghouses which states that typical outlet concentrations for all applications range from 0.001 to 0.01 gr/dscf (depending primarily on the design parameters).

B. What Surrogates Did We Use for HAP?

1. PM for Metal HAP

Comment. One commenter contends that PM is not a valid surrogate for HAP metal compounds and that specific limits for individual metals should be established. In support, the commenter points to other rules where EPA has recognized that PM is not a valid surrogate for mercury, lead, and cadmium because of their volatility and that these emissions cannot necessarily be controlled merely by controlling PM emissions. Consequently, EPA cannot claim PM is a valid surrogate for metal HAP in the final rule or that setting standards for individual metals would ". . . achieve little, if any, HAP emission reduction beyond what would be achieved using the surrogate pollutant approach based on total PM." Because EPA has already recognized that PM is not an adequate surrogate for mercury, lead, and cadmium, EPA must set individual emission standards for such HAP.

Response. We disagree with the commenter and believe that PM is a valid surrogate for the HAP metal compounds emitted from integrated iron and steel sources. The rationale in the preamble for the hazardous waste combustors (HWC) rule is unique to that source category and does not apply to the metal HAP emissions and controls in the integrated iron and steel industry.

The preamble for the final HWC rule makes this point clearly:

> . . . However, for sources not burning hazardous waste and without a significant potential for extreme variability in metals feed rates, PM is an adequate surrogate for metal HAP (*e.g.*, for nonhazardous waste burning cement kilns).[1]

Hazardous waste combustors are unique and different from integrated iron and steel sources in several respects:

- They have significant levels of volatile and semi-volatile HAP metal compounds in the waste-derived fuels being burned,
- The feed rate of these metals can be highly variable, and
- The high temperatures in the combustion process can volatilize semi-volatile metals and form fine PM, which can be harder to control. In contrast, the raw materials used in iron and steel processes have relatively low levels of metal HAP, the level of metal HAP does not vary significantly as do the HAP metals in waste materials fed to HWC, and test data indicate that PM control devices effectively control the HAP metals from iron and steel processes.

A key parameter for the control of both semi-volatile and non-volatile metal compounds is the operating temperature of the air pollution control device that is applied. At temperatures of 200 to 400°F, the range typical of control devices applied to emissions from integrated iron and steel processes, any semi-volatile and non-volatile HAP metal compounds present would exist in the form of fine PM, and, therefore, will be controlled in direct relationship to PM.

Mercury is an exception because of its high volatility. However, we have no data that show any significant emissions of mercury from integrated iron and steel plants, and there is no reason to suspect its presence in any appreciable quantities in emissions from ironmaking and steelmaking. In the two sinter plant tests we conducted, we sampled and analyzed for mercury. The results showed only trace levels of mercury (7×10^{-7} to 2×10^{-6} gr/dscf). Thus, we believe that mercury emissions from integrated iron and steel sources are negligible and that the performance of these units with respect to any trace levels of mercury can not be measurably improved. Moreover, no iron and steel plants operate an emissions control system that would further reduce these trace amounts of mercury emissions, or otherwise take any steps that would reduce such emissions. Because no units currently reduce mercury emissions from the integrated iron and steel industry, the MACT floor for mercury (for both new and existing sources) would be no reduction in emissions. Because the mercury concentrations are already so low, no technically feasible control technologies can be identified that could reduce these trace levels of mercury emissions. Therefore, no mercury emissions standards are proposed for integrated iron and steel sources.

2. Oil Content for Organic HAP

Comment. Two commenters urged us to establish emission standards for specific organic HAP, including dioxin, in lieu of the oil content limit. One commenter contends that the proposed rule should contain emission limits for the many organic HAP emitted from iron and steel plants, including dioxin, polycyclic organic matter, benzene, and toluene. The proposed operating requirement for sinter plants is not an emission standard and does not satisfy CAA requirements. Furthermore, regulations pursuant to section 112 of the CAA must include emission standards for each HAP emitted from an affected source category. The commenter adds that EPA provided no data in support of the proposed approach for controlling dioxin emissions. This commenter believes the proposed rule effectively ignores organic HAP in contradiction of CAA requirements because vapor phase organics are not removed by the fabric filters or wet scrubbers.

Several commenters contend that EPA has not met its requirements to show a correlation between the surrogate to be controlled and the object of control. Two commenters state that EPA has not provided sufficient data to demonstrate a correlation. Eight other commenters do not believe that there is a correlation to dioxin emissions or that control of the oil and grease would reduce HAP organic emissions. In support, they claim data from one plant (Bethlehem Steel, Sparrows Point) show no VOC increase in windbox emissions as oil content increases.

Response. The only available data regarding organic HAP emissions from these units are from two tests we conducted. These tests are insufficient to generate a meaningful characterization of emission control levels that can be achieved under varying process conditions over time, and there is no way to use this emissions test data to identify the best-performing plants. Moreover, the add-on emission controls used by units in the category (baghouses and venturi scrubbers) do not control vapor phase organic compounds. As a result, we believe that the best way to assess current levels of VOC emission control, and to limit such emissions is to rely upon existing methods of pollution prevention. Accordingly, we have established limits on the amount of organic HAP precursor material (specifically oil and grease) that may be in the sinter feed, in order to control emissions of organic compounds. Additionally, section 112(d)(2) of the CAA specifically allows EPA to establish MACT standards based on emission controls that rely on pollution prevention techniques.

We have added information to the docket from a European study that shows dioxin emissions are related to oil content-emissions increase as the oil content increases. We have also added information from two U.S. sinter plants that show VOC emissions increase as oil content increases, and the VOC contains volatile HAP such as benzene. In fact, plants in Indiana control VOC emissions by limiting the amount of oil in the sinter feed. Because the two are related, Indiana allows monitoring oil content as an alternative to VOC monitoring. In the past, sinter plants with baghouses have voluntarily limited oil content because the organic compounds that were emitted tend to condense and blind the bags as well as pose a fire hazard. We believe these studies conclusively show that oil content correlates with organic emissions.

An emission limit for individual organic compounds is not practical because the emission controls that are used do not effectively control all organic HAP. Conventional control systems used for organics, such as incineration or carbon adsorption, would not be practicable because they are ineffective at the very low concentration (parts per million levels) in the windbox exhaust stream. On the other hand, a limit on oil content effectively limits emissions of organic HAP, and control of oil content is a proven emission control measure. Consequently, in this instance, we believe that a limit on oil content is the only feasible way to ensure that all plants achieve the MACT level of control for organic HAP from the sinter plant windbox exhaust.

C. Is a Risk Analysis Warranted?

Comment. Seven commenters urge EPA to perform a risk assessment under section 112(d)(4) of the CAA for manganese to determine if HAP controls are necessary. Manganese is a health threshold pollutant, and there is little likelihood of chronic or widespread

[1] See Footnote 40 in preamble to the final HWC rule (64 FR 52846, September 30, 1999).

exposure at concentrations above the threshold at iron and steel plants. The EPA conducted this analysis for the pulp and paper standards and decided not to regulate hydrogen chloride emissions. According to the commenters, risk-based standards under section 112(d)(4) would result in no standards, or less stringent and more cost effective standards.

Response. Section 112(d)(4) of the CAA provides EPA with authority, at its discretion, to develop risk-based standards for HAP ". . . for which a health threshold has been established," provided that the standard achieves an "ample margin of safety." Section 112(d)(4) says:

> [w]ith respect to pollutants for which a health threshold has been established, the Administrator may consider such threshold level, with an ample margin of safety, when establishing emission standards under this subsection.

As EPA has indicated in the past (*see* 63 FR 18754 and 67 FR 44713), we generally apply section 112(d)(4) of the CAA only to HAP that are not carcinogens because Congress clearly expected that carcinogens would be non-threshold pollutants. The legislative history further indicates that if EPA invokes this provision, it must assure that any emission standard results in ambient concentrations less than the health threshold, with an ample margin of safety, and that the standards must also be sufficient to protect against adverse environmental effects. (*See* S. Rep. No. 228, 101st Cong. at 171.) The EPA is not to consider cost in establishing a standard pursuant to section 112(d)(4).

Therefore, EPA believes it has the discretion under section 112(d)(4) of the CAA to develop risk-based standards for some categories emitting threshold pollutants, which may be less stringent than the corresponding floor-based MACT standard would be. Where EPA develops standards under this provision, we seek to ensure that emissions from every source in the category or subcategory are less than the threshold level to an individual exposed at the upper end of the exposure distribution. We believe that assuring protection to persons at the upper end of the exposure distribution is consistent with the ample margin of safety requirement in section 112(d)(4). (*See* 63 FR 18754 at 18768.)

However, the EPA emphasizes that use of section 112(d)(4) of the CAA authority is wholly discretionary. As the legislative history described above indicates, cases may arise in which other considerations dictate that the Agency should not invoke this authority to establish less stringent standards, despite the existence of a health effects threshold that is not jeopardized. For instance, EPA does not anticipate that it would set less stringent standards where evidence indicates a threat of significant or widespread environmental effects, although it may be shown that emissions from a particular source category do not approach or exceed a level requisite to protect public health with an ample margin of safety. The EPA may also elect not to set less stringent standards where the estimated health threshold for a contaminant is subject to large uncertainty. Thus, in considering appropriate uses of its discretionary authority under section 112(d)(4), EPA considers other factors in addition to health thresholds, including uncertainty and potential adverse environmental effects, as that phrase is defined in section 112(a)(7) of the CAA.

For several reasons, in this case, we have decided not to exercise our discretion to consider existing threshold levels for manganese in setting the emission standards for metal HAP compounds from integrated iron and steel facilities. This decision is appropriate because we have insufficient data about the nature and degree of public exposures to these emissions, including background exposure levels and other relevant factors, to meaningfully consider whether maximum exposures to manganese emissions from integrated iron and steel facilities would remain below the relevant threshold. In fact, it is clear that facilities in this source category emit significant quantities of manganese, totaling about 250 tpy. Because the commenters did not provide us with any of the detailed site-specific information that we would need to perform an adequate assessment of emissions and exposures, we have concluded that it would be inappropriate to consider the threshold nature of manganese in establishing MACT standards for the integrated iron and steel source category. Additionally, the commenters have supplied no information about the environmental impact of metal emissions from integrated iron and steel plants, and we have no data upon which we can rely for such an environmental assessment.

Moreover, even if we had access to more detailed data regarding emissions, exposures, and environmental impact, it is not clear whether consideration of the manganese health threshold would have any practical effect on the MACT standards established in today's final rule. In particular, emissions from integrated iron and steel plants include metal HAP besides manganese that are not threshold pollutants (including lead, nickel, and chromium compounds), and these pollutants are controlled using the same control technologies that reduce emissions of manganese. As with manganese, we have no data regarding maximum exposures or environmental impacts from such emissions at integrated iron and steel facilities, and we have no data specifically characterizing these metal emissions. These plants emit about 360 tpy of HAP metal compounds—including about 111 tpy of lead, nickel and chromium compounds. Certain lead, nickel and chromium compounds are listed as carcinogens and have no applicable human health threshold. For additional information, see our guidance document entitled "Guidance on the Major Source Determination for Certain Hazardous Air Pollutants" available on our Web site at *http://www.epa.gov//ttn/oarpg/t3/memoranda/agghapmem.pdf.*

Today's final rule controls all metal HAP emissions (including lead, nickel, and chromium) by using PM as a surrogate. Because we use PM as a surrogate, eliminating only one or some of the metal HAP from consideration would have little if any practical impact on the MACT standards. Consequently, we believe the MACT standards finalized today are appropriate and will reduce emissions of all HAP at integrated iron and steel plants to the levels currently being achieved by the best-performing facilities.

D. How Did We Revise the Emission Limitations?

1. Sinter Cooler Emissions

Comment. Seven commenters explain that some exhaust systems on the sinter plant discharge end are designed to capture emissions at the point where sinter is loaded onto the sinter cooler and portions of the sinter cooler itself. In situations where cooler emissions are exhausted in part or in whole to the discharge end control system, the commenters request that the cooler stack emissions standard of 0.03 gr/dscf (for existing facilities) apply to the discharge end baghouse.

Response. We disagree and have written the final rule to clarify that the limit of 0.02 gr/dscf for the discharge end applies even when other emissions are ducted to the control device. The most effective technology for controlling emissions from the discharge end is a baghouse, and a properly-designed and operated baghouse can achieve 0.02 gr/dscf on a continuing basis. An emission limit of 0.03 gr/dscf is too high to be representative of the MACT floor, and

does not reflect what is currently achieved by the five best-performing sources.

2. Sinter Plant Oil Content Requirement

Comment. Sinter plants in Maryland and Indiana already must comply with rules that regulate the oil and grease content for the sinter plant raw material blend. The rules limit VOC emissions to no more than 0.25 lb/ton of sinter (except Indiana allows 0.36 lb/ton during non-ozone season). Maryland requires VOC testing and Indiana provides the option of VOC testing or sampling for oil content. Seven commenters recommend VOC testing as an option in the final rule because most plants in these states already use them; some comments also suggest a 30-day rolling average for VOC.

Response. We reviewed data submitted by two plants that showed VOC emissions correlated with oil content. LTV Steel (now owned by International Steel Group) performed simultaneous testing of oil content and VOC emissions, correlated the results, and showed that an oil content of 0.024 percent was equivalent to the State VOC limit of 0.25 lb/ton of sinter. As a result, the State allowed them to use alternative monitoring procedures. Based on our review of the data, we believe that maintaining the VOC at a level of 0.2 lb/ton or lower will ensure that the operating limit of 0.02 percent oil is maintained. Consequently, we have written the final rule to include an alternative emission limitation for VOC of 0.2 lb/ton of sinter. A plant electing the alternative limit is required to measure VOC emissions (total gaseous nonmethane organics as carbon) in source emissions using EPA Method 25 in 40 CFR part 60, appendix A (or a previously approved method). As with the oil content, the VOC limit is based on a 30-day rolling average. The 30-day average provides additional flexibility because it allows an occasional high daily value to be averaged with lower values on other days to achieve compliance. We believe the 30-day average accounts for day-to-day variability and enhances the achievability of the limit.

3. ESP Operating Limit

Comment. For plants required to use COMS to monitor ESP, the proposed rule establishes an enforceable operating limit based on the opacity observed during the initial performance test. Eight commenters argue that COMS data should not be used for compliance determinations because of measurement uncertainties and unreliability. They point to the recognized limitation for measuring opacity below 10 percent and provide supporting data comparing COMS measurements in ESP stacks to EPA Method 9 data. Like the steel pickling MACT standard, COMS data should be used only to indicate if the ESP is operating properly and to institute corrective action as appropriate; subsequent EPA Method 9 observations may be appropriate in the event of a high number of measured excursions. These commenters also object to the operating limit for ESP equipped with COMS because EPA has not demonstrated a correlation between opacity and PM emissions from BOPF controlled by ESP to support using opacity as a surrogate for PM. A COMS opacity reading that is above that observed during a performance test does not necessarily indicate an exceedance because the high reading could have been caused by water vapor or another interference. The commenters believe EPA has not demonstrated that the tiny amount of data collected during the initial performance test would be representative of the opacity performance of ESP over the full range of foreseeable operating conditions. Thirty 6-minute averages taken over a 3-hour period will not adequately characterize the range of 87,600 6-minute averages generated over an entire year. Thus, EPA has not demonstrated that a limit set in this manner would be consistently achievable by well-operated and maintained equipment under the most adverse operating conditions over time.

Response. We believe that opacity is well established as a surrogate for PM. However, we understand the concerns of the commenters with respect to variability and have written the procedures in the final rule for determining the COMS operating limit to account for variability. The opacity operating limit is based on measurement of 6-minute averages during the performance test, and then calculating the 99 percent upper confidence limit on the mean of a normal distribution of the average opacity values. This statistical approach will account for normal variability and still provide assurance that the ESP is operating properly.

4. Operating Limits for Capture Systems

Comment. Nine commenters believe that an enforceable range of operating limits applicable under all operating conditions cannot be determined from the initial performance test for damper systems. Fixed damper positions for one set of operating conditions are not appropriate due to varying simultaneous operations, normal process variations, and seasonable variations. The final rule should allow sources to specify multiple operating scenarios or ranges of operation in the operation and maintenance plan and require plants to meet the values in the plan rather than those set in the initial performance test. Eight of these commenters also recommend that the final rule include an alternative allowing continuous monitoring of fan amperage, like the provisions included in the proposed standards for coke plants.

Response. We investigated this issue further, and based on the additional information we received, we agree that fixed damper settings are not practicable or desirable in many cases. For example, damper settings may need to be changed in the BOPF shop depending on the operations underway at the time, such as hot metal transfer, desulfurization, charging, oxygen blowing, and tapping. We have written the final rule to provide flexibility and have modeled it after the MACT standard for primary copper smelters. The owner or operator must specify in the operation and maintenance plan the damper settings that will be used under different operating scenarios and for seasonal variations. These damper settings must be checked once per day. We have also added fan amperage as an acceptable alternative, consistent with the MACT standards for coke ovens and for primary copper smelters.

E. How Did We Revise the Performance Test Requirements?

1. Overlapping Cycles

Comment. Some plants have the capability of overlapping cycles of two separate furnaces (*e.g.*, they may blow one furnace while another is being tapped). It appears that EPA's database is comprised of tests conducted on single furnaces. For this reason, seven commenters ask EPA to clarify that testing of primary emissions from BOPF is to be conducted during the steel production cycle of a single furnace. Other shop operations may be suspended during the testing. This approach is consistent with the manner in which the data were collected.

Response. We specify in the final rule exactly when owners or operators must test primary emissions from BOPF. For closed hood BOPF, plants must sample only during the primary oxygen blow. For open hood BOPF, plants must sample during the steel production cycle. We clarified that the steel production cycle begins when scrap is charged to the furnace and ends 3 minutes after the slag is emptied from the vessel. These requirements are

consistent with the way the emission test data were collected. We do not agree that testing should be performed under conditions that do not represent normal operations, such as suspending certain shop operations. The provisions in 40 CFR 63.7(e) apply and require that sampling be conducted under conditions that are based on representative performance (*i.e.*, performance based on normal operating conditions of the affected source).

2. Testing Multiple Stacks

Comment. Eight commenters believe it is impractical and burdensome to require simultaneous tests of multiple stacks or vents for a control device (*e.g.*, baghouse with eight modules, each with its own fan and stack). Successive testing of each stack or vent could be more manageable, but still has excessive costs. One commenter estimates 42 days of testing could be needed at one plant if each stack and vent must be tested. For these reasons, the proposed rule should be revised to allow for performance tests of a representative exhaust flow where control devices with multiple stacks are used.

Response. We agree and believe that because of the site-specific nature of this problem, decisions should be made on a case-by-case basis by the applicable permitting authority. We have written the final rule such that a source may conduct a representative sampling of stacks subject to the approval of the permitting authority when there are more than three stacks associated with a process.

F. How Did We Revise the Cost Estimates and Economic Impact Analysis?

Comment. Several commenters stated that we significantly underestimated the cost of the proposed rule. At proposal, we estimated a capital cost of $34 million. The commenters said that the total capital cost was in the range of $270 to $320 million. Their estimate includes the cost of controls for plants not included in EPA's estimate as well as higher estimates of the cost for controls and monitoring in general.

Response. Following proposal and the receipt of comments, we contacted facilities to discuss the details of their cost estimates. Some facilities provided the details and basis of their estimates, and we incorporated them into our revised estimates. Other plants did not provide details or documentation; consequently, we developed our best estimate of potential costs for these facilities. In addition, we collected opacity data for most of the operating plants. We used these data to identify plants that may need to install capture and control systems in the blast furnace casthouse or BOPF shop to meet the 20 percent opacity limit. Our revised capital cost estimate increased to $93 million.

Comment: Eight commenters urge EPA to update it's economic impact analysis to represent current economic conditions of the steel industry and the cumulative effect of all other pending environmental regulatory requirements facing the industry during the same time period.

Response: We agree with the commenters and have performed a revised economic impact analysis. The revised analysis attempts to account for the factors mentioned in the comment. At proposal, we estimated domestic production from integrated steel mills would decline by 3,100 tons, and operating profits were expected to decrease by $5.2 million annually. With our revised analysis, we estimate domestic production from integrated mills will decline by 73,000 tons, and operating profits will decrease by $13 million per year. A complete copy of the economic impact analysis is available in the docket.

IV. Summary of Environmental, Energy, and Economic Impacts

A. What Are the Air Emission Impacts?

The installation of new controls and upgrades will result in reductions in emissions of metal HAP and PM. We estimate that five new capture and control systems for the blast furnace casthouses will reduce these emissions by 90 percent, a reduction of 14 tpy of HAP and 2,100 tpy of PM. The new BOPF scrubbers at one plant and upgrades at two others will result in a 50 percent reduction in emissions, 5 tpy of HAP and 350 tpy of PM. Six new capture and control systems for fugitive emissions from BOPF shops will result in a 90 percent reduction in emissions, 48 tpy of HAP and 3,300 tpy of PM.

Most plants currently operate air pollution control equipment sufficient to meet the final rule requirements. We expect the standard to reduce metal HAP emissions from plants that will need to install or upgrade controls by 67 tpy and PM emissions by 5,800 tpy. Nationwide emissions of metal HAP and PM from integrated iron and steel plants will be reduced by nearly 20 percent from current levels.

B. What Are the Cost Impacts?

The nationwide capital and annual costs of new and upgraded capture and control systems are estimated at $93 million and $15 million/yr, respectively. The total nationwide annual costs (including monitoring and recordkeeping) are about $16 million/yr. These costs are based on a new primary control system (high-pressure drop venturi scrubbers) for one BOPF shop, upgraded primary controls at two others, six new capture and control systems for fugitive BOPF emissions, and five new capture and control systems for blast furnace casthouses. In addition, the estimate includes a capital cost of $0.9 million and a total annual cost of $1 million for monitoring, reporting, and recordkeeping.

C. What Are the Economic Impacts?

We conducted a detailed economic impact analysis to determine the impacts of the final rule on both the industry and the U.S. market for steel mill products. We estimate the economic impacts in both areas to be negligible. We project the price of steel mill products, in aggregate, to increase by less than 0.1 percent with domestic production from integrated mills declining by 73,100 short tons. This decline in production at affected integrated mills is somewhat offset by increases at nonintegrated domestic steel producers (15,800 short tons) and foreign imports (49,500 short tons). In terms of industry impacts, the integrated steel producers are projected to experience a slight decrease in operating profits of $13 million annually, which reflects increased costs of compliance and associated reductions in revenues from producing final steel mill products. In addition, we don't foresee any individual integrated facility being in jeopardy of closure as a result of implementing the rule.

Based on the market analysis, the annual costs to society of today's final rule are projected to be $15.4 million. As a result of slightly higher prices for steel mill products, the final consumers of these products will incur an additional $6.2 million annually. Profits at integrated steel mills are expected to decline by $13 million annually because of directly incurred control costs and reduced product revenues, while nonintegrated steel mills that compete in these markets and are unaffected by today's rule will experience an increase in profits of $2.2 million. Similarly, foreign steel producers will also experience an increase in profits of $1.7 million due to the slightly higher prices and increases in imports to the U.S. market. For more information, consult the economic impact analysis supporting the proposed rule.

D. What Are the Non-Air Health, Environmental, and Energy Impacts?

Implementation of the rule will result in a small increase in solid waste-3,200 tpy of sludge and 5,500 tpy of dust. The energy increase is estimated at 24,000 megawatt-hours per year, primarily due to the energy requirements of new venturi scrubbers.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must determine whether the regulatory action is "significant" and, therefore, subject to review by the Office of Management and Budget (OMB) and the requirements of the Executive Order. The Executive Order defines a "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that the final rule is not a "significant regulatory action" under the terms of Executive Order 12866, and is, therefore, not subject to OMB review.

B. Paperwork Reduction Act

The information collection requirements in the final rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* An information collection request (ICR) document has been prepared by EPA (ICR No. 2003.02), and a copy may be obtained from Susan Auby by mail at U.S. EPA, Office of Environmental Information, Collection Strategies Division (2822T), 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy also may be downloaded off the Internet at *http://www.epa.gov/icr*. The information requirements are not enforceable until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to NESHAP. These recordkeeping and reporting requirements are specifically authorized by section 112 of the CAA (42 U.S.C. 7414). All information submitted to the EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies in 40 CFR part 2, subpart B.

The final rule requires applicable one-time notifications required by the General Provisions for each affected source. As required by the NESHAP General Provisions, all plants must prepare and operate by a startup, shutdown, and malfunction plan. Plants also are required to prepare an operation and maintenance plan for capture systems and control devices subject to operating limits. Records are required to demonstrate continuous compliance with the monitoring, operation, and maintenance requirements for capture systems, control devices, and monitoring systems. Semiannual compliance reports also are required. These reports must describe any deviation from the standards, any period a continuous monitoring system was out-of-control, or any startup, shutdown, or malfunction event where actions taken to respond were inconsistent with startup, shutdown, and malfunction plan. If no deviation or other event occurred, only a summary report is required. Consistent with the General Provisions, if actions taken in response to a startup, shutdown, or malfunction event are not consistent with the plan, an immediate report must be submitted within 2 days of the event with a letter report 7 days later.

The annual public reporting and recordkeeping burden for this collection of information averaged over the first 3 years after May 20, 2003 is estimated to total 4,772 labor hours per year at a total annual cost of $347,115, including labor, capital, and operation and maintenance. Total capital costs associated with the monitoring equipment is estimated at $885,000. The total annualized cost of the monitoring equipment is estimated at $126,000. This estimate includes the capital, operating, and maintenance costs associated with the installation and operation of the monitoring equipment.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to respond to a collection of information; search existing data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule. The EPA has also determined that the final rule will not have a significant economic impact on a substantial number of small entities. For purposes of assessing the impacts of today's final rule on small entities, small entity is defined as: (1) A small business according to the U.S. Small Business Administration (SBA) size standards for NAICS code 33111 (Iron and Steel Mills) of 1,000 or fewer employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. Based on the SBA size category for this source category, no small businesses are subject to the final rule and its requirements.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Pub. L. 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, the EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may

result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires the EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least-burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least-costly, most cost-effective, or least-burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before the EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

Today's final rule contains no Federal mandate (under the regulatory provisions of the UMRA) for State, local, or tribal governments. The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector of $100 million or more in any one year. Thus, the final rule is not subject to the requirements of sections 202 and 205 of the UMRA. The EPA has also determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments. Thus, today's final rule is not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" is defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments. Thus, Executive Order 13132 does not apply to the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 9, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications."

The final rule does not have tribal implications, as specified in Executive Order 13175. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. No tribal governments own facilities subject to the NESHAP. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health & Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant," as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045 because it is based on control technology and not on health or safety risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113; 15 U.S.C. 272 note) directs the EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs EPA to provide Congress, through annual reports to OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

The final rule involves technical standards. Therefore, the EPA conducted a search to identify potentially applicable voluntary consensus standards. However, we identified no such standards as alternatives to EPA Methods 2F, 2G, 5D, 9 and OSW 846 Method 9071B, and none were brought to our attention in comments.

The Agency identified ASTM D4536–96, "Test Method for High Volume Sampling for Solid Particulate Matter and Determination of Particle Emissions," as being potentially applicable and proposed it as an alternative to Method 5 or 17 for testing positive pressure fabric filters. However, this standard has been replaced by ASTM D6331–98, "Standard Test Method for Determination of Mass Concentration of Particulate Matter from Stationary Sources at Low Concentrations (Manual Gravimetric Method)." We have decided not to use ASTM D6331 in the final rule. The use of this voluntary consensus standard would be impractical or inconsistent with applicable law because it is not similar enough to replace ASTM D4536–96.

The search for emissions measurement procedures identified 16 other voluntary consensus standards. The EPA has not adopted these standards as alternatives in the final rule because they are impractical or still under development. Our search and review results are available in the docket.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the final rule in the **Federal Register**. The final rule is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Incorporation by reference, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 2. Section 63.14 is amended by adding a new paragraph (k) to read as follows:

§ 63.14 Incorporation by reference.

* * * * *

(k) The following material may be obtained from U.S. EPA, Office of Solid Waste (5305W), 1200 Pennsylvania Avenue, NW., Washington, DC 20460:

(1) Method 9071B, "n-Hexane Extractable Material(HEM) for Sludge, Sediment, and Solid Samples," (Revision 2, April 1998) as published in EPA Publication SW–846: "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods." The incorporation by reference of Method 9071B is approved for Section 63.7824(e) of Subpart FFFFF of this part.

■ 3. Part 63 is amended by adding subpart FFFFF to read as follows:

Subpart FFFFF—National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities

Sec.

What This Subpart Covers

63.7780 What is the purpose of this subpart?
63.7781 Am I subject to this subpart?
63.7782 What parts of my plant does this subpart cover?
63.7783 When do I have to comply with this subpart?

Emission Limitations

63.7790 What emission limitations must I meet?

Operation and Maintenance Requirements

63.7800 What are my operation and maintenance requirements?

General Compliance Requirements

63.7810 What are my general requirements for complying with this subpart?

Initial Compliance Requirements

63.7820 By what date must I conduct performance tests or other initial compliance demonstrations?
63.7821 When must I conduct subsequent performance tests?
63.7822 What test methods and other procedures must I use to demonstrate initial compliance with the emission limits for particulate matter?
63.7823 What test methods and other procedures must I use to demonstrate initial compliance with the opacity limits?
63.7824 What test methods and other procedures must I use to establish and demonstrate initial compliance with the operating limits?
63.7825 How do I demonstrate initial compliance with the emission limitations that apply to me?
63.7826 How do I demonstrate initial compliance with the operation and maintenance requirements that apply to me?

Continuous Compliance Requirements

63.7830 What are my monitoring requirements?
63.7831 What are the installation, operation, and maintenance requirements for my monitors?
63.7832 How do I monitor and collect data to demonstrate continuous compliance?
63.7833 How do I demonstrate continuous compliance with the emission limitations that apply to me?
63.7834 How do I demonstrate continuous compliance with the operation and maintenance requirements that apply to me?
63.7835 What other requirements must I meet to demonstrate continuous compliance?

Notifications, Reports, and Records

63.7840 What notifications must I submit and when?
63.7841 What reports must I submit and when?
63.7842 What records must I keep?
63.7843 In what form and how long must I keep my records?

Other Requirements and Information

63.7850 What parts of the General Provisions apply to me?
63.7851 Who implements and enforces this subpart?
63.7852 What definitions apply to this subpart?

Tables to Subpart FFFFF of Part 63

Table 1 to Subpart FFFFF of Part 63—Emission and Opacity Limits
Table 2 to Subpart FFFFF of Part 63—Initial Compliance with Emission and Opacity Limits
Table 3 to Subpart FFFFF of Part 63—Continuous Compliance with Emission and Opacity Limits
Table 4 to Subpart FFFFF of Part 63—Applicability of General Provisions to Subpart FFFFF

Subpart FFFFF—National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities

What This Subpart Covers

§ 63.7780 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for integrated iron and steel manufacturing facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with all applicable emission limitations and operation and maintenance requirements in this subpart.

§ 63.7781 Am I subject to this subpart?

You are subject to this subpart if you own or operate an integrated iron and steel manufacturing facility that is (or is part of) a major source of hazardous air pollutants (HAP) emissions. Your integrated iron and steel manufacturing facility is a major source of HAP if it emits or has the potential to emit any single HAP at a rate of 10 tons or more per year or any combination of HAP at a rate of 25 tons or more per year.

§ 63.7782 What parts of my plant does this subpart cover?

(a) This subpart applies to each new and existing affected source at your integrated iron and steel manufacturing facility.

(b) The affected sources are each new or existing sinter plant, blast furnace, and basic oxygen process furnace (BOPF) shop at your integrated iron and steel manufacturing facility.

(c) This subpart covers emissions from the sinter plant windbox exhaust, discharge end, and sinter cooler; the blast furnace casthouse; and the BOPF shop including each individual BOPF and shop ancillary operations (hot metal transfer, hot metal desulfurization, slag skimming, and ladle metallurgy).

(d) A sinter plant, blast furnace, or BOPF shop at your integrated iron and steel manufacturing facility is existing if you commenced construction or reconstruction of the affected source before July 13, 2001.

(e) A sinter plant, blast furnace, or BOPF shop at your integrated iron and steel manufacturing facility is new if you commence construction or reconstruction of the affected source on or after July 13, 2001. An affected source is reconstructed if it meets the definition of reconstruction in § 63.2.

§ 63.7783 When do I have to comply with this subpart?

(a) If you have an existing affected source, you must comply with each emission limitation and operation and maintenance requirement in this subpart that applies to you no later than May 22, 2006.

(b) If you have a new affected source and its initial startup date is on or before May 20, 2003, then you must comply with each emission limitation and operation and maintenance requirement in this subpart that applies to you by May 20, 2003.

(c) If you have a new affected source and its initial startup date is after May 20, 2003, you must comply with each emission limitation and operation and maintenance requirement in this subpart that applies to you upon initial startup.

(d) If your integrated iron and steel manufacturing facility is not a major source and becomes a major source of HAP, the following compliance dates apply to you.

(1) Any portion of the existing integrated iron and steel manufacturing facility that becomes a new affected source or a new reconstructed source must be in compliance with this subpart upon startup.

(2) All other parts of the integrated iron and steel manufacturing facility must be in compliance with this subpart no later than 2 years after it becomes a major source.

(e) You must meet the notification and schedule requirements in § 63.7840. Several of these notifications must be submitted before the compliance date for your affected source.

Emission Limitations

§ 63.7790 What emission limitations must I meet?

(a) You must meet each emission limit and opacity limit in Table 1 to this subpart that applies to you.

(b) You must meet each operating limit for capture systems and control devices in paragraphs (b)(1) through (3) of this section that applies to you.

(1) You must operate each capture system applied to emissions from a sinter plant discharge end or blast furnace casthouse or to secondary emissions from a BOPF at or above the lowest value or settings established for the operating limits in your operation and maintenance plan;

(2) For each venturi scrubber applied to meet any particulate emission limit in Table 1 to this subpart, you must maintain the hourly average pressure drop and scrubber water flow rate at or above the minimum levels established during the initial performance test.

(3) For each electrostatic precipitator applied to emissions from a BOPF, you must maintain the average opacity of emissions for each 6-minute period at or below the site-specific opacity value corresponding to the 99 percent upper confidence limit on the mean of a normal distribution of average opacity values established during the initial performance test.

(c) An owner or operator who uses an air pollution control device other than a baghouse, venturi scrubber, or electrostatic precipitator must submit a description of the device; test results collected in accordance with § 63.7822 verifying the performance of the device for reducing emissions of particulate matter to the atmosphere to the levels required by this subpart; a copy of the operation and maintenance plan required in § 63.7800(b); and appropriate operating parameters that will be monitored to maintain continuous compliance with the applicable emission limitation(s). The monitoring plan identifying the operating parameters to be monitored is subject to approval by the Administrator.

(d) For each sinter plant, you must either:

(1) Maintain the 30-day rolling average oil content of the feedstock at or below 0.02 percent; or

(2) Maintain the 30-day rolling average of volatile organic compound emissions from the windbox exhaust stream at or below 0.2 lb/ton of sinter.

Operation and Maintenance Requirements

§ 63.7800 What are my operation and maintenance requirements?

(a) As required by § 63.6(e)(1)(i), you must always operate and maintain your affected source, including air pollution control and monitoring equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by this subpart.

(b) You must prepare and operate at all times according to a written operation and maintenance plan for each capture system or control device subject to an operating limit in § 63.7790(b). Each plan must address the elements in paragraphs (b)(1) through (5) of this section.

(1) Monthly inspections of the equipment that is important to the performance of the total capture system (*e.g.*, pressure sensors, dampers, and damper switches). This inspection must include observations of the physical appearance of the equipment (*e.g.*, presence of holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in the ductwork, and fan erosion). The operation and maintenance plan also must include requirements to repair any defect or deficiency in the capture system before the next scheduled inspection.

(2) Preventative maintenance for each control device, including a preventative maintenance schedule that is consistent with the manufacturer's instructions for routine and long-term maintenance.

(3) Operating limits for each capture system applied to emissions from a sinter plant discharge end or blast furnace casthouse, or to secondary emissions from a BOPF. You must establish the operating limits according to the requirements in paragraphs (b)(3)(i) through (iii) of this section.

(i) Select operating limit parameters appropriate for the capture system design that are representative and reliable indicators of the performance of the capture system. At a minimum, you must use appropriate operating limit parameters that indicate the level of the ventilation draft and the damper position settings for the capture system when operating to collect emissions, including revised settings for seasonal variations. Appropriate operating limit parameters for ventilation draft include, but are not limited to, volumetric flow rate through each separately ducted hood, total volumetric flow rate at the inlet to the control device to which the capture system is vented, fan motor amperage, or static pressure.

(ii) For each operating limit parameter selected in paragraph (b)(3)(i) of this section, designate the value or setting for the parameter at which the capture system operates during the process operation. If your operation allows for more than one process to be operating simultaneously, designate the value or setting for the parameter at which the capture system operates during each possible configuration that you may operate.

(iii) Include documentation in your plan to support your selection of the operating limits established for the capture system. This documentation must include a description of the capture system design, a description of the capture system operating during production, a description of each selected operating limit parameter, a rationale for why you chose the parameter, a description of the method used to monitor the parameter according to the requirements of § 63.7830(a), and the data used to set the value or setting for the parameter for each of your process configurations.

(4) Corrective action procedures for bag leak detection systems. In the event a bag leak detection system alarm is triggered, you must initiate corrective action to determine the cause of the alarm within 1 hour of the alarm, initiate corrective action to correct the cause of the problem within 24 hours of the alarm, and complete the corrective action as soon as practicable. Corrective actions may include, but are not limited to:

(i) Inspecting the baghouse for air leaks, torn or broken bags or filter media, or any other condition that may cause an increase in emissions.

(ii) Sealing off defective bags or filter media.

(iii) Replacing defective bags or filter media or otherwise repairing the control device.

(iv) Sealing off a defective baghouse compartment.

(v) Cleaning the bag leak detection system probe, or otherwise repair the bag leak detection system.

(vi) Shutting down the process producing the particulate emissions; and

(5) Procedures for determining and recording the daily sinter plant production rate in tons per hour.

General Compliance Requirements

§ 63.7810 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations and operation and maintenance requirements in this subpart at all times, except during periods of startup, shutdown, and malfunction as defined in § 63.2.

(b) During the period between the compliance date specified for your affected source in § 63.7783 and the date upon which continuous monitoring systems have been installed and certified and any applicable operating limits have been set, you must maintain a log detailing the operation and maintenance of the process and emissions control equipment.

(c) You must develop and implement a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3).

Initial Compliance Requirements

§ 63.7820 By what date must I conduct performance tests or other initial compliance demonstrations?

(a) You must conduct a performance test to demonstrate initial compliance with each emission and opacity limit in Table 1 to this subpart that applies to you. You must also conduct a performance test to demonstrate initial compliance with the 30-day rolling average operating limit for the oil content of the sinter plant feedstock in § 63.7790(d)(1) or alternative limit for volatile organic compound emissions from the sinter plant windbox exhaust stream in § 63.7790(d)(2). You must conduct the performance tests within 180 calendar days after the compliance date that is specified in § 63.7783 for your affected source and report the results in your notification of compliance status.

(b) For each operation and maintenance requirement that applies to you where initial compliance is not demonstrated using a performance test or opacity observation, you must demonstrate initial compliance within 30 calendar days after the compliance date that is specified for your affected source in § 63.7783.

(c) If you commenced construction or reconstruction between July 13, 2001 and May 20, 2003, you must demonstrate initial compliance with either the proposed emission limit or the promulgated emission limit no later than November 17, 2003 or no later than 180 days after startup of the source, whichever is later, according to § 63.7(a)(2)(ix).

(d) If you commenced construction or reconstruction between July 13, 2001 and May 20, 2003, and you chose to comply with the proposed emission limit when demonstrating initial compliance, you must conduct a second performance test to demonstrate compliance with the promulgated emission limit by November 17, 2006, or no later than 180 days after startup of the source, whichever is later, according to § 63.7(a)(2)(ix).

§ 63.7821 When must I conduct subsequent performance tests?

You must conduct subsequent performance tests to demonstrate compliance with all applicable PM and opacity limits in Table 1 to this subpart no less frequently than twice (at mid-term and renewal) during each term of your title V operating permit. For sources without a title V operating permit, you must conduct subsequent performance tests every 2.5 years.

§ 63.7822 What test methods and other procedures must I use to demonstrate initial compliance with the emission limits for particulate matter?

(a) You must conduct each performance test that applies to your affected source according to the requirements in § 63.7(e)(1) and the conditions detailed in paragraphs (b) through (i) of this section.

(b) To determine compliance with the applicable emission limit for particulate matter in Table 1 to this subpart, follow the test methods and procedures in paragraphs (b)(1) and (2) of this section.

(1) Determine the concentration of particulate matter according to the following test methods in appendix A to part 60 of this chapter:

(i) Method 1 to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

(ii) Method 2, 2F, or 2G to determine the volumetric flow rate of the stack gas.

(iii) Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.

(iv) Method 4 to determine the moisture content of the stack gas.

(v) Method 5, 5D, or 17, as applicable, to determine the concentration of particulate matter (front half filterable catch only).

(2) Collect a minimum sample volume of 60 dry standard cubic feet (dscf) of gas during each particulate matter test run. Three valid test runs are needed to comprise a performance test.

(c) For each sinter plant windbox exhaust stream, you must complete the requirements of paragraphs (c)(1) and (2) of this section:

(1) Follow the procedures in your operation and maintenance plan for measuring and recording the sinter production rate for each test run in tons per hour; and

(2) Compute the process-weighted mass emissions (E_p) for each test run using Equation 1 of this section as follows:

$$E_p = \frac{C \times Q}{P \times K} \qquad \text{(Eq. 1)}$$

Where:

E_p = Process-weighted mass emissions of particulate matter, lb/ton;
C = Concentration of particulate matter, grains per dry standard cubic foot (gr/dscf);
Q = Volumetric flow rate of stack gas, dry standard cubic foot per hour (dscf/hr);
P = Production rate of sinter during the test run, tons/hr; and
K = Conversion factor, 7,000 grains per pound (gr/lb).

(d) If you apply two or more control devices in parallel to emissions from a sinter plant discharge end or a BOPF, compute the average flow-weighted concentration for each test run using Equation 2 of this section as follows:

$$C_W = \frac{\sum_{i=1}^{n} C_i Q_i}{\sum_{i=1}^{n} Q_i} \qquad \text{(Eq. 2)}$$

Where:

C_w = Flow-weighted concentration, gr/dscf;
C_i = Concentration of particulate matter from exhaust stream "i", gr/dscf; and
Q_i = Volumetric flow rate of effluent gas from exhaust stream "i", dry standard cubic foot per minute (dscfm).

(e) For a control device applied to emissions from a blast furnace casthouse, sample for an integral number of furnace tapping operations sufficient to obtain at least 1 hour of sampling for each test run.

(f) For a primary emission control device applied to emissions from a BOPF with a closed hood system, sample only during the primary oxygen blow and do not sample during any subsequent reblows. Continue sampling for each run for an integral number of primary oxygen blows.

(g) For a primary emission control system applied to emissions from a BOPF with an open hood system and for a control device applied solely to secondary emissions from a BOPF, you must complete the requirements of paragraphs (g)(1) and (2) of this section:

(1) Sample only during the steel production cycle. Conduct sampling under conditions that are representative of normal operation. Record the start and end time of each steel production cycle and each period of abnormal operation; and

(2) Sample for an integral number of steel production cycles. The steel production cycle begins when the scrap is charged to the furnace and ends 3 minutes after the slag is emptied from the vessel into the slag pot.

(h) For a control device applied to emissions from BOPF shop ancillary operations (hot metal transfer, skimming, desulfurization, or ladle metallurgy), sample only when the operation(s) is being conducted.

(i) Subject to approval by the permitting authority, you may conduct representative sampling of stacks when there are more than three stacks associated with a process.

§ 63.7823 What test methods and other procedures must I use to demonstrate initial compliance with the opacity limits?

(a) You must conduct each performance test that applies to your affected source according to the requirements in § 63.7(h)(5) and the conditions detailed in paragraphs (b) through (d) of this section.

(b) You must conduct each visible emissions performance test such that the opacity observations overlap with the performance test for particulate matter.

(c) To determine compliance with the applicable opacity limit in Table 1 to this subpart for a sinter plant discharge end or a blast furnace casthouse:

(1) Using a certified observer, determine the opacity of emissions according to Method 9 in appendix A to part 60 of this chapter.

(2) Obtain a minimum of 30 6-minute block averages. For a blast furnace casthouse, make observations during tapping of the furnace. Tapping begins when the furnace is opened, usually by creating a hole near the bottom of the furnace, and ends when the hole is plugged.

(d) To determine compliance with the applicable opacity limit in Table 1 to this subpart for BOPF shops:

(1) For an existing BOPF shop:

(i) Using a certified observer, determine the opacity of emissions according to Method 9 in appendix A to part 60 of this chapter except as specified in paragraphs (d)(1)(ii) and (iii) of this section.

(ii) Instead of procedures in section 2.4 of Method 9 in appendix A to part 60 of this chapter, record observations to the nearest 5 percent at 15-second intervals for at least three steel production cycles.

(iii) Instead of procedures in section 2.5 of Method 9 in appendix A to part 60 of this chapter, determine the 3-minute block average opacity from the average of 12 consecutive observations recorded at 15-second intervals.

(2) For a new BOPF shop housing a bottom-blown BOPF:

(i) Using a certified observer, determine the opacity of emissions according to Method 9 in appendix A to part 60 of this chapter.

(ii) Determine the highest and second highest sets of 6-minute block average opacities for each steel production cycle.

(3) For a new BOPF shop housing a top-blown BOPF:

(i) Determine the opacity of emissions according to the requirements for an existing BOPF shop in paragraphs (d)(1)(i) through (iii) of this section.

(ii) Determine the highest and second highest sets of 3-minute block average opacities for each steel production cycle.

(4) Opacity observations must cover the entire steel production cycle and must be made for at least three cycles. The steel production cycle begins when the scrap is charged to the furnace and ends 3 minutes after the slag is emptied from the vessel into the slag pot.

(5) Determine and record the starting and stopping times of the steel production cycle.

§ 63.7824 What test methods and other procedures must I use to establish and demonstrate initial compliance with operating limits?

(a) For each capture system subject to an operating limit in § 63.7790(b)(1), you must certify that the system operated during the performance test at the site-specific operating limits established in your operation and maintenance plan using the procedures in paragraphs (a)(1) through (4) of this section.

(1) Concurrent with all opacity observations, measure and record values for each of the operating limit parameters in your capture system operation and maintenance plan according to the monitoring requirements specified in § 63.7830(a).

(2) For any dampers that are manually set and remain at the same position at all times the capture system is operating, the damper position must be visually checked and recorded at the beginning and end of each opacity observation period segment.

(3) Review and record the monitoring data. Identify and explain any times the capture system operated outside the applicable operating limits.

(4) Certify in your performance test report that during all observation period segments, the capture system was operating at the values or settings established in your capture system operation and maintenance plan.

(b) For a venturi scrubber subject to operating limits for pressure drop and scrubber water flow rate in

§ 63.7790(b)(2), you must establish site-specific operating limits according to the procedures in paragraphs (b)(1) and (2) of this section.

(1) Using the continuous parameter monitoring system (CPMS) required in § 63.7830(c), measure and record the pressure drop and scrubber water flow rate during each run of the particulate matter performance test.

(2) Compute and record the hourly average pressure drop and scrubber water flow rate for each individual test run. Your operating limits are the lowest average pressure drop and scrubber water flow rate value in any of the three runs that meet the applicable emission limit.

(c) For an electrostatic precipitator subject to the operating limit in § 63.7790(b)(3) for opacity, you must establish a site-specific operating limit according to the procedures in paragraphs (c)(1) through (3) of this section.

(1) Using the continuous opacity monitoring system (COMS) required in § 63.7830(d), measure and record the opacity of emissions from each control device stack during each run of the particulate matter performance test.

(2) Compute and record the 6-minute block average opacity from 36 or more data points equally spaced over each 6-minute period during the test runs.

(3) Determine, based on the 6-minute block averages, the opacity value corresponding to the 99 percent upper confidence limit on the mean of a normal distribution of average opacity values.

(d) You may change the operating limits for a capture system, venturi scrubber, or electrostatic precipitator if you meet the requirements in paragraphs (d)(1) through (3) of this section.

(1) Submit a written notification to the Administrator of your request to conduct a new performance test to revise the operating limit.

(2) Conduct a performance test to demonstrate compliance with the applicable emission limitation in Table 1 to this subpart.

(3) Establish revised operating limits according to the applicable procedures in paragraphs (a) through (c) of this section for a control device or capture system.

(e) For each sinter plant subject to the operating limit for the oil content of the sinter plant feedstock in § 63.7790(d)(1), you must demonstrate initial compliance according to the procedures in paragraphs (e)(1) through (3) of this section.

(1) Sample the feedstock at least three times a day (once every 8 hours), composite the three samples each day, and analyze the composited samples using Method 9071B, "n-Hexane Extractable Material(HEM) for Sludge, Sediment, and Solid Samples," (Revision 2, April 1998). Method 9071B is incorporated by reference (see § 63.14) and is published in EPA Publication SW–846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods." Record the sampling date and time, oil content values, and sinter produced (tons/day).

(2) Continue the sampling and analysis procedure for 30 consecutive days.

(3) Each day, compute and record the 30-day rolling average using that day's value and the 29 previous daily values.

(f) To demonstrate initial compliance with the alternative operating limit for volatile organic compound emissions from the sinter plant windbox exhaust stream in § 63.7790(d)(2), follow the test methods and procedures in paragraphs (f)(1) through (5) of this section.

(1) Determine the volatile organic compound emissions according to the following test methods in appendix A to part 60 of this chapter:

(i) Method 1 to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

(ii) Method 2, 2F, or 2G to determine the volumetric flow rate of the stack gas.

(iii) Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.

(iv) Method 4 to determine the moisture content of the stack gas.

(v) Method 25 to determine the mass concentration of volatile organic compound emissions (total gaseous nonmethane organics as carbon) from the sinter plant windbox exhaust stream stack.

(2) Determine volatile organic compound (VOC) emissions every 24 hours (from at least three samples taken at 8-hour intervals) using Method 25 in 40 CFR part 60, appendix A. Record the sampling date and time, sampling results, and sinter produced (tons/day).

(3) Compute the process-weighted mass emissions (E_v) each day using Equation 1 of this section as follows:

$$E_v = \frac{M_C \times Q}{35.31 \times 454{,}000 \times K} \quad \text{(Eq. 1)}$$

Where:

E_v = Process-weighted mass emissions of volatile organic compounds, lb/ton;

M_c = Average concentration of total gaseous nonmethane organics as carbon by Method 25 (40 CFR part 60, appendix A), milligrams per dry standard cubic meters (mg/dscm) for each day;

Q = Volumetric flow rate of stack gas, dscf/hr;

35.31 = Conversion factor (dscf/dscm);

454,000 = Conversion factor (mg/lb); and

K = Daily production rate of sinter, tons/hr.

(4) Continue the sampling and analysis procedure in paragraphs (f)(1) through (3) of this section for 30 consecutive days.

(5) Compute and record the 30-day rolling average of VOC emissions for each operating day.

(g) You may use an alternative test method to determine the oil content of the sinter plant feedstock or the volatile organic compound emissions from the sinter plant windbox exhaust stack if you have already demonstrated the equivalency of the alternative method for a specific plant and have received previous approval from the applicable permitting authority.

§ 63.7825 How do I demonstrate initial compliance with the emission limitations that apply to me?

(a) For each affected source subject to an emission or opacity limit in Table 1 to this subpart, you have demonstrated initial compliance if:

(1) You meet the conditions in Table 2 to this subpart; and

(2) For each capture system subject to the operating limit in § 63.7790(b)(1), you have established appropriate site-specific operating limit(s) and have a record of the operating parameter data measured during the performance test in accordance with § 63.7824(a)(1).

(3) For each venturi scrubber subject to the operating limits for pressure drop and scrubber water flow rate in § 63.7790(b)(2), you have established appropriate site-specific operating limits and have a record of the pressure drop and scrubber water flow rate measured during the performance test in accordance with § 63.7824(b); and

(4) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3), you have established an appropriate site-specific operating limit and have a record of the opacity measurements made during the performance test in accordance with § 63.7824(c).

(b) For each existing or new sinter plant subject to the operating limit in § 63.7790(d)(1), you have demonstrated initial compliance if the 30-day rolling average of the oil content of the feedstock, measured during the initial performance test in accordance with § 63.7824(e) is no more than 0.02

percent or the volatile organic compound emissions from the sinter plant windbox exhaust stream, measured during the initial performance test in accordance with § 63.7824(f), is no more than 0.2 lb/ton of sinter produced.

(c) For each emission limitation that applies to you, you must submit a notification of compliance status according to § 63.7840(e).

§ 63.7826 How do I demonstrate initial compliance with the operation and maintenance requirements that apply to me?

(a) For a capture system applied to emissions from a sinter plant discharge end or blast furnace casthouse or to secondary emissions from a BOPF, you have demonstrated initial compliance if you meet all of the conditions in paragraphs (a)(1) through (4) of this section.

(1) Prepared the capture system operation and maintenance plan according to the requirements of § 63.7800(b), including monthly inspection procedures and detailed descriptions of the operating parameter(s) selected to monitor the capture system;

(2) Certified in your performance test report that the system operated during the test at the operating limits established in your operation and maintenance plan;

(3) Submitted a notification of compliance status according to the requirements in § 63.7840(e), including a copy of the capture system operation and maintenance plan and your certification that you will operate the capture system at the values or settings established for the operating limits in that plan; and

(4) Prepared a site-specific monitoring plan according to the requirements in § 63.7831(a).

(b) For each control device subject to operating limits in § 63.7790(b)(2) or (3), you have demonstrated initial compliance if you meet all the conditions in paragraphs (b)(1) through (3) of this section.

(1) Prepared the control device operation and maintenance plan according to the requirements of § 63.7800(b), including a preventative maintenance schedule and, if applicable, detailed descriptions of the procedures you use for corrective action for baghouses;

(2) Submitted a notification of compliance status according to the requirements in § 63.7840(e), including a copy of the operation and maintenance plan; and

(3) Prepared a site-specific monitoring plan according to the requirements in § 63.7831(a).

Continuous Compliance Requirements

§ 63.7830 What are my monitoring requirements?

(a) For each capture system subject to an operating limit in § 63.7790(b)(1) established in your capture system operation and maintenance plan, you must install, operate, and maintain a CPMS according to the requirements in § 63.7831(e) and the requirements in paragraphs (a)(1) through (3) of this section.

(1) Dampers that are manually set and remain in the same position are exempt from the requirement to install and operate a CPMS. If dampers are not manually set and remain in the same position, you must make a visual check at least once every 24 hours to verify that each damper for the capture system is in the same position as during the initial performance test.

(2) If you use a flow measurement device to monitor the operating limit parameter for a sinter plant discharge end or blast furnace casthouse, you must monitor the hourly average rate (*e.g.*, the hourly average actual volumetric flow rate through each separately ducted hood, the average hourly total volumetric flow rate at the inlet to the control device) according to the requirements in § 63.7832.

(3) If you use a flow measurement device to monitor the operating limit parameter for a capture system applied to secondary emissions from a BOPF, you must monitor the average rate for each steel production cycle (*e.g.*, the average actual volumetric flow rate through each separately ducted hood for each steel production cycle, the average total volumetric flow rate at the inlet to the control device for each steel production cycle) according to the requirements in § 63.7832.

(b) For each baghouse applied to meet any particulate emission limit in Table 1 of this subpart, you must install, operate, and maintain a bag leak detection system according to § 63.7831(f), monitor the relative change in particulate matter loadings according to the requirements in § 63.7832, and conduct inspections at their specified frequencies according to the requirements in paragraphs (b)(1) through (8) of this section.

(1) Monitor the pressure drop across each baghouse cell each day to ensure pressure drop is within the normal operating range identified in the manual.

(2) Confirm that dust is being removed from hoppers through weekly visual inspections or other means of ensuring the proper functioning of removal mechanisms.

(3) Check the compressed air supply for pulse-jet baghouses each day.

(4) Monitor cleaning cycles to ensure proper operation using an appropriate methodology.

(5) Check bag cleaning mechanisms for proper functioning through monthly visual inspection or equivalent means.

(6) Make monthly visual checks of bag tension on reverse air and shaker-type baghouses to ensure that bags are not kinked (kneed or bent) or laying on their sides. You do not have to make this check for shaker-type baghouses using self-tensioning (spring-loaded) devices.

(7) Confirm the physical integrity of the baghouse through quarterly visual inspections of the baghouse interior for air leaks.

(8) Inspect fans for wear, material buildup, and corrosion through quarterly visual inspections, vibration detectors, or equivalent means.

(c) For each venturi scrubber subject to the operating limits for pressure drop and scrubber water flow rate in § 63.7790(b)(2), you must install, operate, and maintain CPMS according to the requirements in § 63.7831(g) and monitor the hourly average pressure drop and water flow rate according to the requirements in § 63.7832.

(d) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3), you must install, operate, and maintain a COMS according to the requirements in § 63.7831(h) and monitor the 6-minute average opacity of emissions exiting each control device stack according to the requirements in § 63.7832.

(e) For each sinter plant subject to the operating limit in § 63.7790(d), you must either:

(1) Compute and record the 30-day rolling average of the oil content of the feedstock for each operating day using the procedures in § 63.7824(e); or

(2) Compute and record the 30-day rolling average of volatile organic compound emissions (lbs/ton of sinter) for each operating day using the procedures in § 63.7824(f).

§ 63.7831 What are the installation, operation, and maintenance requirements for my monitors?

(a) For each CPMS required in § 63.7830, you must develop and make available for inspection upon request by the permitting authority a site-specific monitoring plan that addresses the requirements in paragraphs (a)(1) through (6) of this section.

(1) Installation of the CPMS sampling probe or other interface at a

measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last control device);

(2) Performance and equipment specifications for the sample interface, the parametric signal analyzer, and the data collection and reduction system;

(3) Performance evaluation procedures and acceptance criteria (*e.g.*, calibrations);

(4) Ongoing operation and maintenance procedures in accordance with the general requirements of §§ 63.8(c)(1), (c)(3), (c)(4)(ii), (c)(7), and (c)(8);

(5) Ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d); and

(6) Ongoing recordkeeping and reporting procedures in accordance the general requirements of §§ 63.10(c), (e)(1), and (e)(2)(i).

(b) Unless otherwise specified, each CPMS must:

(1) Complete a minimum of one cycle of operation for each successive 15-minute period and collect a minimum of three of the required four data points to constitute a valid hour of data;

(2) Provide valid hourly data for at least 95 percent of every averaging period; and

(3) Determine and record the hourly average of all recorded readings.

(c) You must conduct a performance evaluation of each CPMS in accordance with your site-specific monitoring plan.

(d) You must operate and maintain the CPMS in continuous operation according to the site-specific monitoring plan.

(e) For each capture system subject to an operating limit in § 63.7790(b)(1), you must install, operate, and maintain each CPMS according to the requirements in paragraphs (a) through (d) of this section.

(f) For each baghouse applied to meet any particulate emission limit in Table 1 of this subpart, you must install, operate, and maintain a bag leak detection system according to the requirements in paragraphs (f)(1) through (7) of this section.

(1) The system must be certified by the manufacturer to be capable of detecting emissions of particulate matter at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

(2) The system must provide output of relative changes in particulate matter loadings.

(3) The system must be equipped with an alarm that will sound when an increase in relative particulate loadings is detected over a preset level. The alarm must be located such that it can be heard by the appropriate plant personnel.

(4) Each system that works based on the triboelectric effect must be installed, operated, and maintained in a manner consistent with the guidance document, "Fabric Filter Bag Leak Detection Guidance," EPA–454/R–98–015, September 1997. You may install, operate, and maintain other types of bag leak detection systems in a manner consistent with the manufacturer's written specifications and recommendations.

(5) To make the initial adjustment of the system, establish the baseline output by adjusting the sensitivity (range) and the averaging period of the device. Then, establish the alarm set points and the alarm delay time.

(6) Following the initial adjustment, do not adjust the sensitivity or range, averaging period, alarm set points, or alarm delay time, except as detailed in your operation and maintenance plan. Do not increase the sensitivity by more than 100 percent or decrease the sensitivity by more than 50 percent over a 365-day period unless a responsible official certifies, in writing, that the baghouse has been inspected and found to be in good operating condition.

(7) Where multiple detectors are required, the system's instrumentation and alarm may be shared among detectors.

(g) For each venturi scrubber subject to operating limits in § 63.7790(b)(2) for pressure drop and scrubber water flow rate, you must install, operate, and maintain each CPMS according to the requirements in paragraphs (a) through (d) of this section.

(h) For each electrostatic precipitator subject to the opacity operating limit in § 63.7790(b)(3), you must install, operate, and maintain each COMS according to the requirements in paragraphs (h)(1) through (4) of this section.

(1) You must install, operate, and maintain each COMS according to Performance Specification 1 in 40 CFR part 60, appendix B.

(2) You must conduct a performance evaluation of each COMS according to § 63.8 and Performance Specification 1 in appendix B to 40 CFR part 60.

(3) Each COMS must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(4) COMS data must be reduced as specified in § 63.8(g)(2).

§ 63.7832 How do I monitor and collect data to demonstrate continuous compliance?

(a) Except for monitoring malfunctions, out-of-control periods as specified in § 63.8(c)(7), associated repairs, and required quality assurance or control activities (including as applicable, calibration checks and required zero and span adjustments), you must monitor continuously (or collect data at all required intervals) at all times an affected source is operating.

(b) You may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels or to fulfill a minimum data availability requirement, if applicable. You must use all the data collected during all other periods in assessing compliance.

(c) A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

§ 63.7833 How do I demonstrate continuous compliance with the emission limitations that apply to me?

(a) You must demonstrate continuous compliance for each affected source subject to an emission or opacity limit in § 63.7790(a) by meeting the requirements in Table 3 to this subpart.

(b) You must demonstrate continuous compliance for each capture system subject to an operating limit in § 63.7790(b)(1) by meeting the requirements in paragraphs (b)(1) and (2) of this section.

(1) Operate the capture system at or above the lowest values or settings established for the operating limits in your operation and maintenance plan; and

(2) Monitor the capture system according to the requirements in § 63.7830(a) and collect, reduce, and record the monitoring data for each of the operating limit parameters according to the applicable requirements of this subpart;

(c) For each baghouse applied to meet any particulate emission limit in Table 1 to this subpart, you must demonstrate continuous compliance by completing the requirements in paragraphs (c)(1) and (2) of this section:

(1) Maintaining records of the time you initiated corrective action in the event of a bag leak detection system alarm, the corrective action(s) taken, and the date on which corrective action was completed.

(2) Inspecting and maintaining each baghouse according to the requirements in § 63.7831(f) and recording all information needed to document conformance with these requirements. If you increase or decrease the sensitivity of the bag leak detection system beyond the limits specified in § 63.7831(f)(6), you must include a copy of the required written certification by a responsible official in the next semiannual compliance report.

(d) For each venturi scrubber subject to the operating limits for pressure drop and scrubber water flow rate in § 63.7790(b)(2), you must demonstrate continuous compliance by completing the requirements of paragraphs (d)(1) through (3) of this section:

(1) Maintaining the hourly average pressure drop and scrubber water flow rate at levels no lower than those established during the initial or subsequent performance test;

(2) Operating and maintaining each venturi scrubber CPMS according to § 63.7831(g) and recording all information needed to document conformance with these requirements; and

(3) Collecting and reducing monitoring data for pressure drop and scrubber water flow rate according to § 63.7831(b) and recording all information needed to document conformance with these requirements.

(e) For each electrostatic precipitator subject to the site-specific opacity operating limit in § 63.7790(b)(3), you must demonstrate continuous compliance by completing the requirements of paragraphs (e)(1) and (2) of this section:

(1) Maintaining the average opacity of emissions for each 6-minute period no higher than the site-specific limit established during the initial or subsequent performance test; and

(2) Operating and maintaining each COMS and reducing the COMS data according to § 63.7831(h).

(f) For each new or existing sinter plant subject to the operating limit in § 63.7790(d), you must demonstrate continuous compliance by either:

(1) For the sinter plant feedstock oil content operating limit in § 63.7790(d)(1),

(i) Computing and recording the 30-day rolling average of the percent oil content for each operating day according to the performance test procedures in § 63.7824(e);

(ii) Recording the sampling date and time, oil content values, and sinter produced (tons/day); and

(iii) Maintaining the 30-day rolling average oil content of the feedstock no higher than 0.02 percent.

(2) For the volatile organic compound operating limit in § 63.7790(d)(2),

(i) Computing and recording the 30-day rolling average of volatile organic compound emissions for each operating day according to the performance test procedures in § 63.7824(f);

(ii) Recording the sampling date and time, sampling values, and sinter produced (tons/day); and

(iii) Maintaining the 30-day rolling average of volatile organic compound emissions no higher than 0.2 lb/ton of sinter produced.

§ 63.7834 How do I demonstrate continuous compliance with the operation and maintenance requirements that apply to me?

(a) For each capture system and control device subject to an operating limit in § 63.7790(b), you must demonstrate continuous compliance with the operation and maintenance requirements in § 63.7800(b) by meeting the requirements of paragraphs (a)(1) through (3) of this section:

(1) Making monthly inspections of capture systems and initiating corrective action according to § 63.7800(b)(1) and recording all information needed to document conformance with these requirements;

(2) Performing preventative maintenance according to § 63.7800(b)(2) and recording all information needed to document conformance with these requirements; and

(3) Initiating and completing corrective action for a bag leak detection system alarm according to § 63.7800(b)(4) and recording all information needed to document conformance with these requirements.

(b) You must maintain a current copy of the operation and maintenance plan required in § 63.7800(b) onsite and available for inspection upon request. You must keep the plans for the life of the affected source or until the affected source is no longer subject to the requirements of this subpart.

§ 63.7835 What other requirements must I meet to demonstrate continuous compliance?

(a) *Deviations.* You must report each instance in which you did not meet each emission limitation in § 63.7790 that applies to you. This includes periods of startup, shutdown, and malfunction. You also must report each instance in which you did not meet each operation and maintenance requirement in § 63.7800 that applies to you. These instances are deviations from the emission limitations and operation and maintenance requirements in this subpart. These deviations must be reported according to the requirements in § 63.7841.

(b) *Startups, shutdowns, and malfunctions.* During periods of startup, shutdown, and malfunction, you must operate in accordance with your startup, shutdown, and malfunction plan.

(1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the startup, shutdown, and malfunction plan.

(2) The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

Notifications, Reports, and Records

§ 63.7840 What notifications must I submit and when?

(a) You must submit all of the notifications in §§ 63.6(h)(4) and (5), 63.7(b) and (c), 63.8(e) and (f)(4), and 63.9(b) through (h) that apply to you by the specified dates.

(b) As specified in § 63.9(b)(2), if you startup your affected source before May 20, 2003, you must submit your initial notification no later than September 17, 2003.

(c) As specified in § 63.9(b)(3), if you start your new affected source on or after May 20, 2003, you must submit your initial notification no later than 120 calendar days after you become subject to this subpart.

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin as required in § 63.7(b)(1).

(e) If you are required to conduct a performance test, opacity observation, or other initial compliance demonstration, you must submit a notification of compliance status according to § 63.9(h)(2)(ii).

(1) For each initial compliance demonstration that does not include a performance test, you must submit the notification of compliance status before the close of business on the 30th calendar day following completion of the initial compliance demonstration.

(2) For each initial compliance demonstration that does include a performance test, you must submit the notification of compliance status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test according to § 63.10(d)(2).

§ 63.7841 What reports must I submit and when?

(a) *Compliance report due dates.* Unless the Administrator has approved a different schedule, you must submit a semiannual compliance report to your permitting authority according to the requirements in paragraphs (a)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in § 63.7783 and ending on June 30 or December 31, whichever date comes first after the compliance date that is specified for your source in § 63.7783.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after your first compliance report is due.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (a)(1) through (4) of this section.

(b) *Compliance report contents.* Each compliance report must include the information in paragraphs (b)(1) through (3) of this section and, as applicable, paragraphs (b)(4) through (8) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your startup, shutdown, and malfunction plan, the compliance report must include the information in § 63.10(d)(5)(i).

(5) If there were no deviations from the continuous compliance requirements in §§ 63.7833 and 63.7834 that apply to you, a statement that there were no deviations from the emission limitations or operation and maintenance requirements during the reporting period.

(6) If there were no periods during which a continuous monitoring system (including a CPMS, COMS, or continuous emission monitoring system (CEMS) was out-of-control as specified in § 63.8(c)(7), a statement that there were no periods during which the CPMS was out-of-control during the reporting period.

(7) For each deviation from an emission limitation in § 63.7790 that occurs at an affected source where you are not using a continuous monitoring system (including a CPMS, COMS, or CEMS) to comply with an emission limitation in this subpart, the compliance report must contain the information in paragraphs (b)(1) through (4) of this section and the information in paragraphs (b)(7)(i) and (ii) of this section. This includes periods of startup, shutdown, and malfunction.

(i) The total operating time of each affected source during the reporting period.

(ii) Information on the number, duration, and cause of deviations (including unknown cause, if applicable) as applicable and the corrective action taken.

(8) For each deviation from an emission limitation occurring at an affected source where you are using a continuous monitoring system (including a CPMS or COMS) to comply with the emission limitation in this subpart, you must include the information in paragraphs (b)(1) through (4) of this section and the information in paragraphs (b)(8)(i) through (xi) of this section. This includes periods of startup, shutdown, and malfunction.

(i) The date and time that each malfunction started and stopped.

(ii) The date and time that each continuous monitoring was inoperative, except for zero (low-level) and high-level checks.

(iii) The date, time, and duration that each continuous monitoring system was out-of-control as specified in § 63.8(c)(7), including the information in § 63.8(c)(8).

(iv) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(v) A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

(vi) A breakdown of the total duration of the deviations during the reporting period including those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(vii) A summary of the total duration of continuous monitoring system downtime during the reporting period and the total duration of continuous monitoring system downtime as a percent of the total source operating time during the reporting period.

(viii) A brief description of the process units.

(ix) A brief description of the continuous monitoring system.

(x) The date of the latest continuous monitoring system certification or audit.

(xi) A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

(c) *Immediate startup, shutdown, and malfunction report.* If you had a startup, shutdown, or malfunction during the semiannual reporting period that was not consistent with your startup, shutdown, and malfunction plan, you must submit an immediate startup, shutdown, and malfunction report according to the requirements in § 63.10(d)(5)(ii).

(d) *Part 70 monitoring report.* If you have obtained a title V operating permit for an affected source pursuant to 40 CFR part 70 or 71, you must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If you submit a compliance report for an affected source along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report includes all the required information concerning deviations from any emission limitation or operation and maintenance requirement in this subpart, submission of the compliance report satisfies any obligation to report the same deviations in the semiannual monitoring report. However, submission of a compliance report does not otherwise affect any obligation you may have to report deviations from permit requirements for an affected source to your permitting authority.

§ 63.7842 What records must I keep?

(a) You must keep the following records:

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any initial notification or notification of

compliance status that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) Records of performance tests, performance evaluations, and opacity observations as required in § 63.10(b)(2)(viii).

(b) For each COMS, you must keep the records specified in paragraphs (b)(1) through (4) of this section.

(1) Records described in § 63.10(b)(2)(vi) through (xi).

(2) Monitoring data for a performance evaluation as required in § 63.6(h)(7)(i) and (ii).

(3) Previous (that is, superceded) versions of the performance evaluation plan as required in § 63.8(d)(3).

(4) Records of the date and time that each deviation started and stopped, and whether the deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(c) You must keep the records required in § 63.6(h)(6) for visual observations.

(d) You must keep the records required in §§ 63.7833 and 63.7834 to show continuous compliance with each emission limitation and operation and maintenance requirement that applies to you.

§ 63.7843 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record according to § 63.10(b)(1). You can keep the records offsite for the remaining 3 years.

Other Requirements and Information

§ 63.7850 What parts of the General Provisions apply to me?

Table 4 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

§ 63.7851 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the United States Environmental Protection Agency (U.S. EPA), or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under subpart E of this part, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are specified in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternative opacity emission limits in Table 1 to this subpart under § 63.6(h)(9).

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90, except for approval of an alternative method for the oil content of the sinter plant feedstock or volatile organic compound measurements for the sinter plant windbox exhaust stream stack as provided in § 63.7824(g).

(3) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major alternatives to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.7852 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in § 63.2, and in this section as follows.

Bag leak detection system means a system that is capable of continuously monitoring relative particulate matter (dust) loadings in the exhaust of a baghouse to detect bag leaks and other upset conditions. A bag leak detection system includes, but is not limited to, an instrument that operates on tribroelectric, light scattering, light transmittance, or other effect to continuously monitor relative particulate matter loadings.

Basic oxygen process furnace means any refractory-lined vessel in which high-purity oxygen is blown under pressure through a bath of molten iron, scrap metal, and fluxes to produce steel. This definition includes both top and bottom blown furnaces, but does not include argon oxygen decarburization furnaces.

Basic oxygen process furnace shop means the place where steelmaking operations that begin with the transfer of molten iron (hot metal) from the torpedo car and end prior to casting the molten steel, including hot metal transfer, desulfurization, slag skimming, refining in a basic oxygen process furnace, and ladle metallurgy occur.

Basic oxygen process furnace shop ancillary operations means the processes where hot metal transfer, hot metal desulfurization, slag skimming, and ladle metallurgy occur.

Blast furnace means a furnace used for the production of molten iron from iron ore and other iron bearing materials.

Bottom-blown furnace means any basic oxygen process furnace in which oxygen and other combustion gases are introduced into the bath of molten iron through tuyeres in the bottom of the vessel or through tuyeres in the bottom and sides of the vessel.

Casthouse means the building or structure that encloses the bottom portion of a blast furnace where the hot metal and slag are tapped from the furnace.

Certified observer means a visible emission observer certified to perform EPA Method 9 opacity observations.

Desulfurization means the process in which reagents such as magnesium, soda ash, and lime are injected into the hot metal, usually with dry air or nitrogen, to remove sulfur.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limitation (including operating limits) or operation and maintenance requirement;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Discharge end means the place where those operations conducted within the sinter plant starting at the discharge of the sintering machine's traveling grate including (but not limited to) hot sinter crushing, screening, and transfer operations occur.

Emission limitation means any emission limit, opacity limit, or operating limit.

Hot metal transfer station means the location in a basic oxygen process furnace shop where molten iron (hot

metal) is transferred from a torpedo car or hot metal car used to transport hot metal from the blast furnace casthouse to a holding vessel or ladle in the basic oxygen process furnace shop. This location also is known as the reladling station or ladle transfer station.

Integrated iron and steel manufacturing facility means an establishment engaged in the production of steel from iron ore.

Ladle metallurgy means a secondary steelmaking process that is performed typically in a ladle after initial refining in a basic oxygen process furnace to adjust or amend the chemical and/or mechanical properties of steel.

Primary emissions means particulate matter emissions from the basic oxygen process furnace generated during the steel production cycle which are captured and treated in the furnace's primary emission control system.

Primary emission control system means the combination of equipment used for the capture and collection of primary emissions (*e.g.*, an open hood capture system used in conjunction with an electrostatic precipitator or a closed hood system used in conjunction with a scrubber).

Primary oxygen blow means the period in the steel production cycle of a basic oxygen process furnace during which oxygen is blown through the molten iron bath by means of a lance inserted from the top of the vessel (top-blown) or through tuyeres in the bottom and/or sides of the vessel (bottom-blown).

Responsible official means responsible official as defined in § 63.2.

Secondary emissions means particulate matter emissions that are not controlled by a primary emission control system, including emissions that escape from open and closed hoods, lance hole openings, and gaps or tears in ductwork to the primary emission control system.

Secondary emission control system means the combination of equipment used for the capture and collection of secondary emissions from a basic oxygen process furnace.

Sinter cooler means the apparatus used to cool the hot sinter product that is transferred from the discharge end through contact with large volumes of induced or forced draft air.

Sinter plant means the machine used to produce a fused clinker-like aggregate or sinter of fine iron-bearing materials suited for use in a blast furnace. The machine is composed of a continuous traveling grate that conveys a bed of ore fines and other finely divided iron-bearing material and fuel (typically coke breeze), a burner at the feed end of the grate for ignition, and a series of downdraft windboxes along the length of the strand to support downdraft combustion and heat sufficient to produce a fused sinter product.

Skimming station means the locations inside a basic oxygen process furnace shop where slag is removed from the top of the molten metal bath.

Steel production cycle means the operations conducted within the basic oxygen process furnace shop that are required to produce each batch of steel. The following operations are included: scrap charging, preheating (when done), hot metal charging, primary oxygen blowing, sampling, (vessel turndown and turnup), additional oxygen blowing (when done), tapping, and deslagging. The steel production cycle begins when the scrap is charged to the furnace and ends after the slag is emptied from the vessel into the slag pot.

Top-blown furnace means any basic oxygen process furnace in which oxygen is introduced into the bath of molten iron by means of an oxygen lance inserted from the top of the vessel.

Windboxes means the compartments that provide for a controlled distribution of downdraft combustion air as it is drawn through the sinter bed of a sinter plant to make the fused sinter product.

Tables to Subpart FFFFF of Part 63

TABLE 1 TO SUBPART FFFFF OF PART 63.—EMISSION AND OPACITY LIMITS

[As required in § 63.7790(a), you must comply with each applicable emission and opacity limit in the following table]

For . . .	You must comply with each of the following . . .
1. Each windbox exhaust stream at an existing sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.4 lb/ton of product sinter.
2. Each windbox exhaust stream at a new sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.3 lb/ton of product sinter.
3. Each discharge end at an existing sinter plant	a. You must not cause to be discharged to the atmosphere any gases that exit from one or more control devices that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf [1]; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the building or structure housing the discharge end that exhibit opacity greater than 20 percent (6-minute average).
4. Each discharge end at a new sinter plant	a. You must not cause to be discharged to the atmosphere any gases that exit from one or more control devices that contain, on a flow weighted basis, particulate matter in excess of 0.01 gr/dscf; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the building or structure housing the discharge end that exhibit opacity greater than 10 percent (6-minute average).
5. Each sinter cooler stack at an existing sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.03 gr/dscf.
6. Each sinter cooler stack at a new sinter plant ..	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.01 gr/dscf.
7. Each casthouse at an existing blast furnace	a. You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the casthouse or structure housing the blast furnace that exhibit opacity greater than 20 percent (6-minute average).
8. Each casthouse at a new blast furnace	a. You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.003 gr/dscf; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the casthouse or structure housing the blast furnace that exhibit opacity greater than 15 percent (6-minute average).

TABLE 1 TO SUBPART FFFFF OF PART 63.—EMISSION AND OPACITY LIMITS—Continued

[As required in § 63.7790(a), you must comply with each applicable emission and opacity limit in the following table]

For . . .	You must comply with each of the following . . .
9. Each BOPF at a new or existing shop	a. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with a closed hood system at a new or existing BOPF shop that contain, on a flow-weighted basis, particulate matter in excess of 0.03 gr/dscf during the primary oxygen blow [2]; b. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with an open hood system that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf during the steel production cycle for an existing BOPF shop or 0.01 gr/dscf during the steel production cycle for a new BOPF shop [2]; and c. You must not cause to be discharged to the atmosphere any gases that exit from a control device used solely for the collection of secondary emissions from the BOPF that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop.
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop or 0.003 gr/dscf for a new BOPF shop.
11. Each ladle metallurgy operation at a new or existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop.
12. Each roof monitoring at an existing BOPF shop.	You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or any other building housing the BOPF or BOPF shop operation that exhibit opacity greater than 20 percent (3-minute average).
13. Each roof monitor at a new BOPF shop	a. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or other building housing a bottom-blown BOPF or BOPF shop operations that exhibit opacity (for any set of 6-minute averages) greater than 10 percent, except that one 6-minute period not to exceed 20 percent may occur once per steel production cycle; or b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or other building housing a top-blown BOPF or BOPF shop operations that exhibit opacity (for any set of 3-minute averages) greater than 10 percent, except that one 3-minute period greater than 10 percent but less than 20 percent may occur once per steel production cycle.

[1] This limit applies if the cooler is vented to the same control device as the discharge end.
[2] This limit applies to control devices operated in parallel for a single BOPF during the oxygen blow.

TABLE 2 TO SUBPART FFFFF OF PART 63.—INITIAL COMPLIANCE WITH EMISSION AND OPACITY LIMITS

[As required in § 63.7825(a)(1), you must demonstrate initial compliance with the emission and opacity limits according to the following table]

For . . .	You have demonstrated initial compliance if . . .
1. Each windbox exhaust stream at an existing sinter plant.	The process-weighted mass rate of particulate matter from a windbox exhaust stream, measured according to the performance test procedures in § 63.7822(c), did not exceed 0.4 lb/ton of product sinter.
2. Each windbox exhaust stream at a new sinter plant.	The process-weighted mass rate of particulate matter from a windbox exhaust stream, measured according to the performance test procedures in § 63.7822(c), did not exceed 0.3 lb/ton of product sinter.
3. Each discharge end at an existing sinter plant	a. The flow-weighted average concentration of particulate matter from one or more control devices applied to emissions from a discharge end, measured according to the performance test procedures in § 63.7822(d), did not exceed 0.02 gr/dscf; and b. The opacity of secondary emissions from each discharge end, determined according to the performance test procedures in § 63.7823(c), did not exceed 20 percent (6-minute average).
4. Each discharge end at a new sinter plant	a. The flow-weighted average concentration of particulate matter from one or more control devices applied to emissions from a discharge end, measured according to the performance test procedures in § 63.7822(d), did not exceed 0.01 gr/dscf; and b. The opacity of secondary emissions from each discharge end, determined according to the performance test procedures in § 63.7823(c), did not exceed 10 percent (6-minute average).
5. Each sinter cooler stack at an existing sinter plant.	The average concentration of particulate matter from a sinter cooler stack, measured according to the performance test procedures in § 63.7822(b), did not exceed 0.03 gr/dscf.
6. Each sinter cooler stack at a new sinter plant	The average concentration of particulate matter from a sinter cooler stack, measured according to the performance test procedures in § 63.7822(b), did not exceed 0.01 gr/dscf.
7. Each casthouse at an existing blast furnace	a. The average concentration of particulate matter from a control device applied to emissions from a casthouse, measured according to the performance test procedures in § 63.7822(e), did not exceed 0.01 gr/dscf; and b. The opacity of secondary emissions from each casthouse, determined according to the performance test procedures in § 63.7823(c), did not exceed 20 percent (6-minute average).

TABLE 2 TO SUBPART FFFFF OF PART 63.—INITIAL COMPLIANCE WITH EMISSION AND OPACITY LIMITS—Continued

[As required in §63.7825(a)(1), you must demonstrate initial compliance with the emission and opacity limits according to the following table]

For . . .	You have demonstrated initial compliance if . . .
8. Each casthouse at a new blast furnace	a. The average concentration of particulate matter from a control device applied to emissions from a casthouse, measured according to the performance test procedures in §63.7822(e), did not exceed 0.003 gr/dscf; and b. The opacity of secondary emissions from each casthouse, determined according to the performance test procedures in §63.7823(c), did not exceed 15 percent (6-minute average).
9. Each BOPF at a new or existing BOPF shop	a. The average concentration of particulate matter from a primary emission control system applied to emissions from a BOPF with a closed hood system, measured according to the performance test procedures in §63.7822(f), did not exceed 0.03 gr/dscf for a new or existing BOPF shop; b. The average concentration of particulate matter from a primary emission control system applied to emissions from a BOPF with an open hood system, measured according to the performance test procedures in §63.7822(g), did not exceed 0.02 gr/dscf for an existing BOPF shop or 0.01 gr/dscf for a new BOPF shop; and c. The average concentration of particulate matter from a control device applied solely to secondary emissions from a BOPF, measured according to the performance test procedures in §63.7822(g), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop.
10. Each hot metal transfer skimming, and desulfurization at a new or existing BOPF shop.	The average concentration of particulate matter from a control device applied to emissions from hot metal transfer, skimming, or desulfurization, measured according to the performance test procedures in §63.7822(h), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.003 gr/dscf for a new BOPF shop.
11. Each ladle metallurgy operation at a new or existing BOPF shop.	The average concentration of particulate matter from a control device applied to emissions from a ladle metallurgy operation, measured according to the performance test procedures in §63.7822(h), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop.
12. Each roof monitor at an existing BOPF shop	The opacity of secondary emissions from each BOPF shop, determined according to the performance test procedures in §63.7823(d), did not exceed 20 percent (3-minute average).
13. Each roof monitor at a new BOPF shop	a. The opacity of the highest set of 6-minute averages from each BOPF shop housing a bottom-blown BOPF, determined according to the performance test procedures in §63.7823(d), did not exceed 20 percent and the second highest set of 6-minute averages did not exceed 10 percent; or b. The opacity of the highest set of 3-minute averages from each BOPF shop housing a top-blown BOPF, determined according to the performance test procedures in §63.7823(d), did not exceed 20 percent and the second highest set of 3-minute averages did not exceed 10 percent.

TABLE 3 TO SUBPART FFFFF OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS

[As required in §63.7833(a), you must demonstrate continuous compliance with the emission and opacity limits according to the following table]

For . . .	You must demonstrate continuous compliance by . . .
1. Each windbox exhaust stream at an existing sinter plant.	a. Maintaining emissions of particulate matter at or below 0.4 lb/ton of product sinter; and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
2. Each windbox exhaust stream at a new sinter plant.	a. Maintaining emissions of particulate matter at or below 0.3 lb/ton of product sinter; and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
3. Each discharge end at an existing sinter plant	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.02 gr/dscf; and b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 20 percent (6-minute average); and c. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
4. Each discharge end at a new sinter plant	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.01 gr/dscf; b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 10 percent (6-minute average); and c. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
5. Each sinter cooler stack at an existing sinter plant.	a. Maintaining emissions of particulate matter at or below 0.03 gr/dscf; and b. Conducting subsequent performance sinter plant tests at least twice during each term of your title V operating permit (at midterm and renewal).
6. Each sinter cooler stack at a new sinter plant	a. Maintaining emissions of particulate matter at or below 0.01 gr/dscf; and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
7. Each casthouse at an existing blast furnace	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf;

TABLE 3 TO SUBPART FFFFF OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS—Continued

[As required in § 63.7833(a), you must demonstrate continuous compliance with the emission and opacity limits according to the following table]

For . . .	You must demonstrate continuous compliance by . . .
	b. Maintaining the opacity of secondary emissions that exit any opening in the casthouse or structure housing the blast furnace at or below 20 percent (6-minute average); and c. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
8. Each casthouse at a new blast furnace	a. Maintaining emissions of particulate matter from a control device at or below 0.003 gr/dscf; b. Maintaining the opacity of secondary emissions that exit any opening in the casthouse or building housing the casthouse at or below 15 percent (6-minute average); and c. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
9. Each BOPF at a new or existing BOPF shop	a. Maintaining emissions of particulate matter from the primary emission control system for a BOPF with a closed hood system at or below 0.03 gr/dscf; b. Maintaining emissions of particulate matter from the primary emission control system for a BOPF with an open hood system at or below 0.02 gr/dscf for an existing BOPF shop or 0.01 gr/dscf for a new BOPF shop; c. Maintaining emissions of particulate matter from a control device applied solely to secondary emissions from a BOPF at or below 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop; and d. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF or 0.003 gr/dscf for a new BOPF; and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
11. Each ladle metallurgy operation at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop; and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
12. Each roof monitor at an existing BOPF shop	a. Maintaining the opacity of secondary emissions that exit any opening in the BOPF shop or other building housing the BOPF or shop operation at or below 20 percent (3-minute average); and b. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).
13. Each roof monitor at a new BOPF shop	a. Maintaining the opacity (for any set of 6-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a bottom-blown BOPF or shop operation at or below 10 percent, except that one 6-minute period greater than 10 percent but no more than 20 percent may occur once per steel production cycle; b. Maintaining the opacity (for any set of 3-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a top-blown BOPF or shop operation at or below 10 percent, except that one 3-minute period greater than 10 percent but less than 20 percent may occur once per steel production cycle; and c. Conducting subsequent performance tests at least twice during each term of your title V operating permit (at midterm and renewal).

TABLE 4 TO SUBPART FFFFF OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF

[As required in § 63.7850, you must comply with the requirements of the NESHAP General Provisions (40 CFR part 63, subpart A) shown in the following table]

Citation	Subject	Applies to Subpart FFFFF	Explanation

period allowed for in the proposal. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action may not be challenged later in proceedings to enforce its requirements. (See section 307(b)(2).)

List of Subjects in 40 CFR Part 62

Environmental protection, Administrative practice and procedure, Air pollution control, Intergovernmental relations, Reporting and recordkeeping requirements, Waste treatment and disposal.

Dated: May 8, 2003.

Robert W. Varney,

Regional Administrator, EPA New England.

■ 40 CFR part 62 is amended as follows:

PART 62—[AMENDED]

■ 1. The authority citation for part 62 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart UU—Vermont

■ 2. Subpart UU is amended by adding a new § 62.11485 and a new undesignated center heading to read as follows:

Emission From Existing Municipal Solid Waste Landfills

§ 62.11485 Identification of Plan—negative declaration.

On August 20, 1996, the Vermont Department of Environmental Conservation submitted a letter certifying that there are no existing municipal solid waste landfills in the state subject to the emission guidelines under part 60, subpart B of this chapter.

RIN 2060–AG93

National Emission Standards for Hazardous Air Pollutants for Semiconductor Manufacturing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for new and existing semiconductor manufacturing operations located at major sources of emissions of hazardous air pollutants (HAP). The final standards implement section 112(d) of the Clean Air Act (CAA), which requires the Administrator to regulate emissions of HAP listed in section 112(b) of the CAA. The intent of the standards is to protect public health and the environment by requiring new and existing major sources to control emissions to the level attainable by implementing the maximum achievable control technology (MACT). The primary HAP that will be controlled with this action include hydrochloric acid (HCl), hydrogen flouride (HF), methanol, glycol ethers, and xylene. Exposure to these substances has been demonstrated to cause adverse health effects such as irritation of the lung, eye, and mucous membranes; effects on the central nervous system; liver and kidney damage; and, possibly cancer. We do not have the type of current detailed data on each of the facilities and the people living around the facilities covered by today's final rule for this source category that would be necessary to conduct an analysis to determine the actual population exposures to the HAP emitted from these facilities and the potential for resultant health effects. Therefore, we do not know the extent to which the adverse health effects described above occur in the populations surrounding these facilities. However, to the extent the adverse effects do occur, and today's final rule reduces emissions, subsequent exposures will be reduced.

EFFECTIVE DATE: May 22, 2003.

ADDRESSES: Docket No. A–97–15 and E-Docket No. OAR–2002–0086 contain supporting information used in developing the standards for the semiconductor manufacturing source category. The docket is located at EPA Docket Center (Air Docket), U.S. EPA, 1301 Constitution Avenue, NW., Room B108, Mail Code: 6102T, Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: Mr. John Schaefer, U.S. EPA, Office of Air Quality Planning and Standards, Emission Standards Division (C504–05), Research Triangle Park, NC 27711, telephone number (919) 541–0296, electronic mail (e-mail) address: *schaefer.john@epa.gov*.

SUPPLEMENTARY INFORMATION: *Docket.* The docket is an organized and complete file of all the information considered by the EPA in the development of the rule. The docket is a dynamic file because material is added throughout the rule development process. The docketing system is intended to allow members of the public and industries involved to readily identify and locate documents so that they can effectively participate in the rule development process. Along with the proposed and promulgated standards and their preambles, the contents of the docket will serve as the record in the case of judicial review. (See section 307(d)(7)(A) of the CAA.) The regulatory text and other materials related to the final rule are available for review in the docket or copies may be mailed on request from the Air and Radiation Docket and Information Center by calling (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Docket Access. You may access the final rule electronically through the EPA Internet under the "**Federal Register**" listings at *http://www.epa.gov/fedrgstr/*. An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility in the above paragraph entitled "Docket." Once in the system, select "search," then key in the appropriate docket identification number.

World Wide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule will also be available on the WWW through the EPA's Technology Transfer Network (TTN). Following signature by the EPA Administrator, a copy of the final rule will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg*. The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Regulated Entities. Categories and entities potentially regulated by this action include those listed on the following table. This table is not intended to be exhaustive, but is just a guide to entities likely to be regulated by these standards. It lists the types of entities that may be regulated, but you

should examine the applicability criteria in §§ 63.7181 and 63.7182 of the final rule to decide whether your facility is regulated by the standards. If you have any questions about whether your facility is subject to the standards, call the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

CATEGORIES AND ENTITIES POTENTIALLY REGULATED BY THE STANDARDS

Category	NAICS code	SIC code	Examples of regulated entities
Industrial	334413	3674	Semiconductor crystal growing facilities, semiconductor wafer fabrication facilities, semiconductor test and assembly facilities.

Judicial Review. Under section 307(b) of the CAA, judicial review of the final rule is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by July 21, 2003. Under section 307(d)(7)(B) of the CAA, only an objection to the rule which was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by this final action may not be challenged separately in any civil or criminal proceeding we bring to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Source of Authority for Development of NESHAP?
B. What Criteria Do We Use in the Development of NESHAP?
II. What Changes and Clarifications Have We Made for the Final Standards?
A. MACT Floors and Emission Limits
B. Compliance Options and Procedures
III. Response to Comments on the Proposed NESHAP for Semiconductor Manufacturing
IV. What Are the Final Standards?
A. What Is the Source Category?
B. What Is the Affected Source?
C. What Are the Emission Standards?
V. When Must I Comply With the Final Rule?
VI. What Are the Testing and Initial Compliance Requirements?
A. Test Methods and Procedures
B. Monitoring Requirements
VII. What Notification, Recordkeeping, and Reporting Requirements Must I Follow?
VIII. What Are the Environmental, Energy, and Economic Impacts of the Final Rule?
A. What Are the Secondary and Energy Impacts?

I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. On July 16, 1992, major source categories covered by the NESHAP were listed under the Semiconductor Manufacturing industry group (57 FR 31576). Major sources of HAP are those that have the potential to emit considering controls, in the aggregate, 10 tons per year (tpy) or more of any HAP or 25 tpy or more of any combination of HAP.

B. What Criteria Do We Use in the Development of NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new and existing major sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as MACT.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the standard is set at a level that assures that all major sources achieve the level of control at least as stringent as that already achieved by the better-controlled and lower-emitting sources in each source category or subcategory. For new sources, the MACT floor cannot be less stringent than the emission control that is achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than the standards for new sources, but they cannot be less stringent than the average emission limitation achieved by the best performing 12 percent of existing sources in the category or subcategory (or the best performing five sources for categories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on consideration of the cost of achieving the emission reductions, any health and environmental impacts, and energy requirements.

II. What Changes and Clarifications Have We Made for the Final Standards?

In response to public comments received on the proposed standards, we made several changes in developing the final rule. Some of the changes had a direct effect on the MACT floors and emission limits, while other changes clarified the substantive requirements for the final rule. A more comprehensive summary of comments and responses can be found in Docket No. A–97–15 and E–Docket No. OAR–2002–0086.

A. MACT Floors and Emission Limits

Process vents. When we developed the original MACT floors for process vents, we first determined the control efficiency, expressed as percent emission reduction, for each process vent for which we had inlet and outlet HAP concentration data. We then ranked the process vents based on the control efficiency achieved. Based on the best performing five process vents, we determined that thermal oxidation was used for emission control on four of them. Consequently, we selected thermal oxidation as the MACT floor. For the emission limit, we chose 98 percent control as representative of the level of control typically achieved by thermal oxidizers in practice. We decided not to base the emission limit on the reported performance of the thermal oxidizers because, in all cases, the inlet streams were high volume with low concentration of HAP. Under those conditions, measurements of the actual performance of a thermal oxidizer can be unreliable. As such, we believe

choosing 98 percent control efficiency is more representative of what the thermal oxidizers can consistently achieve in practice.

One commenter objected to this procedure, stating that the CAA directs us to consider only the actual performance of the sources used to establish the MACT floor. The commenter believed that we should revise the MACT floor and emission limits based on the reported performance of the five best performing sources. While we agree that the CAA directs us to base the MACT floors on actual performance, we believe that the test data do not accurately represent actual performance because of the high-volume, low-concentration nature of the emission streams.

In response to this comment, we decided to reevaluate the process vent MACT floor by considering organic and inorganic streams separately, as suggested by another commenter. By doing so, we can more accurately assess the performance of the different control devices used for these two types of emission streams.

Organic emission streams are almost always controlled by some type of thermal oxidation. As discussed above, measurements of thermal oxidizer performance can be unreliable for high-volume, low-concentration streams. Thus, we continue to believe that the test data for organic HAP emission control we obtained for thermal oxidizers controlling semiconductor manufacturing process vents may not accurately portray actual performance. Thus, our original selection of a known achievable emission reduction percentage, as used for MACT in rules such as the Hazardous Organic NESHAP or HON (57 FR 19402), better represents actual performance as directed by the CAA. For the final rule, we retained 98 percent control as the emission limit for organic emission streams from process vents. We also retained the alternative emission limit of 20 parts per million by volume (ppmv) for organic emission streams.

For inorganic emissions from process vents, all the data we obtained showed that scrubbers were used to control those emissions. Unlike thermal oxidizers, scrubbers experience less erratic performance characteristics with high-volume, low-concentration emission streams. Accordingly, we were able to use the actual performance data to establish the MACT floor for the control of inorganic emissions from process vents. Again, using the top five best performing process vents, we established the MACT floor as 95 percent control. Based on the actual outlet emissions of those five process vents, we established the alternative emission limit as 0.42 ppmv.

Storage tanks. We received comments on whether all of the tanks we included in the MACT floor analysis were the type of tank we intended to regulate through the rulemaking. The comments provided additional clarifying information on a number of the tanks we used to develop the MACT floor. Specifically, the comments questioned whether storage tanks for wastewater with very low concentration of HAP, waste storage tanks already covered under the Resource Conservation and Recovery Act (RCRA), and wastewater treatment tanks should have been included in the MACT floor analysis.

With the exception of wastewater treatment tanks, it was our intent to include all of these types of tanks in the affected source. However, based on the additional information provided by the industry, we have concluded that it was not appropriate to develop one MACT floor for all types of tanks due to the wide range of emissions from the each type of tank. Therefore, we developed separate MACT floors for chemical storage tanks (including waste storage tanks regulated under RCRA) and wastewater storage tanks.

We found that the level of control, based on the top five best performing sources in each data set, is the same for each type of tank. The level of control is to reduce emissions through the use of a scrubber and is identical to the level of control used to establish the MACT floor that was the basis of the emission limits in the proposed rule. However, based on other comments we received, we have decided not to use the same MACT floor procedure for the final rule.

Since the semiconductor industry storage tank emission streams will have similar characteristics to those of process vents (*i.e.*, low pollutant concentration), rather than hydrochloric acid production industry storage tanks, we now believe the most representative similar sources for evaluating the MACT floor for storage tanks are the semiconductor industry process vents. Therefore, in response to the comments concerning our use of hydrochloric acid production industry storage tanks as the most representative similar source, we are adopting the process vent inorganic HAP emission limits for all storage tanks required to control emissions in the final rule.

The comments we received clarified that the reported wastewater treatment tanks were not actually storage tanks but flow-through tanks used for certain continuous treatment processes such as pH adjustment. The tank volume merely allows for a buffer so that the treatment can be adequately carried out. All of the flow-through tanks in the data supplied by the industry are controlled by scrubbers. However, the industry also provided information that the purpose of all of these scrubbers was primarily to control ammonia odors. We do not believe that requiring scrubbers on flow-through tanks would result in significant reductions of HAP emissions, nor was it our intent in the proposed rule to regulate such tanks. Therefore, the definition of storage tank that we added to the final rule clarifies that flow-through tanks are not considered storage tanks for the purposes of the final rule.

We made an additional change for the final rule based on our revised storage tank MACT floor analysis. Because we eliminated several tanks from the data set used in the MACT floor analysis, the cutoff for the smallest size tank for which the final rule applies increased from 800 gallons to 1,500 gallons. We also revised our analysis of alternatives more stringent than the MACT floor to reflect the increased tank size. We found that the cost per ton of additional emission reduction (approximately $300,000/ton) is still too great to warrant a more stringent level of control. We have also included a definition for "storage tank" to 40 CFR 63.7195 to clarify which tanks we intended to be subject to the final rule.

B. Compliance Options and Procedures

As part of our reevaluation of the MACT floors for process vents as described above, we also considered other compliance options to reflect our position on the performance of control devices. While we believe the performance of scrubbers controlling high-volume, low-concentration emission streams can be measured, we also recognize that control efficiency cannot always be reliably predicted for such streams. Also, facilities may choose to use a control device other than a scrubber which may be more difficult to measure performance. For these situations, we have included a compliance option to the final rule (see 40 CFR 63.7187(i)) that allows a source to perform a design evaluation of the add-on control device. If the inlet concentration of inorganic HAP is less than or equal to 20 ppmv, then the facility may choose to perform a design evaluation of the control device that demonstrates the device is capable of achieving the required control efficiency.

We chose 20 ppmv as the cutoff for allowing a design evaluation because the data we obtained showed erratic

performance measurement values below this level. The test results show control device performance decreasing as the inlet concentration decreases. However, the last entry shows that even at very low inlet concentrations, control device performance can sometimes be high. These data show the difficulty of measuring control device performance with high-volume, low-concentration inlet streams, and why we believe a design evaluation procedure is necessary. In the final rule, we have adopted the design evaluation procedure alternative from the Pharmaceuticals Production NESHAP (40 CFR part 63, subpart GGG).

During our review of the proposed rule, we realized that we inadvertently omitted Method 26A of 40 CFR part 60, appendix A, for analysis of emission streams for inorganic HAP. The final rule includes this test method.

III. Response to Comments on the Proposed NESHAP for Semiconductor Manufacturing

Comment: One commenter requested that EPA consider providing exemptions that would exclude insignificant sources from regulation. The commenter argued that the administrative burdens associated with the proposed rule are unwarranted for such sources. The commenter further argued that if additional add-on control devices would be required, it would result in insignificant HAP reductions. Another commenter suggested that storage tanks are insignificant HAP emission sources and should be excluded from the final rule.

Response: While we understand the commenters' concern with the burden imposed by regulation of sources with low annual emissions, the CAA does not provide a mechanism by which we can exempt such emission sources from the affected source solely on the basis of emissions. Additionally, some facilities in the semiconductor industry are characterized by multiple point sources of emissions, many of which have low annual emissions. If we exempted all such sources, there is a possibility that a large portion of the emissions from the facility could escape regulation. For these reasons, we are not exempting sources with low HAP emissions from the final rule.

Comment: One commenter contended that EPA's exemption of sources during periods of startup, shutdown, and malfunction is a violation of the requirement for continuous compliance. The commenter argued that EPA may only allow unavoidable deviations from emissions standards and must require that sources use best air pollution control practices during those periods.

Response: We disagree with the commenter's interpretation of the proposed rule. The General Provisions at 40 CFR 63.6(e)(1)(i) require that sources must at all times, including periods of startup, shutdown, and malfunction, maintain the affected source in a manner such that emissions are minimized to the level required by the relevant standard. That section further clarifies that this means to "meet the emission standards or comply with the startup, shutdown, and malfunction plan." The purpose of the startup, shutdown, and malfunction plan (SSMP), as described in 40 CFR 63.6(e)(3)(i)(A), is to:

> [e]nsure that, at all times, the owner or operator operate and maintain affected sources, including associated air pollution control and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions to at least the levels required by the relevant standards.

A properly written SSMP does not allow the source to emit at whatever levels they want merely because they comply with what they have written in the SSMP. Under the SSMP, the source must detail the procedures that will be used to maintain emissions within the limits set by the rule during periods of startup, shutdown, and malfunction. In this case, the SSMP is analogous to parameter monitoring for evaluating continuous compliance of add-on control devices. Just as maintaining the temperature of a thermal oxidizer at the proper operating temperature as determined during the initial compliance demonstration is deemed to be compliance with the emission limits, following the SSMP is deemed to be compliance with emission limits during periods of startup, shutdown, and malfunction.

Comment: One commenter was concerned with the burden of compliance as proposed at facilities that are classified as major sources of HAP due to processes other than semiconductor manufacturing and that only conduct minimal production of semiconductors for research and development purposes. The commenter requested that EPA add a *de minimis* threshold for rule applicability.

Response: Through our data gathering efforts, we found that research and development activities are often integrated into the production activities at semiconductor manufacturing facilities. Such research and development activities are often used in actual production because the technology upon which the manufacturing process is based undergoes substantial change every few years. This extremely short technology life cycle results in constant research and development efforts geared toward developing and implementing new manufacturing technologies. The continual research and development efforts result in an ongoing integration of new technologies into mainstream production operations. New manufacturing operations are typically not developed apart from existing manufacturing operations, but rather side-by-side with them. The new operations are gradually integrated into mainstream production. As such, the majority of research and development work is done in a manner nearly indistinguishable from the existing manufacturing process.

Given the manner in which research and development activities are integrated into production, there is no bright line distinction between research and development and production. They are located in the same clean rooms and, more importantly, share the same exhaust plenums and emission control devices. For these reasons, the research and development activities are considered part of the production process and are within the affected source.

We note, however, that the research and development operations have to be located at a semiconductor manufacturing facility to be considered a semiconductor manufacturing process unit. Therefore, research and development activities that are not used to produce semiconductors for commerce, or produce them only for captive use, would not be semiconductor manufacturing process units and would not be subject to the final rule. Nor would research and development operations that are stand alone activities (that is, not integrated into the production process) be subject to the final rule. We modified 40 CFR 63.7182(b) of the final rule to clarify this point.

Comment: One commenter argued that EPA must regulate all major sources and believed the proposed rule fails to do this because it does not apply to sources that installed add-on control devices after the facility was designed and commenced operation. The commenter interpreted the court's ruling in *Alabama Power* (*Alabama Power Co.* v. *U.S. EPA*, 636 F.2d 323 (DC Cir. 1979)) as specifying that controls must be incorporated into the original design of the facility in order to be considered when calculating the facility's potential to emit.

Response: We believe the commenter incorrectly interpreted the court's decision in *Alabama Power*. That case addressed, in part, the interpretation of "potential to emit" in the definition of major source in the prevention of significant deterioration (PSD) regulations (also part of the CAA, but unrelated to hazardous air pollutant regulations). The court found that EPA "must look to the facility's 'design capacity' a concept which not only includes a facility's maximum productive capacity * * * but also takes into account the anticipated functioning of the air pollution control equipment designed into the facility." (*Alabama Power*, 636 F.2d at 353). The commenter has interpreted this statement to mean that only controls that were part of the original design of the facility can be taken into account when calculating potential to emit. Nowhere does the court state or even imply such a result in its decision. The commenter failed to take into account that the PSD regulations define a *preconstruction* permitting process. Because the air emission sources under consideration in the PSD process have yet to be constructed, the permitting process must necessarily deal with only designs of future air emission sources. We believe the court's language reflects only this aspect of the PSD review process, not the interpretation given by the commenter.

The NESHAP program, on the other hand, is concerned with air emission sources already in existence, as well as new sources. If we were to apply the wording of *Alabama Power* to the NESHAP program, our interpretation would be that the phrase "designed into the facility" means any air emission control equipment in use at the facility at the time a major source determination must be made, not the interpretation given by the commenter. This is reflected in our memorandum [1] on the interim policy on federal enforceability of limitations on potential to emit. In this memorandum, we stated:

[T]he EPA regulations provide that "controls" (*i.e.*, both pollution control equipment and operational restrictions) that limit a source's maximum capacity to emit a pollutant may be considered in determining its potential to emit. Historically, large numbers of new or modified sources that otherwise would be subject to PSD and NSR permitting requirements have limited their PTE in order to obtain "synthetic minor" status and thereby avoid major source requirements. With the advent of operating permit programs under Title V and the MACT program under section 112, many sources that otherwise would be subject to these new requirements under the Clean Air Act Amendments of 1990 also have obtained, or plan to obtain, PTE limits to avoid coverage.

The phrase "have obtained, or plan to obtain" implies that these sources will be adding controls to limit emissions. Since these controls would be added to an existing facility, they could not have been designed into the facility before it was ever constructed. Thus, the commenter's interpretation is incorrect, and we have made no changes for the final rule in response to this comment.

Comment: One commenter requested that a definition for "process vent" be added to the final rule. Additionally, the commenter further argued that if EPA cannot exclude research and development vents from the definition of process vents, then the final rule must provide an exemption for research and development activities consistent with section 112(c)(7) of the CAA.

A second commenter was also concerned with the absence of a definition for process vent. The commenter pointed out that the absence of a definition results in ambiguity regarding compliance obligations. The commenter also suggested that a process vent definition would allow EPA to exclude categories of emission points with negligible emissions potential.

Response: We agree that a definition of "process vent" would be beneficial in determining which emission points at a semiconductor manufacturing facility are subject to the emission limitations in 40 CFR 63.7184 of the final rule. Because the affected source is defined in terms of semiconductor manufacturing process units (see 40 CFR 63.7182), the process vents subject to regulation necessarily must originate from these process units. Therefore, we have included the following definition to 40 CFR 63.7195: *Process vent* means the point at which HAP emissions are released to the atmosphere from a semiconductor manufacturing process unit or storage tank by means of a stack, chimney, vent, or other functionally equivalent opening. The HAP emission points originating from wastewater treatment equipment, other than storage tanks, are not considered to be a process vent, unless the wastewater treatment equipment emission points are connected to a common vent or exhaust plenum with other process vents.

We do not believe any of the other process vent exemptions requested by these commenters are appropriate. Research and development operations are considered to be part of the overall semiconductor manufacturing process unless they are stand alone operations. We believe that relief valve discharge points, process analyzers, and conservation vents can be adequately connected to process vent exhaust ducts, if this is not already the case. Emergency electrical generators are not included in the definition of semiconductor manufacturing process unit, so there is no need to exclude them from the definition of process vent.

Comment: One commenter was concerned about the broad definition of "control device" in 40 CFR 63.981(a). According to the commenter, this paragraph could be interpreted to mean that certain devices that are part of the process (not an add-on control device) would be subject to the rule.

Response: We agree that there are certain devices used by the semiconductor industry that could be construed as control devices but are in fact an inherent part of the process, and that clarification is necessary in the final rule. In response, we have included the following definition to 40 CFR 63.7195: *Control device* means a combustion device, recovery device, recapture device, or any combination of these devices used for the primary purpose of reducing emissions to comply with this subpart. Devices that are inherent to a process or are integral to the operation of a process are not considered control devices for the purposes of this subpart, even though these devices may have the secondary effect of reducing emissions.

Comment: One commenter objected to the EPA's approach of using area source information to establish the MACT floor as being inconsistent with section 112(d)(3) of the CAA. The commenter believed that area sources are not part of the semiconductor manufacturing category for major sources and should not be relied on for establishing the MACT floor.

Response: Section 112(a)(1) of the CAA defines major source as "any stationary source or group of stationary sources * * * that emits or has the potential to emit considering controls, in the aggregate, 10 tpy or more of any hazardous air pollutant or 25 tpy or more of any combination of hazardous air pollutants." An area source is then defined in section 112(a)(2) as any stationary source that is not a major source. The facilities which we used to establish the MACT floor were "synthetic minor" sources, meaning that they reduced their potential to emit below the major source threshold (here, through the use of add-on control devices and material substitution). Without these controls, these facilities

[1] "Release of Interim Policy on Federal Enforceability of Limitations on Potential to Emit" (January 22, 1996) (available at *http://www.epa.gov/ttn/oarpg/t5/memoranda/pte122.pdf*).

would have the potential to emit at major source levels.

We disagree that the MACT floors must be based solely on major sources of HAP emissions. Section 112(d)(1) of the CAA directs us to promulgate rules for categories of major and area sources of HAP emissions. Then, section 112(d)(2) mandates that these standards "shall require the maximum degree of reduction in emissions * * * achievable for new or existing sources." Section 112(d)(3) specifies how we are to determine the maximum degree of emission reduction and describes it as "not less stringent than the emission control that is achieved in practice by the best controlled similar source" for new sources, and for existing sources describes it as "the average emission limitation achieved by the best performing 12 percent of the existing sources * * *" Even though Congress saw fit to distinguish between major and area sources in many other places in section 112 of the CAA, they specifically did not require that the floor be based on major sources. Throughout section 112(d), Congress simply used the term "source." We interpret this to mean that Congress left it to our discretion to determine the most appropriate sources on which to base the MACT floors. Accordingly, for the proposed rule we used both major sources and synthetic minor sources as the basis of the MACT floors. We believe our interpretation of section 112(d) of the CAA is correct, and no changes were made for the final rule as a result of these comments.

Comment: One commenter contended that EPA may not set floors for process vents based on the technology of thermal oxidizers, but must identify the best performing process vents, determine their actual performance, and calculate floors based on the average of that performance. Another commenter questioned the validity of establishing a single concentration for total HAP emissions from process vents and requested that different control and concentration limits be set for the organic HAP and inorganic HAP emissions.

Response: After reviewing the procedure we used to establish the MACT floors in light of these comments, we agree that we should first establish a MACT floor for both organic and inorganic HAP emissions from process vents (other than storage tanks) and then evaluate the appropriate emission limits for each. Based on a revised analysis, we calculated the MACT floor for organic process vents to be 98 percent control, or an organic HAP emission limit of 20 ppmv, which were the emission limits in the proposed rule. For inorganic HAP, we calculated the MACT floor to be 95 percent control or an inorganic emission limit of 0.42 ppmv. We have written 40 CFR 63.7184 of the final rule to reflect these revised MACT floors.

Comment: One commenter had several concerns with the approach used to establish the MACT floor for storage tanks. The commenter believed that area source semiconductor manufacturing facilities and HCl production sources are not part of the major source semiconductor manufacturing category and should not have been relied on to set the storage tank MACT floor. Two commenters requested that any storage tank limits should be limited specifically to tanks storing HCl or hydrofluoric acid (HF).

Another commenter argued that EPA improperly based floors for storage tanks over 800 gallons on the performance of scrubbers. The commenter stated that EPA must identify the relevant best performing storage tanks, determine their actual performance, and recalculate floors for storage tanks over 800 gallons based on the average of that performance. The commenter also contended that EPA must conduct beyond-the-floor analysis for storage tanks under 800 gallons to determine the maximum degree of emissions reductions achievable.

One commenter argued that any final rule should exclude hazardous waste storage tanks and vessels storing wastewater. The commenter contended that EPA has not made the required MACT finding for hazardous waste storage tanks and vessels storing wastewater. The commenter further argued that hazardous waste storage vessels and vessels storing wastewater have low HAP concentrations and do not warrant regulation beyond RCRA requirements.

Response: We agree that the procedure outlined by these commenters is the best procedure for determining the MACT floors, assuming that the appropriate data are available. In the case of storage tanks, we had no such data. The only data the industry could provide to us were the size of the tank, contents of the tank, and whether emissions from the tank were controlled. No performance data were available for the tank emission controls used by the semiconductor industry. For these reasons, we used data on the performance of the most representative similar source for which data were available, which were for scrubbers on HCl storage tanks obtained from the HCl manufacturing industry. Based on these comments, we now believe it is more appropriate to develop separate MACT floors for the different types of storage tanks in the semiconductor industry, and that it was inappropriate to use storage tanks from the HCl production industry as the most representative similar source.

It was always our intent to include all storage and wastewater tanks containing HAP in the affected source. However, based on the additional information provided by the industry, we have concluded that it was not appropriate to develop one MACT floor for all types of tanks due to the wide range of emissions from the each type of tank. While we cannot exempt an emission source solely due to the low annual emissions from that source, we thought that the MACT floor level of control could be influenced by the level of emissions from each type of tank and the existing regulations (*i.e.*, RCRA) to which some tanks may be subject. Therefore, we developed separate MACT floors for chemical storage tanks (including waste storage tanks regulated under RCRA), wastewater storage tanks, and wastewater treatment tanks.

We found that the MACT floor level of control for both chemical storage tanks and wastewater storage tanks, based on the top five best performing sources in each data set, is the same for each type of tank. The level of control is to reduce emissions through the use of a scrubber and is identical to the level of control used to establish the emission limits as proposed. However, based on other comments we received, we decided not to use the same procedure to establish the emission limits for the final rule. For wastewater treatment tanks, we determined the MACT floor level of control to be no emissions reduction.

The data set we used to establish the original MACT floor for storage tank emissions included the type of control (*e.g.*, scrubbers), but no information on the performance of the control devices or pollutant concentration in the outlet streams. In order to establish emission limits, we previously relied on the performance of controls used by the HCl production industry on HCl storage tanks. We used these data because the majority of tanks reported by the semiconductor industry contained HCl as well. We considered the HCl production industry data to be the most representative similar source for which we had data.

The comments we received questioned whether these storage tanks were representative, similar sources. In response to these comments, we further investigated the similarities and differences of the semiconductor manufacturing industry storage tanks

and the HCl production industry tanks. We first determined that there is a large size differential between the tanks used by the semiconductor industry and those used by the HCl production industry. The largest reported semiconductor industry storage tank was 16,000 gallons, and most were less than 10,000 gallons. In contrast, most of the storage tanks reported by the HCl production industry ranged from 200,000 gallons to over 2 million gallons. We then determined that the HCl stored by the semiconductor industry was often diluted, while the HCl production industry almost exclusively stored concentrated HCl. Based on the larger tank size and the higher concentration of material stored, the emission streams from the HCl production industry storage tanks will have a considerably higher pollutant concentration than from the semiconductor industry storage tanks. We believe this is a more important consideration when establishing emission limits than simply looking at the similarity of the material stored. Thus, we expect that the emissions streams from the semiconductor manufacturing industry storage tanks will have a very low concentration of pollutants.

Since the semiconductor industry storage tank emission streams will have similar characteristics to those of process vents (*i.e.*, low pollutant concentration), we now believe the most representative similar sources for evaluating the MACT floor for storage tanks are the semiconductor industry process vents. Therefore, in response to the comments concerning our use of HCl production industry storage tanks as the most representative similar source, we are adopting the process vent inorganic HAP emission limits for storage tanks in the final rule.

We also agree that we should have given further consideration to controls more stringent than the MACT floor for storage tanks less than 800 gallons (now 1,500 gallons in the final rule as discussed below) and wastewater treatment tanks. The MACT floor for both of these types of tanks was determined to be no control. However, controls more stringent than the MACT floor (*i.e.*, scrubbers) are technically feasible as demonstrated by the data provided by the industry on tanks greater than 1,500 gallons.

In order to include emission limits more stringent than the MACT floor level of control in the final rule, they must be feasible on both a technical and cost basis. Technical feasibility is assumed based on similar control on larger tanks as reported by the industry. To evaluate cost feasibility, we estimated the HAP emissions from a 1,500 gallon tank containing concentrated HCl, assuming one complete turnover per day. These parameters will result in the maximum amount of HAP emissions from the tank that we would expect for the semiconductor manufacturing industry. We then estimated the cost of a scrubber to control these emissions by 99 percent. Finally, we calculated the cost per ton of additional HAP emission reduction achieved above the MACT floor level of control, which was more than $285,000 per ton. Based on this result, we considered this level of control to be infeasible on a cost basis and did not require emission control more stringent than the MACT floor for storage tanks less than 1,500 gallons or wastewater treatment tanks in the final rule.

We made an additional change for the final rule based on our revised storage tank MACT floor analysis. Because we eliminated several tanks from the data set used in the MACT floor analysis, the cutoff for the smallest size tank for which the final rule applies increased from 800 gallons to 1,500 gallons.

While the storage tanks that were used to establish the MACT floor level of control stored either HCl or HF, we believe this level of control is applicable to any material stored by a semiconductor manufacturing facility. Therefore, we do not believe that the emission limits must necessarily be limited to these two chemicals, as suggested by one of the commenters.

In our final analysis, we determined that the level of control already existing on waste storage tanks regulated under RCRA is equivalent to the storage tank MACT floor level of control. We also determined that the MACT floor for wastewater treatment tanks was no emissions reduction. Accordingly, we excluded both types of tanks from any requirements in the final rule. We added the following definition (based on the definition of "tank" in 40 CFR 63.901, (subpart OO—National Emission Standards for Tanks-Level 1) and 40 CFR 63.1101 (subpart YY—National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards)) for "storage tank" to 40 CFR 63.7195 that clarifies which tanks we intended to be covered under the final rule: *Storage* tank means a stationary unit that is constructed primarily from nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provides structural support and is designed to hold an accumulation of liquids or other materials used in or generated by a semiconductor manufacturing process unit. The following are not storage tanks for the purposes of the final rule:

- Tanks permanently attached to motor vehicles such as trucks, railcars, barges, or ships;
- Flow-through tanks where wastewater undergoes treatment (such as pH adjustment) before discharge, and are not used to accumulate wastewater;
- Bottoms receiver tanks; and
- Surge control tanks.

Comment: One commenter reiterated a previous request for EPA to delist the Semiconductor Manufacturing source category and provided information to support their request. The commenter claimed that this information shows that there will be no stand alone semiconductor manufacturing facilities. Therefore, since EPA listed this category on the MACT source category list at a time when there were stand alone facilities that were major sources, the basis for listing the category no longer exists. The commenter cited the preamble language from the initial source category listing notice (57 FR 31576, July 16, 1992) and the first notice revising the list (61 FR 28200, June 4, 1996) to support their interpretation of when a category should be included on the source category list. The commenter stated that if a stand alone major source did come into existence in the future, EPA could promulgate a MACT standard at that time. Additionally, the commenter pointed out that case-by-case MACT determinations under section 112(g) of the CAA could also be used to control emissions from such a source.

The commenter also pointed to other EPA actions to support their position. The commenter noted that EPA guidance issued after the National Mining Association court case (*National Mining Association* v. *U.S. EPA*, 59 F.3d 1351 (D.C. Cir. 1995)) states that section 112(d) standards should be applied to source categories that contain stand alone major sources or that have sources "commonly located" at major source facilities. The commenter also noted that EPA, in promulgating MACT standards for industrial process cooling towers (IPCT), had found that co-location of an IPCT on a major source site is not sufficient to trigger applicability of the rule, rather, the IPCT must be co-located and an integral part of the facility.

The commenter disagreed with EPA's interpretation that a source category delisting can proceed only under section 112(c)(9) of the CAA. The commenter believed that EPA has a non-discretionary duty under section

112(c)(1) to periodically revise the list in response to new information. Under the provisions specified in section 112(c)(1), which the commenter believes are wholly separate from the delisting procedure in section 112(c)(9), EPA has the authority and the latitude to remove a previously listed source category from the MACT standard source category list.

Response: In the preamble to the proposed rule for semiconductor manufacturing, we acknowledged receipt of the pre-proposal request to remove the Semiconductor Manufacturing source category from the list of source categories and indicated we would respond in the final rulemaking (67 FR 30852, May 8, 2002).

Section 112(d)(1) of the CAA directs EPA to promulgate regulations for categories of major sources of HAP emissions. We interpret section 112(a) as requiring consideration of all emissions sources in determining major source status. Thus, if a source emits 10 tons or more per year of any single HAP or 25 tons or more per year of any combination of HAP, it is a major source. Similarly, if a source is co-located with sources in other categories and the aggregate emissions of the combined sources is 10 or more tons per year of a single HAP or 25 tons or more per year of any combination of HAP, that group of co-located sources is a major source. This interpretation is consistent with the legislative history on the definition of "major source," which indicates clearly that all portions of a major source are subject to MACT even if, standing alone, individual portions of that source would not qualify as major. [136 Cong. Rec. S. 16927 (October 27, 1990)].

The definition of major source also includes provisions to assure that stationary sources which would otherwise be subject to the emissions standards are not excluded from control requirements as the result of arbitrary subdivision or description of the source. A stationary source potentially subject to an emissions standard because it emits a listed air pollutant is to be defined to include all emission points and units of such source located within a contiguous area and under common control.

Because the statute instructs EPA to consider co-located sources as major sources, we believe we must list and promulgate standards for source categories that are major sources as a result of co-location. Accordingly, when we published the initial list of source categories, we "includ[ed] categories of major sources where there was reasonable certainty that at least one stationary source is a major source or where sources in the category [were] commonly located on the premises of major sources." (57 FR 31576, July 16,1992). The EPA continues to believe that major source determinations must be based on facility-wide emissions and that a major source can be either a stand alone major source or co-located with other sources that in combination emit or have the potential to emit over the major source threshold.

We disagree with the commenter's reading of the preamble to the IPCT MACT standard. In promulgating the MACT standard, we said that even though no individual source in the IPCT source category is itself a major source, we promulgated a MACT standard in light of IPCT being co-located with other major sources of HAP (59 FR 46339, September 8, 1994). The IPCT MACT provides clear precedent both for promulgating a semiconductor MACT standard and to not remove the Semiconductor Manufacturing source category from the list of source categories.

Accordingly, because section 112(d) requires EPA to promulgate MACT standards for all major sources, and since the Semiconductor Manufacturing source category is a category of major sources, albeit, because existing sources are co-located with other sources that in combination emit or have the potential to emit over the major source thresholds, EPA will not revise the list of source categories to remove the Semiconductor Manufacturing source category.

Finally, we also believe this source category is not static and that changes (either economic or process) may trigger operational changes that could result in increased HAP emissions. Thus, it is not entirely clear whether those sources that are currently "synthetic area sources" will continue to be "synthetic area sources." And accordingly, it is not inconceivable that the MACT standards promulgated today will eventually be applicable to more than the one currently co-located facility. In addition, there is always the possibility of new major sources being constructed in the future.

Comment: One commenter requested that EPA reconsider delisting this source category using *de minimis* principles under section 112(c)(1) of the CAA. The commenter proposed exemption of all nonmajor semiconductor process units from regulation in a manner consistent with the approach to applicability in section 112(g) of the CAA.

Response: The commenter's suggested *de minimis* cutoff levels are inconsistent with the CAA's prescribed method for determining the MACT floor. We do not believe that the CAA authorizes exempting an emission source solely due to the low annual emissions from that source. The outlet concentration limits for both inorganic and organic emissions serve as the minimum applicable limits for the affected sources. If the outlet concentration is below the applicable emission limit, no controls are required to demonstrate compliance.

IV. What Are the Final Standards?

A. What Is the Source Category?

The Semiconductor Manufacturing source category includes operations used to manufacture p-type and n-type semiconductors and active solid-state devices from a wafer substrate. Research and development activities located at a site manufacturing p-type and n-type semiconductors and active solid-state devices are integrated into the manufacturing process (that is, they are not stand alone operations), and these are included in the definition of semiconductor manufacturing. Examples of semiconductor or related solid-state devices include semiconductor diodes, semiconductor stacks, rectifiers, integrated circuits, and transistors. The source category includes all manufacturing from crystal growth through wafer fabrication, and test and assembly.

The crystal growing stage is where crystalline wafers of silicon or other specific semiconducting materials are manufactured for use as the substrate in the wafer fabrication process. Crystal growing begins with storage of the raw materials (usually trichlorosilane, which is refined from ordinary sand) and ends with the final polishing of a wafer.

The wafer fabrication process is where a group of integrated circuits are created on the wafer through a series of pattern-forming processes. Wafer fabrication begins at the point where the wafer receives its first protective oxidative layer and ends when a functional integrated circuit or circuits have been created on a wafer.

The test and assembly process is the final step in the integrated circuit manufacturing process and begins when a wafer is cut into individual chips. The chips are then mounted onto a metal frame, connected to the leads, and enclosed in a protective housing. The process endpoint is the last test performed at an assembly facility to verify proper function of a completed integrated circuit housing.

B. What Is the Affected Source?

We define an affected source as a stationary source, group of stationary sources, or part of a stationary source to which specific NESHAP apply. Within a source category, we select the specific emission sources (emission points or groupings of emission points) that will make up the affected source for that category. To select these emission sources, we mainly consider the constituent HAP and quantity emitted from individual or groups of emission points.

For the Semiconductor Manufacturing source category, the affected source includes the collection of all semiconductor manufacturing units used to manufacture p-type and n-type semiconductors and active solid-state devices from a wafer substrate, research and development activities integrated into the manufacturing process at a semiconductor manufacturing site, and storage tanks located at a major source.

A semiconductor manufacturing process unit is the equipment assembled and connected by duct work or hard piping including: Furnaces and associated unit operations; associated wet and dry work benches; associated recovery devices; feed, intermediate, and product storage tanks; product transfer racks and connected ducts and piping; pumps, compressors, agitators, pressure-relief devices, sampling connection systems, open-ended valves or lines, valves, connectors, and instrumentation systems; and control devices. We have identified three distinct processes used in the manufacture of these semiconductors and devices: Crystal growing, wafer fabrication, and assembly and test. A semiconductor manufacturing unit is typically engaged in one of these processes.

C. What Are the Emission Standards?

Emission limits. We are promulgating standards that regulate HAP emissions from process vents and storage tank vents at semiconductor manufacturing facilities. The standards are the same for existing and new sources. All major sources must reduce process vent organic HAP outlet concentrations by 98 percent from their uncontrolled levels and reduce uncontrolled inorganic HAP outlet concentrations by 95 percent. As an alternative, process vents may be controlled to a level below 20 ppmv organic HAP and 0.42 ppmv inorganic HAP. In addition, all major sources must reduce storage tank vent HAP outlet inorganic HAP concentrations by 95 percent from their uncontrolled levels. As an alternative, storage tank vents may be controlled to a level below 0.42 ppmv inorganic HAP.

General Provisions. The General Provisions (40 CFR part 63, subpart A) also apply to you as outlined in the final rule. The General Provisions codify certain procedures and criteria for all 40 CFR part 63 NESHAP. The General Provisions contain administrative procedures, preconstruction review procedures for new sources, and procedures for conducting compliance-related activities such as notifications, reporting, and recordkeeping, performance testing, and monitoring. The final rule refers to individual sections of the General Provisions to emphasize key sections that you should be aware of. However, unless otherwise specifically excluded in the final rule, all of the relevant General Provisions requirements apply to you.

V. When Must I Comply With the Final Rule?

Existing semiconductor manufacturing affected sources must comply with the final rule no later than 3 years after May 22, 2003. The effective date is May 22, 2003. New or reconstructed affected sources must comply upon start-up or May 22, 2003, whichever is later. Details of the compliance requirements can be found in the General Provisions, as outlined in Table 2 to the subpart.

VI. What Are the Testing and Initial Continuous Compliance Requirements?

In addition to the specific testing and monitoring requirements specified below for the affected source, the final rule adopts the testing requirements specified in 40 CFR 63.7.

We are promulgating testing and initial and continuous compliance requirements that are, where appropriate, based on procedures and methods that we have previously developed and used for sources similar to those for which standards are being promulgated today. For example, we are promulgating compliance determination procedures, performance tests, and test methods to determine what level of control a process vent needs to achieve to demonstrate compliance with the standards. We are promulgating compliance procedures to determine process vent and storage tank vent flow rates and HAP concentrations. The promulgated test methods parallel what we have used for process vents in previous organic HAP emissions standards (*e.g.*, the HON) and inorganic HAP emission standards. For measuring vent stream flow rate, you must use Method 2, 2A, 2C, 2D, 2F, or 2G of 40 CFR part 60, appendix A. For measuring total vent stream organic HAP concentration to determine whether it is below a specified level, you must use Method 18 of 40 CFR part 60, appendix A. For measuring the total HAP concentration of emission streams with inorganic HAP to determine if it is below a specified level, you must use Method 320 of 40 CFR part 60, appendix A. For measuring inorganic HAP that are hydrogen halides, such as HCl or HF, you must use Method 26A of 40 CFR part 60, appendix A.

Additionally, we are requiring initial performance tests for all process vent and storage tank vent HAP emission control devices other than flares and certain boilers and process heaters. For vents controlled using flares, we are not requiring performance tests because we have developed design specifications that ensure these devices will achieve 98 percent destruction efficiency. As with the HON, we are not promulgating a requirement to perform an initial performance test for boilers and process heaters larger than 44 megawatts (MW) because they operate at high temperatures and residence times. In general, the higher the temperature and residence time, the greater the level of HAP destruction that is achieved by a control device. Therefore, boilers and process heaters larger than 44 MW easily achieve the required 98 percent destruction efficiency or the alternative requirement to reduce outlet concentrations below 20 ppmv.

For all other types of control devices, the final rule requires you to conduct a performance test to demonstrate that the control device can achieve the required control level and to establish operating parameters to be maintained to demonstrate continuous compliance. The testing requirements for semiconductor manufacturing list the parameters that can be monitored for the common types of combustion devices. For other control devices, we require that you establish site-specific parameter ranges for monitoring purposes through the Notification of Compliance Status report and through the facility's operating permit. Parameters selected are required to be good indicators of continuous control device performance.

VII. What Notification, Recordkeeping, and Reporting Requirements Must I Follow?

We are promulgating notification, recordkeeping, and reporting requirements in accordance with 40 CFR part 63, subpart A and other previously promulgated NESHAP for similar source categories.

We are requiring that owners or operators of semiconductor manufacturing affected sources submit the following four types of reports: An Initial Notification report, a Notification of Compliance Status report, periodic compliance reports, reports of changes and other specified events. Records of reported information and other information necessary to document compliance with the promulgated standards are required to be kept for 5 years. Equipment design records would be required to be kept for the life of the equipment.

For the Initial Notification report, we are requiring that you list the semiconductor manufacturing operations at your facility, and the provisions of the final rule that may apply. The Initial Notification report must also state whether your facility can achieve compliance by the specified compliance date. You must submit this notification by May 21, 2004, for existing sources, and within 180 days before commencement of construction or reconstruction of an affected source.

For the Notification of Compliance Status report, we are requiring that you submit the information necessary to demonstrate that compliance has been achieved, such as the results of performance tests and design analyses. For each test method that you use for a particular kind of emission point (*e.g.*, process vent), you must submit one complete test report. This notification must also include the specific range established for each monitored parameter for each emission point for demonstrating continuous compliance, and the rationale for why this range indicates proper operation of the control device.

We are requiring that you submit semiannual compliance reports. These reports must include a statement that no deviations from the emission limitations occurred during the reporting period, and that no continuous monitoring system (CMS) was inoperative, inactive, malfunctioning, out-of-control, repaired, or adjusted. Additionally, a statement must be included if you had a startup, shutdown, or malfunction during the reporting period, and you took actions consistent with your SSMP. For process and storage tank vents, records of continuously monitored parameters must be kept. Records that such inspections or measurements were performed must be kept, but results are included in your periodic report only if there is a deviation from the operating limit. For each deviation from an emission limit, the semiannual compliance reports must document the time periods of each deviation; its cause; whether it occurred during a period of startup, shutdown, or malfunction; and whether and what time periods the CMS was inoperative or out of control.

We are requiring that you submit an immediate startup, shutdown, and malfunction report if you had a startup, shutdown, or malfunction that is not consistent with your SSMP.

Other reporting requirements include reports to notify the regulatory authority before or after a specific event (*e.g.*, if a process change is made, requests for extension of repair period).

VIII. What Are the Environmental, Energy, and Economic Impacts of the Final Rule?

This section presents projected impacts for existing sources only. We did not calculate impacts for new sources because we do not project any new major sources will commence construction in the foreseeable future. We expect that any new sources will have HAP emissions below major source thresholds. The industry trend over the past several years has been that HAP emissions have decreased while semiconductor production has increased. As a result, only one source in the industry is still a major source of HAP, and only because it is collocated at a facility with other HAP-emitting operations. We do not project that any other new semiconductor sources will be built on the site of another major HAP emitting operation. We also project that the types of technologies that have evolved (*e.g.*, producing larger wafers), which are in general emit fewer HAP per chip manufactured, will continue.

A. What Are the Secondary and Energy Impacts?

We do not anticipate any significant increase in national annual energy usage as a result of the final rule. Energy impacts include changes in energy use, typically increases, and secondary air impacts associated with increased energy use. Increases in energy use are associated with the operation of control equipment—in this case, the use of thermal oxidizers and scrubbers—to control process vents. Secondary air impacts associated with increased energy use are the emission of particulates, sulfur oxides (SO_X), and nitrogen oxides (NO_X). These secondary impacts are associated with power plants that would supply the increased energy demand. Since we project the final rule will apply to only one existing major source, no significant new control equipment requirements are expected. Therefore, secondary and energy impacts will be negligible.

B. What Are the Cost Impacts?

Although we estimate there are approximately 127 facilities engaged in semiconductor production, we estimate that the source category contains only one existing major source subject to the regulatory provisions specified under the final rule. The remaining facilities are either area sources or synthetic minor sources, which are sources that have the potential to emit above major source thresholds but have taken enforceable permit conditions limiting their HAP emissions to below these major source thresholds.

We estimate the annualized cost for the one major source affected by this final rule to be $2,300, solely to comply with monitoring, inspecting, reporting and recordkeeping requirements. (**Note:** This source meets the CAA section 112 definition of "major source" not because it emits 10 tons or more of any one HAP or 25 tons or more of HAP in aggregate, but because it is collocated at a plant site that is a major source subject to other NESHAP. We estimate this semiconductor manufacturing source emits less than one ton of HAP per year.) We project there will be no capital or operating costs for control equipment. Further, we estimate a one-time total cost of $33,000 for the approximately 126 non-major sources to read the rule. We estimate that there will be no impacts on new sources because we do not project that any new major sources will be built over the next 3 years.

C. What Are the Economic Impacts?

The final rule applies to only one major existing source, and no significant new control equipment requirements are expected. We estimate the MIRR costs for this facility to be only $6,956 over a 3-year period. Therefore, no economic impact on the industry is expected.

IX. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), we must determine whether the regulatory action is "significant" and therefore subject to review by the Office of Management and Budget (OMB) and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy,

productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligation of recipients thereof; or

(4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review.

B. Paperwork Reduction Act

The information collection requirements in the final rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 2042.01) and a copy may be obtained from Susan Auby by mail at the Collection Strategies Division (2822), U.S. EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the internet at *http://www.epa.gov/icr*. The information requirements are not *enforceable* until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies set forth in 40 CFR part 2, subpart B.

The annual monitoring, reporting, and recordkeeping burden for this collection, as averaged over the first 3 years after the effective date of the rule, is estimated to be 41 labor hours per year at a total annual cost of $2,319. This estimate includes a one-time plan for demonstrating compliance, annual compliance certification reports, notifications, and recordkeeping. Total labor burden associated with the monitoring requirements over the 3-year period of the ICR are estimated at $6,956.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR, chapter 15. The OMB control number for the information collection requirements in this rule will be listed in an amendment to 40 CFR part 9 in a subsequent **Federal Register** document after OMB approves the ICR.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule. The EPA has also determined that this final rule will not have a significant economic impact on a substantial number of small entities. For purposes of assessing the impacts of this final rule on small entities, small entity is defined as: (1) A small business according to Small Business Administration (SBA) size standards for NAICS code 334413 (*i.e.*, semiconductor crystal growing facilities, semiconductor wafer fabrication facilities, semiconductor test and assembly facilities) whose parent company has 500 or fewer employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities. Based on the above definition of small entities, the EPA has determined that there are no small businesses within this source category that would be subject to the final rule.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rule with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more to State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The maximum total annual cost of the final rule for any year has been estimated to be about $35,800. Thus, the final rule is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the standards contains no regulatory

requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires the EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. Thus, Executive Order 13132 does not apply to the rule. Although section 6 of Executive Order 13132 does not apply to the rule, EPA did consult with State and local officials to enable them to provide timely input in the development of the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires the EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175. No tribal governments own or operate semiconductor manufacturing facilities. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health & Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045 because it is based on technology performance and not on an assessment of health or safety risks. Furthermore, the final rule has been determined not to be "economically significant" as defined under Executive Order 12866.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. No. 104–113; 15 U.S.C. 272 note) directs the EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs EPA to provide Congress, through annual reports to the Office of Management and Budget (OMB), with explanations when an agency does not use available and applicable voluntary consensus standards.

The final rule involves technical standards. The EPA cites the following standards in this rule: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 18, 25, 25A, 26, 26A, and 320. Consistent with the NTTAA, EPA conducted searches to identify voluntary consensus standards in addition to these EPA method. No applicable voluntary consensus standards were identified for EPA Methods 1A, 2A, 2D, 2F, 2G. The search and review results have been documented and are placed in the docket A–97–15 for the final rule.

The voluntary consensus standard ASTM D6420–99, "Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (GC/MS)," is appropriate in the cases described below for inclusion in this rule in addition to EPA Method 18 codified at 40 CFR Part 60 Appendix A for the measurement of toluene and total organic HAP.

Similar to EPA's performance-based Method 18, ASTM D6420–99 is also a performance-based method for measurement of gaseous organic compounds. However, ASTM D6420–99 was written to support the specific use of highly portable and automated GC/MS. While offering advantages over the traditional Method 18, the ASTM method does allow some less stringent criteria for accepting GC/MS results than required by Method 18. Therefore, ASTM D6420–99 is a suitable alternative to Method 18 only where: (1) The target compound(s) are those listed in Section 1.1 of ASTM D6420–99, and (2) the target concentration is between 150 ppbv and 100 ppmv.

For target compound(s) not listed in Section 1.1 of ASTM D6420–99, *but potentially detected by mass spectrometry*, the regulation specifies that the additional system continuing calibration check after each run, as detailed in Section 10.5.3 of the ASTM method, must be followed, met, documented, and submitted with the data report even if there is no moisture condenser used or the compound is not considered water soluble. For target compound(s) not listed in Section 1.1 of ASTM D6420–99, and not amenable to detection by mass spectrometry, ASTM D6420–99 does not apply.

As a result, EPA will cite ASTM D6420–99 in this rule. The EPA will also cite Method 18 as a gas chromatography (GC) option in addition to ASTM D6420–99. This will allow the continued use of GC configurations other than GC/MS.

In addition to the voluntary consensus standard EPA cites in this rule, the search for emissions measurement procedures identified 14 other voluntary consensus standards. The EPA determined that 11 of these 14 standards identified for measuring emissions of the HAPs or surrogates subject to emission standards in this rule were impractical alternatives to EPA test methods for the purposes of this rule. Therefore, EPA does not intend to adopt these standards for this purpose. The reasons for this

determination for the 11 methods are discussed in the docket.

Two of the 14 voluntary consensus standards identified in this search were not available at the time the review was conducted for the purposes of the final rule because they are under development by a voluntary consensus body: ASME/BSR MFC 13M, "Flow Measurement by Velocity Traverse," for EPA Method 2 (and possibly 1); and ASME/BSR MFC 12M, "Flow in Closed Conduits Using Multiport Averaging Pitot Primary Flowmeters," for EPA Method 2.

The voluntary consensus standard ASTM D6348–98, "Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform (FTIR) Spectroscopy," has been reviewed by the EPA as a potential alternative to EPA Method 320. Suggested revisions to ASTM D6348–98 were sent to ASTM by the EPA that would allow the EPA to accept ASTM D6348–98 as an acceptable alternative. The ASTM Subcommittee D22–03 is currently undertaking a revision of ASTM D6348–98. Because of this, we are not citing this standard as a acceptable alternative for EPA Method 320 in the final rule today. However, upon successful ASTM balloting and demonstration of technical equivalency with the EPA FTIR methods, the revised ASTM standard could be incorporated by reference for EPA regulatory applicability. In the interim, facilities have the option to request ASTM D6348–98 as an alternative test method under 40 CFR 63.7(f) and 63.8(f) on a case-by-case basis.

Table 1 to subpart BBBBB lists the EPA testing methods included in the final rule. Under 40 CFR 63.7(f) and 63.8(f) of subpart A, a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any of the EPA testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the SBREFA, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The rule will be effective May 22, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine T. Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Part 63 is amended by adding subpart BBBBB to read as follows:

Subpart BBBBB—National Emission Standards for Hazardous Air Pollutants for Semiconductor Manufacturing

Sec.

What This Subpart Covers

63.7180 What is the purpose of this subpart?
63.7181 Am I subject to this subpart?
63.7182 What parts of my facility does this subpart cover?
63.7183 When do I have to comply with this subpart?

Emission Standards

63.7184 What emission limitations, operating limits, and work practice standards must I meet?

Compliance Requirements

63.7185 What are my general requirements for complying with this subpart?
63.7186 By what date must I conduct performance tests or other initial compliance demonstrations?
63.7187 What performance tests and other compliance procedures must I use?
63.7188 What are my monitoring installation, operation, and maintenance requirements?

Applications, Notifications, Reports, and Records

63.7189 What applications and notifications must I submit and when?
63.7190 What reports must I submit and when?
63.7191 What records must I keep?
63.7192 In what form and how long must I keep my records?

Other Requirements and Information

63.7193 What parts of the General Provisions apply to me?
63.7194 Who implements and enforces this subpart?
63.7195 What definitions apply to this subpart?

Tables to Subpart BBBBB of Part 63

Table 1 to Subpart BBBBB of Part 63—Requirements for Performance Tests
Table 2 to Subpart BBBBB of Part 63—Applicability of General Provisions to Subpart BBBBB

What This Subpart Covers

§ 63.7180 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for semiconductor manufacturing facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission standards.

§ 63.7181 Am I subject to this subpart?

(a) You are subject to this subpart if you own or operate a semiconductor manufacturing process unit that is a major source of hazardous air pollutants (HAP) emissions or that is located at, or is part of, a major source of HAP emissions.

(b) A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit, considering controls, in the aggregate, any single HAP at a rate of 10 tons per year (tpy) or more or any combination of HAP at a rate of 25 tpy or more.

§ 63.7182 What parts of my facility does this subpart cover?

(a) This subpart applies to each new, reconstructed, or existing affected source that you own or operate that manufactures semiconductors.

(b) An affected source subject to this subpart is the collection of all semiconductor manufacturing process units used to manufacture p-type and n-type semiconductors and active solid-state devices from a wafer substrate, including research and development activities integrated into a semiconductor manufacturing process unit. A semiconductor manufacturing process unit includes the equipment assembled and connected by ductwork or hard-piping including furnaces and associated unit operations; associated wet and dry work benches; associated recovery devices; feed, intermediate, and product storage tanks; product transfer racks and connected ducts and piping; pumps, compressors, agitators, pressure-relief devices, sampling connecting systems, open-ended valves

or lines, valves, connectors, and instrumentation systems; and control devices.

(c) Your affected source is a new affected source if you commence construction of the affected source after May 8, 2002, and you meet the applicability criteria in § 63.7181 at the time you commence construction.

(d) Your affected source is a reconstructed affected source if you meet the criteria for "reconstruction," as defined in § 63.2.

(e) Your source is an existing affected source if it is not a new or reconstructed affected source.

§ 63.7183 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source, you must comply with this subpart according to paragraphs (a)(1) and (2) of this section.

(1) If you start up your affected source before May 22, 2003, then you must comply with the emission standards for new and reconstructed sources in this subpart no later than May 22, 2003.

(2) If you start up your affected source after May 22, 2003, then you must comply with the emission standards for new and reconstructed sources in this subpart upon startup of your affected source.

(b) If you have an existing affected source, you must comply with the emission standards for existing sources no later than 3 years from May 22, 2003.

(c) If you have an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP and an affected source subject to this subpart, paragraphs (c)(1) and (2) of this section apply.

(1) Any portion of your existing facility that is a new affected source as specified at § 63.7182(c), or a reconstructed affected source as specified at § 63.7182(d), must be in compliance with this subpart upon startup.

(2) Any portion of your facility that is an existing affected source, as specified at § 63.7182(e), must be in compliance with this subpart by not later than 3 years after it becomes a major source.

(d) You must meet the notification requirements in § 63.7189 and in subpart A of this part. You must submit some of the notifications (*e.g.*, Initial Notification) before the date you are required to comply with the emission limitations in this subpart.

Emission Standards

§ 63.7184 What emission limitations, operating limits, and work practice standards must I meet?

(a) If you have a new, reconstructed, or existing affected source, as defined in § 63.7182(b), you must comply with all applicable emission limitations in this section on and after the compliance dates specified in § 63.7183.

(b) *Process vents—organic HAP emissions.* For each process vent that emits organic HAP, other than process vents from storage tanks, you must limit organic HAP emissions to the level specified in paragraph (b)(1) or (2) of this section. These limitations can be met by venting emissions from your process vent through a closed vent system to any combination of control devices meeting the requirements of § 63.982(a)(2).

(1) Reduce the emissions of organic HAP from the process vent stream by 98 percent by weight.

(2) Reduce or maintain the concentration of emitted organic HAP from the process vent to less than or equal to 20 parts per million by volume (ppmv).

(c) *Process vents—inorganic HAP emissions.* For each process vent that emits inorganic HAP, other than process vents from storage tanks, you must limit inorganic HAP emissions to the level specified in paragraph (c)(1) or (2) of this section. These limitations can be met by venting emissions from your process vent through a closed vent system to a halogen scrubber meeting the requirements of §§ 63.983 (closed vent system requirements) and 63.994 (halogen scrubber requirements); the applicable general monitoring requirements of § 63.996; the applicable performance test requirements; and the monitoring, recordkeeping and reporting requirements referenced therein.

(1) Reduce the emissions of inorganic HAP from the process vent stream by 95 percent by weight.

(2) Reduce or maintain the concentration of emitted inorganic HAP from the process vent to less than or equal to 0.42 ppmv.

(d) *Storage tanks.* For each storage tank, 1,500 gallons or larger, you must limit total HAP emissions to the level specified in paragraph (d)(1) or (2) of this section if the emissions from the storage tank vent contains greater than 0.42 ppmv inorganic HAP. These limitations can be met by venting emissions from your storage tank through a closed vent system to a halogen scrubber meeting the requirements of §§ 63.983 (closed vent system requirements) and 63.994 (halogen scrubber requirements); the applicable general monitoring requirements of § 63.996; the applicable performance test requirements; and the monitoring, recordkeeping and reporting requirements referenced therein.

(1) Reduce the emissions of inorganic HAP from each storage tank by 95 percent by weight.

(2) Reduce or maintain the concentration of emitted inorganic HAP from the process vent to less than or equal to 0.42 ppmv.

(e) You must comply with the applicable work practice standards and operating limits contained in § 63.982(a)(1) and (2). The closed vent system inspection requirements of § 63.983(c), as referenced by § 63.982(a)(1) and (2), do not apply.

Compliance Requirements

§ 63.7185 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the requirements of § 63.7184 at all times, except during periods of startup, shutdown, or malfunction.

(b) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i).

(c) You must develop and implement a written startup, shutdown, and malfunction plan (SSMP). Your SSMP must be prepared in accordance with the provisions in § 63.6(e)(3).

(d) You must perform all the items listed in paragraphs (d)(1) through (3) of this section:

(1) Submit the necessary notifications in accordance with § 63.7189.

(2) Submit the necessary reports in accordance with § 63.7190.

(3) Maintain all necessary records you have used to demonstrate compliance with this subpart in accordance with § 63.7191.

§ 63.7186 By what date must I conduct performance tests or other initial compliance demonstrations?

For each process vent or storage tank vent emission limitation in § 63.7184 for which initial compliance is demonstrated by meeting a percent by weight HAP emissions reduction, or a HAP concentration limitation, you must conduct performance tests or an initial compliance demonstration within 180 days after the compliance date that is specified for your source in § 63.7183 and according to the provisions in § 63.7(a)(2).

§ 63.7187 What performance tests and other compliance procedures must I use?

(a) You must conduct each performance test in Table 1 to this subpart that applies to you as specified for process vents in § 63.982(a)(2) and storage tanks in § 63.982(a)(1). Performance tests must be conducted under maximum operating conditions or HAP emissions potential. Section 63.982(a)(1) and (2) only includes methods to measure the total organic regulated material or total organic carbon (TOC) concentration. The EPA Methods 26 and 26A are included in Table 1 to this subpart in addition to the test methods contained within § 63.982(a)(1) and (2). The EPA Method 26 or 26A must be used for testing regulated material containing inorganic HAP. Method 320 of 40 CFR part 63, appendix A, must be used to measure total vapor phase organic and inorganic HAP concentrations.

(b) If, without the use of a control device, your process vent stream has an organic HAP concentration of 20 ppmv or less or an inorganic HAP concentration of 0.42 ppmv or less, or your storage tank vent stream has an inorganic HAP concentration of 0.42 ppmv or less, you may demonstrate that the vent stream is compliant by engineering assessments and calculations or by conducting the applicable performance test requirements specified in Table 1 to this subpart. Your engineering assessments and calculations, as with performance tests (as specified in § 63.982(a)(1) and (2)), must represent your maximum operating conditions or HAP emissions potential and must be approved by the Administrator. You must demonstrate continuous compliance by certifying that your operations will not exceed the maximum operating conditions or HAP emissions potential represented by your engineering assessments, calculations, or performance test.

(c) If you are using a control device to comply with the emission limitations in § 63.7184 and the inlet concentration of HAP to the control device is 20 ppmv or less, then you may demonstrate that the control device meets the percent by weight HAP emission reduction limitation in § 63.7184(c)(1) or (d)(1) by conducting a design evaluation as specified in paragraph (i) of this section. Your design evaluation must represent your maximum operating conditions or HAP emissions potential and must be approved by the Administrator. You must demonstrate continuous compliance by certifying that your operations will not exceed the maximum operating conditions or HAP emissions potential represented by your design evaluation.

(d) During periods of startup, shutdown, and malfunction, you must operate in accordance with your SSMP.

(e) For each monitoring system required in this section, you must develop and submit for approval a site-specific monitoring plan that addresses the criteria specified in paragraphs (e)(1) through (3) of this section.

(1) Installation of the continuous monitoring system (CMS) sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last control device);

(2) Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system; and

(3) Performance evaluation procedures and acceptance criteria (*e.g.*, calibrations).

(f) In your site-specific monitoring plan, you must also address the procedural processes in paragraphs (f)(1) through (3) of this section.

(1) Ongoing operation and maintenance procedures in accordance with the general requirements of § 63.8(c)(1), (3), (4)(ii), (7), and (8);

(2) Ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d); and

(3) Ongoing recordkeeping and reporting procedures in accordance with the general requirements of § 63.10(c), (e)(1), and (e)(2)(i).

(g) You must conduct a performance evaluation of each CMS in accordance with your site-specific monitoring plan.

(h) You must operate and maintain the CMS in continuous operation according to the site-specific monitoring plan.

(i) *Design evaluation.* To demonstrate that a control device meets the required percent by weight inorganic HAP emission reduction limitation in § 63.7184(c)(1) or (d)(1), a design evaluation must address the composition of the inorganic HAP concentration of the vent stream entering the control device. A design evaluation also must address other vent stream characteristics and control device operating parameters as specified in any one of paragraphs (i)(1) through (5) of this section, depending on the type of control device that is used. If the vent stream is not the only inlet to the control device, the efficiency demonstration must also consider all other vapors, gases, and liquids, other than fuels, received by the control device.

(1) For a condenser, the design evaluation shall consider the vent stream flow rate, relative humidity, and temperature and shall establish the design outlet organic HAP compound concentration level, design average temperature of the condenser exhaust vent stream, and the design average temperatures of the coolant fluid at the condenser inlet and outlet. The temperature of the gas stream exiting the condenser must be measured and used to establish the outlet organic HAP concentration.

(2) For a carbon adsorption system that regenerates the carbon bed directly onsite in the control device such as a fixed-bed adsorber, the design evaluation shall consider the vent stream flow rate, relative humidity, and temperature and shall establish the design exhaust vent stream organic compound concentration level, adsorption cycle time, number and capacity of carbon beds, type and working capacity of activated carbon used for carbon beds, design total regeneration stream mass or volumetric flow over the period of each complete carbon bed regeneration cycle, design carbon bed temperature after regeneration, design carbon bed regeneration time, and design service life of carbon. For vacuum desorption, the pressure drop shall be included.

(3) For a carbon adsorption system that does not regenerate the carbon bed directly onsite in the control device such as a carbon canister, the design evaluation shall consider the vent stream mass or volumetric flow rate, relative humidity, and temperature and shall establish the design exhaust vent stream organic compound concentration level, capacity of carbon bed, type and working capacity of activated carbon used for carbon bed, and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule.

(4) For a scrubber, the design evaluation shall consider the vent stream composition, constituent concentrations, liquid-to-vapor ratio, scrubbing liquid flow rate and concentration, temperature, and the reaction kinetics of the constituents with the scrubbing liquid. The design evaluation shall establish the design exhaust vent stream organic compound concentration level and will include the additional information in paragraphs (i)(5)(i) and (ii) of this section for trays and a packed column scrubber.

(i) Type and total number of theoretical and actual trays;

(ii) Type and total surface area of packing for entire column, and for individual packed sections if column contains more than one packed section.

§ 63.7188 What are my monitoring installation, operation, and maintenance requirements?

If you comply with the emission limitations of § 63.7184 by venting the emissions of your semiconductor process vent through a closed vent system to a control device, you must comply with the requirements of paragraphs (a) and (b) of this section.

(a) You must meet the applicable general monitoring, installation, operation, and maintenance requirements specified in § 63.996.

(b) You must meet the monitoring, installation, operation, and maintenance requirements specified for closed vent systems and applicable control devices in §§ 63.983 through 63.995. If you used the design evaluation procedure in § 63.7187(i) to demonstrate compliance, you must use the information from the design evaluation to establish the operating parameter level for monitoring of the control device.

Applications, Notifications, Reports, and Records

§ 63.7189 What applications and notifications must I submit and when?

(a) You must submit all of the applications and notifications in §§ 63.7(b) and (c); 63.8(e), (f)(4) and (f)(6); and 63.9(b) through (e), (g) and (h) that apply to you by the dates specified.

(b) As specified in § 63.9(b)(2), if you start up your affected source before May 22, 2003, you must submit an Initial Notification not later than 120 calendar days after May 22, 2003.

(c) As specified in § 63.9(b)(3), if you start up your new or reconstructed affected source on or after May 22, 2003. you must submit an Initial Notification not later than 120 calendar days after you become subject to this subpart.

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin as required in § 63.7(b)(1).

(e) If you are required to conduct a performance test or other initial compliance demonstration, you must submit a Notification of Compliance Status according to § 63.9(h)(2)(ii) and according to paragraphs (e)(1) and (2) of this section.

(1) For each initial compliance demonstration that does not include a performance test, you must submit the Notification of Compliance Status before the close of business on the 30th calendar day following the completion of the initial compliance demonstration. If you used the design evaluation procedure in § 63.7187(i) to demonstrate compliance, you must include the results of the design evaluation in the Notification of Compliance Status.

(2) For each initial compliance demonstration required that includes a performance test conducted according to the requirements in Table 1 to this subpart, you must submit a notification of the date of the performance evaluation at least 60 days prior to the date the performance evaluation is scheduled to begin as required in § 63.8(e)(2).

§ 63.7190 What reports must I submit and when?

(a) You must submit each of the following reports that apply to you.

(1) *Periodic compliance reports.* You must submit a periodic compliance report that contains the information required under paragraphs (c) through (e) of this section, and any requirements specified to be reported for process vents in § 63.982(a)(2) and storage tanks in § 63.982(a)(1).

(2) *Immediate startup, shutdown, and malfunction report.* You must submit an Immediate Startup, Shutdown, and Malfunction Report if you had a startup, shutdown, or malfunction during the reporting period that is not consistent with your SSMP. Your report must contain actions taken during the event. You must submit this report by fax or telephone within 2 working days after starting actions inconsistent with you SSMP. You are required to follow up this report with a report specifying the information in § 63.10(d)(5)(ii) by letter within 7 working days after the end of the event unless you have made alternative arrangements with your permitting authority.

(b) Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report by the date according to paragraphs (b)(1) through (5) of this section.

(1) The first periodic compliance report must cover the period beginning on the compliance date that is specified for your affected source in § 63.7183 and ending on June 30 or December 31, whichever date is the first date following the end of the first 12 calendar months after the compliance date that is specified for your source in § 63.7183.

(2) The first periodic compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first 12 calendar months after the compliance date that is specified for your affected source in § 63.7183.

(3) Each subsequent periodic compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent periodic compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent periodic compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) The periodic compliance report must contain the information specified in paragraphs (c)(1) through (5) of this section.

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If there are no deviations from any emission limitations that apply to you, a statement that there were no deviations from the emission limitations during the reporting period and that no CMS was inoperative, inactive, malfunctioning, out-of-control, repaired, or adjusted.

(5) If you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSMP, your periodic compliance report must include the information in § 63.10(d)(5) for each startup, shutdown, and malfunction.

(d) For each deviation from an emission limitation that occurs at an affected source where you are not using a CMS to comply with the emission limitations, the periodic compliance report must contain the information in

paragraphs (d)(1) through (2) of this section.

(1) The total operating time of each affected source during the reporting period.

(2) Information on the number, duration, and cause of deviations (including unknown cause), if applicable.

(e) For each deviation from an emission limitation occurring at an affected source where you are using a CMS to demonstrate compliance with the emission limitation, you must include the information in paragraphs (e)(1) through (8) of this section.

(1) The date and time that each malfunction started and stopped, and the reason it was inoperative.

(2) The date and time that each CMS was inoperative, except for calibration checks.

(3) The date and time that each CMS was out-of-control, including the information in § 63.8(c)(8).

(4) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period, and the cause of the deviation.

(5) A summary of the total duration of the deviation during the reporting period, and the total duration as a percent of the total source operating time during that reporting period.

(6) A summary of the total duration of CMS downtime during the reporting period, and the total duration of CMS downtime as a percent of the total source operating time during the reporting period.

(7) An identification of each HAP that was monitored at the affected source.

(8) The date of the latest CMS certification or audit.

§ 63.7191 What records must I keep?

(a) You must keep the records listed in paragraphs (a)(1) through (3) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Notification of Compliance Status and periodic report of compliance that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunctions.

(3) Records of performance tests and performance evaluations as required in § 63.10(b)(2)(viii).

(b) For each CMS, you must keep the records listed in paragraphs (b)(1) through (5) of this section.

(1) Records described in § 63.10(b)(2)(vi) through (xi).

(2) All required measurements needed to demonstrate compliance with a relevant standard (*e.g.*, 30-minute averages of CMS data, raw performance testing measurements, raw performance evaluation measurements).

(3) All required CMS measurements (including monitoring data recorded during unavoidable CMS breakdowns and out-of-control periods).

(4) Records of the date and time that each deviation started and stopped, and whether the deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(5) Records for process vents according to the requirements specified in § 63.982(a)(2) and storage tank vents according to the requirements specified in § 63.982(a)(1).

§ 63.7192 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You can keep the records offsite for the remaining 3 years.

Other Requirements and Information

§ 63.7193 What parts of the General Provisions apply to me?

Table 2 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.13 apply to you.

§ 63.7194 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. Environmental Protection Agency (EPA), or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the U.S. EPA Administrator and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are as listed in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the non-opacity emission limitations in § 63.7184 under § 63.6(g).

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major alternatives to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.7195 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in §§ 63.2 and 63.981, the General Provisions of this part (40 CFR part 63, subpart A), and in this section as follows:

Control device means a combustion device, recovery device, recapture device, or any combination of these devices used for the primary purpose of reducing emissions to comply with this subpart. Devices that are inherent to a process or are integral to the operation of a process are not considered control devices for the purposes of this subpart, even though these devices may have the secondary effect of reducing emissions.

Process vent means the point at which HAP emissions are released to the atmosphere from a semiconductor manufacturing process unit or storage tank by means of a stack, chimney, vent, or other functionally equivalent opening. The HAP emission points originating from wastewater treatment equipment, other than storage tanks, are not considered to be a process vent, unless the wastewater treatment equipment emission points are connected to a common vent or exhaust plenum with other process vents.

Semiconductor manufacturing means the collection of semiconductor manufacturing process units used to manufacture p-type and n-type semiconductors or active solid state devices from a wafer substrate, including processing from crystal growth through wafer fabrication, and testing and assembly. Examples of semiconductor or related solid state devices include semiconductor diodes, semiconductor stacks, rectifiers, integrated circuits, and transistors.

Semiconductor manufacturing process unit means the collection of equipment used to carry out a discrete operation in the semiconductor manufacturing process. These

operations include, but are not limited to, crystal growing; solvent stations used to prepare and clean materials for subsequent processing or for parts cleaning; wet chemical stations used for cleaning (other than solvent cleaning); photoresist application, developing, and stripping; etching; gaseous operation stations used for stripping, cleaning, doping, etching, and layering; separation; encapsulation; and testing. Research and development operations associated with semiconductor manufacturing and conducted at a semiconductor manufacturing facility are considered to be semiconductor manufacturing process units.

Storage tank means a stationary unit that is constructed primarily from nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provides structural support and is designed to hold an accumulation of liquids or other materials used in or generated by a semiconductor manufacturing process unit. The following are not storage tanks for the purposes of this subpart:

(1) Tanks permanently attached to motor vehicles such as trucks, railcars, barges, or ships;

(2) Flow-through tanks where wastewater undergoes treatment (such as pH adjustment) before discharge, and are not used to accumulate wastewater;

(3) Bottoms receiver tanks; and

(4) Surge control tanks.

Tables to Subpart BBBBB of Part 63

As stated in § 63.7187, you must comply with the requirements for performance tests in the following table:

TABLE 1 TO SUBPART BBBBB OF PART 63.—REQUIREMENTS FOR PERFORMANCE TESTS

For . . .	You must . . .	Using . . .	According to the following requirements . . .
1. Process or storage tank vent streams.	a. Select sampling port's location and the number of traverse ports.	Method 1 or 1A of 40 CFR part 60, appendix A.	Sampling sites must be located at the inlet (if emission reduction or destruction efficiency testing is required) and outlet of the control device and prior to any releases to the atmosphere.
	b. Determine velocity and volumetric flow rate.	Method 2, 2A, 2C, 2D, 2F, or 2G of 40 CFR part 60, appendix A.	For HAP reduction efficiency testing only; not necessary for determining compliance with a ppmv concentration limit.
	c. Conduct gas molecular weight analysis.	i. Method 3, 3A, or 3B of 40 CFR part 60, appendix A.	For flow rate determination only.
		ii. ASME PTC 19.10–1981–Part 10.	You may use ASME PTC 19.10–1981–Part 10 (available for purchase from Three Park Avenue, New York, NY 10016–5990) as an alternative to EPA Method 3B.
	d. Measure moisture content of the stack gas.	Method 4 of 40 CFR part 60, appendix A.	For flow rate determination and correction to dry basis, if necessary.
2. Process vent stream	a. Measure organic and inorganic HAP concentration (two method option).	i. Method 18, 25, or 25A of 40 CFR part 60, appendix A, AND ii. Method 26 or 26A of 40 CFR part 60, appendix A.	(1) To determine compliance with the percent by weight emission reduction limit, conduct simultaneous sampling at inlet and outlet of control device and analyze for same organic and inorganic HAP at both inlet and outlet; and (2) If you use Method 25A to determine the TOC concentration for compliance with the 20 ppmv emission limitation, the instrument must be calibrated on methane or the predominant HAP. If you calibrate on the predominant HAP, you must comply with each of the following: —The organic HAP used as the calibration gas must be the single organic HAP representing the largest percent of emissions by volume. —The results are acceptable if the response from the high level calibration gas is at least 20 times the standard deviation of the response from the zero calibration gas when the instrument is zeroed on its most sensitive scale. —The span value of the analyzer must be less than 100 ppmv. To determine compliance with 98 percent reduction limit, conduct simultaneous sampling at inlet and outlet of control device and analyze for same organic and inorganic HAP at both inlet and outlet.
	c. Measure organic and inorganic HAP simultaneously (one method option).	Method 320 of 40 CFR part 63, appendix A.	To determine compliance with the percent by weight emission reduction limit, conduct simultaneous sampling at inlet and outlet of control device and analyze for same organic and inorganic HAP at both inlet and outlet.
3. Storage tank vent stream	Measure inorganic HAP concentration.	Method 26 or 26A of 40 CFR part 60, appendix A, or Method 320 of 40 CFR part 63, appendix A.	To determine compliance with percent by weight emission reduction limit, conduct simultaneous sampling at inlet and outlet of control device and analyze for same inorganic HAP at both inlet and outlet.

As stated in § 63.7193, you must comply with the applicable General Provisions requirements according to the following table:

TABLE 2 TO SUBPART BBBBB OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART BBBBB

Citation	Subject	Applicable to Subpart BBBBB?
§63.1	Applicability	Yes.
§63.2	Definitions	Yes.
§63.3	Units and Abbreviations	Yes.
§63.4	Prohibited Activities and Circumvention	Yes.
§63.5	Construction and Reconstruction	Yes.
§63.6	Compliance with Standards and Maintenance	Yes.
§63.7	Performance Testing Requirements	Yes, with the exception of §63.7(e)(1). The requirements of §63.7(e)(1) do not apply. Performance testing requirements that apply are specified in this subpart, and in §63.982(a)(1) and (2).
§63.8	Monitoring Requirements	Monitoring requirements are specified in this subpart and in §63.982(a)(1) and (2). The closed vent system inspection requirements of §63.983(c), as referenced by §63.982(a)(1) and (2), do not apply.
§63.9	Notification Requirements	Yes.
§63.10	Recordkeeping and Reporting Requirements	Yes, with the exception of §63.10(e). The requirements of §63.10(e) do not apply. In addition, the recordkeeping and reporting requirements specified in this subpart apply.
§63.11	Flares	Yes.
§63.12	Delegation	Yes.
§63.13	Addresses	Yes.
§63.14	Incorporation by Reference	Yes.
§63.15	Availability of Information	Yes.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 300

[FRL–7500–8]

National Oil and Hazardous Substance Pollution Contingency Plan; National Priorities List

AGENCY: Environmental Protection Agency.

ACTION: Direct Final Notice of Deletion of the Rose Park Sludge Pit Superfund Site From the National Priorities List.

SUMMARY: The Environmental Protection Agency (EPA) Region 8 is publishing a Direct Final Notice of Deletion of the Rose Park Sludge Pit Superfund Site (Site), located in Salt Lake City, Utah, from the National Priorities List (NPL).

The NPL, promulgated pursuant to Section 105 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, as amended, is appendix B to 40 CFR part 300, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). This direct final deletion is being published by EPA with the concurrence of the State of Utah, through the Utah Department of Environmental Quality (UDEQ), based on EPA's determination that all appropriate response actions under CERCLA, other than five-year reviews and operation & maintenance, have been completed at the Site and, therefore, further remedial action pursuant to CERCLA is not appropriate.

DATES: This direct final deletion will be effective June 30, 2003, unless EPA receives adverse comments by June 23, 2003. If EPA receives significant adverse comment(s), EPA will withdraw the Direct Final Notice of Deletion and it will not take effect.

ADDRESSES: Comments should be mailed to: Armando Saenz, Remedial Project Manager (RPM), Mail Code: 8EPR–SR, U.S. EPA Region 8, 999 18th Street, Suite 300, Denver, Colorado, 80202–2466.

Information Repositories: Comprehensive information is available for viewing and copying at the following information repositories for the Site: (1) U.S. EPA Region 8 Superfund Records Center, 999 18th Street, Fifth Floor, Denver, Colorado 80202–2466, Monday through Friday, 8 a.m.—4:30 p.m.; and, (2) Utah Department of Environmental Quality, Division of Environmental Response & Remediation, 168 North 1950 West, Salt Lake City, Utah 84116.

FOR FURTHER INFORMATION CONTACT: Armando Saenz, 303–312–6559, Remedial Project Manager (RPM), Mail Code: 8EPR–SR, U.S. EPA Region 8, 999 18th Street, Suite 300, Denver, Colorado, 80202–2466.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Introduction
II. NPL Deletion Criteria
III. Deletion Procedures
IV. Basis for Site Deletion
V. Deletion Action

I. Introduction

EPA Region 8 is publishing this Direct Final Notice of the Deletion of the Rose Park Sludge Pit Superfund Site from the NPL.

The EPA identifies sites that appear to present a significant risk to public health or the environment and maintains the NPL as the list of those sites. As described in § 300.425(e)(3) of the NCP, sites deleted from the NPL remain eligible for remedial actions if conditions at a deleted site warrant such action, pursuant to EPA's authority under CERCLA and the NCP.

Because EPA considers this action to be noncontroversial, this action is being taken without prior publication of a notice of intent to delete. This action will be effective June 30, 2003 unless EPA receives adverse comments by June 23, 2003 on this document. If adverse comments are received within the 30-day public comment period on this document, EPA will publish a timely withdrawal of this direct final deletion before the effective date of the deletion and the deletion will not take effect. EPA will, as appropriate, prepare a response to comments and continue with the deletion process on the basis of this Notice and the comments already received. There will be no additional opportunity to comment on this deletion process.

Section II of this document explains the criteria for deleting sites from the NPL. Section III discusses procedures that EPA is using for this action. Section

Environmental Protection Agency

40 CFR Part 63
National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR–2002–0048—FRL–7462–1]

RIN 2060–AG55

National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for new and existing metal furniture surface coating operations located at major sources of hazardous air pollutant (HAP) emissions. The final standards implement section 112(d) of the Clean Air Act (CAA) which requires the Administrator to regulate emissions of HAP listed in section 112(b) of the CAA. The intent of the standards is to protect public health and the environment by requiring new and existing major sources to control emissions to the level attainable by implementing the maximum achievable control technology (MACT). The final standards will eliminate approximately 73 percent of nationwide HAP emissions from major sources that coat metal furniture. Metal furniture surface coating operations emit HAP such as xylene, toluene, ethylene glycol monobutyl ether and other glycol ethers, ethylbenzene, and methyl ethyl ketone. Health effects associated with these pollutants include eye, nose, throat, and skin irritation; nausea, vomiting, headache, and dizziness; and liver and kidney damage. We do not have the type of current detailed data on each of the facilities covered by the final rule and the people living around the facilities that would be necessary to conduct an analysis to determine the actual population exposures to the HAP emitted from these facilities and potential for resultant health effects. Therefore, we do not know the extent to which the adverse health effects described above occur in the populations surrounding these facilities. However, to the extent the adverse effects do occur, the final rule will reduce emissions and subsequent exposures.

EFFECTIVE DATE: May 23, 2003. The incorporation by reference of certain publications listed in today's final rule is approved by the Director of the Federal Register as of May 23, 2003.

ADDRESSES: *Docket.* Docket ID No. OAR–2002–0048 (formerly Docket No. A–97–40) is located at the EPA Docket Center, EPA West, U.S. EPA (6102T), 1301 Constitution Avenue, NW, Room B–102, Washington, DC 20460.

Background Information Document. A background information document (BID) for the promulgated NESHAP may be obtained from the docket; the U.S. EPA Library (C267–01), Research Triangle Park, NC 27711, telephone (919) 541–2777; or from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161, telephone (703) 487–4650. Refer to "National Emission Standards for Hazardous Air Pollutants (NESHAP): Surface Coating of Metal Furniture-Summary of Public Comments and Responses on Proposed Rule" (EPA–453/R–03–002). The promulgation BID contains a summary of changes made to the standards since proposal, public comments made on the proposed standards, and EPA responses to the comments.

FOR FURTHER INFORMATION CONTACT: Dr. Mohamed Serageldin, Coating and Consumer Products Group (C539–03), Emission Standards Division, U.S. EPA, Research Triangle Park, NC 27711, telephone number (919) 541–2379, facsimile number (919) 541–5689, electronic mail (e-mail) address: *serageldin.mohamed@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* Categories and entities potentially regulated by this action include those listed on the following table. This table is not intended to be exhaustive, but is just a guide to entities likely to be regulated by the standards. It lists the types of entities that may be regulated, but you should examine the applicability criteria in §§ 63.4881 and 63.4882 of the rule to decide whether your facility is regulated by the standards.

CATEGORIES AND ENTITIES POTENTIALLY REGULATED BY THE STANDARDS

Product description	NAICS code(s)	NAICS Product Description
Metal Household Furniture	337124	Metal Household Furniture Manufacturing.
Office Furniture, Except Wood	337214	Nonwood Office Furniture Manufacturing.
Public Building and Related Furniture	337127	Institutional Furniture Manufacturing.
Office and Store Fixtures, Partitions, Shelving, and Lockers, Except Wood.	337215	Showcase, Partition, Shelving, and Locker Manufacturing.
Furniture and Fixtures, Not Classified Elsehwere	337127	Institutional Furniture Manufacturing.
Hardware, Not Classified Elsewhere	332951	Hardware Manufacturing.
Metal Stampings, Not Classified Elsewhere (Except Kitchen Utensils, Pots and Pans for Cooking, and Coins).	332116	Metal Stamping.
Wire Springs	332612	Wire Spring Manufacturing.
Fabricated Metal Products, Not Classified Elsewhere	337215	Showcase, Partition, Shelving, and Locker Manufacturing.
Residential Electric Lighting Fixtures	335121	Residential Electric Lighting Fixture Manufacturing.
Commercial, Industrial, and Institutional Electric Lighting Fixtures	335122	Commercial, Industrial, and Institutional Electric Lighting Fixture Manufacturing.
Laboratory Apparatus and Furniture	339111	Laboratory Furniture Manufacturing.
Dental Equipment and Supplies	339114	Dental Equipment Manufacturing.
Manufacturing Industries, Not Classified Elsewhere	337127	Institutional Furniture Manufacturing.
Reupholstery and Furniture Repair	81142	Reupholstery and Furniture Repair.
State/Federal Governmental Agencies	.....	State/Federal correctional institutions that apply coatings to metal furniture.

Docket. The EPA has established an official public docket for this action under Docket ID No. OAR–2002–0048 (formerly Docket No. A–97–40). The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the

official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the EPA Docket Center, EPA West, Room B–102, 1301 Constitution Avenue, NW., Washington, DC 20460. The Docket Center is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Docket is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Access. You may access this **Federal Register** document electronically through the EPA Internet under the **Federal Register** listings at *http://www.epa.gov/fedrgstr/.*

An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified above. Once in the system, select "search," then key in the appropriate docket identification number.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's final rule will also be available on the WWW through EPA's Technology Transfer Network (TTN). Following signature by the EPA Administrator, a copy of the rule will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. Under section 307(b) of the CAA, judicial review of the final rule is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by July 22, 2003. Under section 307(d)(7)(B) of the CAA, only an objection to the rule which was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by today's final action may not be challenged separately in any civil or criminal proceeding we bring to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Source of Authority for Development of NESHAP?
B. What Criteria Do We Use in the Development of NESHAP?
II. What Changes and Clarifications Have We Made to the Proposed Standards?
A. Overlap With Other NESHAP Source Categories

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. The category of major sources covered by the final NESHAP was listed on July 16, 1992 (57 FR 31576) under the Surface Coating Processes industry group. Major sources of HAP are those that emit or have the potential to emit considering controls, in the aggregate, 9.07 megagrams per year (Mg/yr) (10 tons per year (tpy)) or more of any HAP or 22.68 Mg/yr (25 tpy) or more of any combination of HAP.

B. What Criteria Do We Use in the Development of NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new and existing major sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as the MACT.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the emission limitation is set at a level that assures that all major sources achieve the level of control at least as stringent as that already achieved by the better-controlled and lower-emitting sources in each source category or subcategory. For new sources, the MACT floor cannot be less stringent than the emission control that is achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than the standards for new sources, but they cannot be less stringent than the average emission limitation achieved by the best performing 12 percent of existing sources in the category or subcategory (or the best performing five sources for categories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on consideration of the cost of achieving the emission reductions, any health and environmental impacts, and energy requirements.

II. What Changes and Clarifications Have We Made to the Proposed Standards?

In response to public comments received on the proposed standards, we made several changes in developing the final rule. While some of the changes were designed to make our intentions clearer, other changes resulted in revisions to the MACT floors and emission limits. The substantive comments and our responses and rule

changes are summarized in the following sections. A more detailed summary of these comments as well as other comments received along with our responses can be found in the BID for the final rule which is available from several sources (see **ADDRESSES**).

A. Overlap with Other NESHAP Source Categories

Two commenters requested that the final rule provide compliance flexibility for facilities that coat a variety of items in addition to metal furniture and metal furniture components. Such facilities may be affected by several surface coating NESHAP, such as the existing standards for wood furniture, the proposed standards for miscellaneous metal parts and products (67 FR 52780, August 13, 2002), and the proposed standards for plastic parts and products (67 FR 72276, December 4, 2002). The commenters sought a regulatory approach that would allow facilities to opt specific coating operations or product lines that are collocated with metal furniture surface coating operations out of the rule and into one of the other surface coating NESHAP.

Another commenter believed that the proposed rule did not adequately address all the possible overlap issues between the metal furniture and wood furniture surface coating NESHAP, particularly when a furniture item consists of both metal and wood components.

We understand that it could be beneficial to consolidate regulatory requirements at facilities where coating operations belonging to different source categories (such as metal furniture, miscellaneous metal parts and products, and plastic parts and products) are collocated. Consolidation may reduce the amount of records, reports, or compliance calculations that the facility would have to maintain. Some commenters suggested that the final rule include a compliance option that would allow this consolidation of different regulatory requirements within a facility. Section 112(d)(2) of the CAA states that all major sources within a regulated source category must meet the maximum degree of emission reduction that we determine to be achievable. We do not believe that the commenters' recommendation of allowing a facility to choose which coating operations to opt into, or out of, a particular NESHAP would ensure that the MACT level of control was met for all HAP emission points within each source category. Therefore, to comply with these CAA requirements, we have not included the compliance option suggested by the commenters in the final rule.

We recognize that there is not always a clear dividing line between the affected sources of the surface coating rules. This is evident in the furniture manufacturing industry, where both metal and wood furniture may be produced in the same facility, and many pieces of furniture contain substantial portions of metal and wood. For those commenters concerned with lack of clarity between the applicability of the metal furniture rule and other surface coating rules, in particular the wood furniture surface coating rule (40 CFR part 63, subpart JJ), we are providing clarification through the following examples.

Example 1. Coating operations at facilities currently subject to the wood furniture rule (40 CFR part 63, subpart JJ) would continue to be subject to that rule. This would be the case even if the items coated contained metal components, as long as the items meet the definition of wood furniture or wood furniture component in § 63.801(a) of 40 CFR part 63, subpart JJ.

Example 2. Coating operations at facilities that coat metal furniture (as defined in § 63.4881(a)(2) of the final rule) constructed either entirely or partially from metal (but not qualifying as wood furniture components under subpart JJ) would be subject to the metal furniture rule.

Example 3. Facilities that coat only metal furniture components such as knobs, hinges, and screws (that is, components that are of a more generic nature and could have broader uses in products other than metal furniture) and provide these components exclusively to metal furniture manufacturing facilities would be subject to the metal furniture rule.

Example 4. The applicability of the surface coating rules when the item coated is composed of both metal and wood components in approximately equivalent percentages will depend primarily on the functionality of the entire unit. A common example of such an item is a commercial shelving unit constructed of a metal base and wood backing. For reasons related to structural rigidity or overall stability, the functionality of this particular shelving unit depends more on the metal components than the wood components. The surface coating of this shelving unit would be regulated under the metal furniture rule. Thus, the surface coating of all components of this shelving unit, regardless of whether they are made of metal or wood, would be regulated under the metal furniture rule, so long as the facility is a metal furniture manufacturing facility. This would be true even if the metal furniture manufacturing facility dedicated a coating line exclusively to the coating of the wood components.

Example 5. Coating operations such as those presented in Example 4 may not involve items that can be readily classified according to functionality. For these situations, the applicability determination would be made on a case-by-case basis taking into account functionality and other relevant factors. These factors may include the primary North American Industrial Classification System (NAICS) code for the facility, amount of surface area coated for each type of substrate, and how the coating operations have been classified for other surface coating rules (such as new source performance standards (NSPS) and State rules).

The examples we have provided here are necessarily simplistic in nature compared to many of the situations encountered in the metal furniture manufacturing industry and are intended only to provide guidance. Even so, the examples demonstrate the complex applicability issues related to this rule and why precisely defining applicability among the surface coating rules has proved to be a challenge. While we realize that many of the situations encountered in the metal furniture manufacturing industry can be far more complicated than presented here, discussion of these more complex situations is beyond the scope of this preamble. For these reasons, we intend to provide additional guidance documents in the future that will specifically address some of the more complex applicability issues. In order to address the specific concerns raised by the metal furniture industry, we are planning to involve all interested stakeholders in the development of these guidance documents. We will announce at a future date how stakeholders may become involved in this effort.

B. MACT Floors and Emission Limits

The database we used to determine the MACT floors for new and existing sources consisted of 49 facilities that responded to our questionnaires. Of these 49 facilities, 22 provided complete data such that we could calculate an emission rate for all of the metal furniture surface coating operations in terms of kilograms (kg) organic HAP per liter coating solids used. Of the 27 remaining facilities, we believed we had enough data to estimate that, had all of the requested data been provided, their emission rates would have fallen within the range represented by the facilities for which we had complete data. Therefore, we based the existing source

MACT floor on the best performing 12 percent of 49 facilities rather than 12 percent of 22 facilities.

One commenter stated that section 112(d)(3)(A) of the CAA requires us to use only those facilities "for which the Administrator has emissions information." The commenter believed that this language limited us to considering only the 22 facilities, not the entire group of 49 facilities.

In response to these comments, we reviewed the information that was submitted by the 27 facilities with incomplete data. We also attempted to obtain additional information from some of the facilities. As a result of these efforts, we could not confirm the accuracy of our original assumption that the emission rates for these 27 facilities would fall within the range represented by the facilities with complete data. As a result, we agree with the commenter that a more appropriate basis for the floor determination is the data set for the 22 facilities that submitted complete data. Using information from only those facilities, we recalculated the existing source MACT floor based on the average of the best performing 12 percent of 22 facilities. This calculation reduced the MACT floor from 0.12 kg organic HAP per liter (1.0 lb/gallon (gal)) coating solids used to 0.10 kg organic HAP per liter (0.83 lb/gal) coating solids. In the final rule, the existing source emission limit in § 63.4890 corresponds to the new MACT floor value.

Two commenters also questioned our rejection of above-the-floor options for existing sources. We continue to believe that rejecting above-the-floor options was appropriate for existing sources. However, during our analysis of these comments, we began to further consider how the state-of-the-art for new sources has changed since our initial data gathering efforts. We have always recognized that there are certain coating technologies that may emit no organic HAP (as calculated according to § 63.4941(a)) such as powder coatings and liquid coatings that contain no organic HAP. The industry questionnaire responses that we reviewed in 1998 (representing 1997 data) showed that six facilities used powder coatings exclusively, and they were not used for the MACT floor calculations because they were true area sources. These powder coating facilities produced metal furniture items such as office chairs, dental chairs, commercial and residential lighting fixtures, and indoor and outdoor lighting fixtures. Of these six powder coating facilities, three had coating solids usages within the range represented by the facilities we used to determine the MACT floor (in other words, had these three facilities used conventional liquid coatings instead of powder coatings, we would expect them to be major sources of HAP emissions and they would have been included in the determination of the MACT floor). We believe these data demonstrate the industry's current ability to exclusively use powder coatings in many situations.

Based on the 1998 questionnaire responses of the 22 facilities that provided complete data, information was provided for 188 individual liquid coatings. Eight of these coatings were reported as containing no organic HAP. In addition, another 48 individual coatings were reported as containing less than 1 percent by mass of organic HAP (typically as a small component of a solvent blend such as aromatic naphtha). We believe that this high percentage of non-HAP (or essentially non-HAP) coatings used by these 22 facilities indicates the coating suppliers' ability to produce and market non-HAP coatings and demonstrates that they are currently in use by the industry.

Over the past 5 years since we sent questionnaires to the metal furniture manufacturing industry, non-HAP coating technologies have undergone continual development. The availability of powder coatings in a wide range of colors has increased, as has the ability to produce various surface finishes and control film thickness. Coating manufacturers have also made significant strides in formulating non-HAP coatings, driven in large part by the requirements of surface coating NESHAP for a wide variety of industries. In addition, we are aware of other coating technologies, such as electrocoating, that have the potential to emit no HAP. Although we are not currently aware of these coating technologies being used in the metal furniture industry, we believe they can be used in certain circumstances and represent viable alternatives for new sources.

We believe the continual development of these non-HAP coating technologies over the past several years has allowed them to gain wider acceptance and use within the metal furniture surface coating industry, such that we now believe they represent in the aggregate the MACT floor for new sources. Considering that new sources have much greater latitude than existing sources to design manufacturing operations and the metal furniture items themselves to accommodate these coating technologies, new sources can more readily take advantage of these coating technologies. Accordingly, we have revised the new source MACT floor to be no emissions of organic HAP from metal furniture surface coating operations. The emission limit for new sources in § 63.4890 of the final rule reflects this new MACT floor determination.

We also recognize that there may be specialized appearance or functional characteristics that can be produced only with coating technologies employing organic HAP, even for new sources. To accommodate these situations, we added a provision in the final rule that allows a new affected source to demonstrate on a case-by-case basis that organic HAP-free coating technologies cannot be used for their specific products. If we approve such a request, then the source would be required to meet an emission limit of 0.094 kg organic HAP per liter (0.78 lb/gal) coating solids used. This emission limit is the same as the emission limit originally proposed for new sources and would apply only to the specific products for which the determination was made, not all of the metal furniture surface coating operations at the new source.

C. Military Coatings

One commenter expressed concern about metal furniture used in battlefield situations. Such furniture may be coated with chemical agent resistant coatings and other coatings unique to the military. The commenter believed that the emission limits developed for the metal furniture rule did not take into account the needs of the military to sustain metal furniture and other battlefield support equipment and requested that all such coatings be regulated under the proposed NESHAP for miscellaneous metal parts and products, once those standards become final. Upon further analysis, we agree that military coatings used for refurbishment of military equipment may be unique from those used to develop the emission limits as in the proposed metal furniture surface coating rule and require special consideration. However, because so many different products are involved (metal furniture, large appliances, wood furniture, miscellaneous metal parts, fabric coating, and plastic parts), we believe the more appropriate approach is to group all of the products coated with specialized military coatings into their own source category. Thus, we are creating a new source category for the surface coating of refurbished military equipment for this purpose. The final rule for metal furniture includes an exemption for military coatings (see § 63.4881(c)(6) of the final rule) that will

be included in the newly created source category.

D. Compliance During Periods of Startup, Shutdown, and Malfunction

One commenter believed that the statement in § 63.4900(a)(2) of the proposed rule that affected sources do not have to comply with the emission limitations during periods of startup, shutdown, and malfunction does not comply with the CAA. This provision is often found in NESHAP in which compliance with the standards is based on the results of a short-term initial performance test and short-term averaging of continuous monitoring results thereafter. In consideration of this comment, we realized that this provision is not appropriate for the surface coating NESHAP when these short-term tests and monitoring results are only one component of a compliance determination that determines emissions over a long period of time, which in this case is a month. For the metal furniture surface coating NESHAP, the source owner or operator will use the performance test and continuous monitoring results in combination with data on coatings and other materials used over a month's period of time. These components will be combined to calculate a monthly organic HAP emission rate. Since there may be many startups and shutdowns of a coating operation over the course of a month as part of normal operation, it is not appropriate to exempt such periods from compliance with the standards. We believe that a month-long compliance period will accommodate potential short-term higher emission rates that might occur due to startup, shutdown, or malfunction, and that the proposed exemption is not necessary or appropriate. Thus, we revised and simplified the general compliance requirements in § 63.4900; we removed the statement that sources must be in compliance except during periods of startup, shutdown, and malfunction. We state in § 63.4900(a) of the final rule that all affected sources must be in compliance with the emission limitations in § 63.4890 at all times. We left in place the requirement for sources using an emission capture system and add-on control device to develop and implement a written startup, shutdown, and malfunction plan according to § 63.6(e)(3).

E. Monitoring

One commenter believed we inappropriately used the terms "sensitivity" and "tolerance" interchangeably in § 63.4968 of the proposed rule (now § 63.4967 in the final rule). We agree with the commenter and replaced both terms with the term "accuracy." We also made numerous changes throughout this section to simplify monitoring requirements and maintain consistency with the monitoring requirements in other surface coating NESHAP under development.

F. Title V Operating Permits

Several commenters had concerns about possible conflicts between reporting requirements under this rule and their approved title V programs. It is important to emphasize that a permitting authority does not have the authority to change the reporting requirements of this rule (such as type of report, content of report, and/or frequency of submission). Reporting requirements under this rule are applicable requirements, and sources must comply with them.

The final rule, consistent with the proposed rule, does however allow an affected source to submit its semiannual compliance report along with, or as part of, its 6-month monitoring report required by 40 CFR part 70 or 40 CFR part 71. See § 63.4920(a)(1)(iv) and (a)(2) of the final rule. As a result of comments, § 63.4920(a)(1)(iv) and (a)(2) of the final rule have been modified to clarify when monitoring reports are required by 40 CFR part 70 or 40 CFR part 71 (every 6 months) and when a 6-month monitoring report must cross-reference a semiannual compliance report. Language was also added to § 63.4920(a)(1)(iv) of the final rule to ensure that a semiannual compliance report is submitted within a reasonable time (30 days) after the end of the semiannual reporting period.

At the request of commenters, §§ 63.4910(c)(2) and 63.4920(a)(3)(ii) of the final rule have been revised to ensure that certifications of truth, accuracy, and completeness for the notifications of compliance status and semiannual compliance reports under this rule are consistent with the certification requirements under 40 CFR part 70 or 40 CFR part 71. Additionally, "of the content" was deleted from both of these paragraphs as a responsible official needs to certify that the entire submittal is complete, not just the content of the report.

It is also important to correct in this final preamble a statement made in subsection B of Section II of the preamble to the proposed rule (67 FR 20206, 20208). In this subsection—"What is the relationship to other rules?"—the following is stated: "Overlapping reporting, recordkeeping, and monitoring requirements may be resolved through the title V permit process." This statement is overly broad as 40 CFR part 70 and 40 CFR part 71 only address situations where more than one monitoring (including recordkeeping designed to serve as monitoring) or testing requirement applies. Specifically, 40 CFR 70.6(a)(3)(i)(A) and 40 CFR 71.6(a)(3)(i)(A) state in part that "If more than one monitoring or testing requirement applies, the permit may specify a streamlined set of monitoring or testing provisions provided the specified monitoring or testing is adequate to assure compliance at least to the same extent as the monitoring or testing applicable requirements that are not included in the permit as a result of such streamlining; * * *." There are no provisions in 40 CFR part 70 or 40 CFR part 71, however, which allow for the streamlining of overlapping recordkeeping or reporting requirements, unless the recordkeeping is designed to serve as monitoring as described in 40 CFR 70.6(a)(3)(i)(B) or 40 CFR 71.6(a)(3)(i)(B).

G. Other Changes and Clarifications

In addition to the changes described above, we note several areas of the proposed rule that warrant rewriting for the final rule, even though commenters did not object to them. They are necessary so that the provisions properly reflect our intent and are consistent with other surface coating NESHAP under development.

The proposed rule allowed the volume fraction of coating solids to be determined by means of a test method or from information provided by the supplier or manufacturer. We realize that there may be certain situations where neither of these options is adequate and added a calculation at § 63.4941(b)(3) for volume fraction of coating solids when the mass fraction and average density of the volatile components of the coating are known.

Section 63.4962 of the proposed rule contained detailed procedures for determining compliance when a source operates under different sets of representative operating conditions. Upon further review of this section, we believe this option is overly complicated and would be difficult to implement in actual practice. Rather than including these detailed compliance procedures in the final rule, we decided on a general statement allowing such a compliance demonstration if you believe a workable and enforceable procedure can be maintained to demonstrate compliance under different sets of representative operating conditions (see § 63.4891(d)(2)

of the final rule). You would be required to develop your own detailed compliance procedure tailored to your specific situation and submit the procedure to the Administrator for approval. We also took this action to maintain consistency with other surface coating NESHAP under development that do not contain this option.

We added an alternative to Method 3B at § 63.4965(a)(3) of the final rule. This alternative test method, ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], was inadvertently omitted from the proposed rule. We also added § 63.4966(g) to provide guidance for monitoring when a bioreactor system is used as an add-on control device to comply with the emission limits.

In addition to the actions described above, we have clarified our intent to promote consistency with other surface coating NESHAP currently under development.

III. What Are the Final Standards?

A. What Is the Source Category?

The rule applies to you if you own or operate a metal furniture surface coating facility that is a major source, is located at a major source, or is part of a major source of HAP emissions. We have defined a metal furniture surface coating facility as one that applies coatings to metal furniture or components of metal furniture. Metal furniture means furniture or components that are constructed either entirely or partially from metal.

You would not be subject to the rule if your metal furniture surface coating facility is located at an area source. An area source of HAP is any facility that emits or has the potential to emit HAP but is not a major source. You may establish area source status by limiting the source's potential to emit HAP through appropriate mechanisms available through the permitting authority. You would not be subject to the rule if you use only coatings, thinners, and cleaning materials that contain no organic HAP. The source category does not include surface coating that occurs at research or laboratory facilities or that is part of janitorial, building, and facility maintenance operations. It also does not include coating applications using handheld nonrefillable aerosol containers.

B. What Is the Affected Source?

We define an affected source as a stationary source, group of stationary sources, or part of a stationary source to which specific NESHAP apply. Within a source category, we select the specific emission sources (emission points or groupings of emission points) that will make up the affected source for that category. To select these emission sources, we mainly consider the constituent HAP and quantity emitted from individual or groups of emission points.

For the metal furniture surface coating NESHAP, the affected source is the collection of all operations associated with the surface coating of metal furniture or components of metal furniture that are performed at a contiguous area under common control. These operations include preparation of a coating for application (for example, mixing with thinners); surface preparation of the metal furniture or component; coating application and flash-off; drying and/or curing of applied coatings; cleaning of equipment used in surface coating; storage of coatings, thinners, and cleaning materials; and handling and conveyance of waste materials from the surface coating operations. Coatings include such materials as adhesives and protective or decorative coatings.

C. What Are the Emission Standards?

We are promulgating standards that limit HAP emissions from the surface coating of metal furniture. The standards include emission limits and operating limits. The emission limits are different for new and existing sources and have changed since proposal.

Emission limits. We are limiting each new and reconstructed affected source to no organic HAP emissions. The limit for each existing affected source is 0.10 kg organic HAP/liter (0.83 lb/gal) coating solids used. These limits apply to the total of all coatings, thinners, and cleaning materials used in coating operations at the affected source.

There are three compliance options available for meeting the emission limits. The compliant material option requires that each coating used in the coating operation meet the limit, and each thinner and cleaning material must contain no organic HAP. Under the emission rate without add-on controls option, you may average all of the coatings, thinners, and cleaning materials used together and demonstrate that the overall emission rate is in compliance with the applicable limit. The emission rate with add-on controls option applies to coating operations for which add-on controls are used to meet the limit. Under this option, you must meet certain operating limits for the capture systems and control devices and follow a work practice plan for your material storage, mixing, conveying, and spills.

Operating limits. If you reduce emissions by using a capture system and add-on control device (other than a solvent recovery system for which you conduct a monthly liquid-liquid material balance), the rule's operating limits would apply to you. These limits are site-specific parameter limits you determine during the initial performance test of the system. For capture systems, you would establish average volumetric flow rate limits for each capture device (or enclosure) in each capture system. You would also establish limits on average pressure drop across openings in the capture system.

For thermal and catalytic oxidizers, you would monitor temperature. For solvent recovery systems for which you do not conduct a monthly liquid-liquid material balance, you would monitor the carbon bed temperature and the amount of steam or nitrogen used to desorb the bed. For condensers, you would monitor the temperature of the outlet gas temperature from the condenser.

All operating limits must reflect operation of the capture system and control devices during a performance test that demonstrates achievement of the emission limit during representative operating conditions.

General Provisions. The General Provisions (40 CFR part 63, subpart A) also apply to you as outlined in Table 2 of the final rule. The General Provisions codify certain procedures and criteria for all 40 CFR part 63 NESHAP. The General Provisions contain administrative procedures, preconstruction review procedures for new sources, and procedures for conducting compliance-related activities such as notifications, reporting, and recordkeeping, performance testing, and monitoring. The rule refers to individual sections of the General Provisions to emphasize key sections that you should be aware of. However, unless specifically overridden in the rule, all of the applicable General Provisions requirements apply to you.

D. Interaction With Other Regulations

Affected sources subject to the rule may also be subject to other rules. The relationship between this rule and other rules is discussed below.

New source performance standards—40 CFR part 60, subpart EE. The metal furniture NSPS apply to facilities that apply organic coatings to metal furniture and that began construction, reconstruction, or modification after November 28, 1980. The pollutants

regulated are volatile organic compounds (VOC). Emissions of VOC are limited to 0.09 kg per liter of coating solids applied, and the affected source is each individual coating operation.

The rule differs from the NSPS in three ways. First, the affected source for the rule is defined broadly as the collection of all coating operations and related activities and equipment at the facility, whereas the affected facility for the NSPS is defined narrowly as each individual coating operation. The broader definition of affected source allows a facility's emissions to be combined for compliance purposes. Second, the NESHAP regulate organic HAP. While most organic HAP emitted from metal furniture surface coating operations are VOC, some VOC are not listed as HAP and, therefore, the NSPS regulate a broader range of pollutants than would the NESHAP. Third, the emission limitations in the NESHAP would be based on the amount of solids used at the affected source. The NSPS limitations are based on the amount of solids actually applied to the metal furniture which necessitates estimates of transfer efficiency in the compliance calculations.

Because of the differences between the NESHAP and the NSPS, compliance with either one cannot be deemed compliance with the other. A metal furniture surface coating facility that meets the applicability requirements of both rules must comply with both.

National emission standards for wood furniture manufacturing operations—40 CFR part 63, subpart JJ. There may be situations where a manufacturer of wood furniture also coats metal components of that wood furniture. Coating lines that are currently subject to subpart JJ will remain subject to only that rule so long as they continue to coat products that meet the definition of "wood furniture" or "wood furniture component" in § 63.801. This will be the case even if there are metal parts on the wood furniture or wood furniture components when they are coated.

Future national emission standards for the surface coating of miscellaneous metal parts. Metal furniture often contains components, such as metal knobs, hinges, and screws, that have a wider use beyond metal furniture. As stated previously, the coating of such parts would be subject to the metal furniture rule if the coating takes place at a facility that is coating metal furniture, or a facility whose entire production is dedicated to coating parts to be used exclusively in, or on, metal furniture. If the coating of such parts takes place at a facility that coats these parts for multiple types of products (*e.g.*, not exclusively metal furniture), the coating operations would be subject to the proposed NESHAP for the surface coating of miscellaneous metal parts and products (August 13, 2002, 67 FR 52780).

Future national emission standards for the surface coating of plastic parts and products. Plastic parts and products may be components (*e.g.*, plastic handles) of metal furniture. The coating of such plastic parts would be subject to the metal furniture rule if the coating takes place at a metal furniture surface coating facility; or if it takes place at a facility whose entire production is dedicated to coating plastic parts for metal furniture. If the coating takes place at a facility that coats these plastic parts for multiple types of products (*e.g.*, not exclusively metal furniture), the coating operations would be subject to the proposed NESHAP for the surface coating of plastic parts and products (December 4, 2002, 67 FR 72276).

IV. When Do I Show Initial Compliance With the Rule?

Existing affected sources must comply with the rule no later than 3 years after May 23, 2003. The effective date is May 23, 2003. New or reconstructed affected sources must comply upon start-up or May 23, 2003, whichever is later. Details of the compliance requirements can be found in the General Provisions, as outlined in Table 2 of today's rule.

Before your initial compliance demonstration, you must choose which of the several compliance options you will use for your affected source. In your initial compliance certification, you must notify the Administrator of your choice and after that, you must monitor and report compliance results accordingly. If you decide to change to other emission limit options, you are also required to notify the Administrator, as with other changes at the facility, as discussed later in this preamble.

V. What Testing and Monitoring Must I Do?

In addition to the specific testing and monitoring requirements specified below for the affected source, the rule adopts the testing requirements specified in 40 CFR 63.7.

A. Test Methods and Procedures

Emission limit(s). There are several options for complying with the emission limit(s), and the testing and initial compliance requirements vary accordingly.

If you demonstrate compliance based on the materials used in the affected source, you must determine the mass of organic HAP and the volume of solids in all materials used during the initial compliance period.

To determine the mass of organic HAP in coatings, thinners, and cleaning materials and the volume coating solids, you could either rely on manufacturer's data or on results from the test methods listed below. Under § 63.4941 of the rule, you would be required to determine the mass of organic HAP in coatings, thinners, and cleaning materials used. To do this, you must count HAP that are present at 1 percent by mass or more if they are not carcinogens identified by the Occupational Safety and Health Administration (OSHA) at 29 CFR 1910.1200(d)(4), and count HAP that are present at 0.1 percent by mass or more if they are OSHA-identified carcinogens. Coating and solvent manufacturers are accustomed to providing a breakdown of material components according to this distinction and routinely report the values on Material Safety Data Sheets for the materials, as required by OSHA. We could have selected some other way to count HAP components of materials but concluded that allowing this long-standing approach to be used for compliance with the rule would provide the information needed for compliance assurance and would not impose any additional burden on the industry.

You may use alternative test methods provided you get EPA approval in accordance with the NESHAP General Provisions, § 63.7(f). If there is any inconsistency between the test method results (either EPA's or an approved alternative) and manufacturer's data, the test method results would prevail for compliance and enforcement purposes.

- For organic HAP content, use Method 311 of 40 CFR part 63, appendix A;
- The rule allows you to use nonaqueous volatile matter as a surrogate for organic HAP, which would include all organic HAP plus all other organic compounds. If you choose this option, then use Method 24 of 40 CFR part 60, appendix A; and
- For volume fraction of coating solids, use either manufacturer's data or ASTM Method D2697–86 (1998), Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings, or ASTM Method D6093–97, Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer. If you are not able to use these procedures, then you may calculate the volume fraction of coating solids based on the density and mass fraction of the volatile components.

To demonstrate initial compliance based on the materials used, you are required to either ensure that the organic HAP content of each coating meets the emission limit and that you use no organic HAP-containing thinners or cleaning materials; or ensure that the total mass of organic HAP in all coatings, thinners, and cleaning materials divided by the total volume of coating solids meets the emission limit. For the latter option, you are required to:

- For the initial compliance period, determine the quantity of each coating, thinner, and cleaning material used in the affected source.
- Determine the mass of organic HAP in each coating, thinner, and cleaning material.
- Determine the volume fraction coating solids for each coating.
- Calculate the total mass of organic HAP for materials and total volume of coating solids used in the affected source for the compliance period. You may subtract from the total mass of organic HAP the amount of organic HAP contained in waste materials you send, during that compliance period, to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266. The calculation equation (Equation 1 in § 63.4951) adds together all the organic HAP in the coatings, thinners, and cleaning materials and allows you to subtract organic HAP in waste materials as indicated above. The calculated mass of organic HAP is, therefore, not based on actual measurement of emissions to the atmosphere but rather assumes that all organic HAP used (less those in waste materials as appropriate) are emitted. This means of determining organic HAP emissions for compliance is consistent with the means by which we calculated emission rates from industry data on which the emission limits are based. We believe that Equation 1 in § 63.4951 is a simple mass-balance relationship which adequately quantifies the organic HAP emissions without imposing an excessive burden on respondents.
- Calculate the ratio of the total mass of organic HAP for the materials used to the total volume of coating solids used.
- Record the calculations and results and include them in your notification of compliance status.

If you use a capture system and control device other than a solvent recovery system for which you conduct a monthly liquid-liquid material balance, you must:

- Conduct an initial performance test to determine the capture and control efficiencies of the equipment (described below) and to establish operating limits to be achieved on a continuous basis (also described below). The performance test must be completed no later than the compliance date for existing sources and 180 days after the compliance date for new and reconstructed sources (§ 63.4960). You must schedule it in time to obtain the results for use in completing your compliance determination for the initial compliance period.
- Determine the mass of organic HAP in each material and the volume fraction coating solids for each coating used during the initial compliance period.
- Calculate the organic HAP emissions from all the controlled coating operations using the capture and control efficiencies determined during the performance test and the total mass of organic HAP in materials used in controlled coating operations.
- Calculate the total mass of organic HAP emissions from uncontrolled coating operations.
- Calculate the ratio of the total mass of HAP emissions from both controlled and uncontrolled coating operations to the total volume of coating solids used during the initial compliance period.
- Record the calculations and results and include them in your Notification of Compliance Status.

The capture and control efficiency for a capture and control system other than a solvent recovery system for which you conduct monthly liquid-liquid material balances must be demonstrated based on emission capture and reduction efficiency. To determine the capture efficiency, you must either verify the presence of a permanent total enclosure (PTE) using EPA Method 204 of 40 CFR part 51, appendix M, (all materials must be applied and dried within the enclosure) or use one of three protocols in § 63.4964 to measure capture efficiency. If you have a PTE and all materials are applied and dried within the enclosure and you route all exhaust gases from the enclosure to a control device, then you would assume 100 percent capture.

To determine the emission reduction efficiency of the control device, you must conduct measurements of the inlet and outlet gas streams. The test must consist of three runs, each run lasting 1 hour, using the following EPA Methods in 40 CFR part 60, appendix A:

- Method 1 or 1A for selection of the sampling sites.
- Method 2, 2A, 2C, 2D, 2F, or 2G to determine the gas volumetric flow rate.
- Method 3, 3A, or 3B for gas analysis to determine dry molecular weight. As an alternative to Method 3B, you may use ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Analyses].
- Method 4 to determine stack moisture.
- Method 25 or 25A to determine organic volatile matter concentration. In lieu of Method 25 or 25A, you may use Method 18 if you know the HAP constituents in the inlet and outlet gas streams and you quantify at least 90 percent of the organic compounds in the gas stream. Alternatively, any other test method or data that have been validated according to the applicable procedures in Method 301 of 40 CFR part 63, appendix A, and approved by the Administrator, could be used.

If you use a solvent recovery system and wish to calculate the mass of organic HAP emission reduction, you could determine the overall control efficiency using a liquid-liquid material balance instead of conducting an initial performance test. If you use the material balance alternative, you must measure the amount of all materials used in the affected source during the initial compliance period and determine the total mass of volatile matter contained in these materials. You must also measure the amount of volatile matter recovered by the solvent recovery system during the compliance period. Then you must compare the amount recovered to the amount used to determine the overall control efficiency, and apply this efficiency to the total amount of organic HAP for the materials used. You must record the calculations and results and include them in your Notification of Compliance Status when you present your calculations of the organic HAP emission rate.

Operating limits. In accordance with section 114(a) of the CAA, the operating limits would require the use of continuous parameter monitoring systems (CPMS) to ensure that sources are in compliance. The monitoring must be capable of detecting deviations with sufficient representativeness, accuracy, precision, reliability, frequency, and timeliness to determine if compliance is continuous during a reporting period.

As mentioned above, you must establish operating limits as part of the initial performance test of a capture system and control device, other than a solvent recovery system for which you conduct liquid-liquid material balances. The operating limits are the minimum or maximum (as applicable) values achieved for capture systems and control devices during the most recent performance test that demonstrated compliance with the emission limit.

B. Monitoring Requirements

According to paragraph (a)(3) of section 114 of the CAA, monitoring of stationary sources is required to determine the compliance status of the sources, and whether compliance is continuous or intermittent. For affected sources complying with the standards by using capture and control systems, initial compliance is determined through an initial performance test and ongoing compliance through continuous monitoring. We specify the operating parameters that need to be monitored for certain control devices used in the metal furniture surface coating industry. You must set the values of these parameters, which demonstrate compliance with the standards, during your initial performance test. These values are your operating limits. If future monitoring shows that capture and control equipment is operating outside the range of values established during the initial performance test, then you are deviating from the operating limits.

The rule specifies the parameters to monitor for the types of emission control systems commonly used in the industry. You are required to install, calibrate, maintain, and continuously operate all monitoring equipment according to manufacturer's specifications and ensure that the CPMS meet the requirements in § 63.4967 of the rule. If you use control devices other than those identified in the rule, you must submit the operating parameters to be monitored to the Administrator for approval. The authority to approve the parameters to be monitored is retained by EPA and is not delegated to States.

If you use a thermal or catalytic oxidizer, you must continuously monitor temperature and record it at least every 15 minutes. For thermal oxidizers, the temperature monitor is placed in the firebox or in the duct immediately downstream of the firebox before any substantial heat exchange occurs. The operating limit is the average temperature measured during the performance test, and during each 3-hour period the average temperature must be at or above this limit. For catalytic oxidizers, temperature monitors are placed immediately before and after the catalyst bed. The operating limits are the average combustion temperature just before the catalyst bed and the average temperature difference across the catalyst bed during the performance test, and for each 3-hour period the average combustion temperature and the average temperature difference must be at or above these limits. As an alternative for catalytic oxidizers, you may establish the temperature just before the catalyst bed as an operating parameter as described above and also develop and implement a site-specific inspection and maintenance plan for the oxidizer.

If you use a solvent recovery system, and do not conduct liquid-liquid material balances to demonstrate compliance, then you must monitor the carbon bed temperature after each regeneration and the total amount of steam or nitrogen used to desorb the bed for each regeneration. The operating limits are the minimum carbon bed temperature after the cooling cycle and the minimum amount of steam or nitrogen used for desorption.

If you use a condenser, you must monitor the outlet gas temperature to ensure that the air stream is being cooled to a low enough temperature. The operating limit is the average condenser outlet gas temperature measured during the performance test, and for each 3-hour period the average temperature must be at or below this limit.

For each capture system, you must establish operating limits for gas volumetric flow rate and pressure drop across an opening in each enclosure or capture device. The operating limits are the average volumetric flow rate and average pressure drop across the opening during the performance test, to be met as a minimum.

VI. What Notification, Recordkeeping, and Reporting Requirements Must I Follow?

The rule requires you to comply with notification, recordkeeping, and reporting requirements, generally as described in the General Provisions (see Table 2 of the rule) and specifically as designed to support demonstration of compliance with the rule. We believe that these requirements are necessary and sufficient to ensure that you comply with the requirements in the rule.

A. Initial Notification

If the rule applies to you, you must send an initial notification to the EPA Regional Office in the region where your facility is located and to your State agency. If you have an existing affected source, you must submit the initial notification no later than 1 year before the compliance date, which is May 23, 2006. If you have a new or reconstructed affected source, you must submit the notification no later than 120 days after either the date of initial start-up or May 23, 2006, whichever is later.

The initial notification notifies us and your State agency that you have an existing affected source that is subject to the standards or that you have constructed a new affected source. Thus, it allows you and the Federal or State enforcement agency to plan for compliance activities. The General Provisions specify the information you must include in the initial notification and other reporting requirements for both existing affected sources and new or reconstructed affected sources.

B. Notification of Performance Tests

If the rule applies to you, you have several options for demonstrating compliance. If you demonstrate compliance by using a capture and control system for which you do not conduct a monthly liquid-liquid material balance, you must conduct a performance test as described in the rule. Prior to conducting the performance test, you must notify us or the delegated State or local agency at least 60 calendar days before the performance test is scheduled to begin, as indicated in the General Provisions.

C. Notification of Compliance Status

Your compliance procedures depend on which compliance option you choose. For each compliance option, you must send us a Notification of Compliance Status within 30 days after the end of the initial compliance period. In the notification, you must certify whether the affected source has complied with the standards, identify the option you used to demonstrate initial compliance, summarize the data and calculations supporting the compliance demonstration, and describe how you will determine continuous compliance.

If you elect to comply by using a capture system and control device for which you conduct performance tests, you must provide the results of the tests. Your notification must also include the measured range of each monitored parameter and the operating limits established during the performance test, and information showing whether the source has achieved its operating limits during the initial compliance period.

D. Recordkeeping Requirements

You are required to keep records of reported information and all other information necessary to document compliance with the rule for 5 years. As required under § 63.10(b)(1) of the General Provisions, records for the 2 most recent years must be kept on-site; the other 3 years' records may be kept off-site. Records pertaining to the design and manufacturer's specifications for the operation of the add-on control equipment must be kept on-site for the life of the equipment. We corrected this

oversight in the final rule. See § 63.4930(b) and § 63.4931(c).

Depending on the compliance option that you choose, you could need to keep records of the following:

- Organic HAP content, volatile matter content, coating solids content, and quantity of the coatings, thinners, and cleaning materials used during each compliance period;
- All documentation supporting initial notifications and notifications of compliance status.

If you demonstrate compliance by using a capture system and control device, you must keep records of the following:

- The occurrence and duration of each startup, shutdown, or malfunction of the emission capture system and control device;
- All maintenance performed on the capture system and control device;
- Actions taken during startup, shutdown, and malfunction that are different from the procedures specified in the affected source's startup, shutdown, and malfunction plan (SSMP);
- All information necessary to demonstrate conformance with the affected source's SSMP when the plan procedures are followed;
- All information necessary to demonstrate conformance with the affected source's plan for minimizing emissions from mixing, storage, and waste handling operations;
- Each period during which a CPMS is malfunctioning or inoperative (including out-of-control periods);
- All required measurements needed to demonstrate compliance with the standards; and
- All results of performance tests.

The rule requires you to collect and keep records according to certain minimum data requirements for the CPMS. Failure to collect and keep the specified minimum data is a deviation that is separate from any emission limit, operating limit, or work practice standard. A complete definition of what constitutes a deviation is provided in § 63.4981 of the final rule.

If you use a capture system and control device to reduce HAP emissions, you must make your SSMP available for inspection if the Administrator requests to see it. The plan must stay in your records for the life of the affected source or until the source is no longer subject to the standards. If you revise the plan, you must keep the previous superceded versions on record for 5 years following the revision.

E. Semiannual Reports

Each reporting year is divided into two semiannual reporting periods. You must submit a semiannual report after the end of each semiannual period. If no deviations occur during a semiannual reporting period, your semiannual compliance report must state that the affected source has been in compliance. A deviation, as defined in § 63.4891 of the final rule, is any instance in which you fail to meet any requirement or obligation of the standards or any term or condition adopted to meet the standards. The following information is required in semiannual compliance reports when deviations occur:

- If you are complying by using capture systems and add-on control devices, report all deviations from the operating parameter values established for the capture system and the control device operating parameters.
- If you are complying by using solvent recovery systems and liquid-liquid material balances, report material balance calculations for all months when the material balance deviated from the emission limit.
- If you are complying by using low-HAP coating materials, report all deviations from the emission limit.
- If you are complying by using a combination of capture and control systems with low-HAP coating materials, report all deviations from the emission limit and all deviations from operating parameters described above.

If any of the following events occur, you must report that event in the next semiannual report following the event:

- A change occurs at your facility or within your process that might affect its compliance status.
- A change from what was reported in the initial notice occurs at your facility or within your process.
- You decide to change to another emission limitation option.
- You had a startup, shutdown, or malfunction of an emission control device during the semiannual period and the actions taken were consistent with your SSMP.

VII. What Are the Environmental, Energy, and Economic Impacts of the Rule?

We developed model plants to aid in the estimation of the impacts the MACT floor level of control would have on the metal furniture industry. Three model plants distinguished by size, as measured by the total volume of coating solids used, were developed. We then estimated impacts for each model plant and scaled these individual impacts to nationwide levels based on the number of facilities corresponding to each model plant size. We used the model plant approach because we did not have adequate data to determine impacts for each actual facility.

A variety of compliance methods are available to the industry to meet the standards. We analyzed the information obtained from the industry questionnaire responses, industry site visits, trade groups, and industry representatives to determine which compliance methods would most likely be used by existing and new sources. We expect that the most widely used method would be low-HAP content liquid coatings (coatings with HAP contents at or below the emission limits) and lower-HAP cleaning materials. Powder coatings and add-on capture and control systems would likely be used to a lesser extent. Various combinations of these methods may be used. For the purpose of assessing impacts, we assumed that all existing sources would convert to lower-HAP content liquid coatings, thinners, and cleaning materials.

We first estimated the impacts of the emission limits on the three model plants. To scale up the model plant impacts to nationwide levels, we multiplied the individual model plant impacts by the estimated number of major sources in the United States corresponding to each model plant size. We used United States Census Bureau data as the basis for this estimate, which was a total of 655 facilities. For more information on how impacts were estimated, see Chapters 7 and 8 of the BID to the proposed standards, EPA–453/R–01–010, October 2001.

A. What Are the Air Impacts?

For existing major sources, we estimated that compliance with the emission limits would result in a reduction of nationwide organic HAP emissions of 14,800 Mg/yr (16,300 tpy). This represents a reduction of approximately 73 percent from the baseline organic HAP emissions of 20,300 Mg/yr (22,308 tpy).

We anticipate that all new sources will take steps to reduce their actual and potential HAP emissions to below the major source threshold and avoid becoming subject to the NESHAP. Therefore, we are not attributing any HAP emission reduction for new sources to the rule.

B. What Are the Cost Impacts?

An affected source may incur three types of costs to comply with the standards: Capital, direct, and indirect. Capital costs represent the one-time purchase of equipment. We have included coatings, thinners, and cleaning materials as direct costs incurred on a continuing basis for

materials consumed in the manufacturing process. The cost of utilities, where applicable, is also included in the direct costs. Indirect costs typically include overhead, taxes, insurance, and administrative costs, as well as capital recovery costs.

Existing sources. To comply with the emission limits, we estimated that existing facilities would likely use reformulated coatings, thinners, and cleaning materials. No capital costs have been attributed to these compliance methods. We estimated full costs for 517 of the estimated 655 metal furniture surface coating facilities. Of the remaining 138 facilities, approximately 59 facilities would have only recordkeeping and reporting costs because these facilities would already be in compliance with the standards (based on questionnaire responses). We estimated that 79 facilities would achieve area source status before the compliance date of the final standards and will not incur compliance costs directly attributable to the rule.

We estimated no incremental costs associated with the use of lower-HAP coatings and thinners. Only the incremental cost of organic HAP-free cleaning materials over organic HAP cleaning materials was counted. The average annual cost for each facility incurring full costs is approximately $26,000. This value includes monitoring, recordkeeping, and reporting costs.

We estimated total nationwide annual costs in the 5th year to comply with the emission limits to be $14.8 million for existing sources. These costs include $4.66 million direct costs associated with material usage and $10.1 million for recordkeeping and reporting.

New sources. As previously stated in this preamble, we anticipate that all new sources will reduce potential HAP emissions to less than the major source threshold. All of these new sources will be areas sources not subject to the rule and will incur no costs directly attributable to the rule.

C. What Are the Economic Impacts?

We performed an economic impact analysis (EIA) to provide an estimate of the facility and market impacts of the standards as well as its social costs. In general, we expect the economic impacts of the standards to be minimal, with price increases and production decreases of less than 0.1 percent. Given the negligible market impacts of this rule, the social costs are expected to be roughly the same as the estimated engineering compliance costs of $14.8 million for existing sources.

For affected facilities, the distribution of costs is slanted toward the lower impact levels with many facilities incurring only those related to recordkeeping and reporting. The EIA indicates that these regulatory costs are expected to represent only 0.1 percent of the value of product shipments, which should not cause producers to cease or alter their current operations. Hence, no firms or facilities are expected to become at risk of closure because of the standards. International trade impacts would only occur for the metal household furniture segment of the industry, but the small price increase (that is, 0.04 percent) on this segment indicates negligible impacts, if any. Based on the projected characteristics and costs for new sources, we do not expect any differential impacts on these sources. For more information, refer to the "Economic Impact Analysis of the Proposed NESHAP: Surface Coating of Metal Furniture" (Docket ID No OAR–2002–0048, formerly Docket No. A–97–40).

D. What Are the Nonair Health, Environmental, and Energy Impacts?

Based on information from the industry questionnaire responses, there was no indication that the use of low-organic-HAP content coatings, thinners, and cleaning materials would result in any increase or decrease in nonair health, environmental, and energy impacts. There would be no change in the utility requirements associated with the use of these materials, so there would be no change in the amount of energy consumed as a result of the material conversion. Also, we estimate that there would be no significant change in the amount of materials used or the amount of waste produced and there would be no additional energy requirements for affected sources.

VIII. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligation of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review.

B. Paperwork Reduction Act

The information collection requirements in the rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 1952.02) and a copy may be obtained from Susan Auby by mail at the Collection Strategies Division (2822T), U.S. EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. The information requirements are not effective until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies set forth in 40 CFR part 2, subpart B.

The rule would require maintaining records of all coatings, thinners, and cleaning materials data and calculations used to determine compliance. This information includes the volume used during each monthly compliance period, mass fraction organic HAP, density, and, for coatings only, volume fraction solids.

If an add-on control device is used, records must be kept of the capture efficiency of the capture system,

destruction or removal efficiency of the add-on control device, and the monitored operating parameters. In addition, records must be kept of each calculation of the affected sourcewide emissions for each monthly compliance period and all data, calculations, test results, and other supporting information used to determine this value.

The monitoring, recordkeeping, and reporting burden in the 5th year after the effective date of the promulgated rule is estimated to be approximately 159,000 labor hours at a cost of approximately $10 million for existing sources. We estimate that no cost will be incurred by new sources (other than the labor costs associated with initially reading the rule) because we anticipate that all new sources will reduce their potential HAP emissions to less than the major source threshold. Thus, as area sources, these new sources will not be subject to the rule.

Although we estimated no cost will be incurred by new sources, they may incur some level of cost to achieve area source status. Typically these costs would be associated with the differential in cost between conventional liquid coatings and the coating technology they use to reduce organic HAP emissions. For example, we have limited data indicating that the cost of powder coatings in terms of dollars per liter coating solids is higher than most liquid coatings. New sources would also incur some costs to initially read the rule to determine whether it applies to them (we estimated this cost to be about $300 per facility). A cost savings will be realized by new sources because they will not have the recordkeeping, reporting, and monitoring burden as described above for existing sources. While all of these potential costs and savings are difficult to quantify, we believe that in the balance there will be essentially no cost to new facilities.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR, chapter 15. The OMB control number for the information collection requirements in this rule will be listed in an amendment to 40 CFR part 9 in a subsequent **Federal Register** document after OMB approves the ICR.

C. Regulatory Flexibility Act (RFA)

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule. The EPA has also determined that the rule will not have a significant economic impact on a substantial number of small entities. For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business ranging from 100 to 1,000 employees, according to Small Business Administration size standards established under the NAICS for the industries affected by today's rule; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities.

In accordance with the RFA and SBREFA, EPA conducted an assessment of the standards on small businesses within the metal furniture surface coating industry. Based on Small Business Administration size definitions and reported sales and employment data, EPA's survey identified 10 of the 24 companies owning metal furniture surface coating facilities as small businesses. Although small businesses represent almost 42 percent of the companies within the source category, they are expected to incur 12 percent of the total industry compliance costs. Under the standards, the average annual compliance cost share of sales for small businesses is 0.18 percent, with two of the ten small businesses not expected to incur any additional costs because they are permitted as synthetic minor HAP emission sources. In addition, small businesses in this industry typically have 5 percent profit margins. For more information, consult the docket for this project.

Although the final rule will not have a significant economic impact on a substantial number of small entities, EPA nonetheless has tried to reduce the impact of this rule on small entities. We solicited input from small entities during the data-gathering phase of the proposed rulemaking.

We have included compliance options in the rule which give small entities flexibility in choosing the most cost effective and least burdensome alternative for their operation. For example, a facility could purchase and use low-HAP coatings (*i.e.*, pollution prevention) that meet the standards instead of using add-on capture and control systems. This method of compliance can be demonstrated with minimum burden by using purchase and usage records. No testing of materials would be required, as the facility owner could show that their coatings meet the emission limits by providing formulation data supplied by the manufacturer.

D. Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal

governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the rule does not contain a Federal mandate that may result in expenditures of $100 million or more to State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The maximum total annual cost of the rule for any year has been estimated to be about $15 million. Thus, today's rule is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the standards contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. This rule contains requirements that may apply to State government correctional institutions that manufacture or repair metal furniture. However, these requirements do not uniquely or significantly affect those institutions. Therefore, today's rule is not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. Thus, Executive Order 13132 does not apply to the rule. Although section 6 of Executive Order 13132 does not apply to the rule, EPA did consult with State and local officials to enable them to provide timely input in the development of the rule.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175. No tribal governments own or operate metal furniture surface coating facilities. Thus, Executive Order 13175 does not apply to this rule.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045, "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997), applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. This rule is not subject to Executive Order 13045 because it is based on technology performance and not on health or safety risks. Furthermore, the rule has been determined not to be "economically significant" as defined under Executive Order 12866.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211, "Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001), because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law No. 104–113, (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable VCS.

This rulemaking involves technical standards. The EPA cites the following standards in this rule: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 24, 25, 25A, 204, 204A–F, and 311; and Performance Specifications (PS) 6, 8, and 9. Consistent with the NTTAA, EPA conducted searches to identify VCS in addition to these EPA methods/performance specifications. No applicable VCS were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, 204, 204A through 204F, and 311, and PS 6, 8, and 9. The search and review results have been documented and are placed in the docket (Docket ID No OAR–2002–0048, formerly Docket No. A–97–40) for the rule.

The three VCS were identified as acceptable alternatives to EPA test methods for the purposes of the rule.

The VCS ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," is cited in this rule for its manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas. This part of ANSI/ASME PTC 19.10–1981, Part 10, is an acceptable alternative to Method 3B.

The two VCS, ASTM D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings," and ASTM D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer," are cited in this rule as acceptable alternatives to EPA Method 24 for measuring volume of solids in coatings. Currently, Method 24 does not have a procedure for determining the volume of solids in coatings. These standards

augment the procedures in EPA Method 24, which states that volume solids content be calculated from the coating manufacturer's formulation.

Six VCS: ASTM D1475–90, ASTM D2369–95, ASTM D3792–91, ASTM D4017–96a, ASTM D4457–85 (Reapproved 1991), and ASTM D5403–93 are already incorporated by reference (IBR) in EPA Method 24. Five VCS: ASTM D1979–91, ASTM D3432–89, ASTM D4747–87, ASTM D4827–93, and ASTM PS9–94 are IBR in EPA Method 311.

In addition to the VCS EPA uses in the rule, the search for emissions measurement procedures identified 14 other VCS. The EPA determined that 11 of these 14 standards identified for measuring emissions of the HAP or surrogates subject to emission standards in the rule were impractical alternatives to EPA test methods for the purposes of this rule. Therefore, EPA does not intend to adopt these standards for this purpose. The reasons for this determination for the 11 methods are discussed in the docket.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. § 801, *et seq.*, as added by the SBREFA of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register.** A major rule cannot take effect until 60 days after it is published in the **Federal Register.** This action is not a "major rule" as defined by 5 U.S.C. § 804(2). The rule will be effective May 23, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine T. Whitman,

Administrator.

■ For the reasons set out in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Part 63 is amended by revising paragraphs (b)(24) and (25) and paragraph (i)(3) to § 63.14 of subpart A. The revisions read as follows:

§ 63.14 Incorporations by Reference

* * * * *

(b) * * *

(24) ASTM D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings," IBR approved for §§ 63.4141(b)(1), 63.4941(b)(1), and 63.5160(c).

(25) ASTM D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer," IBR approved for §§ 63.4141(b)(1), 63.4941(b)(1), and 63.5160(c).

* * * * *

(i) * * *

(3) ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," IBR approved for §§ 63.865(b), 63.3360(e)(1)(iii), 63.4166(a)(3), 63.4965(a)(3), and 63.5160(d)(1)(iii).

* * * * *

■ 3. Part 63 is amended by adding subpart RRRR to read as follows:

Subpart RRRR—National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture

Sec.

What This Subpart Covers

63.4880 What is the purpose of this subpart?
63.4881 Am I subject to this subpart?
63.4882 What parts of my plant does this subpart cover?
63.4883 When do I have to comply with this subpart?

Emission Limitations

63.4890 What Emission Limits Must I Meet?
63.4891 What are my options for demonstrating compliance with the emission limits?
63.4892 What operating limits must I meet?
63.4893 What work practice standards must I meet?

General Compliance Requirements

63.4900 What are my general requirements for complying with this subpart?
63.4901 What parts of the General Provisions apply to me?

Notifications, Reports, and Records

63.4910 What notifications must I submit?
63.4920 What reports must I submit?
63.4930 What records must I keep?
63.4931 In what form and for how long must I keep my records?

Compliance Requirements for the Compliant Material Option

63.4940 By what date must I conduct the initial compliance demonstration?
63.4941 How do I demonstrate initial compliance with the emission limitations?
63.4942 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate Without Add-On Controls Option

63.4950 By what date must I conduct the initial compliance demonstration?
63.4951 How do I demonstrate initial compliance with the emission limitations?
63.4952 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate With Add-On Controls Option

63.4960 By what date must I conduct performance tests and other initial compliance demonstrations?
63.4961 How do I demonstrate initial compliance?
63.4962 How do I demonstrate continuous compliance with the emission limitations?
63.4963 What are the general requirements for performance tests?
63.4964 How do I determine the emission capture system efficiency?
63.4965 How do I determine the add-on control device emission destruction or removal efficiency?
63.4966 How do I establish the emission capture system and add-on control device operating limits during the performance test?
63.4967 What are the requirements for continuous parameter monitoring system installation, operation, and maintenance?

Other Requirements and Information

63.4980 Who implements and enforces this subpart?
63.4981 What definitions apply to this subpart?

Tables to Subpart RRRR of Part 63

Subpart RRRR—National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture

What This Subpart Covers

§ 63.4880 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for metal furniture surface coating facilities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§ 63.4881 Am I subject to this subpart?

(a) Except as provided in paragraph (c) of this section, the source category to which this subpart applies is surface coating of metal furniture.

(1) Surface coating is the application of coatings to a substrate using, for example, spray guns or dip tanks.

(2) Metal furniture means furniture or components of furniture constructed either entirely or partially from metal. Metal furniture includes, but is not limited to, components of the following types of products as well as the products themselves: household, office, institutional, laboratory, hospital, public building, restaurant, barber and beauty shop, and dental furniture; office and store fixtures; partitions; shelving; lockers; lamps and lighting fixtures; and wastebaskets.

(b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source as defined in § 63.4882, in the source category defined in paragraph (a) of this section, and that is a major source, is located at a major source, or is part of a major source of emissions of hazardous air pollutants (HAP). A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (Mg) (10 tons) or more per year or any combination of HAP at a rate of 22.68 Mg (25 tons) or more per year.

(c) This subpart does not apply to surface coating that meets any of the criteria of paragraphs (c)(1) through (6) of this section.

(1) Surface coating conducted at an affected source that uses only coatings, thinners, and cleaning materials that contain no organic HAP.

(2) Surface coating of metal components of wood furniture conducted in an operation that is subject to the wood furniture manufacturing NESHAP in subpart JJ of this part.

(3) Surface coating that occurs at research or laboratory facilities or that is part of janitorial, building, and facility maintenance operations.

(4) Surface coating of only small items such as knobs, hinges, or screws that have a wider use beyond metal furniture are not subject to this subpart unless the surface coating occurs at an affected metal furniture source.

(5) Surface coating of metal furniture conducted for the purpose of repairing or maintaining metal furniture used by a major source and not for commerce is not subject to this subpart, unless organic HAP emissions from the surface coating itself are as high as the rates specified in paragraph (b) of this section.

(6) Surface coating of metal furniture performed on-site at installations owned or operated by the Armed Forces of the United States (including the Coast Guard and the National Guard of any State).

§ 63.4882 What parts of my plant does this subpart cover?

(a) This subpart applies to each new, reconstructed, and existing affected source.

(b) The affected source is the collection of all of the items listed in paragraphs (b)(1) through (4) of this section that are used for surface coating of metal furniture:

(1) All coating operations as defined in § 63.4981;

(2) All storage containers and mixing vessels in which coatings, thinners, and cleaning materials are stored or mixed;

(3) All manual and automated equipment and containers and all pumps and piping within the affected source used for conveying coatings, thinners, and cleaning materials; and

(4) All storage containers, all pumps and piping, and all manual and automated equipment and containers within the affected source used for conveying waste materials generated by a coating operation.

(c) An affected source is a new affected source if you commenced its construction after April 24, 2002, and the construction is of a completely new metal furniture surface coating facility where previously no metal furniture surface coating facility had existed.

(d) An affected source is reconstructed if you meet the criteria as defined in § 63.2.

(e) An affected source is existing if it is not new or reconstructed.

§ 63.4883 When do I have to comply with this subpart?

The date by which you must comply with this subpart is called the compliance date. The compliance date for each type of affected source is specified in paragraphs (a) through (c) of this section. The compliance date begins the initial compliance period during which you conduct the initial compliance demonstration described in §§ 63.4940, 63.4950, and 63.4960.

(a) For a new or reconstructed affected source, the compliance date is the applicable date in paragraph (a)(1) or (2) of this section:

(1) If the initial startup of your new or reconstructed affected source is before May 23, 2003, the compliance date is May 23, 2003.

(2) If the initial startup of your new or reconstructed affected source occurs after May 23, 2003, the compliance date is the date of initial startup of your affected source.

(b) For an existing affected source, the compliance date is the date 3 years after May 23, 2003.

(c) For an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP emissions, the compliance date is specified in paragraphs (c)(1) and (2) of this section.

(1) For any portion of the source that becomes a new or reconstructed affected source subject to this subpart, the compliance date is the date of initial startup of the affected source or May 23, 2003, whichever is later.

(2) For any portion of the source that becomes an existing affected source subject to this subpart, the compliance date is the date 1 year after the area source becomes a major source or 3 years after May 23, 2003, whichever is later.

(d) You must meet the notification requirements in § 63.4910 according to the dates specified in that section and in subpart A of this part. Some of the notifications must be submitted before the compliance dates described in paragraphs (a) through (c) of this section.

Emission Limitations

§ 63.4890 What emission limits must I meet?

(a) For a new or reconstructed affected source, you must emit no organic HAP during each compliance period, determined according to the procedures in § 63.4941.

(b) *Alternative emission limit.* You may request approval from the Administrator to use an alternative new source emission limit for specific metal

furniture components or type of components for which you believe the emission limit in paragraph (a) of this section cannot be achieved.

(1) Any request to use an alternative emission limit under paragraph (b) of this section must contain specific information demonstrating why no organic HAP-free coating technology can be used on the metal furniture components. The request must be based on objective criteria related to the performance or appearance requirements of the finished coating, which may include but is not limited to the criteria listed in paragraphs (b)(1)(i) through (viii) of this section.

(i) Low dried film thickness requirements (*e.g.*, less than 0.0254 millimeters (0.001 inch)).

(ii) Flexibility requirements for parts subject to repeated bending.

(iii) Chemical resistance to withstand chemical exposure in environments such as laboratories.

(iv) Resistance to the effects of exposure to ultraviolet light.

(v) Adhesion characteristics related to the condition of the substrate.

(vi) High gloss requirements.

(vii) Custom colors such as matching the color of a corporate logo.

(viii) Non-uniform surface finishes such as an antique appearance that requires visible cracking of the dried film.

(2) If the request to use an alternative emission limit under paragraph (b) of this section is approved, the new source must meet an emission limit of 0.094 kilogram (kg) organic HAP per liter (kg/liter) (0.78 pounds per gallon (lb/gal)) coating solids used for only those components subject to the approval. All other metal furniture surface coating operations at the new source must meet the emission limit specified in paragraph (a) of this section. Until approval to use the alternative emission limit has been granted by the Administrator under this paragraph (b)(2), you must meet the emission limit specified in paragraph (a) of this section and all other applicable requirements in this subpart.

(c) For an existing affected source, you must limit organic HAP emissions to the atmosphere to no more than 0.10 kg organic HAP per liter (0.83 lb/gal) of coating solids used during each compliance period, determined according to the procedures in § 63.4941, § 63.4951, or § 63.4961.

§ 63.4891 What are my options for demonstrating compliance with the emission limits?

You must include all coatings, thinners, and cleaning materials used in the affected source when determining whether the organic HAP emission rate is equal to or less than the applicable emission limit in § 63.4890. To make this determination, you must use at least one of the three compliance options listed in paragraphs (a) through (c) of this section. You may apply any of the compliance options to an individual coating operation or to multiple coating operations as a group or to the entire affected source. You may use different compliance options for different coating operations or at different times on the same coating operation. However, you may not use different compliance options at the same time on the same coating operation. If you switch between compliance options for any coating operation or group of coating operations, you must document this switch as required by § 63.4930(c), and you must report it in the next semiannual (6-month period) compliance report required in § 63.4920.

(a) *Compliant material option.* Demonstrate that the organic HAP content of each coating used in the coating operation or group of coating operations is less than or equal to the applicable emission rate limit in § 63.4890 and that each thinner and each cleaning material used contains no organic HAP. You must meet all the requirements of §§ 63.4940, 63.4941, and 63.4942 to demonstrate compliance with the emission limit using this option.

(b) *Emission rate without add-on controls option.* Demonstrate that, based on the coatings, thinners, and cleaning materials used in the coating operation or group of coating operations, the organic HAP emission rate for the coating operation or group of coating operations is less than or equal to the applicable emission rate limit in § 63.4890, calculated as a monthly emission rate. You must meet all the requirements of §§ 63.4950, 63.4951, and 63.4952 to demonstrate compliance with the emission rate limit using this option.

(c) *Emission rate with add-on controls option.* Demonstrate that, based on the coatings, thinners, and cleaning materials used in the coating operation or group of coating operations, and the emission reductions achieved by emission capture and add-on control systems, the organic HAP emission rate is less than or equal to the applicable emission rate limit in § 63.4890, calculated as a monthly emission rate. If you use this compliance option, you must also demonstrate that all capture systems and add-on control devices for the coating operation or group of coating operations meet the operating limits required in § 63.4892, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4961(j); and that you meet the work practice standards required in § 63.4893. You must meet all the requirements of §§ 63.4960 through 63.4967 to demonstrate compliance with the emission limits, operating limits, and work practice standards using this option.

(d) If you choose to use the emission rate with add-on controls compliance option in paragraph (c) of this section and operate the coating operation, its emission capture system, or its add-on control device at multiple sets of representative operating conditions that result in different capture system or add-on control device efficiencies during a compliance period, you must follow one of the procedures in paragraph (d)(1) or (2) of this section.

(1) Determine the operating conditions that result in the lowest emission capture system and add-on control device efficiencies through performance testing conducted according to §§ 63.4963, 63.4964, and 63.4965. Use these emission capture system and add-on control device efficiencies for all representative operating conditions during the compliance period.

(2) Develop a compliance calculation procedure for determining the organic HAP emission rate for the compliance period that takes into account all of the representative operating conditions the source was operated under during the compliance period and submit the procedure to the Administrator for approval. Until you receive approval from the Administrator, you must determine compliance according to paragraph (c) of this section.

§ 63.4892 What operating limits must I meet?

(a) For any coating operation or group of coating operations for which you use the compliant material option or the emission rate without add-on controls option to demonstrate compliance, you are not required to meet any operating limits.

(b) For any coating operation or group of coating operations for which you use the emission rate with add-on controls option to demonstrate compliance, except those for which you use a solvent recovery system and conduct a liquid-liquid material balance according to § 63.4961(j), you must meet the operating limits specified in Table 1 to this subpart. These operating limits apply to the emission capture and control systems on the coating operation or group of coating operations for which

you use emission capture and add-on controls to demonstrate compliance. You must establish the operating limits during the performance test according to the requirements in § 63.4966. You must meet the operating limits at all times after you establish them.

(c) If you use an add-on control device other than those listed in Table 1 to this subpart, or wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of alternative monitoring under § 63.8(f).

§ 63.4893 What work practice standards must I meet?

(a) For any coating operation or group of coating operations for which you use the compliant material option or the emission rate without add-on controls option to demonstrate compliance, you are not required to meet any work practice standards.

(b) For any coating operation or group of coating operations for which you use the emission rate with add-on controls option to demonstrate compliance, you must develop and implement a work practice plan to minimize organic HAP emissions from the storage, mixing, and conveying of coatings, thinners, and cleaning materials used in, and waste materials generated by, the coating operation or group of coating operations for which you use this option; or you must meet an alternative standard as provided in paragraph (c) of this section. The plan must specify practices and procedures to ensure that, at a minimum, the elements specified in paragraphs (b)(1) through (5) of this section are implemented.

(1) All organic-HAP-containing coatings, thinners, cleaning materials, and waste materials must be stored in closed containers. You must ensure that these containers are kept closed at all times except when depositing or removing these materials from the container.

(2) Spills of organic-HAP-containing coatings, thinners, cleaning materials, and waste materials must be minimized.

(3) Organic-HAP-containing coatings, thinners, cleaning materials, and waste materials must be conveyed from one location to another in closed containers or pipes.

(4) Mixing vessels which contain organic-HAP-containing coatings and other materials must be closed except when adding to, removing, or mixing the contents.

(5) Emissions of organic HAP must be minimized during cleaning of storage, mixing, and conveying equipment.

(c) As provided in § 63.6(g), the Administrator may choose to grant you permission to use an alternative to the work practice standards in this section.

General Compliance Requirements

§ 63.4900 What are my general requirements for complying with this subpart?

(a) The affected source must be in compliance at all times with the emission limitations specified in § 63.4890.

(b) You must always operate and maintain your affected source, including all air pollution control and monitoring equipment you use for purposes of complying with this subpart, according to the provisions in § 63.6(e)(1)(i).

(c) If your affected source uses an emission capture system and add-on control device to comply with the emission limitations in § 63.4890, you must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). The SSMP must address the startup, shutdown, and corrective actions in the event of a malfunction of the emission capture system or the add-on control device. The SSMP must also address any coating operation equipment that may cause increased emissions or that would affect capture efficiency if the process equipment malfunctions, such as conveyors that move parts among enclosures.

§ 63.4901 What parts of the General Provisions apply to me?

Table 2 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

Notifications, Reports, and Records

§ 63.4910 What notifications must I submit?

(a) *General.* You must submit the notifications in §§ 63.7(b) and (c), 63.8(f)(4), and 63.9(b) through (e), (h), and (j) that apply to you by the dates specified in those sections, except as provided in paragraphs (b) and (c) of this section.

(b) *Initial Notification.* You must submit the Initial Notification required by § 63.9(b) for a new or reconstructed affected source no later than 120 days after initial startup or 120 days after May 23, 2003, whichever is later. For an existing affected source, you must submit the Initial Notification no later than 1 year after May 23, 2003.

(c) *Notification of Compliance Status.* You must submit the Notification of Compliance Status required by § 63.9(h) no later than 30 calendar days following the end of the initial compliance period described in § 63.4940, § 63.4950, or § 63.4960 that applies to your affected source. The Notification of Compliance Status must contain the information specified in paragraphs (c)(1) through (9) of this section and the applicable information specified in § 63.9(h).

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the report. Such certifications must also comply with the requirements of 40 CFR 70.5(d) or 40 CFR 71.5(d).

(3) Date of the report and beginning and ending dates of the reporting period. The reporting period is the initial compliance period described in § 63.4940, § 63.4950, or § 63.4960 that applies to your affected source.

(4) Identification of the compliance option or options specified in § 63.4891 that you used on each coating operation in the affected source during the initial compliance period and that you will use for demonstrating continuous compliance.

(5) Statement of whether or not the affected source achieved the emission limitations for the initial compliance period.

(6) If you had a deviation, include the information in paragraphs (c)(6)(i) and (ii) of this section.

(i) A description and statement of the cause of the deviation.

(ii) If you failed to meet the applicable emission limit in § 63.4890, include all the calculations you used to determine compliance. You do not need to submit information provided by material suppliers or manufacturers or test reports.

(7) For each of the data items listed in paragraphs (c)(7)(i) through (iv) of this section that is required by the compliance option(s) you used to demonstrate compliance with the emission limit, include an example of how you determined the value, including calculations and supporting data. Supporting data can include a copy of the information provided by the supplier or manufacturer of the example coating or material or a summary of the results of testing conducted according to § 63.4941(a), (b), or (c). You do not need to submit copies of any test reports.

(i) Mass fraction of organic HAP for one coating, for one thinner, and for one cleaning material.

(ii) Volume fraction of coating solids for one coating.

(iii) Density for one coating, one thinner, and one cleaning material, except that if you use the compliant material option, only the example coating density is required.

(iv) The amount of waste materials and the mass of organic HAP contained in the waste materials for which you are

claiming an allowance in Equation 1 of § 63.4951.

(8) The calculation of the organic HAP emission rate for the compliance option(s) you used, as specified in paragraphs (c)(8)(i) through (iii) of this section.

(i) For the compliant materials option, provide an example calculation of the organic HAP content for one coating, using Equation 2 of § 63.4941.

(ii) For the emission rate without add-on controls option, provide the information specified in paragraphs (c)(8)(ii)(A) through (C) of this section.

(A) The calculation of the total mass of organic HAP emissions during the initial compliance period, using Equation 1 of § 63.4951.

(B) The calculation of the total volume of coating solids used during the initial compliance period, using Equation 2 of § 63.4951.

(C) The calculation of the organic HAP emission rate for the initial compliance period, using Equation 3 of § 63.4951.

(iii) For the emission rate with add-on controls option, provide the information specified in paragraphs (c)(8)(iii)(A) through (D) of this section.

(A) The calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used during the initial compliance period, using Equation 1 of § 63.4951.

(B) The calculation of the total volume of coating solids used during the initial compliance period, using Equation 2 of § 63.4951.

(C) The calculation of the mass of organic HAP emission reduction during the initial compliance period by emission capture systems and add-on control devices, using Equation 1 of § 63.4961, and the calculation of the mass of organic HAP emission reduction for the coating operations controlled by solvent recovery systems during each compliance period, using Equation 3 of § 63.4961 as applicable.

(D) The calculation of the organic HAP emission rate for the initial compliance period, using Equation 4 of § 63.4961.

(9) For the emission rate with add-on controls option, you must include the information specified in paragraphs (c)(9)(i) through (v) of this section. However, the requirements in paragraphs (c)(9)(i) through (iii) of this section do not apply to solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4961(j).

(i) For each emission capture system, a summary of the data and copies of the calculations supporting the determination that the emission capture system is a permanent total enclosure (PTE) or a measurement of the emission capture system efficiency. Include a description of the protocol followed for measuring capture efficiency, summaries of any capture efficiency tests conducted, and any calculations supporting the capture efficiency determination. If you use the data quality objective (DQO) or lower confidence limit (LCL) approach, you must also include the statistical calculations to show you meet the DQO or LCL criteria in appendix A to subpart KK of this part. You do not need to submit complete test reports.

(ii) A summary of the results of each add-on control device performance test. You do not need to submit complete test reports.

(iii) A list of each emission capture system's and add-on control device's operating limits and a summary of the data used to calculate those limits.

(iv) A statement of whether or not you developed and implemented the work practice plan required by § 63.4893.

(v) A statement of whether or not you developed and implemented the SSMP required by § 63.4900.

§ 63.4920 What reports must I submit?

(a) *Semiannual compliance reports.* You must submit semiannual compliance reports for each affected source according to the requirements of paragraphs (a)(1) through (7) of this section. The semiannual compliance reporting requirements may be satisfied by reports required under other parts of the Clean Air Act (CAA), such as those detailed in paragraph (a)(2) of this section.

(1) *Dates.* Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must prepare and submit each semiannual compliance report according to the dates specified in paragraphs (a)(1)(i) through (iv) of this section.

(i) The first semiannual compliance report must cover the first semiannual reporting period which begins the day after the end of the initial compliance period described in § 63.4940, § 63.4950, or § 63.4960 that applies to your affected source and ends on June 30 or December 31, whichever occurs first following the end of the initial compliance period.

(ii) Each subsequent semiannual compliance report must cover the subsequent semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(iii) Each semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(iv) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting 6-month monitoring reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent semiannual compliance reports according to the dates the permitting authority has established for the 40 CFR part 70 or 40 CFR part 71 6-month monitoring reports instead of according to the dates specified in paragraph (a)(1)(iii) of this section. However, under no circumstances shall the semiannual compliance report be submitted more than 30 days after the end of the semiannual reporting period established in paragraphs (a)(1)(i) and (ii) of this section.

(2) *Inclusion with title V report.* Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 40 CFR part 71 must report all deviations as defined in this subpart in the 6-month monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a semiannual compliance report pursuant to this section along with, or as part of, the 6-month monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the semiannual compliance report includes all information required by the part 70 or part 71 6-month monitoring report concerning deviations from the requirements of this subpart as defined in § 63.4981, the submission of the semiannual compliance report shall be deemed to satisfy any obligation to report the same deviation information in the part 70 or part 71 6-month monitoring report. However, in such situations, the 6-month monitoring report must cross-reference the semiannual compliance report, and submission of a semiannual compliance report shall not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permitting authority.

(3) *General requirements.* The semiannual compliance report must contain the information specified in paragraphs (a)(3)(i) through (v) of this section, and the information specified in paragraphs (a)(4) through (7) and (c)(1)

of this section that is applicable to your affected source.

(i) Company name and address.

(ii) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the report. Such certifications must also comply with the requirements of 40 CFR 70.5(d) or 40 CFR 71.5(d)

(iii) Date of report and beginning and ending dates of the reporting period. The reporting period is the 6-month period ending on June 30 or December 31.

(iv) Identification of the compliance option or options specified in § 63.4891 that you used on each coating operation during the reporting period. If you switched between compliance options during the reporting period, you must report the beginning and ending dates you used each option.

(v) If you used the emission rate without add-on controls or the emission rate with add-on controls compliance option (§ 63.4891(b) or (c)), the calculation results for each organic HAP emission rate for each compliance period ending in the 6-month reporting period.

(4) *No deviations.* If there were no deviations from the emission limits, operating limits, and work practice standards in §§ 63.4890, 63.4892, and 63.4893, respectively, that apply to you, the semiannual compliance report must include an affirmative statement that there were no deviations from the emission limitations, operating limits, or work practice standards in §§ 63.4890, 63.4892, and 63.4893 during the reporting period. If there were no deviations from the emission limitations in § 63.4890, the semiannual compliance report must include the affirmative statement that is described in either § 63.4942(c), § 63.4952(c), or § 63.4962(f), as applicable. If you used the emission rate with add-on controls option and there were no periods during which the continuous parameter monitoring systems (CPMS) were out-of-control as specified in § 63.8(c)(7), the semiannual compliance report must include a statement that there were no periods during which the CPMS were out-of-control during the reporting period as specified in § 63.8(c)(7).

(5) *Deviations: compliant material option.* If you used the compliant material option, and there was a deviation from the applicable emission limit in § 63.4890, the semiannual compliance report must contain the information in paragraphs (a)(5)(i) through (iv) of this section.

(i) Identification of each coating used that deviated from the emission limit, and of each thinner and cleaning material used that contained organic HAP, and the dates and time periods each was used.

(ii) The calculation of the organic HAP content for each coating identified in paragraph (a)(5)(i) of this section, using Equation 2 of § 63.4941. You do not need to submit background data supporting this calculation, for example, information provided by materials suppliers or manufacturers, or test reports.

(iii) The determination of mass fraction of organic HAP for each coating, thinner, and cleaning material identified in paragraph (a)(5)(i) of this section. You do not need to submit background data supporting this calculation, for example, information provided by materials suppliers or manufacturers, or test reports.

(iv) A statement of the cause of each deviation.

(6) *Deviations: emission rate without add-on controls option.* If you used the emission rate without add-on controls option, and there was a deviation from any applicable emission limit in § 63.4890, the semiannual compliance report must contain the information in paragraphs (a)(6)(i) through (v) of this section. You do not need to submit background data supporting these calculations, for example, information provided by materials suppliers or manufacturers, or test reports.

(i) The beginning and ending dates of each compliance period during which the organic HAP emission rate exceeded the applicable emission limit in § 63.4890.

(ii) The calculation of the total mass of organic HAP emissions for each month, using Equations 1 of § 63.4951.

(iii) The calculation of the total volume of coating solids used each month, using Equation 2 of § 63.4951.

(iv) The calculation of the organic HAP emission rate for each month, using Equation 3 of § 63.4951.

(v) A statement of the cause of each deviation.

(7) *Deviations: emission rate with add-on controls option.* If you used the emission rate with add-on controls option, and there was a deviation from any applicable emission limitation (including any periods when emissions bypassed the add-on control device and were diverted to the atmosphere), the semiannual compliance report must contain the information in paragraphs (a)(7)(i) through (xvii) of this section. This includes periods of startup, shutdown, and malfunction during which deviations occurred. You do not need to submit background data supporting these calculations, for example, information provided by materials suppliers or manufacturers, or test reports.

(i) The beginning and ending dates of each compliance period during which the organic HAP emission rate exceeded the applicable emission limit in § 63.4890.

(ii) The calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used during each month, using Equation 1 of § 63.4951 and, if applicable, the calculation used to determine the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste treatment, storage, and disposal facility (TSDF) for treatment or disposal during each compliance period, according to § 63.4951(e)(4).

(iii) The calculation of the total volume of coating solids used, using Equation 2 of § 63.4951.

(iv) The calculation of the mass of organic HAP emission reduction each month by emission capture systems and add-on control devices, using Equation 1 of § 63.4961, and Equation 3 of § 63.4961 for the calculation of the mass of organic HAP emission reduction for the coating operation controlled by solvent recovery systems each compliance period, as applicable.

(v) The calculation of the organic HAP emission rate for each compliance period, using Equation 4 of § 63.4961.

(vi) The date and time that each malfunction started and stopped.

(vii) A brief description of the CPMS.

(viii) The date of the latest CPMS certification or audit.

(ix) The date and time that each CPMS was inoperative, except for zero (low-level) and high-level checks.

(x) The date, time, and duration that each CPMS was out-of-control, including the information in § 63.8(c)(8).

(xi) The date and time period of each deviation from an operating limit in Table 1 to this subpart; date and time period of any bypass of the add-on control device; and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(xii) A summary of the total duration of each deviation from an operating limit in Table 1 to this subpart and each bypass of the add-on control device during the semiannual reporting period and the total duration as a percent of the total affected source operating time during that semiannual reporting period.

(xiii) A breakdown of the total duration of the deviations from the operating limits in Table 1 to this

subpart and bypasses of the add-on control device during the semiannual reporting period into those that were due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(xiv) A summary of the total duration of CPMS downtime during the semiannual reporting period and the total duration of CPMS downtime as a percent of the total affected source operating time during that semiannual reporting period.

(xv) A description of any changes in the CPMS, coating operation, emission capture system, or add-on control device since the last semiannual reporting period.

(xvi) For each deviation from the work practice standards, a description of the deviation; the date and time period of the deviation; and the actions you took to correct the deviation.

(xvii) A statement of the cause of each deviation.

(b) *Performance test reports.* If you use the emission rate with add-on controls option, you must submit reports of performance test results for emission capture systems and add-on control devices no later than 60 days after completing the tests as specified in § 63.10(d)(2).

(c) *Startup, shutdown, and malfunction reports.* If you used the emission rate with add-on controls option and you had a startup, shutdown, or malfunction during the semiannual reporting period, you must submit the reports specified in paragraphs (c)(1) and (2) of this section.

(1) If your actions were consistent with your SSMP, you must include the information specified in § 63.10(d)(5) in the semiannual compliance report required by paragraph (a) of this section.

(2) If your actions were not consistent with your SSMP, you must submit an immediate startup, shutdown, and malfunction report as described in paragraphs (c)(2)(i) and (ii) of this section.

(i) You must describe the actions taken during the event in a report delivered by facsimile, telephone, or other means to the Administrator within 2 working days after starting actions that are inconsistent with the plan.

(ii) You must submit a letter to the Administrator within 7 working days after the end of the event, unless you have made alternative arrangements with the Administrator as specified in § 63.10(d)(5)(ii). The letter must contain the information specified in § 63.10(d)(5)(ii).

§ 63.4930 What records must I keep?

You must collect and keep records of the data and information specified in this section. Failure to collect and keep these records is a deviation from the applicable standard.

(a) A copy of each notification and report that you submitted to comply with this subpart, and the documentation supporting each notification and report.

(b) A current copy of information provided by materials suppliers or manufacturers. This would include records pertaining to the design and manufacturer's specifications for the life of the add-on control equipment. It would also include information such as manufacturer's formulation data for the materials used, or test data used to determine the mass fraction of organic HAP and density for each coating, thinner, and cleaning material and the volume fraction of coating solids for each coating. If you conducted testing to determine mass fraction of organic HAP, density, or volume fraction of coating solids, you must keep a copy of the complete test report. If you use information provided to you by the manufacturer or supplier of the material that was based on testing, you must keep the summary sheet of results provided to you by the manufacturer or supplier. You are not required to obtain the test report or other supporting documentation from the manufacturer or supplier.

(c) For each compliance period, the records specified in paragraphs (c)(1) through (4) of this section.

(1) A record of the coating operations at which you used each compliance option and the time periods (beginning and ending dates and times) you used each option.

(2) For the compliant material option, a record of the calculation of the organic HAP content for each coating, using Equation 2 of § 63.4941.

(3) For the emission rate without add-on controls option, a record of the calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used during each compliance period, using Equation 1 of § 63.4951 and, if applicable, the calculation used to determine the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period, according to § 63.4951(e)(4); the calculation of the total volume of coating solids used during each compliance period, using Equation 2 of § 63.4951; and the calculation of the organic HAP emission rate for each compliance period, using Equation 3 of § 63.4951.

(4) For the emission rate with add-on controls option, records of the calculations specified in paragraphs (c)(4)(i) through (iv) of this section.

(i) The calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used during each compliance period, using Equation 1 of § 63.4951 and, if applicable, the calculation used to determine the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period, according to § 63.4951(e)(4);

(ii) The calculation of the total volume of coating solids used during each compliance period, using Equation 2 of § 63.4951;

(iii) The calculation of the mass of organic HAP emission reduction by emission capture systems and add-on control devices, using Equation 1 of § 63.4961, and the calculation of the mass of organic HAP emission reduction for the coating operation controlled by a solvent recovery system during the compliance period, using Equation 3 of § 63.4961, as applicable;

(iv) The calculation of the organic HAP emission rate for each compliance period, using Equation 4 of § 63.4961.

(d) A record of the name and volume of each coating, thinner, and cleaning material used during each compliance period.

(e) A record of the mass fraction of organic HAP for each coating, thinner, and cleaning material used during each compliance period.

(f) A record of the volume fraction of coating solids for each coating used during each compliance period.

(g) If a determination of density is required by the compliance option(s) you used to demonstrate compliance with the emission limit, a record of the density for each coating used during each compliance period; and, if you use either the emission rate without add-on controls or the emission rate with add-on controls compliance option, the density for each thinner and cleaning material used during each compliance period.

(h) If you use an allowance in Equation 1 of § 63.4951 for organic HAP contained in waste materials sent to or designated for shipment to a TSDF according to § 63.4951(e)(4), you must keep records of the information specified in paragraphs (h)(1) through (3) of this section.

(1) The name and address of each TSDF to which you sent waste materials for which you use an allowance in

Equation 1 of § 63.4951, a statement of which subparts under 40 CFR parts 262, 264, 265, and 266 apply to the facility, and the date of each shipment.

(2) Identification of the coating operations producing waste materials included in each shipment and the month or months in which you used the allowance for these materials in Equation 1 of § 63.4951.

(3) The methodology used in accordance with § 63.4951(e)(4) to determine the total amount of waste materials sent to or the amount collected, stored, and designated for transport to a TSDF each month; and the methodology to determine the mass of organic HAP contained in these waste materials. This must include the sources for all data used in the determination, methods used to generate the data, frequency of testing or monitoring, and supporting calculations and documentation, including the waste manifest for each shipment.

(i) [Reserved]

(j) You must keep records of the date, time, and duration of each deviation.

(k) If you use the emission rate with add-on controls option, you must keep the records specified in paragraphs (k)(1) through (8) of this section.

(1) For each deviation, a record of whether the deviation occurred during a period of startup, shutdown, or malfunction.

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) The records required to show continuous compliance with each operating limit specified in Table 1 to this subpart that applies to you.

(4) For each capture system that is a PTE, the data and documentation you used to support a determination that the capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and has a capture efficiency of 100 percent, as specified in § 63.4964(a).

(5) For each capture system that is not a PTE, the data and documentation you used to determine capture efficiency according to the requirements specified in §§ 63.4963 and 63.4964(b) through (e), including the records specified in paragraphs (k)(5)(i) through (iii) of this section that apply to you.

(i) *Records for a liquid-to-uncaptured-gas protocol using a temporary total enclosure or building enclosure.* Records of the mass of total volatile hydrocarbon (TVH) as measured by Method 204A or F of appendix M to 40 CFR part 51 for each material used in the coating operation, and the total TVH for all materials used, during each capture efficiency test run, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run, as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(ii) *Records for a gas-to-gas protocol using a temporary total enclosure or a building enclosure.* Records of the mass of TVH emissions captured by the emission capture system as measured by Method 204B or C of appendix M to 40 CFR part 51 at the inlet to the add-on control device, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run, as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(iii) *Records for an alternative protocol.* Records needed to document a capture efficiency determination using an alternative method or protocol as specified in § 63.4964(e), if applicable.

(6) The records specified in paragraphs (k)(6)(i) and (ii) of this section for each add-on control device organic HAP destruction or removal efficiency determination as specified in § 63.4965.

(i) Records of each add-on control device performance test conducted according to §§ 63.4963 and 63.4965.

(ii) Records of the coating operation conditions during the add-on control device performance test showing that the performance test was conducted under representative operating conditions.

(7) Records of the data and calculations you used to establish the emission capture and add-on control device operating limits as specified in § 63.4966 and to document compliance with the operating limits as specified in Table 1 to this subpart.

(8) A record of the work practice plan required by § 63.4893 and documentation that you are implementing the plan on a continuous basis.

§ 63.4931 In what form and for how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1). Where appropriate, the records may be maintained as electronic spreadsheets or as a database.

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on-site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You may keep these records off-site for the remaining 3 years. You must keep records on-site pertaining to the design and manufacturer's specifications for operation of add-on control equipment for the life of the equipment.

Compliance Requirements for the Compliant Material Option

§ 63.4940 By what date must I conduct the initial compliance demonstration?

You must complete the initial compliance demonstration for the initial compliance period according to the requirements in § 63.4941. The initial compliance period begins on the applicable compliance date specified in § 63.4883 and ends on the last day of the first full month following the compliance date. The initial compliance demonstration includes the calculations according to § 63.4941 and supporting documentation showing that, during the initial compliance period, you used no coating with an organic HAP content that exceeded the applicable emission limit in § 63.4890, and you used no thinners or cleaning materials that contained organic HAP.

§ 63.4941 How do I demonstrate initial compliance with the emission limitations?

You may use the compliant material option for any individual coating operation, for any group of coating operations in the affected source, or for all the coating operations in the affected source to demonstrate compliance with an organic HAP emission limit. You must use either the emission rate without add-on controls option or the emission rate with add-on controls option for any coating operation in the affected source for which you do not use this option. To demonstrate initial compliance using the compliant material option, during the compliance period the coating operation or group of coating operations must use no coating with an organic HAP content that exceeds the applicable emission limit in

§ 63.4890 and must use no thinner or cleaning material that contains organic HAP as determined according to this section. Any coating operation for which you use the compliant material option is not required to comply with the operating limits or work practice standards required in §§ 63.4892 and 63.4893, respectively. To demonstrate initial compliance with the emission limitations using the compliant material option, you must meet all the requirements of this section for the coating operation or group of coating operations using this option. Use the procedures in this section for each coating, thinner, and cleaning material in the condition it is in when it is received from its manufacturer or supplier and prior to any alteration. You do not need to redetermine the organic HAP content of cleaning materials that are reclaimed and reused onsite provided these materials in their condition as received were demonstrated to comply with the compliant material option.

(a) *Determine the mass fraction of organic HAP for each material used.* You must determine the mass fraction of organic HAP for each coating, thinner, and cleaning material used during the compliance period by using one of the options in paragraphs (a)(1) through (5) of this section.

(1) *Method 311 (appendix A to 40 CFR part 63).* You may use Method 311 for determining the mass fraction of organic HAP. Use the procedures specified in paragraphs (a)(1)(i) and (ii) of this section when performing a Method 311 test.

(i) Count each organic HAP that is measured to be present at 0.1 percent by mass or more for Occupational Safety and Health Administration (OSHA)-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1.0 percent by mass or more for other organic HAP compounds. For example, if toluene (not an OSHA carcinogen) is measured to be 0.5 percent of the material by mass, you do not have to count it. Express the mass fraction of each organic HAP you count as a value truncated to four places after the decimal point (for example, 0.3791).

(ii) Calculate the total mass fraction of organic HAP in the test material by adding up the individual organic HAP mass fractions and truncating the result to three places after the decimal point (for example, 0.763).

(2) *Method 24 (appendix A to 40 CFR part 60).* For coatings, you may use Method 24 to determine the mass fraction of nonaqueous volatile matter and use that value as a substitute for mass fraction of organic HAP.

(3) *Alternative method.* You may use an alternative test method for determining the mass fraction of organic HAP once the Administrator has approved it. You must follow the procedure in § 63.7(f) to submit an alternative test method for approval.

(4) *Information from the supplier or manufacturer of the material.* You may rely on information other than that generated by the test methods specified in paragraphs (a)(1) through (3) of this section, such as manufacturer's formulation data, if it represents each organic HAP that is present at 0.1 percent by mass or more for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1.0 percent by mass or more for other organic HAP compounds. For example, if toluene (not an OSHA carcinogen) is 0.5 percent of the material by mass, you do not have to count it. If there is a disagreement between such information and results of a test conducted according to paragraphs (a)(1) through (3) of this section, then the test method results will take precedence.

(5) *Solvent blends.* Solvent blends may be listed as single components for some materials in data provided by manufacturers or suppliers. Solvent blends may contain organic HAP which must be counted toward the total organic HAP mass fraction of the materials. When test data and manufacturer's data for solvent blends are not available, you may use the default values for the mass fraction of organic HAP in these solvent blends listed in Table 3 or 4 to this subpart. If you use the tables, you must use the values in Table 3 for all solvent blends that match Table 3 entries, and you may only use Table 4 if the solvent blends in the materials you use do not match any of the solvent blends in Table 3, and you only know whether the blend is aliphatic or aromatic. However, if the results of a Method 311 test indicate higher values than those listed on Table 3 or 4 of this subpart, the Method 311 results will take precedence.

(b) *Determine the volume fraction of coating solids for each coating.* You must determine the volume fraction of coating solids (liters of coating solids per liter of coating) for each coating used during the compliance period by a test or by information provided by the supplier or the manufacturer of the material, as specified in paragraphs (b)(1), (2), and (3) of this section. If test results obtained according to paragraph (b)(1) of this section do not agree with the information obtained under paragraph (b)(2) or (3) of this section, the test results will take precedence.

(1) *Test results.* You may use ASTM Method D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings" (incorporated by reference, see § 63.14), or D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer" (incorporated by reference, see § 63.14), to determine the volume fraction of coating solids for each coating. Divide the nonvolatile volume percent obtained with the methods by 100 to calculate volume fraction of coating solids. Alternatively, you may use another test method once you obtain approval from the Administrator according to the requirements of § 63.7(f).

(2) *Information from the supplier or manufacturer of the material.* You may obtain the volume fraction of coating solids for each coating from the supplier or manufacturer.

(3) *Calculation of volume fraction of coating solids.* If the volume fraction of coating solids cannot be determined using the options in paragraphs (b)(1) and (2) of this section, you must determine it using Equation 1 of this section:

$$V_s = 1 - \frac{M_{volatiles}}{D_{avg}} \qquad \text{(Eq. 1)}$$

Where:

V_s = Volume fraction of coating solids, liters coating solids per liter coating.

$M_{volatiles}$ = Total volatile matter content of the coating, including HAP, volatile organic compounds (VOC), water, and exempt compounds, determined according to Method 24 in appendix A of 40 CFR part 60, grams volatile matter per liter coating.

D_{avg} = Average density of volatile matter in the coating, grams volatile matter per liter volatile matter, determined from test results using ASTM Method D1475–90, information from the supplier or manufacturer of the material, or reference sources providing density or specific gravity data for pure materials. If there is disagreement between ASTM Method D1475–90 test results and other information sources, the test results will take precedence.

(c) *Determine the density of each coating.* You must determine the density of each coating used during the compliance period from test results using ASTM Method D1475–90 or information from the supplier or manufacturer of the material. If there is disagreement between ASTM Method

D1475–90 test results and the supplier's or manufacturer's information, the test results will take precedence.

(d) *Calculate the organic HAP content of each coating.* Calculate the organic HAP content, kg organic HAP per liter coating solids, of each coating used during the compliance period, using Equation 2 of this section, except that if the mass fraction of organic HAP in the coating equals zero, then the organic HAP content also equals zero and you are not required to use Equation 2 to calculate the organic HAP content.

$$H_c = \frac{(D_c)(W_c)}{V_s} \qquad \text{(Eq. 2)}$$

Where:

H_c = Organic HAP content of the coating, kg organic HAP per liter coating solids.

D_c = Density of coating, kg coating per liter coating, determined according to paragraph (c) of this section.

W_c = Mass fraction of organic HAP in the coating, kg organic HAP per kg coating, determined according to paragraph (a) of this section.

V_s = Volume fraction of coating solids, liter coating solids per liter coating, determined according to paragraph (b) of this section.

(e) *Compliance demonstration.* The calculated organic HAP content for each coating used during the initial compliance period must be less than or equal to the applicable emission limit in § 63.4890 and each thinner and cleaning material used during the initial compliance period must contain no organic HAP, determined according to paragraph (a) of this section. You must keep all records required by §§ 63.4930 and 63.4931. As part of the Notification of Compliance Status required in § 63.4910(c) and the semiannual compliance reports required in § 63.4920, you must identify each coating operation and group of coating operations for which you used the compliant material option. If there were no deviations from the emission limit, include a statement that each was in compliance with the emission limitations during the initial compliance period because it used no coatings for which the organic HAP content exceeded the applicable emission limit in § 63.4890, and it used no thinners or cleaning materials that contained organic HAP.

§ 63.4942 How do I demonstrate continuous compliance with the emission limitations?

(a) Following the initial compliance period, you must complete a compliance demonstration according to the requirements in § 63.4941(e) for each subsequent compliance period. Each month following the initial compliance period described in § 63.4940 is a compliance period.

(b) If you choose to comply with the emission limitations by using the compliant material option, the use of any coating, thinner, or cleaning material that does not meet the criteria specified in paragraph (a) of this section is a deviation from the emission limitations that must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(5).

(c) As part of each semiannual compliance report required by § 63.4920, you must identify the coating operation or group of coating operations for which you used the compliant material option. If there were no deviations from the emission limits in § 63.4890, submit an affirmative statement that the coating operation or group of coating operations was in compliance with the emission limitations during the reporting period because you used no coating for which the organic HAP content exceeded the applicable emission limit in § 63.4890, and you used no thinner or cleaning material that contained organic HAP.

(d) You must maintain records as specified in §§ 63.4930 and 63.4931.

Compliance Requirements for the Emission Rate Without Add-On Controls Option

§ 63.4950 By what date must I conduct the initial compliance demonstration?

You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4951. The initial compliance period begins on the applicable compliance date specified in § 63.4883 and ends on the last day of the first full month following the compliance date. The initial compliance demonstration includes the calculations showing that the organic HAP emission rate for the initial compliance period was equal to or less than the applicable emission limit in § 63.4890.

§ 63.4951 How do I demonstrate initial compliance with the emission limitations?

You may use the emission rate without add-on controls option for any individual coating operation, for any group of coating operations in the affected source, or for all the coating operations in the affected source to demonstrate compliance with an organic HAP emission limit. You must use either the compliant material option or the emission rate with add-on controls option for any coating operation in the affected source for which you do not use this option. To demonstrate initial compliance using the emission rate without add-on controls option, the coating operation or group of coating operations must comply with the applicable emission limit in § 63.4890, but is not required to meet the operating limits or work practice standards in §§ 63.4892 and 63.4893, respectively. You must meet all the requirements of this section to demonstrate initial compliance with the applicable emission limit in § 63.4890 for the coating operation or group of coating operations. When calculating the organic HAP emission rate according to this section, do not include any coatings, thinners, or cleaning materials used on coating operations for which you use the compliant material option or the emission rate with add-on controls option. You do not need to include organic HAP in coatings, thinners, or cleaning materials that have been reclaimed onsite and reused in the coating operation for which you use the emission rate without add-on controls option.

(a) *Determine the mass fraction of organic HAP for each material.* You must determine the mass fraction of organic HAP for each coating, thinner, and cleaning material used during the compliance period according to the requirements in § 63.4941(a).

(b) *Determine the volume fraction of coating solids for each coating.* You must determine the volume fraction of coating solids for each coating used during the compliance period according to the requirements in § 63.4941(b).

(c) *Determine the density of each material.* You must determine the density of each coating, thinner, and cleaning material used during the compliance period according to the requirements in § 63.4941(c) from test results using ASTM Method D1475–90, information from the supplier or manufacturer of the material, or reference sources providing density or specific gravity data for pure materials. If there is disagreement between ASTM Method D1475–90 test results and such other information sources, the test results will take precedence.

(d) *Determine the volume of each material used.* You must determine the volume (liters) of each coating, thinner, and cleaning material used during the compliance period by measurement or usage records.

(e) *Calculate the mass of organic HAP emissions.* The mass of organic HAP emissions is the combined mass of organic HAP contained in all coatings, thinners, and cleaning materials used during the compliance period minus the organic HAP in certain waste materials.

Use Equation 1 of this section to calculate the mass of organic HAP emissions:

$$H_e = A + B + C - R_w \quad \text{(Eq. 1)}$$

Where:

H_e = Total mass of organic HAP emissions during the compliance period, kg.

A = Total mass of organic HAP in the coatings used during the compliance period, kg, as calculated in Equation 1A of this section.

B = Total mass of organic HAP in the thinners used during the compliance period, kg, as calculated in Equation 1B of this section.

C = Total mass of organic HAP in the cleaning materials used during the compliance period, kg, as calculated in Equation 1C of this section.

R_w = Total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during the compliance period, kg, determined according to paragraph (e)(4) of this section. The mass of any waste material reused during the same compliance period may not be included in R_w. (You may assign a value of zero to R_w if you do not wish to use this allowance.)

(1) Calculate the mass of organic HAP in the coatings used during the compliance period, using Equation 1A of this section:

$$A = \sum_{i=1}^{m} \left(Vol_{c,i}\right)\left(D_{c,i}\right)\left(W_{c,i}\right) \quad \text{(Eq. 1A)}$$

Where:

A = Total mass of organic HAP in the coatings used during the compliance period, kg.

$Vol_{c,i}$ = Total volume of coating, i, used during the compliance period, liters.

$D_{c,i}$ = Density of coating, i, kg coating per liter coating.

$W_{c,i}$ = Mass fraction of organic HAP in coating, i, kg organic HAP per kg coating.

m = Number of different coatings used during the compliance period.

(2) Calculate the mass of organic HAP in the thinners used during the compliance period, using Equation 1B of this section:

$$B = \sum_{j=1}^{n} \left(Vol_{t,j}\right)\left(D_{t,j}\right)\left(W_{t,j}\right) \quad \text{(Eq. 1B)}$$

Where:

B = Total mass of organic HAP in the thinners used during the compliance period, kg.

$Vol_{t,j}$ = Total volume of thinner, j, used during the compliance period, liters.

$D_{t,j}$ = Density of thinner, j, kg per liter.

$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, kg organic HAP per kg thinner.

n = Number of different thinners used during the compliance period.

(3) Calculate the mass of organic HAP in the cleaning materials used during the compliance period using Equation 1C of this section:

$$C = \sum_{k=1}^{p} \left(Vol_{s,k}\right)\left(D_{s,k}\right)\left(W_{s,k}\right) \quad \text{(Eq. 1C)}$$

Where:

C = Total mass of organic HAP in the cleaning materials used during the compliance period, kg.

$Vol_{s,k}$ = Total volume of cleaning material, k, used during the compliance period, liters.

$D_{s,k}$ = Density of cleaning material, k, kg per liter.

$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, kg organic HAP per kg material.

p = Number of different cleaning materials used during the compliance period.

(4) If you choose to account for the mass of organic HAP contained in waste materials sent or designated for shipment to a hazardous waste TSDF in the calculation of the total mass of organic HAP emissions during the compliance period in Equation 1 of this section, then you must determine the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period, according to paragraphs (e)(4)(i) through (iv) of this section.

(i) You may include in the determination of the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period only waste materials that are generated by coating operations for which you use Equation 1 of this section and that will be treated or disposed of by a facility regulated as a TSDF under 40 CFR part 262, 264, 265, or 266. The TSDF may be either off-site or on-site. You may not include in the determination of the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period only waste materials that are generated by coating operations the organic HAP contained in wastewater, nor the organic HAP contained in any waste material reused during the same compliance period.

(ii) You must determine either the amount of the waste materials sent to a TSDF during the compliance period or the amount collected and stored during the compliance period and designated for future transport to a TSDF. Do not include in your determination of the total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during each compliance period only waste materials that are generated by coating operations any waste materials sent to a TSDF during a compliance period if you have already included them in the amount collected and stored during that or a previous compliance period.

(iii) Determine the total mass of organic HAP contained in the waste materials specified in paragraph (e)(4)(ii) of this section.

(iv) You must document your methodology to determine the amount of waste materials and the total mass of organic HAP they contain, as required in § 63.4930(h). To the extent that waste manifests include this information, they may be used as part of the documentation of the amount of waste materials and mass of organic HAP contained in them.

(f) *Calculate the total volume of coating solids used.* Calculate the total volume of coating solids used, which is the combined volume of coating solids for all the coatings used during the compliance period, using Equation 2 of this section:

$$V_{st} = \sum_{i=1}^{m} \left(Vol_{c,i}\right)\left(V_{s,i}\right) \quad \text{(Eq. 2)}$$

Where:

V_{st} = Total volume of coating solids used during the compliance period, liters.

$Vol_{c,i}$ = Total volume of coating, i, used during the compliance period, liters.

$V_{s,i}$ = Volume fraction of coating solids for coating, i, liter solids per liter coating, determined according to § 63.4941(b).

m = Number of coatings used during the compliance period.

(g) *Calculate the organic HAP emission rate.* Calculate the organic HAP emission rate for the compliance period, kg organic HAP per liter coating solids used, using Equation 3 of this section:

$$H_{avg} = \frac{H_e}{V_{st}} \quad \text{(Eq. 3)}$$

Where:

H_{avg} = Organic HAP emission rate for the compliance period, kg organic HAP per liter coating solids.

H_e = Total mass of organic HAP emissions from all materials used during the compliance period, kg, as calculated by Equation 1 of this section.

V_{st} = Total volume of coating solids used during the compliance period, liters, as calculated by Equation 2 of this section.

(h) *Compliance demonstration.* The calculated organic HAP emission rate for the initial compliance period must be less than or equal to the applicable emission limit in § 63.4890. You must keep all records as required by §§ 63.4930 and 63.4931. As part of the Notification of Compliance Status required by § 63.4910 and the semiannual compliance reports required in § 63.4920, you must identify the coating operation or group of coating operations for which you used the emission rate without add-on controls option. If there were no deviations from the emission limit, include a statement that the coating operation or group of coating operations was in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in § 63.4890, determined according to this section.

§ 63.4952 How do I demonstrate continuous compliance with the emission limitations?

(a) Following the initial compliance period, you must complete a compliance demonstration according to the requirements in § 63.4951(h) for each subsequent compliance period. Each month following the initial compliance period described in § 63.4950 is a compliance period.

(b) If the organic HAP emission rate for any compliance period exceeded the applicable emission limit in § 63.4890, this is a deviation from the emission limitations for that compliance period and must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(6).

(c) As part of each semiannual compliance report required by § 63.4920, you must identify the coating operation or group of coating operations for which you used the emission rate without add-on controls option. If there were no deviations from the emission limitations, you must submit an affirmative statement that the coating operation or group of coating operations was in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in § 63.4890.

(d) You must maintain records as specified in §§ 63.4930 and 63.4931.

Compliance Requirements for the Emission Rate With Add-On Controls Option

§ 63.4960 By what date must I conduct performance tests and other initial compliance demonstrations?

(a) *New and reconstructed affected sources.* For a new or reconstructed affected source, you must meet the requirements of paragraphs (a)(1) through (4) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4883. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4961(j), you must conduct a performance test of each capture system and add-on control device according to §§ 63.4963, 63.4964, and 63.4965, and establish the operating limits required by § 63.4892, no later than 180 days after the applicable compliance date specified in § 63.4883. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4961(j), you must initiate the first material balance no later than 180 days after the applicable compliance date specified in § 63.4883.

(2) You must develop and begin implementing the work practice plan required by § 63.4893 no later than the compliance date specified in § 63.4883.

(3) You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4961. The initial compliance period begins on the applicable compliance date specified in § 63.4883 and ends on the last day of the first full month following the compliance date. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4963, 63.4964, and 63.4965; results of liquid-liquid material balances conducted according to § 63.4961(j); calculations showing whether the organic HAP emission rate for the initial compliance period was equal to or less than the emission limit in § 63.4890; the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4967; and documentation of whether you developed and implemented the work practice plan required by § 63.4893.

(4) You do not need to comply with the operating limits for the emission capture system and add-on control device required by § 63.4892 until after you have completed the performance tests specified in paragraph (a)(1) of this section. Instead, you must maintain a log detailing the operation and maintenance of the emission capture system, add-on control device, and continuous parameter monitors during the period between the compliance date and the performance test. You must begin complying with the operating limits for your affected source on the date you complete the performance tests specified in paragraph (a)(1) of this section. The requirements in this paragraph (a)(4) do not apply to solvent recovery systems for which you conduct liquid-liquid material balances.

(b) *Existing affected sources.* For an existing affected source, you must meet the requirements of paragraphs (b)(1) through (3) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4883. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4961(j), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4963, 63.4964, and 63.4965, and establish the operating limits required by § 63.4892, no later than the compliance date specified in § 63.4883. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4961(j), you must initiate the first material balance no later than the compliance date specified in § 63.4883.

(2) You must develop and begin implementing the work practice plan required by § 63.4893 no later than the compliance date specified in § 63.4883.

(3) You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4961. The initial compliance period begins on the applicable compliance date specified in § 63.4883 and ends on the last day of the first full month following the compliance date. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4963, 63.4964, and 63.4965; results of liquid-liquid material balances conducted according to § 63.4961(j); calculations showing whether the organic HAP

emission rate for the initial compliance period was equal to or less than the emission limit in § 63.4890(c); the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4967; and documentation of whether you developed and implemented the work practice plan required by § 63.4893.

§ 63.4961 How do I demonstrate initial compliance?

(a) *When add-on controls are used.* You may use the emission rate with add-on controls option for any coating operation, for any group of coating operations in the affected source, or for all of the coating operations in the affected source. You may include both controlled and uncontrolled coating operations in a group for which you use this option. You must use either the compliant material option or the emission rate without add-on controls option for any coating operation in the affected source for which you do not use the emission rate with add-on controls option. To demonstrate initial compliance, the coating operation or group of coating operations for which you use the emission rate with add-on controls option must meet the applicable emission limit in § 63.4890, and each controlled coating operation must meet the operating limits and work practice standards required in §§ 63.4892 and 63.4893, respectively. You must meet all the requirements of this section to demonstrate initial compliance with the emission limitations. When calculating the organic HAP emission rate according to this section, do not include any coatings, thinners, or cleaning materials used on coating operations for which you use the compliant material option or the emission rate without add-on controls option.

(b) *Compliance with operating limits.* Except as provided in § 63.4960(a)(4), you must establish and demonstrate continuous compliance during the initial compliance period with the operating limits required by § 63.4892, using the procedures specified in §§ 63.4966 and 63.4967.

(c) *Compliance with work practice requirements.* You must develop, implement, and document your implementation of the work practice plan required by § 63.4893 during the initial compliance period, as specified in § 63.4930.

(d) *Compliance with emission limits.* You must follow the procedures in paragraphs (e) through (m) of this section to demonstrate compliance with the applicable emission limit in § 63.4890.

(e) *Determine the mass fraction of organic HAP, density, volume used, and volume fraction of coating solids.* Follow the procedures specified in § 63.4951(a) through (d) to determine the mass fraction of organic HAP, density, and volume of each coating, thinner, and cleaning material used during each compliance period and the volume fraction of coating solids for each coating used during each compliance period.

(f) *Calculate the total mass of organic HAP emissions before add-on controls.* Using Equation 1 of § 63.4951, calculate the total mass of organic HAP emissions before add-on controls from all coatings, thinners, and cleaning materials used during the compliance period.

(g) *Calculate the organic HAP emission reduction for each controlled coating operation.* Determine the mass of organic HAP emissions reduced for each controlled coating operation during each compliance period. The emission reduction determination quantifies the total organic HAP emissions that pass through the emission capture system and are destroyed or removed by the add-on control device. Use the procedures in paragraph (h) of this section to calculate the mass of organic HAP emission reduction for each controlled coating operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances. For each controlled coating operation using a solvent recovery system for which you conduct a liquid-liquid material balance, use the procedures in paragraph (j) of this section to calculate the organic HAP emission reduction.

(h) *Calculate the organic HAP emission reduction for controlled coating operations not using liquid-liquid material balance.* For each controlled coating operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emission reduction, using Equation 1 of this section. The calculation applies the emission capture system efficiency and add-on control device efficiency to the mass of organic HAP contained in the coatings, thinners, and cleaning materials that are used in the coating operation served by the emission capture system and add-on control device during the compliance period. For any period of time a deviation specified in § 63.4962(c) or (d) occurs in the controlled coating operation, including a deviation during a period of startup, shutdown, or malfunction, you must assume zero efficiency for the emission capture system and add-on control device. Equation 1 of this section treats the materials used during such a deviation as if they were used on an uncontrolled coating operation for the time period of the deviation:

$$H_R = (A_I + B_I + C_I - R_w)\left(\frac{CE}{100} \times \frac{DRE}{100}\right) + H_{unc} \quad \text{(Eq. 1)}$$

Where:

H_R = Mass of organic HAP emission reduction for the controlled coating operation during the compliance period, kg.

A_I = Total mass of organic HAP in the coatings used in the controlled coating operation during the compliance period, excluding coatings used during deviations, kg, as calculated in Equation 1A of this section.

B_I = Total mass of organic HAP in the thinners used in the controlled coating operation during the compliance period, excluding thinners used during deviations, kg, as calculated in Equation 1B of this section.

C_I = Total mass of organic HAP in the cleaning materials used in the controlled coating operation during the compliance period, excluding cleaning materials used during deviations, kg, as calculated in Equation 1C of this section.

R_w = Total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during the compliance period, kg, determined according to § 63.4951(e)(4). The mass of any waste material reused during the same compliance period may not be included in R_w. (You may assign a

value of zero to R_w if you do not wish to use this allowance.)

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent. Use the test methods and procedures specified in §§ 63.4963 and 63.4964 to measure and record capture efficiency.

DRE = Organic HAP destruction or removal efficiency of the add-on control device, percent. Use the test methods and procedures in §§ 63.4963 and 63.4965 to measure and record the organic HAP destruction or removal efficiency.

H_{unc} = Total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations specified in § 63.4962(c) and (d) that occurred during the compliance period in the controlled coating operation, kg, as calculated in Equation 1D of this section.

(1) Calculate the mass of organic HAP in the coatings used in the controlled coating operation, using Equation 1A of this section. Do not include in the calculation the coatings used during any deviation specified in § 63.4962(c) or (d) that occurred during the month. Include such coatings in the calculation of the total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations that occurred during the compliance period in the controlled coating operation in Equation 1D of this section.

$$A_I = \sum_{i=1}^{m} (Vol_{c,i})(D_{c,i})(W_{c,i}) \quad \text{(Eq. 1A)}$$

Where:

A_I = Total mass of organic HAP in the coatings used in the controlled coating operation during the compliance period, excluding coatings used during deviations, kg.

$Vol_{c,i}$ = Total volume of coating, i, used during the compliance period except during deviations, liters.

$D_{c,i}$ = Density of coating, i, kg per liter.

$W_{c,i}$ = Mass fraction of organic HAP in coating, i, kg per kg.

m = Number of different coatings used.

(2) Calculate the mass of organic HAP in the thinners used in the controlled coating operation, using Equation 1B of this section. Do not include in the calculation the thinners used during any deviation specified in § 63.4962(c) or (d) that occurred during the month. Include such coatings in the calculation of the total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations that occurred during the compliance period in the controlled coating operation in Equation 1D of this section.

$$B_I = \sum_{j=1}^{n} (Vol_{t,j})(D_{t,j})(W_{t,j}) \quad \text{(Eq. 1B)}$$

Where:

B_I = Total mass of organic HAP in the thinners used in the controlled coating operation during the compliance period, excluding thinners used during deviations, kg.

$Vol_{t,j}$ = Total volume of thinner, j, used during the compliance period except during deviations, liters.

$D_{t,j}$ = Density of thinner, j, kg per liter.

$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, kg per kg.

n = Number of different thinners used.

(3) Calculate the mass of organic HAP in the cleaning materials used in the controlled coating operation, using Equation 1C of this section. Do not include in the calculation the cleaning materials used during any deviation specified in § 63.4962(c) or (d) that occurred during the compliance period. Include such cleaning materials in the calculation of the total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations that occurred during the compliance period in the controlled coating operation in Equation 1D of this section.

$$C_I = \sum_{k=1}^{p} (Vol_{s,k})(D_{s,k})(W_{s,k}) \quad \text{(Eq. 1C)}$$

Where:

C_I = Total mass of organic HAP in the cleaning materials used in the controlled coating operation during the compliance period, excluding cleaning materials used during deviations, kg.

$Vol_{s,k}$ = Total volume of cleaning material, k, used during the compliance period except during deviations, liters.

$D_{s,k}$ = Density of cleaning material, k, kg per liter.

$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, kg per kg.

p = Number of different cleaning materials used.

(4) Calculate the mass of organic HAP in the coatings, thinners, and cleaning materials used in the controlled coating operation during deviations specified in § 63.4962(c) and (d), using Equation 1D of this section:

$$H_{unc} = \sum_{h=1}^{q} (Vol_h)(D_h)(W_h) \quad \text{(Eq. 1D)}$$

Where:

H_{unc} = Total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations specified in § 63.4962(c) and (d) that occurred during the compliance period in the controlled coating operation, kg.

Vol_h = Total volume of coating, thinner, or cleaning material, h, used in the controlled coating operation during deviations, liters.

D_h = Density of coating, thinner, or cleaning material, h, kg per liter.

W_h = Mass fraction of organic HAP in coating, thinner, or cleaning material, h, kg organic HAP per kg coating.

q = Number of different coatings, thinning solvents, or cleaning materials.

(i) [Reserved]

(j) *Calculate the organic HAP emission reduction for controlled coating operations using liquid-liquid material balance.* For each controlled coating operation using a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emission reduction by applying the volatile organic matter collection and recovery efficiency to the mass of organic HAP contained in the coatings, thinners, and cleaning materials that are used in the coating operation controlled by the solvent recovery system during the compliance period. Perform a liquid-liquid material balance for each compliance period as specified in paragraphs (j)(1) through (6) of this section. Calculate the mass of organic HAP emission reduction by the solvent recovery system as specified in paragraph (j)(7) of this section.

(1) For each solvent recovery system, you must install, calibrate, maintain, and operate according to the manufacturer's specifications, a device that indicates the cumulative amount of volatile organic matter recovered by the solvent recovery system each compliance period. The device must be initially certified by the manufacturer to be accurate to within ±2.0 percent of the mass of volatile organic matter recovered.

(2) For each solvent recovery system, determine the mass of volatile organic matter recovered for the compliance period, based on measurement with the device required in paragraph (j)(1) of this section.

(3) Determine the mass fraction of volatile organic matter for each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the compliance period. You may determine the volatile organic matter mass fraction using Method 24 of 40 CFR part 60, appendix A, or an EPA-approved alternative method, or you may use

information provided by the manufacturer or supplier of the coating. In the event of any inconsistency between information provided by the manufacturer or supplier and the results of Method 24 of 40 CFR part 60, appendix A, or an approved alternative method, the test method results will govern.

(4) Determine the density of each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the compliance period according to § 63.4951(c).

(5) Measure the volume of each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the compliance period.

(6) For each compliance period, calculate the solvent recovery system's volatile organic matter collection and recovery efficiency, using Equation 2 of this section:

$$R_v = 100\frac{M_{VR}}{\sum_{i=1}^{m} Vol_i D_i WV_{c,i} + \sum_{j=1}^{n} Vol_j D_j WV_{t,j} + \sum_{k=1}^{p} Vol_k D_k WV_{s,k}} \quad \text{(Eq. 2)}$$

Where:

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system during the compliance period, percent.

M_{VR} = Mass of volatile organic matter recovered by the solvent recovery system during the compliance period, kg.

Vol_i = Volume of coating, i, used in the coating operation controlled by the solvent recovery system during the compliance period, liters.

D_i = Density of coating, i, kg per liter.

$WV_{c,i}$ = Mass fraction of volatile organic matter for coating, i, kg volatile organic matter per kg coating.

Vol_j = Volume of thinner, j, used in the coating operation controlled by the solvent recovery system during the compliance period, liters.

D_j = Density of thinner, j, kg per liter.

$WV_{t,j}$ = Mass fraction of volatile organic matter for thinner, j, kg volatile organic matter per kg thinner.

Vol_k = Volume of cleaning material, k, used in the coating operation controlled by the solvent recovery system during the compliance period, liters.

D_k = Density of cleaning material, k, kg per liter.

$WV_{s,k}$ = Mass fraction of volatile organic matter for cleaning material, k, kg volatile organic matter per kg cleaning material.

m = Number of different coatings used in the coating operation controlled by the solvent recovery system during the compliance period.

n = Number of different thinners used in the coating operation controlled by the solvent recovery system during the compliance period.

p = Number of different cleaning materials used in the coating operation controlled by the solvent recovery system during the compliance period.

(7) Calculate the mass of organic HAP emission reduction for the coating operation controlled by the solvent recovery system during the compliance period, using Equation 3 of this section:

$$H_{CSR} = (A_{CSR} + B_{CSR} + C_{CSR})\left(\frac{R_V}{100}\right) \quad \text{(Eq. 3)}$$

Where:

H_{CSR} = Mass of organic HAP emission reduction for the coating operation controlled by the solvent recovery system during the compliance period, kg.

A_{CSR} = Total mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system, kg, calculated using Equation 3A of this section.

B_{CSR} = Total mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system, kg, calculated using Equation 3B of this section.

C_{CSR} = Total mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system, kg, calculated using Equation 3C of this section.

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system, percent, from Equation 2 of this section.

(i) Calculate the mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system, kg, using Equation 3A of this section.

$$A_{CSR} = \sum_{i=1}^{m} (Vol_{c,i})(D_{c,i})(W_{c,i}) \quad \text{(Eq. 3A)}$$

Where:

A_{CSR} = Total mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system during the month, kg.

$Vol_{c,i}$ = Total volume of coating, i, used during the month in the coating operation controlled by the solvent recovery system, liters.

$D_{c,i}$ = Density of coating, i, kg coating per liter coating.

$W_{c,i}$ = Mass fraction of organic HAP in coating, i, kg organic HAP per kg coating.

m = Number of different coatings used.

(ii) Calculate the mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system, using Equation 3B of this section:

$$B_{CSR} = \sum_{j=1}^{n} (Vol_{t,j})(D_{t,j})(W_{t,j}) \quad \text{(Eq. 3B)}$$

Where:

B_{CSR} = Total mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system during the month, kg.

$Vol_{t,j}$ = Total volume of thinner, j, used during the month in the coating operation controlled by the solvent recovery system, liters.

$D_{t,j}$ = Density of thinner, j, kg thinner per liter thinner.

$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, kg organic HAP per kg thinner.

n = Number of different thinners used.

(iii) Calculate the mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system during the month, using Equation 3C of this section:

$$C_{CSR} = \sum_{k=1}^{p} (Vol_{s,k})(D_{s,k})(W_{s,k}) \quad \text{(Eq. 3C)}$$

Where:

C_{CSR} = Total mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system during the month, kg.

$Vol_{s,k}$ = Total volume of cleaning material, k, used during the month in the coating operation controlled by the solvent recovery system, liters.

$D_{s,k}$ = Density of cleaning material, k, kg cleaning material per liter cleaning material.

$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, kg organic HAP per kg cleaning material.

p = Number of different cleaning materials used.

(k) *Calculate the total volume of coating solids used.* Calculate the total volume of coating solids used, which is the combined volume of coating solids for all the coatings used during the compliance period, using Equation 2 of § 63.4951.

(l) *Calculate the organic HAP emissions rate.* Calculate the organic HAP emission rate to the atmosphere, using Equation 4 of this section:

$$H_{hap} = \frac{H_e - \sum_{i=1}^{q}(H_{R,i}) - \sum_{j=1}^{r}(H_{CSR,j})}{V_{st}} \quad \text{(Eq. 4)}$$

Where:

H_{hap} = Organic HAP emission rate for the compliance period, kg organic HAP per liter coating solids.

H_e = Total mass of organic HAP emissions before add-on controls from all the coatings, thinners, and cleaning materials used during the compliance period, kg, determined according to paragraph (f) of this section.

$H_{R,i}$ = Total mass of organic HAP emission reduction for controlled coating operation, i, not using liquid-liquid material balances, during the compliance period, kg, from Equation 1 of this section.

$H_{CSR,j}$ = Total mass of organic HAP emission reduction for controlled coating operation, j, using a liquid-liquid material balance, during the compliance period, kg, from Equation 3 of this section.

V_{st} = Total volume of coating solids used during the compliance period, liters, from Equation 2 of § 63.4951.

q = Number of controlled coating operations except those controlled with a solvent recovery system.

r = Number of coating operations controlled with a solvent recovery system.

(m) *Compliance demonstration.* To demonstrate initial compliance with the emission limit during the compliance period as calculated using Equation 4 of this section, the HAP emission rate for the compliance period must be less than or equal to the applicable emission limit in § 63.4890. You must keep all records as required by §§ 63.4930 and 63.4931. As part of the Notification of Compliance Status required by § 63.4910 and the semiannual compliance reports required in § 63.4920, you must identify the coating operation or group of coating operations for which you used the emission rate with add-on controls option. If there were no deviations from the emission limit, include a statement that the coating operation or group of coating operations was in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in § 63.4890, and you achieved the operating limits required by § 63.4892 and the work practice standards required by § 63.4893.

§ 63.4962 How do I demonstrate continuous compliance with the emission limitations?

(a) Following the initial compliance period, you must complete a compliance demonstration according to the requirements in § 63.4961(m) for each subsequent compliance period. Each month following the initial compliance period described in § 63.4960 is a compliance period.

(b) If the organic HAP emission rate for any compliance period exceeded the applicable emission limit in § 63.4890, this is a deviation from the emission limitation for that compliance period and must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(7).

(c) You must demonstrate continuous compliance with each operating limit required by § 63.4892 that applies to you, as specified in Table 1 to this subpart.

(1) If an operating parameter is out of the allowed range specified in Table 1 to this subpart, this is a deviation from the operating limit that must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(7).

(2) If an operating parameter deviates from the operating limit specified in Table 1 to this subpart, then you must assume that the emission capture system and add-on control device were achieving zero efficiency during the time period of the deviation. For the purposes of completing the compliance calculations specified in § 63.4961, you must treat the materials used during a deviation on a controlled coating operation as if they were used on an uncontrolled coating operation for the time period of the deviation, as indicated in Equation 1 of § 63.4961.

(d) You must meet the requirements for bypass lines in § 63.4967(b) for controlled coating operations for which you do not conduct liquid-liquid material balances. If any bypass line is opened and emissions are diverted to the atmosphere when the coating operation is running, this is a deviation that must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(7). For the purposes of completing the compliance calculations in § 63.4961, you must treat the materials used during a deviation on a controlled coating operation as if they were used on an uncontrolled coating operation for the time period of the deviation, as indicated in Equation 1 of § 63.4961.

(e) You must demonstrate continuous compliance with the work practice standards in § 63.4893. If you did not develop a work practice plan, or you did not implement the plan, or you did not keep the records required by § 63.4930(k)(8), this is a deviation from the work practice standards that must be reported as specified in §§ 63.4910(c)(6) and 63.4920(a)(7).

(f) As part of each semiannual compliance report required in § 63.4920, you must identify the coating operation or group of coating operations for which you used the emission rate with add-on controls option. If there were no deviations from the emission limitations, submit an affirmative statement that you were in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in § 63.4890, and you achieved the operating limits required by § 63.4892 and the work practice standards required by § 63.4893 during each compliance period.

(g) During periods of startup, shutdown, or malfunction of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency, you must operate in

accordance with the SSMP required by § 63.4900(c).

(h) [Reserved]

(i) You must maintain records as specified in §§ 63.4930 and 63.4931.

§ 63.4963 What are the general requirements for performance tests?

(a) You must conduct each performance test required by § 63.4960 according to the requirements in § 63.7(e)(1) and under the conditions in this section unless you obtain a waiver of the performance test according to the provisions in § 63.7(h).

(1) *Representative coating operation operating conditions.* You must conduct the performance test under representative operating conditions for the coating operation. Operations during periods of startup, shutdown, or malfunction, and during periods of nonoperation do not constitute representative conditions. You must record the process information that is necessary to document operating conditions during the test and explain why the conditions represent normal operation.

(2) *Representative emission capture system and add-on control device operating conditions.* You must conduct the performance test when the emission capture system and add-on control device are operating at a representative flow rate, and the add-on control device is operating at a representative inlet concentration. You must record information that is necessary to document emission capture system and add-on control device operating conditions during the test and explain why the conditions represent normal operation.

(b) You must conduct each performance test of an emission capture system according to the requirements in § 63.4964. You must conduct each performance test of an add-on control device according to the requirements in § 63.4965.

(c) The performance test to determine add-on control device organic HAP destruction or removal efficiency must consist of three runs as specified in § 63.7(e)(3) and each run must last at least 1 hour.

§ 63.4964 How do I determine the emission capture system efficiency?

You must use the procedures and test methods in this section to determine capture efficiency as part of the performance test required by § 63.4960.

(a) *Assuming 100 percent capture efficiency.* You may assume the capture system efficiency is 100 percent if both of the conditions in paragraphs (a)(1) and (2) of this section are met:

(1) The capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and directs all the exhaust gases from the enclosure to an add-on control device.

(2) All coatings, thinners, and cleaning materials used in the coating operation are applied within the capture system; coating solvent flash-off and coating, curing, and drying occurs within the capture system; and the removal of or evaporation of cleaning materials from the surfaces they are applied to occurs within the capture system. For example, this criterion is not met if parts enter the open shop environment when being moved between a spray booth and a curing oven.

(b) *Measuring capture efficiency.* If the capture system does not meet both of the criteria in paragraphs (a)(1) and (2) of this section, then you must use one of the three protocols described in paragraphs (c), (d), and (e) of this section to measure capture efficiency. The capture efficiency measurements use TVH capture efficiency as a surrogate for organic HAP capture efficiency. For the protocols in paragraphs (c) and (d) of this section, the capture efficiency measurement must consist of three test runs. Each test run must be at least 3 hours duration or the length of a production run, whichever is longer, up to 8 hours. For the purposes of this test, a production run means the time required for a single part to go from the beginning to the end of production, which includes surface preparation activities and drying or curing time.

(c) *Liquid-to-uncaptured-gas protocol using a temporary total enclosure or building enclosure.* The liquid-to-uncaptured-gas protocol compares the mass of liquid TVH in materials used in the coating operation to the mass of TVH emissions not captured by the emission capture system. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (c)(1) through (6) of this section to measure emission capture system efficiency using the liquid-to-uncaptured-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the coating operation where coatings, thinners, and cleaning materials are applied, and all areas where emissions from these applied coatings and materials subsequently occur, such as flash-off, curing, and drying areas. The areas of the coating operation where capture devices collect emissions for routing to an add-on control device, such as the entrance and exit areas of an oven or spray booth, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204A or 204F of appendix M to 40 CFR part 51 to determine the mass fraction, kg TVH per kg material, of TVH liquid input from each coating, thinner, and cleaning material used in the coating operation during each capture efficiency test run. To make the determination, substitute TVH for each occurrence of the term VOC in the methods.

(3) Use Equation 1 of this section to calculate the mass of TVH liquid input from all the coatings, thinners, and cleaning materials used in the coating operation during each capture efficiency test run:

$$TVH_{used} = \sum_{i=1}^{n} (TVH_i)(Vol_i)(D_i) \qquad \text{(Eq. 1)}$$

Where:

TVH_{used} = Mass of liquid total volatile hydrocarbons in materials used in the coating operation during the capture efficiency test run, lb.

TVH_i = Mass fraction of TVH in coating, thinner, or cleaning material, i, that is used in the coating operation during the capture efficiency test run, kg TVH per kg material.

Vol_i = Total volume of coating, thinner, or cleaning material, i, used in the coating operation during the capture efficiency test run, liters.

D_i = Density of coating, thinner, or cleaning material, i, kg material per liter material.

n = Number of different coatings, thinners, and cleaning materials used in the coating operation during the capture efficiency test run.

(4) Use Method 204D or E of appendix M to 40 CFR part 51 to measure the total mass of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D if the enclosure is a temporary total enclosure.

(ii) Use Method 204E if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound emitting operations inside the building enclosure, other than the coating operation for which capture efficiency is being determined,

must be shut down, but all fans and blowers must be operating normally.

(5) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system, using Equation 2 of this section:

$$CE = \frac{(TVH_{used} - TVH_{uncaptured})}{TVH_{used}} \times 100 \qquad \text{(Eq. 2)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

TVH_{used} = Total mass of TVH liquid input used in the coating operation during the capture efficiency test run, kg.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, kg.

(6) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(d) *Gas-to-gas protocol using a temporary total enclosure or a building enclosure.* The gas-to-gas protocol compares the mass of TVH emissions captured by the emission capture system to the mass of TVH emissions not captured. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (d)(1) through (5) of this section to measure emission capture system efficiency using the gas-to-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the coating operation where coatings, thinners, and cleaning materials are applied, and all areas where emissions from these applied coatings and materials subsequently occur, such as flash-off, curing, and drying areas. The areas of the coating operation where capture devices collect emissions generated by the coating operation for routing to an add-on control device, such as the entrance and exit areas of an oven or a spray booth, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204B or 204C of appendix M to 40 CFR part 51 to measure the total mass of TVH emissions captured by the emission capture system during each capture efficiency test run as measured at the inlet to the add-on control device. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) The sampling points for the Method 204B or 204C measurement must be upstream from the add-on control device and must represent total emissions routed from the capture system and entering the add-on control device.

(ii) If multiple emission streams from the capture system enter the add-on control device without a single common duct, then the emissions entering the add-on control device must be simultaneously measured in each duct and the total emissions entering the add-on control device must be determined.

(3) Use Method 204D or 204E of appendix M to 40 CFR part 51 to measure the total mass of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D if the enclosure is a temporary total enclosure.

(ii) Use Method 204E if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound emitting operations inside the building enclosure, other than the coating operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(4) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system, using Equation 3 of this section:

$$CE = \frac{TVH_{captured}}{(TVH_{captured} + TVH_{uncaptured})} \times 100 \qquad \text{(Eq. 3)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

$TVH_{captured}$ = Total mass of TVH captured by the emission capture system as measured at the inlet to the add-on control device during the emission capture efficiency test run, kg.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, kg.

(5) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(e) *Alternative capture efficiency protocol.* As an alternative to the procedures specified in paragraphs (c) and (d) of this section, you may determine capture efficiency using any other capture efficiency protocol and test methods that satisfy the criteria of either the DQO or LCL approach as described in appendix A to subpart KK of this part.

§ 63.4965 How do I determine the add-on control device emission destruction or removal efficiency?

You must use the procedures and test methods in this section to determine the add-on control device emission destruction or removal efficiency as part of the performance test required by § 63.4960. You must conduct three test runs as specified in § 63.7(e)(3), and each test run must last at least 1 hour.

(a) For all types of add-on control devices, use the test methods specified in paragraphs (a)(1) through (5) of this section.

(1) Use Method 1 or 1A of appendix A to 40 CFR part 60, as appropriate, to select sampling sites and velocity traverse points.

(2) Use Method 2, 2A, 2C, 2D, 2F, or 2G of appendix A to 40 CFR part 60, as appropriate, to measure gas volumetric flow rate.

(3) Use Method 3, 3A, or 3B of appendix A to 40 CFR part 60, as

appropriate, for gas analysis to determine dry molecular weight. You may also use as an alternative to Method 3B, the manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas in ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]" (incorporated by reference, see § 63.14).

(4) Use Method 4 of appendix A to 40 CFR part 60 to determine stack gas moisture.

(5) Methods for determining gas volumetric flow rate, dry molecular weight, and stack gas moisture must be performed, as applicable, during each test run.

(b) Measure total gaseous organic mass emissions as carbon at the inlet and outlet of the add-on control device simultaneously, using either Method 25 or 25A of appendix A to 40 CFR part 60, as specified in paragraphs (b)(1) through (3) of this section. You must use the same method for both the inlet and outlet measurements.

(1) Use Method 25 if the add-on control device is an oxidizer and you expect the total gaseous organic concentration as carbon to be more than 50 parts per million (ppm) at the control device outlet.

(2) Use Method 25A if the add-on control device is an oxidizer and you expect the total gaseous organic concentration as carbon to be 50 ppm or less at the control device outlet.

(3) Use Method 25A if the add-on control device is not an oxidizer.

(c) If two or more add-on control devices are used for the same emission stream, then you must measure emissions at the outlet of each device. For example, if one add-on control device is a concentrator with an outlet for the high-volume, dilute stream that has been treated by the concentrator, and a second add-on control device is an oxidizer with an outlet for the low-volume, concentrated stream that is treated with the oxidizer, you must measure emissions at the outlet of the oxidizer and the high volume dilute stream outlet of the concentrator.

(d) For each test run, determine the total gaseous organic emissions mass flow rates for the inlet and the outlet of the add-on control device, using Equation 1 of this section. If there is more than one inlet or outlet to the add-on control device, you must calculate the total gaseous organic mass flow rate using Equation 1 of this section for each inlet and each outlet and then total all of the inlet emissions and total all of the outlet emissions.

$$M_f = Q_{sd} C_c (12) (0.0416) \left(10^{-6}\right) \qquad \text{(Eq. 1)}$$

Where:

M_f= Total gaseous organic emissions mass flow rate, kg/per hour (h).

Q_{sd}= Volumetric flow rate of gases entering or exiting the add-on control device, as determined by Method 2, 2A, 2C, 2D, 2F, or 2G, dry standard cubic meters/hour (dscm/h).

C_c= Concentration of organic compounds as carbon in the vent gas, as determined by Method 25 or Method 25A, parts per million by volume (ppmv), dry basis.

0.0416 = Conversion factor for molar volume, kg-moles per cubic meter (mol/m^3) (@ 293 Kelvin (K) and 760 millimeters of mercury (mmHg)).

(e) For each test run, determine the add-on control device organic emissions destruction or removal efficiency, using Equation 2 of this section:

$$DRE = \frac{M_{fi} - M_{fo}}{M_{fi}} \qquad \text{(Eq. 2)}$$

Where:

DRE = Organic emissions destruction or removal efficiency of the add-on control device, percent.

M_{fi}= Total gaseous organic emissions mass flow rate at the inlet(s) to the add-on control device, using Equation 1 of this section, kg/h.

M_{fo}= Total gaseous organic emissions mass flow rate at the outlet(s) of the add-on control device, using Equation 1 of this section, kg/h.

(f) Determine the emission destruction or removal efficiency of the add-on control device as the average of the efficiencies determined in the three test runs and calculated in Equation 2 of this section.

§ 63.4966 How do I establish the emission capture system and add-on control device operating limits during the performance test?

During the performance test required by § 63.4960 and described in §§ 63.4963, 63.4964, and 63.4965, you must establish the operating limits required by § 63.4892 according to this section, unless you have received approval for alternative monitoring and operating limits under § 63.8(f) as specified in § 63.4892.

(a) *Thermal oxidizers.* If your add-on control device is a thermal oxidizer, establish the operating limits according to paragraphs (a)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the combustion temperature at least once every 15 minutes during each of the three test runs. You must monitor the temperature in the firebox of the thermal oxidizer or immediately downstream of the firebox before any substantial heat exchange occurs.

(2) Use the data collected during the performance test to calculate and record the average combustion temperature maintained during the performance test. This average combustion temperature is the minimum operating limit for your thermal oxidizer.

(b) *Catalytic oxidizers.* If your add-on control device is a catalytic oxidizer, establish the operating limits according to either paragraphs (b)(1) and (2) or paragraphs (b)(3) and (4) of this section.

(1) During the performance test, you must monitor and record the temperature just before the catalyst bed and the temperature difference across the catalyst bed at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average temperature just before the catalyst bed and the average temperature difference across the catalyst bed maintained during the performance test. These are the minimum operating limits for your catalytic oxidizer.

(3) As an alternative to monitoring the temperature difference across the catalyst bed, you may monitor the temperature at the inlet to the catalyst bed and implement a site-specific inspection and maintenance plan for your catalytic oxidizer as specified in paragraph (b)(4) of this section. During the performance test, you must monitor and record the temperature just before the catalyst bed at least once every 15 minutes during each of the three test runs. Use the data collected during the performance test to calculate and record the average temperature just before the catalyst bed during the performance test. This is the minimum operating limit for your catalytic oxidizer.

(4) You must develop and implement an inspection and maintenance plan for your catalytic oxidizer(s) for which you elect to monitor according to paragraph (b)(3) of this section. The plan must address, at a minimum, the elements specified in paragraphs (b)(4)(i) through (iii) of this section.

(i) Annual sampling and analysis of the catalyst activity (*i.e.*, conversion efficiency) following the manufacturer's or catalyst supplier's recommended procedures.

(ii) Monthly inspection of the oxidizer system, including the burner assembly and fuel supply lines for problems and,

as necessary, adjust the equipment to assure proper air-to-fuel mixtures.

(iii) Annual internal and monthly external visual inspection of the catalyst bed to check for channeling, abrasion, and settling. If problems are found, you must replace the catalyst bed or take corrective action consistent with the manufacturer's recommendations and conduct a new performance test to determine destruction efficiency according to § 63.4965.

(c) *Carbon adsorbers.* If your add-on control device is a carbon adsorber, establish the operating limits according to paragraphs (c)(1) and (2) of this section.

(1) You must monitor and record the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each regeneration cycle, and the carbon bed temperature after each carbon bed regeneration and cooling cycle, for the regeneration cycle either immediately preceding or immediately following the performance test.

(2) The operating limits for your carbon adsorber are the minimum total desorbing gas mass flow recorded during the regeneration cycle and the maximum carbon bed temperature recorded after the cooling cycle.

(d) *Condensers.* If your add-on control device is a condenser, establish the operating limits according to paragraphs (d)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the condenser outlet (product side) gas temperature at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average condenser outlet (product side) gas temperature maintained during the performance test. This average condenser outlet gas temperature is the maximum operating limit for your condenser.

(e) *Emission capture system.* For each capture device that is not part of a PTE that meets the criteria of § 63.4964(a), establish an operating limit for either the gas volumetric flow rate or duct static pressure, as specified in paragraphs (e)(1) and (2) of this section. The operating limit for a PTE is specified in Table 1 to this subpart.

(1) During the capture efficiency determination required by § 63.4960 and described in §§ 63.4963 and 63.4964, you must monitor and record either the gas volumetric flow rate or the duct static pressure for each separate capture device in your emission capture system at least once every 15 minutes during each of the three test runs at a point in the duct between the capture device and the add-on control device inlet.

(2) Calculate and record the average gas volumetric flow rate or duct static pressure for the three test runs for each capture device. This average gas volumetric flow rate or duct static pressure is the minimum operating limit for that specific capture device.

(f) *Concentrators.* If your add-on control device includes a concentrator, you must establish operating limits for the concentrator according to paragraphs (f)(1) through (4) of this section.

(1) During the performance test, you must monitor and record the desorption concentrate stream gas temperature at least once every 15 minutes during each of the three runs of the performance test.

(2) Use the data collected during the performance test to calculate and record the average temperature. This is the minimum operating limit for the desorption concentrate gas stream temperature.

(3) During the performance test, you must monitor and record the pressure drop of the dilute stream across the concentrator at least once every 15 minutes during each of the three runs of the performance test.

(4) Use the data collected during the performance test to calculate and record the average pressure drop. This is the maximum operating limit for the dilute stream across the concentrator.

(g) *Bioreactors.* If you are using a bioreactor, you must comply with the provisions for the use of an alternative monitoring method as set forth in 40 CFR 63.8(f).

§ 63.4967 What are the requirements for continuous parameter monitoring system installation, operation, and maintenance?

(a) *General.* You must install, operate, and maintain each CPMS specified in paragraphs (c), (e), and (f) of this section according to paragraphs (a)(1) through (6) of this section. You must install, operate, and maintain each CPMS specified in paragraphs (b) and (d) of this section according to paragraphs (a)(3) through (5) of this section.

(1) The CPMS must complete a minimum of one cycle of operation for each successive 15-minute period. You must have a minimum of four equally spaced successive cycles of CPMS operation in 1 hour.

(2) You must determine the average of all recorded readings for each 3-hour period of the emission capture system and add-on control device operation.

(3) You must record the results of each inspection, calibration, and validation check of the CPMS.

(4) You must maintain the CPMS at all times and have available necessary parts for routine repairs of the monitoring equipment.

(5) You must operate the CPMS and collect emission capture system and add-on control device parameter data at all times that a controlled coating operation is operating, except during monitoring malfunctions, repairs to correct the monitor malfunctions, and required quality assurance or control activities (including, if applicable, calibration checks and required zero and span adjustments).

(6) You must not use emission capture system or add-on control device parameter data recorded during monitoring malfunctions, repairs to correct the monitor malfunctions, out-of-control periods, or required quality assurance or control activities when calculating data averages. You must use all the data collected during all other periods in calculating the data averages for determining compliance with the emission capture system and add-on control device operating limits.

(7) A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the CPMS to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. Any period for which the monitoring system is out-of-control and data are not available for required calculations is a deviation from the monitoring requirements.

(b) *Capture system bypass line.* You must meet the requirements of paragraphs (b)(1) and (2) of this section for each emission capture system that contains bypass lines that could divert emissions away from the add-on control device to the atmosphere.

(1) You must monitor or secure the valve or closure mechanism controlling the bypass line in a nondiverting position in such a way that the valve or closure mechanism cannot be opened without creating a record that the valve was opened. The method used to monitor or secure the valve or closure mechanism must meet one of the requirements specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) *Flow control position indicator.* Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow control position indicator that takes a reading at least once every 15 minutes and provides a record indicating whether the emissions are directed to the add-on control device or diverted from the add-on control device. The time of occurrence and flow control position must be recorded, as well as every time the flow direction is changed. The flow control position indicator must be installed at the entrance to any bypass line that could

divert the emissions away from the add-on control device to the atmosphere.

(ii) *Car-seal or lock-and-key valve closures.* Secure any bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. You must visually inspect the seal or closure mechanism at least once every month to ensure that the valve is maintained in the closed position, and the emissions are not diverted away from the add-on control device to the atmosphere.

(iii) *Valve closure monitoring.* Ensure that any bypass line valve is in the closed (nondiverting) position through monitoring of valve position at least once every 15 minutes. You must inspect the monitoring system at least once every month to verify that the monitor will indicate valve position.

(iv) *Automatic shutdown system.* Use an automatic shutdown system in which the coating operation is stopped when flow is diverted by the bypass line away from the add-on control device to the atmosphere when the coating operation is running. You must inspect the automatic shutdown system at least once every month to verify that it will detect diversions of flow and shut down the coating operation.

(2) If any bypass line is opened, you must include a description of why the bypass line was opened and the length of time it remained open in the semiannual compliance reports required in § 63.4920.

(c) *Thermal oxidizers and catalytic oxidizers.* If you are using a thermal oxidizer or catalytic oxidizer as an add-on control device (including those used with concentrators or with carbon adsorbers to treat desorbed concentrate streams), you must comply with the requirements in paragraphs (c)(1) through (3) of this section:

(1) For a thermal oxidizer, install a gas temperature monitor in the firebox of the thermal oxidizer or in the duct immediately downstream of the firebox before any substantial heat exchange occurs.

(2) For a catalytic oxidizer, install a gas temperature monitor in the gas stream immediately before the catalyst bed, and if you are establishing operating limits according to § 63.4966(b)(1) and (2), also install a gas temperature monitor in the gas stream immediately after the catalyst bed.

(3) For each gas temperature monitoring device, you must meet the requirements in paragraphs (a) and (c)(3)(i) through (vi) of this section for each gas temperature monitoring device.

(i) Locate the temperature sensor in a position that provides a representative temperature.

(ii) Use a temperature sensor with an accuracy of at least 5 degrees Fahrenheit or 1.0 percent of the temperature value, whichever is larger.

(iii) Perform an initial calibration according to the manufacturer's requirements.

(iv) Before using the sensor for the first time or upon relocation or replacement of the sensor, perform a validation check by comparing the sensor output to a calibrated temperature measurement device or by comparing the sensor output to a simulated temperature.

(v) Conduct an accuracy audit every quarter and after every 24 hour excursion. Accuracy audit methods include comparisons of sensor output to redundant temperature sensors, to calibrated temperature measurement devices, or to temperature simulation devices.

(vi) Conduct a visual inspection of each sensor every quarter if redundant temperature sensors are not used.

(d) *Carbon adsorbers.* If you are using a carbon adsorber as an add-on control device, you must monitor the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each regeneration cycle, the carbon bed temperature after each regeneration and cooling cycle, and comply with paragraphs (a)(3) through (5) and (d)(1) through (3) of this section.

(1) The regeneration desorbing gas mass flow monitor must be an integrating device having a measurement sensitivity of plus or minus 10 percent, capable of recording the total regeneration desorbing gas mass flow for each regeneration cycle.

(2) The carbon bed temperature monitor must be capable of recording the temperature within 15 minutes of completing any carbon bed cooling cycle.

(3) For all carbon adsorbers, you must meet the requirements in paragraphs (c)(3)(i) through (vi) of this section for each gas temperature monitoring device.

(e) *Condensers.* If you are using a condenser, you must monitor the condenser outlet (product side) gas temperature and comply with paragraphs (a) and (e)(1) and (2) of this section.

(1) The temperature monitor must provide a gas temperature record at least once every 15 minutes.

(2) For all condensers, you must meet the requirements in paragraphs (c)(3)(i) through (vi) of this section for each gas temperature monitoring device.

(f) *Emission capture systems.* The capture system monitoring system must comply with the applicable requirements in paragraphs (f)(1) and (2) of this section.

(1) For each flow measurement device, you must meet the requirements in paragraphs (a) and (f)(1)(i) through (vii) of this section.

(i) Locate a flow sensor in a position that provides a representative flow measurement in the duct from each capture device in the emission capture system to the add-on control device.

(ii) Use a flow sensor with an accuracy of at least 10 percent of the flow.

(iii) Perform an initial sensor calibration in accordance with the manufacturer's requirements.

(iv) Perform a validation check before initial use or upon relocation or replacement of a sensor. Validation checks include comparison of sensor values with electronic signal simulations or via relative accuracy testing.

(v) Perform accuracy audits every quarter and after every 24 hour excursion. Accuracy audits include comparison of sensor values with electronic signal simulations or with values obtained via relative accuracy testing.

(vi) Perform leak checks monthly.

(vii) Perform visual inspections of the sensor system quarterly if there is no redundant sensor.

(2) For each pressure drop measurement device, you must comply with the requirements in paragraphs (a) and (f)(2)(i) through (vii) of this section.

(i) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure drop across each opening you are monitoring.

(ii) Use a pressure sensor with an accuracy of at least 0.5 inches of water column or 5 percent of the measured value, whichever is larger.

(iii) Perform an initial calibration of the sensor according to the manufacturer's requirements.

(iv) Conduct a validation check before initial operation or upon relocation or replacement of the sensor. Validation checks include comparison of the sensor values to calibrated pressure measurement devices or to pressure simulation using calibrated pressure sources.

(v) Conduct accuracy audits every quarter and after every 24 hour excursion. Accuracy audits include comparison of sensor values to calibrated pressure measurement devices or to pressure simulation using calibrated pressure sources.

(vi) Perform monthly leak checks on pressure connections. A pressure of at least 1.0 inches of water column to the

connection must yield a stable sensor result for at least 15 seconds.

(vii) Perform a visual inspection of the sensor at least monthly if there is no redundant sensor.

(g) *Concentrators.* If you are using a concentrator, such as a zeolite wheel or rotary carbon bed concentrator, you must comply with the requirements in paragraphs (a) and (g)(1) and (2) of this section.

(1) You must install a temperature monitor in the desorption gas stream. The temperature monitor must meet the requirements in paragraphs (a) and (c)(3) of this section.

(2) You must install a device to monitor pressure drop across the zeolite wheel or rotary carbon bed. The pressure monitoring device must meet the requirements in paragraphs (a) and (f)(2) of this section.

Other Requirements and Information

§ 63.4980 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. Environmental Protection Agency (EPA), or a delegated authority such as your State, local, or tribal agency. If the Administrator has delegated authority to your State, local, or tribal agency, then that agency (as well as EPA) has the authority to implement and enforce this subpart. You should contact your EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under subpart E of this part, the authorities contained in paragraph (c) of this section are retained by the Administrator and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section:

(1) Approval of alternatives to the work practice standards in § 63.4893 under § 63.6(g).

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f), and as defined in § 63.90.

(3) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major alternatives to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.4981 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in 40 CFR 63.2, and in this section as follows:

Add-on control means an air pollution control device such as a thermal oxidizer or carbon adsorber that reduces pollution in an air stream by destruction or removal before discharge to the atmosphere.

Adhesive means any chemical substance that is applied for the purpose of bonding two surfaces together.

Capture device means a hood, enclosure, room, floor sweep, or other means of containing or collecting emissions and directing those emissions into an add-on air pollution control device.

Capture efficiency or *capture system efficiency* means the portion (expressed as a percentage) of the pollutants from an emission source that is delivered to an add-on control device.

Capture system means one or more capture devices intended to collect emissions generated by a coating operation in the use of coatings or cleaning materials, both at the point of application and at subsequent points where emissions from the coatings and cleaning materials occur, such as flashoff, drying, or curing. As used in this subpart, multiple capture devices that collect emissions generated by a coating operation are considered a single capture system.

Cleaning material means a solvent used to remove contaminants and other materials, such as dirt, grease, oil, and dried or wet coating (*e.g.*, depainting), from a substrate before or after coating application or from equipment associated with a coating operation, such as spray booths, spray guns, racks, tanks, and hangers. Thus, it includes any cleaning material used on substrates or equipment or both.

Coating means a material applied to a substrate for decorative, protective, or functional purposes. Such materials include, but are not limited to, paints, sealants, caulks, inks, adhesives, and maskants. Decorative, protective, or functional materials that consist only of protective oils for metal, acids, bases, or any combination of these substances are not considered coatings for the purposes of this subpart.

Coating operation means equipment used to apply cleaning materials to a substrate to prepare it for coating application or to remove dried or wet coating (surface preparation); to apply coating to a substrate (coating application) and to dry or cure the coating after application; and to clean coating operation equipment (equipment cleaning). A single coating operation may include any combination of these types of equipment, but always includes at least the point at which a coating or cleaning material is applied and all subsequent points in the affected source where organic HAP emissions from that coating or cleaning material occur. There may be multiple coating operations in an affected source. Coating application with hand-held nonrefillable aerosol containers, touchup markers, or marking pens is not a coating operation for the purposes of this subpart.

Coating solids means the nonvolatile portion of the coating that makes up the dry film.

Continuous parameter monitoring system (CPMS) means the total equipment that may be required to meet the data acquisition and availability requirements of this subpart, used to sample, condition (if applicable), analyze, and provide a record of coating operation, or capture system, or add-on control device parameters.

Controlled coating operation means a coating operation from which some or all of the organic HAP emissions are routed through an emission capture system and add-on control device.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, or operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, or operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is allowed by this subpart.

Emission limitation means an emission limit, operating limit, or work practice standard.

Enclosure means a structure that surrounds a source of emissions and captures and directs the emissions to an add-on control device.

Exempt compound means a specific compound that is not considered a VOC due to negligible photochemical reactivity. The exempt compounds are listed in 40 CFR 51.100(s).

Facility maintenance means the routine repair or renovation (including surface coating) of the tools, equipment, machinery, and structures that comprise

the infrastructure of the affected facility and that are necessary for the facility to function in its intended capacity.

Manufacturer's formulation data means data on a material (such as a coating) that are supplied by the material manufacturer based on knowledge of the ingredients used to manufacture that material, rather than based on testing of the material with the test methods specified in § 63.4941(a)(1) through (3). Manufacturer's formulation data may include, but are not limited to, information on density, organic HAP content, volatile organic matter content, and coating solids content.

Mass fraction of coating solids means the ratio of the mass of coating solids to the mass of a coating in which it is contained, expressed as kg of coating solids per kg of coating.

Mass fraction of organic HAP means the ratio of the mass of organic HAP to the mass of a material in which it is contained, expressed as kg of organic HAP per kg of material.

Month means a calendar month or a pre-specified period of 28 days to 35 days to allow for flexibility in recordkeeping when data are based on a business accounting period.

Organic HAP content means the mass of organic HAP per volume of coating solids for a coating, calculated using Equation 2 of § 63.4941. The organic HAP content is determined for the coating in the condition it is in when received from its manufacturer or supplier and does not account for any alteration after receipt.

Permanent total enclosure (PTE) means a permanently installed enclosure that meets the criteria of Method 204 of appendix M, 40 CFR part 51, for a PTE and that directs all the exhaust gases from the enclosure to an add-on control device.

Protective oil means an organic material that is applied to metal for the purpose of providing lubrication or protection from corrosion without forming a solid film. This definition of protective oil includes, but is not limited to, lubricating oils, evaporative oils (including those that evaporate completely), and extrusion oils.

Research or laboratory facility means a facility whose primary purpose is for research and development of new processes and products, that is conducted under the close supervision of technically trained personnel, and is not engaged in the manufacture of final or intermediate products for commercial purposes, except in a *de minimis* manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Startup, initial means the first time equipment is brought online in a facility.

Surface preparation means use of a cleaning material on a portion of or all of a substrate. This includes use of a cleaning material to remove dried coating, which is sometimes called "depainting" or "paint stripping," for the purpose of preparing a substrate for coating application.

Temporary total enclosure means an enclosure constructed for the purpose of measuring the capture efficiency of pollutants emitted from a given source as defined in Method 204 of appendix M, 40 CFR part 51.

Thinner means an organic solvent that is added to a coating after the coating is received from the supplier.

Total volatile hydrocarbon (TVH) means the total amount of nonaqueous volatile organic matter determined according to Methods 204 and 204A through 204F of appendix M to 40 CFR part 51 and substituting the term TVH each place in the methods where the term VOC is used. The TVH includes both VOC and non-VOC.

Uncontrolled coating operation means a coating operation from which none of the organic HAP emissions are routed through an emission capture system and add-on control device.

Volatile organic compound (VOC) means any compound defined as VOC in 40 CFR 51.100(s).

Volume fraction of coating solids means the ratio of the volume of coating solids (also known as volume of nonvolatiles) to the volume of coating, expressed as liters of coating solids per liter of coating.

Wastewater means water that is generated in a coating operation and is collected, stored, or treated prior to being discarded or discharged.

Tables to Subpart RRRR of Part 63

TABLE 1 TO SUBPART RRRR OF PART 63.—OPERATING LIMITS IF USING THE EMISSION RATE WITH ADD-ON CONTROLS OPTION

[If you are required to comply with operating limits by § 63.4892, you must comply with the applicable operating limits in the following table:]

For the following device . . .	you must meet the following operating limit . . .	and you must demonstrate continuous compliance with the operating limit by . . .
1. thermal oxidizer	a. the average combustion temperature in any 3-hour period must not fall below the combustion temperature limit established according to § 63.4966(a).	i. collecting the combustion temperature data according to § 63.4967(c); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average combustion temperature at or above the temperature limit.
2. catalytic oxidizer	a. the average temperature measured just before the catalyst bed in any 3-hour period must not fall below the limit established according to § 63.4966(b); and either	i. collecting the temperature data according to § 63.4967(c); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average temperature before the catalyst bed at or above the temperature limit.
	b. ensure that the average temperature difference across the catalyst bed in any 3-hour period does not fall below the temperature difference limit established according to § 63.4966(b), or	i. collecting the temperature data according to § 63.4967(c); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average temperature difference at or above the temperature difference limit.

TABLE 1 TO SUBPART RRRR OF PART 63.—OPERATING LIMITS IF USING THE EMISSION RATE WITH ADD-ON CONTROLS OPTION—Continued

[If you are required to comply with operating limits by §63.4892, you must comply with the applicable operating limits in the following table:]

For the following device . . .	you must meet the following operating limit . . .	and you must demonstrate continuous compliance with the operating limit by . . .
	c. develop and implement an inspection and maintenance plan according to §63.4966(b)(3) and (4).	i. maintaining an up-to-date inspection and maintenance plan, records of annual catalyst activity checks, records of monthly inspections of the oxidizer system, and records of the annual internal inspections of the catalyst bed. If a problem is discovered during a monthly or annual inspection required by §63.4966(b)(4), you must take corrective action as soon as practicable consistent with the manufacturer's recommendations.
3. carbon adsorber	a. the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each carbon bed regeneration cycle must not fall below the total regeneration desorbing gas mass flow limit established according to §63.4966(c).	i. measuring the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each regeneration cycle according §63.4967(d); and ii. maintaining the total regeneration desorbing gas mass flow at or above the mass flow limit.
	b. the temperature of the carbon bed after completing each regeneration and any cooling cycle must not exceed the carbon bed temperature limit established according to §63.4966(c).	i. measuring the temperature of the carbon bed after completing each regeneration and any cooling cycle according to §63.4967(d); and ii. operating the carbon beds such that each carbon bed is not returned to service until completing each regeneration and any cooling cycle until the recorded temperature of the carbon bed is at or below the temperature limit.
4. condenser	a. the average condenser outlet (product side) gas temperature in any 3-hour period must not exceed the temperature limit established according to §63.4966(d).	i. collecting the condenser outlet (product side) gas temperature according to §63.4967(e); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average gas temperature at the outlet at or below the temperature limit.
5. emission capture system that is a PTE according to §63.4964(a).	a. the direction of the air flow at all times must be into the enclosure; and either	i. collecting the direction of air flow, and either the facial velocity of air through all natural draft openings according to §63.4967(f)(1) or the pressure drop across the enclosure according to §63.4967(f)(2); and ii. maintaining the facial velocity of air flow through all natural draft openings or the pressure drop at or above the facial velocity limit or pressure drop limit, and maintaining the direction of air flow into the enclosure at all times.
	b. the average facial velocity of air through all natural draft openings in the enclosure must be at least 200 feet per minute; or	i. collecting the direction of air flow, and either the facial velocity of air through all natural draft openings according to §63.4967(f)(1) or the pressure drop across the enclosure according to §63.4967(f)(2); and ii. maintaining the facial velocity of air flow through all natural draft openings or the pressure drop at or above the facial velocity limit or pressure drop limit, and maintaining the direction of air flow into the enclosure at all times.
	c. the pressure drop across the enclosure must be at least 0.007 inch H_2O, as established in Method 204 of appendix M to 40 CFR part 51.	i. collecting the direction of air flow, and either the facial velocity of air through all natural draft openings according to §63.4967(f)(1) or the pressure drop across the enclosure according to §63.4967(f)(2); and ii. maintaining the facial velocity of air flow through all natural draft openings or the pressure drop at or above the facial velocity limit or pressure drop limit, and maintaining the direction of air flow into the enclosure at all times.
6. emission capture system that is not a PTE according to §63.4964(a).	a. the average gas volumetric flow rate or duct static pressure in each duct between a capture device and add-on control device inlet in any 3-hour period must not fall below the average volumetric flow rate or duct static pressure limit established for that capture device according to §63.4966(e).	i. collecting the gas volumetric flow rate or duct static pressure for each capture device according to §63.4967(f); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average gas volumetric flow rate or duct static pressure for each capture device at or above the gas volumetric flow rate or duct static pressure limit.

TABLE 1 TO SUBPART RRRR OF PART 63.—OPERATING LIMITS IF USING THE EMISSION RATE WITH ADD-ON CONTROLS OPTION—Continued

[If you are required to comply with operating limits by §63.4892, you must comply with the applicable operating limits in the following table:]

For the following device . . .	you must meet the following operating limit . . .	and you must demonstrate continuous compliance with the operating limit by . . .
7. concentrators, including zeolite wheels and rotary carbon adsorbers.	a. the average gas temperature of the desorption concentrate stream in any 3-hour period must not fall below the limit established according to §63.4966(f).	i. collecting the temperature data according to §63.4967(g); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour average temperature at or above the temperature limit.
	b. the average pressure drop of the dilute stream across the concentrator in any 3-hour period must not fall below the limit established according to §63.4966(f).	i. collecting the pressure drop data according to §63.4967(g); ii. reducing the pressure drop data to 3-hour block averages; and iii. maintaining the 3-hour average pressure drop at or above the pressure drop
8. bioreactor systems	a. the use of an alternative monitoring method as set forth in §63.8(f)	

TABLE 2 TO SUBPART RRRR OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART RRRR

[You must comply with the applicable General Provisions requirements according to the following table:]

Citation	Subject	Applicable to subpart	Explanation
§63.1(a)(1)–(14)	General Applicability	Yes.	
§63.1(b)(1)–(3)	Initial Applicability Determination	Yes	Applicability to subpart RRRR is also specified in §63.4881.
§63.1(c)(1)	Applicability After Standard Established	Yes.	
§63.1(c)(2)–(3)	Applicability of Permit Program for Area Sources.	No	Area sources are not subject to subpart RRRR.
§63.1(c)(4)–(5)	Extensions and Notifications	Yes.	
§63.1(e)	Applicability of Permit Program Before Relevant Standard is Set.	Yes.	
§63.2	Definitions	Yes	Additional definitions are specified in §63.4981.
§63.3(a)–(c)	Units and Abbreviations	Yes.	
§63.4(a)(1)–(5)	Prohibited Activities	Yes.	
§63.4(b)–(c)	Circumvention/Severability	Yes.	
§63.5(a)	Construction/Reconstruction	Yes.	
§63.5(b)(1)–(6)	Requirements for Existing, Newly Constructed, and Reconstructed Sources.	Yes.	
§63.5(d)	Application for Approval of Construction/Reconstruction.	Yes.	
§63.5(e)	Approval of Construction/Reconstruction	Yes.	
§63.5(f)	Approval of Construction/Reconstruction Based on Prior State Review.	Yes.	
§63.6(a)	Compliance With Standards and Maintenance Requirements—Applicability.	Yes.	
§63.6(b)(1)–(7)	Compliance Dates for New and Reconstructed Sources.	Yes	Section 63.4883 specifies the compliance dates.
§63.6(c)(1)–(5)	Compliance Dates for Existing Sources	Yes	Section 63.4883 specifies the compliance dates.
§63.6(e)(1)–(2)	Operation and Maintenance	Yes.	
§63.6(e)(3)	SSMP	Yes	Only sources using an add-on control device to comply with the standard must complete SSMP.
§63.6(f)(1)	Compliance Except During Startup, Shutdown, and Malfunction.	Yes	Applies only to sources using an add-on control device to comply with the standards.
§63.6(f)(2)–(3)	Methods for Determining Compliance	Yes.	
§63.6(g)(1)–(3)	Use of Alternative Standards	Yes.	
§63.6(h)	Compliance With Opacity/Visible Emission Standards.	No	Subpart RRRR does not establish opacity standards and does not require continuous opacity monitoring systems (COMS).
§63.6(i)(1)–(16)	Extension of Compliance	Yes.	
§63.6(j)	Presidential Compliance Exemption	Yes.	
§63.7(a)(1)	Performance Test Requirements—Applicability	Yes	Applies to all affected sources using an add-on control device to comply with the standards. Additional requirements for performance testing are specified in §§63.4963, 63.4964, and 63.4965.

TABLE 2 TO SUBPART RRRR OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART RRRR—Continued

[You must comply with the applicable General Provisions requirements according to the following table:]

Citation	Subject	Applicable to subpart	Explanation
§63.7(a)(2)	Performance Test Requirements—Dates	Yes	Applies only to performance tests for capture system and control device efficiency at sources using these to comply with the standards. Section 63.4960 specifies the schedule for performance test requirements that are earlier than those specified in §63.7(a)(2).
§63.7(a)(3)	Performance Tests Required by the Administrator.	Yes.	
§63.7(b)–(e)	Performance Test Requirements—Notification, Quality Assurance, Facilities Necessary Safe Testing, Conditions During Test.	Yes	Applies only to performance tests for capture system and add-on control device efficiency at sources using these to comply with the standards.
§63.7(f)	Performance Test Requirements—Use of Alternative Test Method.	Yes	Applies to all test methods except those used to determine capture system efficiency.
§63.7(g)–(h)	Performance Test Requirements—Data Analysis, Recordkeeping, Reporting, Waiver of Test.	Yes	Applies only to performance tests for capture system and add-on control device efficiency at sources using these to comply with the standards.
§63.8(a)(1)–(3)	Monitoring Requirements—Applicability	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standards. Additional requirements for monitoring are specified in §63.4967.
§63.8(a)(4)	Additional Monitoring Requirements	No	Subpart RRRR does not have monitoring requirements for flares.
§63.8(b)	Conduct of Monitoring	Yes.	
§63.8(c)(1)–(3)	Continuous Monitoring System (CMS) Operation and Maintenance.	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standards. Additional requirements for CMS operations and maintenance are specified in §63.4967.
§63.8(c)(4)	CMS	No	Section 63.4967 specifies the requirements for the operation of CMS for capture systems and add-on control devices at sources using these to comply.
§63.8(c)(5)	COMS	No	Subpart RRRR does not have opacity or visible emissions standards.
§63.8(c)(6)	CMS Requirements	No	Section 63.4967 specifies the requirements for monitoring systems for capture systems and add-on control devices at sources using these to comply.
§63.8(c)(7)	COS Out-of-Control Periods	Yes.	
§63.8(c)(8)	CMS Out-of-Control Periods Reporting	No	Section 63.4920 requires reporting of CMS out-of-control periods.
§63.8(d)–(e)	Quality Control Program and CMS Performance Evaluation.	No	Subpart RRRR does not require the use of continuous emissions monitoring systems.
§63.8(f)(1)–(5)	Use of an Alternative Monitoring Method	Yes.	
§63.8(f)(6)	Alternative to Relative Accuracy Test	No	Subpart RRRR does not require the use of continuous emissions monitoring systems.
§63.8(g)(1)–(5)	Data Reduction	No	Sections 63.4966 and 63.4967 specify monitoring data reduction.
§63.9(a)–(d)	Notification Requirements	Yes.	
§63.9(e)	Notification of Performance Test	Yes	Applies only to capture system and add-on control device performance tests at sources using these to comply with the standards.
§63.9(f)	Notification of Visible Emissions/Opacity Test	No	Subpart RRRR does not have opacity or visible emission standards.
§63.9(g)(1)–(3)	Additional Notifications When Using CMS	No	Subpart RRRR does not require the use of continuous emissions monitoring systems.
63.9(h)	Notification of Compliance Status	Yes	Section 63.4910 specifies the dates for submitting the notification of compliance status.
§63.9(i)	Adjustment of Submittal Deadlines	Yes.	
§63.9(j)	Change in Previous Information	Yes.	
§63.10(a)	Recordkeeping/Reporting—Applicability and General Information.	Yes.	
§63.10(b)(1)	General Recordkeeping Requirements	Yes	Additional requirements are specified in §§63.4930 and 63.4931.

TABLE 2 TO SUBPART RRRR OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART RRRR—Continued

[You must comply with the applicable General Provisions requirements according to the following table:]

Citation	Subject	Applicable to subpart	Explanation
§63.10(b)(2)(i)–(v)	Recordkeeping Relevant to Startup, Shutdown, and Malfunction Periods and CMS.	Yes	Requirements for Startup, Shutdown, and Malfunction records only apply to add-on control devices used to comply with the standards.
§63.10(b)(2)(vi)–(xi)		Yes.	
§63.10(b)(2)(xii)	Records	Yes.	
§63.10(b)(2)(xiii)		No	Subpart RRRR does not require the use of continuous emissions monitoring systems.
§63.10(b)(2)(xiv)		Yes.	
§63.10(b)(3)	Recordkeeping Requirements for Applicability Determinations.	Yes.	
§63.10(c)(1)–(6)	Additional Recordkeeping Requirements for Sources with CMS.	Yes.	
§63.10(c)(7)–(8)		No	The same records are required in §63.4920(a)(7).
§63.10(c)(9)–(15)		Yes.	
§63.10(d)(1)	General Reporting Requirements	Yes	Additional requirements are specified in §63.4920.
§63.10(d)(2)	Report of Performance Test Results	Yes	Additional requirements are specified in §63.4920(b).
§63.10(d)(3)	Reporting Opacity or Visible Emissions Observations.	No	Subpart RRRR does not require opacity or visible emissions observations.
§63.10(d)(4)	Progress Reports for Sources With Compliance Extensions.	Yes.	
§63.10(d)(5)	Startup, Shutdown, and Malfunction Reports	Yes	Applies only to add-on control devices at sources using these to comply with the standards.
§63.10(e)(1)–(2)	Additional CMS Reports	No	Subpart RRRR does not require the use of continuous emissions monitoring systems.
§63.10(e)(3)	Excess Emissions/CMS Performance Reports	No	Section 63.4920(b) specifies the contents of periodic compliance reports.
§63.10(e)(4)	COMS Data Reports	No	Subpart RRRR does not specify requirements for opacity or COMS.
§63.10(f)	Recordkeeping/Reporting Waiver	Yes.	
§63.11	Control Device Requirements/Flares	No	Subpart RRRR does not specify use of flares for compliance.
§63.12	State Authority and Delegations	Yes	
§63.13	Addresses	Yes.	
§63.14	Incorporation by Reference	Yes.	
§63.15	Availability of Information/Confidentiality	Yes.	

TABLE 3 TO SUBPART RRRR OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS

[You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data:]

Solvent/Solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
1. Toluene	108–88–3	1.0	Toluene.
2. Xylene(s)	1330–20–7	1.0	Xylenes, ethylbenzene.
3. Hexane	110–54–3	0.5	n-hexane.
4. n-Hexane	110–54–3	1.0	n-hexane.
5. Ethylbenzene	100–41–4	1.0	Ethylbenzene.
6. Aliphatic 140		0	None.
7. Aromatic 100		0.02	1% xylene, 1% cumene.
8. Aromatic 150		0.09	Naphthalene.
9. Aromatic naphtha	64742–95–6	0.02	1% xylene, 1% cumene.
10. Aromatic solvent	64742–94–5	0.1	Naphthalene.
11. Exempt mineral spirits	8032–32–4	0	None.
12. Ligroines (VM & P)	8032–32–4	0	None.
13. Lactol spirits	64742–89–6	0.15	Toluene.
14. Low aromatic white spirit	64742–82–1	0	None.
15. Mineral spirits	64742–88–7	0.01	Xylenes.
16. Hydrotreated naphtha	64742–48–9	0	None.
17. Hydrotreated light distillate	64742–47–8	0.001	Toluene.
18. Stoddard solvent	8052–41–3	0.01	Xylenes.
19. Super high-flash naphtha	64742–95–6	0.05	Xylenes.

TABLE 3 TO SUBPART RRRR OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS—Continued

[You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data:]

Solvent/Solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
20. Varsol® solvent	8052–49–3	0.01	0.5% xylenes, 0.5% ethyl benzene.
21. VM & P naphtha	64742–89–8	0.06	3% toluene, 3% xylene.
22. Petroleum distillate mixture	68477–31–6	0.08	4% naphthalene, 4% biphenyl.

TABLE 4 TO SUBPART RRRR OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR PETROLEUM SOLVENT GROUPS [1]

[You May Use the Mass Fraction Values in the Following Fable for Solvent Blends for Which You Do Not Have Test Data or Manufacturer's Formulation Data:]

Solvent type	Average organic HAP mass fraction	Typical organic percent HAP, by mass
Aliphatic [2]	0.03	1% Xylene, 1% Toluene, and 1% Ethylbenzene.
Aromatic [3]	0.06	4% Xylene, 1% Toluene, and 1% Ethylbenzene.

[1] Use this table only if the solvent blend does not match any of the solvent blends in Table 3 to this subpart and you only know whether the blend is aliphatic or aromatic.

[2] E.g., Mineral Spirits 135, Mineral Spirits 150 EC, Naphtha, Mixed Hydrocarbon, Aliphatic Hydrocarbon, Aliphatic Naphtha, Naphthol Spirits, Petroleum Spirits, Petroleum Oil, Petroleum Naphtha, Solvent Naphtha, Solvent Blend.

[3] E.g., Medium-flash Naphtha, High-flash Naphtha, Aromatic Naphtha, Light Aromatic Naphtha, Light Aromatic Hydrocarbons, Aromatic Hydrocarbons, Light Aromatic Solvent.

BILLING CODE 6560–50–P

Statutory and Executive Order Reviews

A. General Requirements

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is not a "significant regulatory action" and therefore is not subject to review by the Office of Management and Budget. For this reason, this action is also not subject to Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001). This action merely approves state law as meeting Federal requirements and imposes no additional requirements beyond those imposed by state law. Accordingly, the Administrator certifies that this rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). Because this rule approves pre-existing requirements under state law and does not impose any additional enforceable duty beyond that required by state law, it does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). This rule also does not have tribal implications because it will not have a substantial direct effect on one or more Indian tribes, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified by Executive Order 13175 (65 FR 67249, November 9, 2000). This action also does not have federalism implications because it does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999). This action merely approves a state rule implementing a Federal standard, and does not alter the relationship or the distribution of power and responsibilities established in the Clean Air Act. This rule also is not subject to Executive Order 13045 "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997), because it is not economically significant.

In reviewing 111(d)/129 plan submissions, EPA's role is to approve state choices, provided that they meet the criteria of the Clean Air Act. In this context, in the absence of a prior existing requirement for the State to use voluntary consensus standards (VCS), EPA has no authority to disapprove a 111(d)/129 plan submission for failure to use VCS. It would thus be inconsistent with applicable law for EPA, when it reviews a 111(d)/129 plan submission, to use VCS in place of a 111(d)/129 plan submission that otherwise satisfies the provisions of the Clean Air Act. Thus, the requirements of section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) do not apply. This rule does not impose an information collection burden under the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*).

B. Submission to Congress and the Comptroller General

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. This rule is not a "major rule" as defined by 5 U.S.C. 804(2).

C. Petitions for Judicial Review

Under section 307(b)(1) of the Clean Air Act, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate circuit by July 28, 2003. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action approving the section 111(d)/129 negative declaration submitted by the West Virginia Department of Environmental Protection, Division of Air Quality, may not be challenged later in proceedings to enforce its requirements. (*See* section 307(b)(2).)

List of Subjects in 40 CFR Part 62

Environmental protection, Administrative practice and procedure, Air pollution control, Aluminum, Fertilizers, Fluoride, Intergovernmental relations, Paper and paper products industry, Phosphate, Reporting and recordkeeping requirements, Sulfur oxides, Sulfur acid plants, Waste treatment and disposal.

Dated: April 30, 2003.

Donald S. Welsh,

Regional Administrator, Region III.

■ 40 CFR part 62, subpart XX, is amended as follows:

PART 62—[AMENDED]

■ 1. The authority citation for part 62 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart XX—West Virginia

■ 2. Subpart XX is amended by adding an undesignated center heading and § 62.12160 to read as follows:

Emissions From Existing Small Municipal Waste Combustion Units

§ 62.12160 Identification of plan—negative declaration.

Letter from the West Virginia Department of Environmental Protection, Division of Air Quality, submitted July 3, 2001, certifying that there are no existing small municipal waste combustion units within the State of West Virginia that are subject to 40 CFR part 60, subpart BBBB.

[OAR–2002–0040, FRL–7461–4]

RIN 2060–A174

National Emission Standards for Hazardous Air Pollutants: Engine Test Cells/Stands

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for engine test cells/stands. We have identified engine test cells/stands as major sources of hazardous air pollutants (HAP) such as toluene, benzene, mixed xylenes, and 1,3-butadiene. The final NESHAP will implement section 112(d) of the Clean Air Act (CAA), which requires all major sources of HAP to meet emission standards reflecting the application of the maximum achievable control technology (MACT). The final NESHAP will protect public health by reducing exposure to air pollution.

EFFECTIVE DATE: The final rule is effective May 27, 2003. The incorporation by reference of certain publications listed in today's final rule is approved by the Director of the Office of the Federal Register as of May 27, 2003.

ADDRESSES: Docket No. OAR–2002–0040 contains supporting documentation used in developing the final rule. The docket is located at the Air and Radiation Docket and Information Center in the EPA Docket Center, (EPA/DC) EPA West, Room B102, 1301 Constitution Ave., NW., Washington, DC and may be inspected from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays.

FOR FURTHER INFORMATION CONTACT: Mr. Jaime Pagán, Combustion Group, Emission Standards Division (C439–01), U.S. EPA, Research Triangle Park, NC 27711; telephone number (919) 541–5340; facsimile number (919) 541–0942; electronic mail (e-mail) address *pagan.jaime@epa.gov*.

SUPPLEMENTARY INFORMATION:

Regulated Entities. Subcategories and entities potentially regulated by this action include those listed in Table 1 of this preamble. In general, engine test cells/stands are covered under the Standard Industrial Classification (SIC) and North American Industrial Classification System (NAICS) codes listed in Table 1 of this preamble. However, cells/stands classified under other SIC or NAICS codes may be subject to the final standards if they meet the applicability criteria. Not all cells/stands classified under the SIC and NAICS codes in Table 1 of this preamble will be subject to the final standards because some of the classifications cover products outside the scope of the final NESHAP for engine test cells/stands.

TABLE 1.—SUBCATEGORIES POTENTIALLY REGULATED BY THE NESHAP FOR ENGINE TEST CELLS/STANDS

Test cells/stands used for testing	SIC codes	NAICS codes
Internal Combustion Engines with rated power of 25 horsepower (hp) (19 kilowatts [kW]) or more.	3531, 3519, 3523, 3559, 3599, 3621, 3711, 3714, 4226, 4512, 5541, 7538, 7539, 8299, 8711, 8731, 8734, 8741.	333120, 333618, 333111, 333319, 335312, 336111, 336120, 336112, 336992, 336312, 336350, 481111, 811111, 811118, 611692, 54171, 541380.
Internal Combustion Engines with rated power of less than 25 hp (19 kW).	3519, 3621, 3524, 8734	333618, 336399, 335312, 332212, 333112, 541380.
Combustion Turbine Engines	3511, 3566, 3721, 3724, 4512, 4581, 7699, 9661.	333611, 333612, 336411, 336412, 481111, 488190, 811310, 811411, 92711.
Rocket Engines	3724, 3761, 3764, 9661, 9711	336412, 336414, 336415, 54171, 92711, 92811

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your engine test cell/stand is regulated by this action, you should examine the applicability criteria in § 63.9285 of the final rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Electronic Docket (E-Docket). The EPA has established an official public docket for this action under Docket ID No. OAR–2002–0040. The official public docket is the collection of materials that is available for public viewing at the EPA Docket Center (Air Docket), EPA West, Room B102, 1301 Constitution Avenue, NW., Washington, DC 20460. The Docket Center is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Access. An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to submit or view public comments, access the index of the contents of the official public docket, and access those documents in the public docket that are available electronically. Once in the system, select "search" and key in the appropriate docket identification number.

Certain types of information will not be placed in the EPA Dockets. Information claimed as confidential business information and other information whose disclosure is restricted by statute, which are not included in the official public docket, will not be available for public viewing in EPA's electronic public docket. The EPA's policy is that copyrighted material will not be placed in EPA's electronic public docket but will be available only in printed, paper form in the official public docket. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified in this document.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's document also will be available on the WWW. Following the Administrator's signature, a copy of this action will be posted at *http://www.epa.gov/ttn/oarpg* on EPA's Technology Transfer Network (TTN) policy and guidance page for newly proposed or promulgated rules. The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 28, 2003. Under section 307(d)(7)(B) of the CAA, only an objection to the final rule that was raised with reasonable specificity during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by the final rule may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce the requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What is the Source of Authority for Development of NESHAP?
B. What Criteria Did We Use in the Development of the NESHAP?
II. What Changes and Clarifications Have We Made to the Proposed Standards?
A. Applicability
B. Affected Source
C. Compliance Dates
D. Reconstruction

E. New Source MACT
F. Monitoring Requirements
G. Cost and Economic Assumptions and Impacts
H. Startup, Shutdown, and Malfunction (SSM)
I. Emissions Averaging
J. Miscellaneous
III. What are the Final Standards?
A. What is the Source Category?
B. What is the Affected Source?
C. What are the Emission Limits?
D. What are the Initial Compliance Requirements?
E. What are the Continuous compliance Requirements?
F. What are the Notification, Recordkeeping, and Reporting Requirements?
IV. What are the Environmental, Energy, Cost, and Economic Impacts?
A. What are the Air Impacts?
B. What are the Non-air Health, Environmental, and Energy Impacts?
C. What are the Economic Impacts?
V. Statutory and Executive Order Reviews
A. Executive Order 12866, Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act
D. Unfunded Mandates Reform Act
E. Executive Order 13132, Federalism
F. Executive Order 13175, Consultation and Coordination with Indian Tribal Governments
G. Executive Order 13045, Protection of Children from Environmental Health and Safety Risks
H. Executive Order 13211, Actions that Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. Engine test facilities were listed as a source category under the fuel combustion industry group, and rocket engine test firing was listed as a source category under the miscellaneous processes industry group in the **Federal Register** on July 16, 1992 (57 FR 31576). These two source categories were combined and renamed engine test cells/stands in the **Federal Register** on May 14, 2002 (67 FR 34547). Major sources of HAP are those that have the potential to emit greater than 10 tons per year (tpy) of any one HAP or 25 tpy of any combination of HAP.

B. What Criteria Did We Use in the Development of the NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new and existing major sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as the MACT.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the standard is set at a level that assures that all major sources achieve the level of control at least as stringent as that already achieved by the better controlled and lower emitting sources in each source category or subcategory. For new sources, the MACT standards cannot be less stringent than the emission control that is achieved in practice by the best controlled similar source. The MACT standards for existing sources can be less stringent than standards for new sources, but they cannot be less stringent than the average emission limitation achieved by the best performing 12 percent of existing sources in the category or subcategory (or the best performing 5 sources for categories or subcategories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on the consideration of cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

II. What Changes and Clarifications Have We Made to the Proposed Standards?

In response to the public comments received on the proposed standards, we made several changes in developing the final rule. Some of the comments and our responses and rule changes are summarized in the following sections. The complete summary of comments and responses can be found in the Response to Comments document, which is available from several sources (*see* **SUPPLEMENTARY INFORMATION** section).

A. Applicability

The final rule applies to an owner or operator of engine test cells/stands located at major sources of HAP emissions. An engine test cell/stand is any apparatus used for testing uninstalled stationary or uninstalled mobile (motive) engines. Because the proposed rule did not include a definition of uninstalled engine, many commenters requested clarification of uninstalled engine versus installed engine testing in regards to determining applicability of the final rule.

The final rule clarifies this applicability issue. The final rule regulates the testing of engines, not the testing of any final product (*e.g.*, automobile, boat, power generator, etc.). If the engine being tested in a test cell/stand is not installed in, or an integrated part of, the final product, then the test cell/stand is considered part of the affected source.

This new clarification for uninstalled also clarifies the applicability of testing outboard motors. One of the comments specifically stated that outboard motors operated while detached from a boat should not be considered uninstalled, since "the engine remains coupled to lower unit gear drive and propeller without modification to its vessel-installed configuration."

In the final rule, outboard motors are considered installed when the engine is coupled with the gear drive and propeller. Therefore, a facility with engine testing involving outboard motors, in their vessel-installed configuration, is not an affected source.

Another comment stated that large diesel engines used in locomotives must drive a load in order to be accurately tested. The facility captures the work produced by the engine by driving a generator to provide the load and utilizes the electric power. The commenter wanted to assure that this type of engine testing situation also would not fall into a source category pertaining to power production. We agree with the comment and clarify that the only applicable source category for engine test cells/stands that utilize incidentally produced power is the Engine Test Cells/Stands NESHAP.

Two other comments prompted specific applicability exclusions. One comment from the petroleum refinery industry stated that the engine test cells/stands NESHAP should not apply to petroleum refinery industry sources using knock engine testing. Because knock engines and other devices used for testing fuels and lubricants at refineries do not test the engine per se but instead test the fuels and lubricants for product quality and development purposes, these engines are not covered. The final rule specifically excludes test cells that are operated to test or evaluate fuels (such as knock engines), transmissions, electronics, etc.

Another comment involved universities with aviation programs using engine test stands for education purposes. The final rule specifically excludes research and teaching activities at major source facilities that are not engaged in the development of

engines or engine test services for commercial purposes.

B. Affected Source

There were several comments requesting that the definition of affected source be revised to include all engine test cells/stands located at a major source. One commenter added that test cells/stands are typically grouped within a common building, often sharing common manifolds.

The proposed rule defined the affected source as any existing, new, or reconstructed engine test cell/stand used for testing uninstalled stationary or uninstalled mobile (motive) engines that is located at a major source of HAP emissions.

The final rule includes a revised definition of affected source in accordance with the rationale in the amended General Provisions (67 FR 16582): "A broader definition of affected source permits emission requirements to apply to a larger group of processes, activities and equipment, and may thereby facilitate more innovative and economically efficient control strategies." (67 FR 16588). The final rule defines an affected source as the collection of all equipment and activities associated with engine test cells/stands used for testing uninstalled stationary or uninstalled mobile (motive) engines located at a major source of HAP emissions.

C. Compliance Dates

Three commenters noted a discrepancy between the language in the proposed preamble and the proposed rule concerning the compliance date.

An inadvertent error in the proposal preamble language was made. The proposal regulatory text was correct. The final rule clarifies the compliance date for existing sources as 3 years after the effective (promulgation) date, and the compliance date for new sources as the effective date or upon startup, whichever is later.

D. Reconstruction

One commenter specifically stated that movement or relocation of portable test stands within a facility should not be considered reconstruction. We do not consider movement or relocation of portable test stands (or related equipment) within a facility to be reconstruction. The revised definition of affected source in the final rule also addresses this issue.

Three commenters had ideas for specific activities to exclude from a reconstruction determination. Two commenters recommended that EPA include a modified definition of reconstruction in the final rule that would add to the General Provisions definition in 40 CFR 63.2 an exclusion for the cost of replacement or modification of components required to demonstrate compliance with EPA's emission regulations contained in 40 CFR parts 89, 90, and 91. The commenter stated that manufacturers may be forced by regulation to invest in new equipment for test cells and fall under the definition of reconstruction in order to comply with new EPA engine requirements, even though such improvements will not change the capacity or emissions from the cell. A specific definition of reconstruction needs to be applied to engine test cells that only counts costs incurred to increase capacity or if the modification results in increased HAP emissions. The commenter further stated that EPA has previously recognized this problem and adopted a reasonable approach in the final Large Municipal Waste Combustor rule (40 CFR 60.50a(f) and 60.50b(d)), and that the same reasoning could be applied to engine test cells. Another commenter specifically recommended that EPA exclude passive measurement and control instrumentation and electronics from inclusion in a reconstruction evaluation.

According to the recently amended General Provisions, the definition of affected source states, "Reconstruction, unless otherwise defined in a relevant standard, means the replacement of components of an affected or previously nonaffected source to such an extent that:

(1) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable new source; and

(2) It is technologically and economically feasible for the reconstructed source to meet the relevant standard(s) established by the Administrator (or a State) pursuant to section 112 of the CAA. Upon reconstruction, an affected source, or a stationary source that becomes an affected source, is subject to relevant standards for new sources, including compliance dates, irrespective of any change in emissions of HAP from that source."

Because of the diversity of engine test cells/stands and test requirements used by the various types of engine manufacturers and industry sectors, it is difficult to define what types of test equipment and support equipment comprise a new affected source (*e.g.* actual engine test cell/stand) or reconstructed affected source. We cannot limit or define reconstruction to include only those changes that will increase capacity or HAP emissions associated with the engine test cell/stand because there is no way of knowing how the engine test cell/stand will be used in the future. However, we do not consider equipment reconfiguration to be reconstruction.

The regulations for Large Municipal Waste Combustors in 40 CFR 60.50a(f) and 60.50b(d) establish that physical or operational changes made to an existing unit primarily for the purpose of complying with emission guidelines under subpart Cb are not considered a modification or reconstruction. We recognize the precedent set by these provisions with respect to the exclusion of costs for required regulatory modifications to comply with other EPA regulations. We have reviewed the regulatory language in these regulations and conclude that it is appropriate to provide a similar level of flexibility to engine test cells/stands. In response to these comments, the final rule includes new language clarifying that changes made to an existing affected source primarily for the purpose of complying with revisions to engine testing requirements under 40 CFR parts 80, 86, 89, 90, 91, or 92 are not considered a modification or reconstruction. We agree with the commenter that it is appropriate to exclude existing engine test cells that are modified to meet revisions under Title 40 provisions. We believe that it is unnecessary to require these existing test cells to install emission control devices when modifications are due to changes to the federal mobile source regulations and since those improvements will not increase the capacity or the emissions from the test cell/stand. Therefore, those affected sources modified to meet revisions to requirements in those parts and subparts will not be subject to new source MACT.

The final rule also includes language that excludes passive measurement and control instrumentation and electronics from the reconstruction evaluation.

E. New Source MACT

Several commenters stated the proposed new source emissions limits (99.9 percent carbon monoxide (CO) emission reduction or 5 parts per million by volume CO outlet concentration) were too stringent or not attainable. The commenters further stated that the limits should reflect real world applications.

In the proposed rule, EPA used the best information available at the time to determine MACT for both new and existing sources. The EPA reviewed the additional test data submitted during

the comment period, as well as the various comments describing test conditions that are significantly different from those used in previously submitted test reports. The EPA also evaluated other rules requiring similar combustion control equipment. The Paper and Other Web Coating NESHAP, subpart JJJJ, has an option of meeting overall emissions reductions of 98 percent. This destruction efficiency achieved through thermal oxidation was generally accepted as the "level of control achievable on a continuous basis under all normal operating conditions applicable to new sources." Therefore, for that particular source category (which involves coatings and cleaning solvents), EPA determined that thermal oxidation was the best control technology and justified setting the emission limits for thermal oxidizers at 98 percent control efficiency or, alternatively, achieving an outlet concentration of 20 parts per million or less.

With this control technology limit in mind, EPA compared the two source categories for similarities and/or differences that could lead to a comparable level of destruction efficiency for engine test cells/stands. Coating operations covered by the Paper and Other Web Coating NESHAP contain large concentrations of solvents that are easily removed through thermal oxidation. Engine testing by-products, on the other hand, are the result (by-products) of an incomplete combustion process, and HAP are typically emitted in significantly lower concentrations than surface coating and solvent cleaning emissions. As noted by the commenters, there are a variety of fuels and test conditions used at different sources for several types of engine tests. (A summary of the submitted test reports and emissions data is included in the docket.) In reviewing the test data submitted by the commenters, we found that even though some of the test reports showed very high destruction efficiencies for thermal oxidizers, the best controlled facilities were only being required to meet 95 percent or 96 percent control volatile organic compounds (VOC), based on their operating permit requirements. These levels of control take into consideration differences in operating conditions for engine test cells/stands. After reviewing the comments and information submitted, we conclude that a maximum control level of 96 percent is appropriate once we consider the differences in HAP emission levels from engines tested, the testing conditions, and also the need to account for measurement uncertainties. We also conclude that increased compliance flexibility will result from the use of total hydrocarbons (THC) (in addition to CO) for demonstrating compliance. Therefore, the new source emission limits have been changed in the final rule to 96 percent reduction for CO or THC based on the updated test data, additional test reports, and estimates reflecting the most prevalent engine test setups and conditions across all engine testing sectors involving engines greater than or equal to 25 horsepower (hp).

F. Monitoring Requirements

Several commenters requested that the continuous emissions monitoring systems (CEMS) requirements be eliminated or changed to parametric monitoring. The commenters stated that CEMS are too expensive and do not provide any meaningful environmental benefit to justify the capital costs to install them on engine test stands. They also pointed out that in other permitting decisions and guidance documents, EPA has determined that initial stack tests followed by monitoring of operating temperature is a proven and cost-effective way of monitoring oxidizer performance.

The EPA reviewed the monitoring requirements in the proposal and compared them with other similar emission sources. The HAP emitted by engine test cells are the result of byproducts of incomplete combustion. Thermal destruction of these HAP occurs at temperatures between 590 °C and 650 °C (1,100 °F and 1,200 °F), thus making temperature an appropriate parameter to monitor the destruction of HAP. In the case of monitoring a regenerative thermal oxidizer (RTO), the temperature is monitored during the initial performance test. After the RTO meets the performance test requirements and demonstrates compliance with the applicable emission limit, the operating temperature is continuously monitored to verify the performance of the RTO. As a result, we have concluded that parametric monitoring is adequate for ensuring compliance with the emission limit. Thus, we have changed the monitoring requirements in the final rule to allow parameter (temperature) monitoring for thermal oxidizers. Since some facilities may already have existing continuous monitoring equipment in place, CEMS are still included in the final rule as a monitoring option.

G. Cost and Economic Assumptions and Impacts

As a result of the changes to address public comments, the final rule includes a new estimation of cost impacts. The final rule estimates there will be 18 affected source facilities at a cost of $3.2 million and a HAP reduction of 65.5 tpy.

H. Startup, Shutdown, and Malfunction (SSM)

The proposed rule specifically required affected sources to comply with the applicable emission limitation at all times, including SSM of the engine test cells/stands. Many commenters disagreed with these provisions. One commenter requested an exclusion for the startup period during which a catalytic oxidizer comes up to operating temperature. The commenter also provided examples of issues involving oxidizer malfunctions: (1) Engines cannot be shut off instantaneously, and excess emissions can occur in the time that it takes to complete an orderly and safe shutdown; and (2) there are certain tests that must be redone at large cost if they are interrupted. An example piston scuff test was described by the commenter as taking about 90 minutes, and if the engine is shutdown, the engine must be rebuilt and the test rerun. In the case of an oxidizer malfunction when such a test is in progress, the commenter requested that the operator be able to complete the test without risk of enforcement action.

The majority of emissions from engine testing occur during the times that would be covered by SSM provisions. Therefore, to ensure that those emissions are controlled, the SSM provisions were excluded from the proposed rule. Because the SSM provisions apply to the process as well as the control equipment, the impact of the engine test NESHAP to minimize HAP emissions would be significantly reduced by adopting the SSM provisions.

Based on the comments, the final rule includes SSM provisions for any control equipment and monitoring equipment related to new or reconstructed affected source emissions. The new language references the General Provisions for SSM procedures related to control equipment. The time required for a catalytic oxidizer to come up to operating temperature is not covered by the SSM provisions because engine testing should not be conducted before the minimum operating temperature (determined during the initial performance test) is achieved.

I. Emissions Averaging

We asked for comments on including some type of averaging provisions, and several commenters recommended that

averaging provisions be included in the final rule. We looked at existing rules that include averaging provisions such as the Petroleum Refineries NESHAP (subpart CC), the Aluminum Reduction Plants NESHAP (subpart LL), and the Group IV Polymers and Resins NESHAP (subpart JJJ) and found that these rules allow averaging only between emission sources covered under each specific rule. In reviewing the comments and considering different averaging options, there were several issues that had to be taken into account. First, in all previous regulations that implemented an averaging scheme, only processes within the same source category were considered and accounted for in the averaging scheme. In other words, the concept of emissions averaging has always been considered and implemented within a given source category, and not across source categories. Second, only existing sources have been allowed to take part in this type of flexibility option. This decision not to allow new sources to average their emissions is consistent with the direction outlined in the statute where new sources are expected to reduce their emissions to a level equivalent to that of the best controlled similar source. Many facilities that operate engine test cells/stands also conduct other processes that emit HAP. However, these other processes, such as coating and cleaning, are not part of the engine test cells/stands source category and are already regulated under other NESHAP.

For these reasons, we concluded that averaging emissions is not an appropriate option for this source category. Therefore, the final rule includes no averaging provisions.

J. Miscellaneous

Some commenters recommended that the term engine test cell/stand be defined to clarify that a rotary test firing operation that holds numerous engines is considered a single engine test cell/stand. Changes to the definition of affected source in the final rule provides for the collection of all equipment and activities associated with engine test cells/stands, which would relieve the necessity for specific language regarding carousel testing setups.

It was also noted that the proposed regulation wording regarding the initial notification requirement for new or reconstructed engine test cells/stands used for testing internal combustion (IC) engines with a rated power of less than 25 hp (19 kilowatts (kW)) was unclear and confusing. Additional language was added to those sections of the final rule dealing with initial notifications to clarify those requirements. Any new or reconstructed source testing IC engines with a rated power less than 25 hp must submit an initial notification, but do not have to comply with any of the other final rule requirements.

III. What Are the Final Standards?

A. What Is the Source Category?

The final rule covers four subcategories of engine test cells/stands located at major source facilities: (1) Engine test cells/stands used for testing internal combustion engines with rated power of 25 hp (19 kW) or more, (2) engine test cells/stands used for testing internal combustion engines with rated power of less than 25 hp, (3) engine test cells/stands used for testing combustion turbine engines, and (4) engine test cells/stands used for testing rocket engines. The rated power criteria for distinguishing between the two internal combustion engine subcategories is based on the largest engine (in terms of rated power) that is tested in the engine test cell/stand.

B. What Is the Affected Source?

The final rule applies to each affected source, which is defined as the collection of all equipment and activities associated with engine test cells/stands used for testing uninstalled stationary or uninstalled mobile (motive) engines located at a major source of HAP emissions. An uninstalled engine is defined as an engine being tested in a test cell/stand that is not installed in, or an integrated part of, the final product. A major source of HAP emissions is a plant site that emits or has the potential to emit any single HAP at a rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year.

Each new or reconstructed affected source used for testing internal combustion engines with a rated power of 25 hp (19 kW) or more that is located at a major source of HAP emissions must comply with the requirements in the final rule. New or reconstructed affected sources used for testing internal combustion engines with a rated power of less than 25 hp (19 kW) are not required to comply with the emission limitations in the final rule, but are required to submit an Initial Notification upon startup of the test cells/stands.

New or reconstructed affected sources used for testing combustion turbine engines or new or reconstructed test cells/stands used for testing rocket engines are not required to comply with the emission limitation or the recordkeeping or reporting requirements in the final rule.

Existing affected sources that are located at major sources of HAP emissions are not required to comply with the emission limitations or the recordkeeping or reporting requirements in the final rule.

The final rule also does not apply to engine test cells/stands that are located at area sources of HAP emissions. An area source is any source that is not a major source of HAP emissions.

C. What Are the Emission Limits?

As the owner or operator of a new or reconstructed affected source used in whole or in part for testing internal combustion engines with rated power of 25 hp (19 kW) or more and located at a major source of HAP emissions, you must comply with one of the following two emission limitations by May 27, 2003 or upon startup if you start up your affected source after May 27, 2003: (1) Reduce CO or THC emissions in the exhaust from the new or reconstructed affected source to 20 parts per million by volume dry basis (ppmvd) or less, at 15 percent oxygen (O_2) content, or (2) reduce CO or THC emissions in the exhaust from the new or reconstructed affected source by 96 percent or more. Existing affected sources used in whole or in part for testing internal combustion engines with rated power of 25 hp (19 kW) or more and located at a major source of HAP emissions are not required to comply with the emission limitations.

Finally, as mentioned earlier, new or reconstructed affected sources used for testing internal combustion engines with a rated power of less than 25 hp (19 kW), new or reconstructed affected sources used for testing combustion turbine engines, and new or reconstructed affected sources used for testing rocket engines are not required to comply with either emission limitation. In addition, neither existing affected sources located at major sources of HAP emissions nor new, reconstructed, or existing affected sources located at area sources of HAP emissions are required to comply with the emission limitations.

D. What Are the Initial Compliance Requirements?

The initial compliance requirements are different depending on whether you demonstrate compliance with the outlet concentration emission limitation or the percent reduction emission limitation. If you choose to comply with the outlet concentration emission limitation, you must conduct EPA Methods 3A and 10 of appendix A to 40 CFR part 60 for CO

measurement or EPA Method 25A of appendix A to 40 CFR part 60 for THC measurement. The final rule also provides for an alternate test method (ASTM D 6522–00) for testing engines that burn natural gas as fuel. You must demonstrate that the outlet concentration of CO or THC emissions from the new or reconstructed affected source or emission control device is 20 ppmvd or less, corrected to 15 percent O_2 content, using the first 4-hour rolling average after a successful performance evaluation.

If you comply with the percent reduction emission limitation, you must conduct an initial performance test to determine the capture and control efficiencies of the equipment and to establish operating limits to be achieved on a continuous basis. The performance test would have to be completed no later than 180 days after the compliance date for new or reconstructed affected sources. You must demonstrate that the reduction in CO or THC emissions is at least 96 percent using the first 4-hour rolling average after a successful performance evaluation. Your inlet and outlet measurements must be on a dry basis and corrected to 15 percent O_2 content.

If you use a capture system and add-on control device, you determine both the efficiency of the capture system and the emission reduction efficiency of the control device. To determine the capture efficiency, you either verify the presence of a potential to emit (PTE) using EPA Method 204 of 40 CFR part 51, appendix M, or use one of the protocols in 40 CFR 63.9320 of the final rule to measure capture efficiency. If you have a PTE and all engine testing occurs within the enclosure and you route all exhaust gases from the enclosure to a control device, then you assume 100 percent capture.

To determine the emission reduction efficiency of the control device, you conduct measurements of the inlet and outlet gas streams. The test would consist of three runs, each run lasting at least 1 hour, using the following EPA Methods in 40 CFR part 60, appendix A:

- Method 1 or 1A for selection of the sampling sites;
- Method 2, 2A, 2C, 2D, 2F, or 2G to determine the gas volumetric flow rate;
- Method 3, 3A, or 3B for gas analysis to determine dry molecular weight;
- Method 4 to determine stack moisture; and
- Method 25 or 25A to determine organic volatile matter concentration. Alternatively, any other test method or data that have been validated according to the applicable procedures in Method 301 of 40 CFR part 63, appendix A, and approved by the Administrator could be used.

E. What Are the Continuous Compliance Requirements?

Several general continuous compliance requirements apply to affected sources required to comply with the applicable emission limitation. You are required to comply with the applicable emission limitation at all times, except during SSM of any control equipment and associated monitoring equipment related to the new or reconstructed affected source emissions. You must operate and maintain your air pollution control equipment and monitoring equipment according to good air pollution control practices at all times. You must conduct monitoring at all times that the new or reconstructed affected source is in operation except during periods of malfunction of the monitoring equipment or necessary repairs and quality assurance or control activities, such as calibration drift checks.

For each new or reconstructed affected source operation on which you use a capture system and control device, the continuous parameter monitoring results for each month would affect your compliance determination. If the monitoring results indicate no deviations from the operating limits and there were no bypasses of the control device, you assume the capture system and control device are achieving the same percent emission reduction efficiency as during the most recent performance test in which compliance was demonstrated. If there are any deviations from the operating limits during the month or any bypasses of the control device, you account for them in the calculation of the monthly emissions by assuming the capture system and control device were achieving zero emission reduction during the periods of deviation. Then, you determine the overall percent reduction of CO or THC emissions.

If you use an emission capture system and control device, the final rule would require you to achieve, on a continuous basis, the operating limits you establish during the performance test. If the continuous monitoring shows that the capture system and control device is operating outside the range of values established during the performance test, you have deviated from the established operating limits.

If you operate a capture system and control device that allow emissions to bypass the control device, you have to demonstrate that CO or THC emissions collected by the capture system are being routed to the control device by monitoring for potential bypass of the control device. You may choose from the following four monitoring procedures:

- Flow control position indicator to provide a record of whether the exhaust stream is directed to the control device;
- Car-seal or lock-and-key valve closures to secure the bypass line valve in the closed position when the control device is operating;
- Valve closure monitoring to ensure any bypass line valve or damper is closed when the control device is operating; or
- Automatic shutdown system to stop the engine test cell/stand operation when flow is diverted from the control device.

If the bypass monitoring procedures indicate that emissions are not routed to the control device, you have deviated from the emission limits.

To demonstrate continuous compliance with either the percent reduction or outlet concentration emission limitation using continuous parameter monitoring systems, you must continuously monitor and record the appropriate parameter, depending on the control device used. The operating parameter must not drop below the level established by the performance test in order to maintain the reduction in CO or THC emissions at or above 96 percent, or 20 ppmvd or less, corrected to 15 percent O_2 content, based on a rolling 4-hour average, averaged every hour.

To demonstrate continuous compliance with the outlet concentration emission limitation using CEMS, you must calibrate and operate your CEMS according to the requirements in 40 CFR 63.8. You must continuously monitor and record the CO or THC and O_2 concentrations at the outlet of the engine test cell/stand or emission control device and calculate the CO or THC emission concentration for each hour. Then, the hourly CO or THC emission concentrations for each hour of the 4-hour compliance period are averaged together. The outlet CO or THC emission concentration must be 20 ppmvd or less, corrected to 15 percent O_2 content, based on the 4-hour rolling average, averaged every hour.

To demonstrate continuous compliance with the percent reduction emission limitation using CEMS, you must calibrate and operate your CEMS according to the requirements in 40 CFR 63.8. You must continuously monitor and record the CO or THC, and O_2 concentration before and after the emission control device and calculate the percent reduction in CO or THC emissions hourly. The reduction in CO

or THC emissions must be 96 percent or more, based on the 4-hour rolling average, averaged every hour.

For monitoring approaches using CEMS, you must also follow procedure 1 of 40 CFR part 60, appendix F, to verify that the CEMS is working properly over time.

F. What Are the Notification, Recordkeeping, and Reporting Requirements?

You must submit all applicable notifications listed in the NESHAP General Provisions (40 CFR part 63, subpart A), including an initial notification, notification of performance evaluation, and a notification of compliance status for each engine test cell/stand required to comply with the emission limitations.

You must submit an initial notification for each single or collection of new or reconstructed engine test cells/stands located at a major source of HAP emissions used for testing internal combustion engines with a rated power of less than 25 hp (19 kW).

You must record all of the data necessary to determine if you are in compliance with the applicable emission limitation. Your records must be in a form suitable and readily available for review. You must also keep each record for 5 years following the date of each occurrence, measurement, maintenance, report, or record. Records must remain on site for at least 2 years and then can be maintained off site for the remaining 3 years.

For each affected source, to comply with the applicable emission limitation you must submit a compliance report semiannually. This report must contain the company name and address, a statement by a responsible official that the report is accurate, a statement of compliance, or documentation of any deviation from the requirements of the final rule during the reporting period.

IV. What Are the Environmental, Energy, Cost, and Economic Impacts?

A. What Are the Air Impacts?

The final rule will reduce HAP emissions in the 5th year following promulgation by an estimated 59.5 megagrams per year (65.5 tpy).

B. What Are the Non-Air Health, Environmental, and Energy Impacts?

Assuming that new or reconstructed affected sources will be controlled by regenerative thermal oxidizers (RTO), secondary air and energy impacts would result from fuel combustion needed to operate these control devices.

The RTO require electricity and the combustion of natural gas to operate and maintain operating temperatures. By-products of fuel combustion required to generate electricity and maintain RTO operating temperature include emission of CO, nitrogen oxides (NO_X), sulfur dioxide (SO_2), and particulate matter less than 10 microns in diameter (PM_{10}). Assuming the electricity required for RTO operation is generated at coal-fired plants built since 1978 and using AP–42 emissions factors, generation of electricity required to operate RTO at an estimated 18 new facilities would result in the following increases in these air pollutants: CO, 3.45 tpy; NO_X, 8.15 tpy; SO_2, 4.15 tpy; and PM_{10}, 0.45 tpy.

Energy impacts include the consumption of electricity and natural gas needed to operate RTO. The estimated increase in electricity consumption from the operation of RTOs is 183,600 kilowatt-hour per year. Increased fuel energy consumption resulting from burning natural gas would be 1,790,000 million British thermal units per year. No significant secondary water or solid waste impacts would result from the operation of emission control devices.

There would also be a very small increase in fuel consumption expected resulting from back pressure caused by the emission control system.

C. What Are the Economic Impacts?

Based on the cost of compliance data provided above, the final rule is not expected to affect any of the existing sources in the industries that use engine test cells/stands, or test rocket engines. We estimate that 18 facilities will construct a total of 72 new engine test cells/stands at large engine research and development or production facilities in the next 5 years, requiring controls to be installed to comply with the final rule. Six of the estimated facilities (with 24 of the new engine test cells/stands) are anticipated to be built by auto, tractor, and diesel engine manufacturers, while 12 of the facilities (with 48 engine test cells/stands) are estimated to be built by military facilities. The total compliance cost to each facility, including control equipment and monitoring, inspection, recordkeeping and reporting costs, is estimated to be $179,000 per year (1999$). The auto, tractor, and diesel engine manufacturing firms that are expected to construct new engine test cells/stands are large multi-national firms; thus, the cost of compliance is insignificant in comparison to firm revenues. For example, the impact on each firm is less than 0.0004 percent of corporate revenues in 1999, or nearly zero in percentage terms. Likewise, the cost of compliance for military facilities that may be affected is insignificant when compared to facility operating budgets. Therefore, the economic impacts associated with the final rule are considered to be negligible.

V. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 5173, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive order. The Executive order defines "significant regulatory action" as one that is likely to result in standards that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive order.

Pursuant to the terms of Executive Order 12866, it has been determined that the final rule does not constitute a "significant regulatory action" because it does not meet any of the above criteria. Consequently, this action was not submitted to OMB for review under Executive Order 12866.

B. Paperwork Reduction Act

The information collection requirements in the final rule are being submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 1967.01), and a copy may be obtained from Susan Auby by mail at Office of Environmental Information, Collection Strategies Division (MD–2822T), 1200 Pennsylvania Avenue, NW., Washington DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded from the Internet at *http://www.epa.gov/icr*. The information requirements are not effective until OMB approves them.

The information requirements are based on notification, recordkeeping,

and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to EPA policies set forth in 40 CFR part 2, subpart B.

The final rule requires maintenance inspections of the control devices but does not require any notifications or reports beyond those required by the General Provisions. The recordkeeping requirements involve only the specific information needed to determine compliance.

The monitoring, reporting, and recordkeeping burden for this collection (averaged over the first 5 years after the effective date of the standards) is estimated to be 4,800 labor hours per year at a total annual cost of $221,000. This estimate includes a one-time (initial) control device performance evaluation, annualized capital monitoring equipment costs, semiannual compliance reports, maintenance inspections, notifications, and recordkeeping. Total annual costs associated with the new source control and monitoring requirements over the period of the ICR are estimated at $3.2 million.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to respond to a collection of information; search existing data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor a collection of information, and a person is not required to respond to such a collection, unless the collection displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA), as Amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA) 5 U.S.C. 601 *et seq.*, generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the Agency certifies that the final rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations and small governmental jurisdictions.

For purposes of assessing the impacts of today's final rule on small entities, a small entity is defined as: (1) A small business whose parent company has either fewer than 500 employees if the business is involved in testing marine engines, or fewer than 1,000 employees if the business is involved in the testing of other types of engines (as defined by the Small Business Administration); (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; or (3) a small organization that is any not-for-profit enterprise that is independently owned and operated and is not dominant in its field. Based on the Small Business Administration definitions, there are no small entities affected by this NESHAP. Pursuant to the provisions of 5 U.S.C. 605(b), we hereby certify that the NESHAP, if promulgated, will not have a significant economic impact on a substantial number of small entities.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation of why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in aggregate, or the private sector in any one year, nor does the final rule significantly or uniquely impact small governments, because it contains no requirements that apply to such governments or impose obligations upon them. Thus, the requirements of the UMRA do not apply to the final rule.

E. Executive Order 13132, Federalism

Executive Order 13132 (64 FR 43255, August 10, 1999) requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected facilities are owned or operated by State governments. Thus, the requirements of section 6 of the Executive Order 13132 do not apply to the final rule.

specifications for measurement system performance, most notably the calibration procedures and instrument performance characteristics. The instrument performance characteristics that are provided are nonmandatory and also do not provide the same level of quality assurance as the EPA methods. For example, the zero and span/calibration drift is only checked weekly, whereas the EPA methods requires drift checks after each run.

Two very similar standards, ASTM D5835–95, Standard Practice for Sampling Stationary Source Emissions for Automated Determination of Gas Concentration, and ISO 10396:1993, Stationary Source Emissions: Sampling for the Automated Determination of Gas Concentrations, are impractical alternatives to EPA Method 3A for the purposes of the final rule because they lack in detail and quality assurance/quality control requirements. Specifically, these two standards do not include the following: (1) Sensitivity of the method; (2) acceptable levels of analyzer calibration error; (3) acceptable levels of sampling system bias; (4) zero drift and calibration drift limits, time span, and required testing frequency; (5) a method to test the interference response of the analyzer; (6) procedures to determine the minimum sampling time per run and minimum measurement time; and (7) specifications for data recorders, in terms of resolution (all types) and recording intervals (digital and analog recorders, only).

The voluntary consensus standard ISO 12039:2001, Stationary Source Emissions—Determination of Carbon Monoxide, Carbon Dioxide, and Oxygen—Automated Methods, is not acceptable as an alternative to EPA Method 3A. This ISO standard is similar to EPA Method 3A, but is missing some key features. In terms of sampling, the hardware required by ISO 12039:2001 does not include a three-way calibration valve assembly or equivalent to block the sample gas flow while calibration gases are introduced. In its calibration procedures, ISO 12039:2001 only specifies a two-point calibration while EPA Method 3A specifies a three-point calibration. Also, ISO 12039:2001 does not specify performance criteria for calibration error, calibration drift, or sampling system bias tests as in the EPA method, although checks of these quality control features are required by the ISO standard.

The standard, ASTM D3162 (1994) Standard Test Method for Carbon Monoxide in the Atmosphere (Continuous Measurement by Nondispersive Infrared Spectrometry), is impractical as an alternative to EPA Method 10 in the final rule because this ASTM standard, which is stated to be applicable in the range of 0.5–100 ppm CO, does not cover the range of EPA Method 10 (20–1,000 ppm CO) at the upper end (but states that it has a lower limit of sensitivity). Also, ASTM D3162 does not provide a procedure to remove carbon dioxide interference. Therefore, this ASTM standard is not appropriate for combustion source conditions. In terms of non-dispersive infrared instrument performance specifications, ASTM D3162 has much higher maximum allowable rise and fall times (5 minutes) than EPA Method 10 (which has 30 seconds).

The voluntary consensus standard CAN/CSA Z223.21–M1978, Method for the Measurement of Carbon Monoxide: 3—Method of Analysis by Non-Dispersive Infrared Spectrometry, is not acceptable as an alternative to EPA Method 10 because it is lacking in the following areas: (1) Sampling procedures; (2) procedures to correct for the carbon dioxide concentration; (3) instructions to correct the gas volume if CO_2 traps are used; (4) specifications to certify the calibration gases are within 2 percent of the target concentration; (5) mandatory instrument performance characteristics (*e.g.*, rise time, fall time, zero drift, span drift, precision); (6) quantitative specification of the span value maximum as compared to the measured value: The standard specifies that the instruments should be compatible with the concentration of gases to be measured, whereas EPA Method 10 specifies that the instrument span value should be no more than 1.5 times the source performance standard.

Two voluntary consensus standards, EN 12619:1999 Stationary Source Emissions—Determination of the Mass Concentration of Total Gaseous Organic Carbon at Low Concentrations in Flue Gases—Continuous Flame Ionization Detector Method, and ISO 14965:2000(E) Air Quality—Determination of Total Nonmethane Organic Compounds—Cryogenic Preconcentration and Direct Flame Ionization Method, are impractical alternatives to EPA Method 25 and 25A for the purposes of the final rule because the standards do not apply to solvent process vapors in concentrations greater than 40 ppm (EN 12619) and 10 ppm carbon (ISO 14965). Methods whose upper limits are this low are too limited to be useful in measuring source emissions, which are expected to be much higher.

Two of the 13 voluntary consensus standards identified in this search were not available at the time the review was conducted for the purposes of the final rule because they are under development by a voluntary consensus body: ASME/BSR MFC 13M, Flow Measurement by Velocity Traverse, for EPA Method 2 (and possibly 1); and ASME/BSR MFC 12M, Flow in Closed Conduits Using Multiport Averaging Pitot Primary Flowmeters, for EPA Method 2.

Sections 63.9310, 63.9320, 63.9321 and 63.9322 to 40 CFR part 63, subpart PPPPP, list the EPA testing methods included in the regulation. Under 40 CFR 63.7(f) and 63.8(f) of subpart A of the General Provisions, a source may apply to EPA for permission to use alternative test methods or alternative monitoring requirements in place of any of the EPA testing methods, performance specifications, or procedures.

J. Congressional Review Act

The Congressional Review Act (5 U.S.C. 801 *et seq.*), as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that, before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. The final rule is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of the Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 2. Section 63.14 is amended by adding paragraph (b)(27) and revising paragraph (i)(3) to read as follows:

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 6, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175, because tribal governments do not own or operate any sources subject to the amendments. We know of one company that reported operating engine test cells/stands that are owned by an Indian tribal government. However, these test cells/stands are used for testing rocket engines. Although test cells/stands used for testing rocket engines are covered by the final rule, test cells/stands used for testing rocket engines are not required to meet any emission limitation, reporting, or recordkeeping requirements. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045, Protection of Children From Environmental Health and Safety Risks

Executive Order 13045 applies to any rule that EPA determines (1) is "economically significant" as defined under Executive Order 12866, and (2) the environmental health or safety risk addressed by the rule has a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by EPA.

The EPA interprets Executive Order 13045 as applying only to regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045, because it is based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 (66 FR 28355, May 22, 2001) because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Public Law 104–113; 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs EPA to provide Congress, through annual reports to the OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

The final rule involves technical standards. The EPA cites the following standards in the final rule: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 10, 10B, 25, 25A, 204, 204B,C,D,E and Performance Specifications (PS) 3 and PS 4A. Consistent with the NTTAA, EPA conducted searches to identify voluntary consensus standards in addition to these EPA methods/performance specifications. No applicable voluntary consensus standards were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, 204, 204B through 204F, and PS 3 and PS 4A. The search and review results have been documented and are placed in the docket (No. OAR–2002–0040) for the final rule.

Two voluntary consensus standards were identified as acceptable alternatives to the EPA methods specified in the final rule. The voluntary consensus standard ASTM D6522–00, Standard Test Method for the Determination of Nitrogen Oxides, Carbon Monoxide, and Oxygen Concentrations in Emissions from Natural Gas-Fired Reciprocating Engines, Combustion Turbines, Boilers and Process Heaters Using Portable Analyzers is cited in the final rule as an acceptable alternative to EPA Methods 3A and 10 for identifying carbon monoxide and oxygen concentrations for the final rule when the fuel is natural gas.

The voluntary consensus standard ANSI/ASME PTC 19.10–1981, Part 10 Flue and Exhaust Gas Analyses, is cited in the final rule for its manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas. This part of ANSI/ASME PTC 19.10–1981 is an acceptable alternative to Method 3B.

In addition to the voluntary consensus standards EPA cites in the final rule, the search for emissions measurement procedures identified 13 other voluntary consensus standards. The EPA determined that 11 of these 13 standards identified for measuring emissions of the HAP or surrogates subject to emission standards in the final rule were impractical alternatives to EPA test methods/performance specifications for the purposes of the final rule. Therefore, the EPA does not intend to adopt these standards. The reasons for the determinations of these 11 methods are discussed below.

The voluntary consensus standard ASTM D3154–00, Standard Method for Average Velocity in a Duct (Pitot Tube Method), is impractical as an alternative to EPA Methods 1, 2, 2C, 3, 3B, and 4 for the purposes of the final rule since the standard appears to lack in quality control and quality assurance requirements. Specifically, ASTM D3154–00 does not include the following: (1) Proof that openings of standard pitot tube have not plugged during the test; (2) if differential pressure gauges other than inclined manometers (*e.g.*, magnehelic gauges) are used, their calibration must be checked after each test series; and (3) the frequency and validity range for calibration of the temperature sensors.

The voluntary consensus standard ASTM D3464–96 (2001), Standard Test Method Average Velocity in a Duct Using a Thermal Anemometer, is impractical as an alternative to EPA Method 2 for the purposes of the final rule primarily because applicability specifications are not clearly defined, *e.g.*, range of gas composition, temperature limits. Also, the lack of supporting quality assurance data for the calibration procedures and specifications, and certain variability issues that are not adequately addressed by the standard limit EPA's ability to make a definitive comparison of the method in these areas.

The voluntary consensus standard ISO 10780:1994, Stationary Source Emissions—Measurement of Velocity and Volume Flowrate of Gas Streams in Ducts, is impractical as an alternative to EPA Method 2 in the final rule. The standard recommends the use of an L-shaped pitot, which historically has not been recommended by EPA. The EPA specifies the S-type design, which has large openings that are less likely to plug up with dust.

The voluntary consensus standard, CAN/CSA Z223.2–M86(1986), Method for the Continuous Measurement of Oxygen, Carbon Dioxide, Carbon Monoxide, Sulphur Dioxide, and Oxides of Nitrogen in Enclosed Combustion Flue Gas Streams, is unacceptable as a substitute for EPA Method 3A since it does not include quantitative

§ 63.14 Incorporation by reference.

■ 3. Part 63 is amended by adding subpart PPPPP to read as follows:

Subpart PPPPP—National Emission Standards for Hazardous Air Pollutants for Engine Test Cells/Stands

What This Subpart Covers

Sec.
63.9280 What is the purpose of subpart PPPPP?
63.9285 Am I subject to this subpart?
63.9290 What parts of my plant does this subpart cover?
63.9295 When do I have to comply with this subpart?

Emission Limitations

63.9300 What emission limitation must I meet?
63.9301 What are my options for meeting the emission limits?
63.9302 What operating limits must I meet?

General Compliance Requirements

63.9305 What are my general requirements for complying with this subpart?
63.9306 What are my continuous parameter monitoring system (CPMS) installation, operation, and maintenance requirements?
63.9307 What are my continuous emissions monitoring system installation, operation, and maintenance requirements?

Testing and Initial Compliance Requirements

63.9310 By what date must I conduct the initial compliance demonstrations?
63.9320 What procedures must I use?
63.9321 What are the general requirements for performance tests?
63.9322 How do I determine the emission capture system efficiency?
63.9323 How do I determine the add-on control device emission destruction or removal efficiency?
63.9324 How do I establish the emission capture system and add-on control device operating limits during the performance test?
63.9330 How do I demonstrate initial compliance with the emission limitation?

Continuous Compliance Requirements

63.9335 How do I monitor and collect data to demonstrate continuous compliance?
63.9340 How do I demonstrate continuous compliance with the emission limitation?

Notifications, Reports, and Records

63.9345 What notifications must I submit and when?
63.9350 What reports must I submit and when?
63.9355 What records must I keep?
63.9360 In what form and how long must I keep my records?

Other Requirements and Information

63.9365 What parts of the General Provisions apply to me?
63.9370 Who implements and enforces this subpart?
63.9375 What definitions apply to this subpart?

Subpart PPPPP—National Emission Standards for Hazardous Air Pollutants for Engine Test Cells/Standards

What This Subpart Covers

§ 63.9280 What is the purpose of subpart PPPPP?

This subpart PPPPP establishes national emission standards for hazardous air pollutants (NESHAP) for engine test cells/stands located at major sources of hazardous air pollutants (HAP) emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations contained in this NESHAP.

§ 63.9285 Am I subject to this subpart?

You are subject to this subpart if you own or operate an engine test cell/stand that is located at a major source of HAP emissions.

(a) An engine test cell/stand is any apparatus used for testing uninstalled stationary or uninstalled mobile (motive) engines.

(b) An uninstalled engine is an engine that is not installed in, or an integrated part of, the final product.

(c) A major source of HAP emissions is a plant site that emits or has the potential to emit any single HAP at a rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year.

§ 63.9290 What parts of my plant does this subpart cover?

This subpart applies to each new, reconstructed, or existing affected source.

(a) *Affected source.* An affected source is the collection of all equipment and activities associated with engine test cells/stands used for testing uninstalled stationary or uninstalled mobile (motive) engines located at a major source of HAP emissions.

(1) *Existing affected source.* An affected source is existing if you commenced construction or reconstruction of the affected source on or before May 14, 2002. A change in ownership of an existing affected source does not make that affected source a new or reconstructed affected source.

(2) *New affected source.* An affected source is new if you commenced construction of the affected source after May 14, 2002.

(3) *Reconstructed affected source.* An affected source is reconstructed if you meet the definition of reconstruction in § 63.2 of subpart A of this part and reconstruction is commenced after May 14, 2002. Changes made to an existing affected source primarily for the purpose of complying with revisions to engine testing requirements under 40 CFR parts 80, 86, 89, 90, 91, or 92 are not considered a modification or reconstruction. In addition, passive measurement and control instrumentation and electronics are not included as part of any affected source reconstruction evaluation.

(b) Existing affected sources do not have to meet the requirements of this subpart and of subpart A of this part.

(c) Any portion of a new or reconstructed affected source located at a major source that is used exclusively for testing internal combustion engines with rated power of less than 25 horsepower (hp) (19 kilowatts(kW)) does not have to meet the requirements of this subpart and of subpart A of this part except for the initial notification requirements of § 63.9345(b).

(d) Any portion of a new or reconstructed affected source located at a major source that meets any of the

criteria specified in paragraphs (d)(1) through (4) of this section does not have to meet the requirements of this subpart and of subpart A of this part.

(1) Any portion of the affected source used exclusively for testing combustion turbine engines.

(2) Any portion of the affected source used exclusively for testing rocket engines.

(3) Any portion of the affected source used in research and teaching activities at facilities that are not engaged in the development of engines or engine test services for commercial purposes.

(4) Any portion of the affected source operated to test or evaluate fuels (such as knock engines), transmissions, or electronics.

§ 63.9295 When do I have to comply with this subpart?

(a) *Affected sources.*

(1) If you start up your new or reconstructed affected source before May 27, 2003, you must comply with the emission limitations in this subpart no later than May 27, 2003.

(2) If you start up your new or reconstructed affected source on or after May 27, 2003, you must comply with the emission limitations in this subpart upon startup.

(b) *Area sources that become major sources.* If your new or reconstructed affected source is located at an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP, your new or reconstructed affected source must be in compliance with this subpart when the area source becomes a major source.

(c) You must meet the notification requirements in § 63.9345 and in 40 CFR part 63, subpart A.

Emission Limitations

§ 63.9300 What emission limitations must I meet?

For each new or reconstructed affected source that is used in whole or in part for testing internal combustion engines with rated power of 25 hp (19 kW) or more and that is located at a major source, you must comply with the emission limitations in Table 1 to this subpart. (Tables are found at the end of this subpart.)

§ 63.9301 What are my options for meeting the emission limits?

You may use either a continuous parameter monitoring system (CPMS) or a continuous emission monitoring system (CEMS) to demonstrate compliance with the emission limitations. Continuous monitoring systems must meet the requirements in § 63.9306 (CPMS) and § 63.9307 (CEMS).

§ 63.9302 What operating limits must I meet?

(a) For any new or reconstructed affected source on which you use add-on controls, you must meet the operating limits specified in Table 2 to this subpart. These operating limits must be established during the performance test according to the requirements in § 63.9324. You must meet the operating limits at all times after you establish them.

(b) If you use an add-on control device other than those listed in Table 2 to this subpart, or wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of alternative monitoring under § 63.8(f).

General Compliane Requirements

§ 63.9305 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitation that applies to you at all times, except during periods of startup, shutdown, or malfunction (SSM) of your control device or associated monitoring equipment.

(b) If you must comply with the emission limitation, you must operate and maintain your engine test cell/stand, air pollution control equipment, and monitoring equipment in a manner consistent with good air pollution control practices for minimizing emissions at all times.

(c) You must develop and implement a written SSM plan (SSMP) for emission control devices and associated monitoring equipment according to the provisions in § 63.6(e)(3). The plan will apply only to emission control devices, and not to engine test cells/stands.

§ 63.9306 What are my continuous parameter monitoring system (CPMS) installation, operation, and maintenance requirements?

(a) *General.* You must install, operate, and maintain each CPMS specified in paragraphs (c) and (d) of this section according to paragraphs (a)(1) through (7) of this section. You must install, operate, and maintain each CPMS specified in paragraph (b) of this section according to paragraphs (a)(3) through (5) of this section.

(1) The CPMS must complete a minimum of one cycle of operation for each successive 15-minute period. You must have a minimum of four equally spaced successive cycles of CPMS operation in 1 hour.

(2) You must determine the average of all recorded readings for each successive 3-hour period of the emission capture system and add-on control device operation.

(3) You must record the results of each inspection, calibration, and validation check of the CPMS.

(4) You must maintain the CPMS at all times and have available necessary parts for routine repairs of the monitoring equipment.

(5) You must operate the CPMS and collect emission capture system and add-on control device parameter data at all times that an engine test cell/stand is operating, except during monitoring malfunctions, associated repairs, and required quality assurance or control activities (including, if applicable, calibration checks and required zero and span adjustments).

(6) You must not use emission capture system or add-on control device parameter data recorded during monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities when calculating data averages. You must use all the data collected during all other periods in calculating the data averages for determining compliance with the emission capture system and add-on control device operating limits.

(7) A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the CPMS to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. Any period for which the monitoring system is out-of-control and data are not available for required calculations is a deviation from the monitoring requirements.

(b) *Capture system bypass line.* You must meet the requirements of paragraphs (b)(1) and (2) of this section for each emission capture system that contains bypass lines that could divert emissions away from the add-on control device to the atmosphere.

(1) You must monitor or secure the valve or closure mechanism controlling the bypass line in a nondiverting position in such a way that the valve or closure mechanism cannot be opened without creating a record that the valve was opened. The method used to monitor or secure the valve or closure mechanism must meet one of the requirements specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) *Flow control position indicator.* Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow control position indicator that takes a reading at least once every 15 minutes and provides a record indicating whether the emissions are directed to the add-on control device

or diverted from the add-on control device. The time of occurrence and flow control position must be recorded, as well as every time the flow direction is changed. The flow control position indicator must be installed at the entrance to any bypass line that could divert the emissions away from the add-on control device to the atmosphere.

(ii) *Car-seal or lock-and-key valve closures.* Secure any bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. You must visually inspect the seal or closure mechanism at least once every month to ensure that the valve is maintained in the closed position, and the emissions are not diverted away from the add-on control device to the atmosphere.

(iii) *Valve closure monitoring.* Ensure that any bypass line valve is in the closed (nondiverting) position through monitoring of valve position at least once every 15 minutes. You must inspect the monitoring system at least once every month to verify that the monitor will indicate valve position.

(iv) *Automatic shutdown system.* Use an automatic shutdown system in which the engine testing operation is stopped when flow is diverted by the bypass line away from the add-on control device to the atmosphere when an engine test cell/stand is operating. You must inspect the automatic shutdown system at least once every month to verify that it will detect diversions of flow and shut down the engine test cell/stand in operation.

(2) If any bypass line is opened, you must include a description of why the bypass line was opened and the length of time it remained open in the semiannual compliance reports required in § 63.9350.

(c) *Thermal oxidizers and catalytic oxidizers.* If you are using a thermal oxidizer or catalytic oxidizer as an add-on control device, you must comply with the requirements in paragraphs (c)(1) through (3) of this section.

(1) For a thermal oxidizer, install a gas temperature monitor in the firebox of the thermal oxidizer or in the duct immediately downstream of the firebox before any substantial heat exchange occurs.

(2) For a catalytic oxidizer, you must install a gas temperature monitor in the gas stream immediately before the catalyst bed, and if you established operating limits according to § 63.9324(b)(1) and (2), also install a gas temperature monitor in the gas stream immediately after the catalyst bed.

(i) If you establish operating limits according to § 63.9324(b)(1) and (2), then you must install the gas temperature monitors both upstream and downstream of the catalyst bed. The temperature monitors must be in the gas stream immediately before and after the catalyst bed to measure the temperature difference across the bed.

(ii) If you establish operating limits according to § 63.9324(b)(3) and (4), then you must install a gas temperature monitor upstream of the catalyst bed. The temperature monitor must be in the gas stream immediately before the catalyst bed to measure the temperature.

(3) For all thermal oxidizers and catalytic oxidizers, you must meet the requirements in paragraphs (a) and (c)(3)(i) through (vii) of this section for each gas temperature monitoring device.

(i) Locate the temperature sensor in a position that provides a representative temperature.

(ii) Use a temperature sensor with a measurement sensitivity of 4 degrees Fahrenheit or 0.75 percent of the temperature value, whichever is larger.

(iii) Shield the temperature sensor system from electromagnetic interference and chemical contaminants.

(iv) If a gas temperature chart recorder is used, it must have a measurement sensitivity in the minor division of at least 20 degrees Fahrenheit.

(v) Perform an electronic calibration at least semiannually according to the procedures in the manufacturer's owner's manual. Following the electronic calibration, you must conduct a temperature sensor validation check in which a second or redundant temperature sensor placed near the process temperature sensor must yield a reading within 30 degrees Fahrenheit of the process temperature sensor reading.

(vi) Conduct calibration and validation checks anytime the sensor exceeds the manufacturer's specified maximum operating temperature range or install a new temperature sensor.

(vii) At least monthly, inspect components for integrity and electrical connections for continuity, oxidation, and galvanic corrosion.

(d) Emission capture systems. The capture system monitoring system must comply with the applicable requirements in paragraphs (d)(1) and (2) of this section.

(1) For each flow measurement device, you must meet the requirements in paragraphs (a) and (d)(1)(i) through (iv) of this section.

(i) Locate a flow sensor in a position that provides a representative flow measurement in the duct from each capture device in the emission capture system to the add-on control device.

(ii) Reduce swirling flow or abnormal velocity distributions due to upstream and downstream disturbances.

(iii) Conduct a flow sensor calibration check at least semiannually.

(iv) At least monthly, inspect components for integrity, electrical connections for continuity, and mechanical connections for leakage.

(2) For each pressure drop measurement device, you must comply with the requirements in paragraphs (a) and (d)(2)(i) through (vi) of this section.

(i) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure drop across each opening you are monitoring.

(ii) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion.

(iii) Check pressure tap pluggage daily.

(iv) Using an inclined manometer with a measurement sensitivity of 0.0002 inch water, check gauge calibration quarterly and transducer calibration monthly.

(v) Conduct calibration checks any time the sensor exceeds the manufacturer's specified maximum operating pressure range or install a new pressure sensor.

(vi) At least monthly, inspect components for integrity, electrical connections for continuity, and mechanical connections for leakage.

§ 63.9307 What are my continuous emissions monitoring system installation, operation, and maintenance requirements?

(a) You must install, operate, and maintain each CEMS to monitor carbon monoxide (CO) or total hydrocarbons (THC) and oxygen (O_2) at the outlet of the exhaust system of the engine test cell/stand or at the outlet of the emission control device.

(b) To comply with the CO or THC percent reduction emission limitation, you may install, operate, and maintain a CEMS to monitor CO or THC and O_2 at both the inlet and the outlet of the emission control device.

(c) To comply with either emission limitations, the CEMS must be installed and operated according to the requirements described in paragraphs (c)(1) through (4) of this section.

(1) You must install, operate, and maintain each CEMS according to the applicable Performance Specification (PS) of 40 CFR part 60, appendix B (PS–3 or PS–4A).

(2) You must conduct a performance evaluation of each CEMS according to the requirements in 40 CFR 63.8 and according to PS–3 of 40 CFR part 60, appendix B, using Reference Method 3A or 3B for the O_2 CEMS, and according to PS–4A of 40 CFR part 60, appendix B, using Reference Method 10 or 10B for

the CO CEMS. If the fuel used in the engines being tested is natural gas, you may use ASTM D 6522–00, Standard Test Method for Determination of Nitrogen Oxides, Carbon Monoxide and Oxygen Concentrations in Emissions from Natural Gas Fired Reciprocating Engines, Combustion Turbines, Boilers, and Process Heaters Using Portable Analyzers (incorporated by reference, see § 63.14). As an alternative to Method 3B, you may use ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," (incorporated by reference, see § 63.14).

(3) As specified in § 63.8(c)(4)(ii), each CEMS must complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period. You must have at least two data points, each representing a different 15-minute period within the same hour, to have a valid hour of data.

(4) All CEMS data must be reduced as specified in § 63.8(g)(2) and recorded as CO concentration in parts per million by volume, dry basis (ppmvd), corrected to 15 percent O_2 content.

(d) If you have CEMS that are subject to paragraph (a) or (b) of this section, you must properly maintain and operate the monitors continuously according to the requirements described in paragraphs (d)(1) and (2) of this section.

(1) *Proper Maintenance.* You must maintain the monitoring equipment at all times that the engine test cell/stand is operating, including but not limited to, maintaining necessary parts for routine repairs of the monitoring equipment.

(2) *Continued Operation.* You must operate your CEMS according to paragraphs (d)(2)(i) and (ii) of this section.

(i) You must conduct all monitoring in continuous operation at all times that the engine test cell/stand is operating, except for, as applicable, monitoring malfunctions, associated repairs, and required quality assurance or control activities (including, as applicable, calibration drift checks and required zero and high-level adjustments). Quality assurance or control activities must be performed according to procedure 1 of 40 CFR part 60, appendix F.

(ii) Data recorded during monitoring malfunctions, associated repairs, out-of-control periods, and required quality assurance or control activities must not be used for purposes of calculating data averages. You must use all of the data collected from all other periods in assessing compliance. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring equipment to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. Any period for which the monitoring system is out-of-control and data are not available for required calculations constitutes a deviation from the monitoring requirements.

Testing and Initial Compliance Requirements

§ 63.9310 By what date must I conduct the initial compliance demonstrations?

You must conduct the initial compliance demonstrations that apply to you in Table 3 to this subpart within 180 calendar days after the compliance date that is specified for your new or reconstructed affected source in § 63.9295 and according to the provisions in § 63.7(a)(2).

§ 63.9320 What procedures must I use?

(a) You must conduct each initial compliance demonstration that applies to you in Table 3 to this subpart.

(b) You must conduct an initial performance evaluation of each capture and control system according to §§ 63.9321, 63.9322, 63.9323 and 63.9324, and each CEMS according to the requirements in 40 CFR 63.8 and according to the applicable Performance Specification of 40 CFR part 60, appendix B (PS–3 or PS–4A).

(c) The initial demonstration of compliance with the carbon monoxide (CO) or total hydrocarbon (THC) concentration limitation consists of the first 4-hour rolling average CO or THC concentration recorded after completion of the CEMS performance evaluation. You must correct the CO or THC concentration at the outlet of the engine test cell/stand or the emission control device to a dry basis and to 15 percent O_2 content according to Equation 1 of this section:

$$C_c = C_{unc}\left(\frac{5.9}{(20.9 - \%O_{2d})}\right) \qquad \text{(Eq. 1)}$$

Where:

C_c = concentration of CO or THC, corrected to 15 percent oxygen, ppmvd

C_{unc} = total uncorrected concentration of CO or THC, ppmvd

$\%O_{2d}$ = concentration of oxygen measured in gas stream, dry basis, percent by volume.

(d) The initial demonstration of compliance with the CO or THC percent reduction emission limitation consists of the first 4-hour rolling average percent reduction in CO or THC recorded after completion of the performance evaluation of the capture/control system and/or CEMS. You must complete the actions described in paragraphs (d)(1) through (2) of this section.

(1) Correct the CO or THC concentrations at the inlet and outlet of the emission control device to a dry basis and to 15 percent O_2 content using Equation 1 of this section.

(2) Calculate the percent reduction in CO or THC using Equation 2 of this section:

$$R = \frac{C_i - C_o}{C_i} \times 100 \qquad \text{(Eq. 2)}$$

Where:

R = percent reduction in CO or THC

C_i = corrected CO or THC concentration at inlet of the emission control device

C_o = corrected CO or THC concentration at the outlet of the emission control device.

§ 63.9321 What are the general requirements for performance tests?

(a) You must conduct each performance test required by § 63.9310 according to the requirements in § 63.7(e)(1) and under the conditions in this section unless you obtain a waiver of the performance test according to the provisions in § 63.7(h).

(1) *Representative engine testing conditions.* You must conduct the performance test under representative operating conditions for the test cell/stand. Operations during periods of SSM, and during periods of nonoperation do not constitute representative conditions. You must record the process information that is necessary to document operating conditions during the test and explain why the conditions represent normal operation.

(2) *Representative emission capture system and add-on control device operating conditions.* You must conduct the performance test when the emission capture system and add-on control device are operating at a representative flow rate, and the add-on control device is operating at a representative inlet concentration. You must record information that is necessary to document emission capture system and add-on control device operating conditions during the test and explain why the conditions represent normal operation.

(b) You must conduct each performance test of an emission capture system according to the requirements in § 63.9322. You must conduct each performance test of an add-on control

device according to the requirements in § 63.9323.

§ 63.9322 How do I determine the emission capture system efficiency?

You must use the procedures and test methods in this section to determine capture efficiency as part of the performance test required by § 63.9310.

(a) *Assuming 100 percent capture efficiency.* You may assume the capture system efficiency is 100 percent if both conditions in paragraphs (a)(1) and (2) of this section are met:

(1) The capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a potential to emit (PTE) and directs all the exhaust gases from the enclosure to an add-on control device.

(2) All engine test operations creating exhaust gases for which the test is applicable are conducted within the capture system.

(b) *Measuring capture efficiency.* If the capture system does not meet the criteria in paragraphs (a)(1) and (2) of this section, then you must use one of the two protocols described in paragraphs (c) and (d) of this section to measure capture efficiency. The capture efficiency measurements use total volatile hydrocarbon (TVH) capture efficiency as a surrogate for organic HAP capture efficiency. For the protocol in paragraph (c) of this section, the capture efficiency measurement must consist of three test runs. Each test run must be at least 3 hours in duration or the length of a production run, whichever is longer, up to 8 hours. For the purposes of this test, a production run means the time required for a single engine test to go from the beginning to the end.

(c) *Gas-to-gas protocol using a temporary total enclosure or a building enclosure.* The gas-to-gas protocol compares the mass of TVH emissions captured by the emission capture system to the mass of TVH emissions not captured. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (c)(1) through (5) of this section to measure emission capture system efficiency using the gas-to-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the engine test cell/stand and all areas where emissions from the engine testing subsequently occur. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204B or 204C of appendix M to 40 CFR part 51 to measure the total mass, kg, of TVH emissions captured by the emission capture system during each capture efficiency test run as measured at the inlet to the add-on control device. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) The sampling points for the Method 204B or 204C of appendix M to 40 CFR part 51 measurement must be upstream from the add-on control device and must represent total emissions routed from the capture system and entering the add-on control device.

(ii) If multiple emission streams from the capture system enter the add-on control device without a single common duct, then the emissions entering the add-on control device must be simultaneously measured in each duct, and the total emissions entering the add-on control device must be determined.

(3) Use Method 204D or 204E of appendix M to 40 CFR part 51 to measure the total mass, kg, of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D of appendix M to 40 CFR part 51 if the enclosure is a temporary total enclosure.

(ii) Use Method 204E of appendix M to 40 CFR part 51 if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound emitting operations inside the building enclosure, other than the engine test cell/stand operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(4) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system using Equation 1 of this section:

$$CE = \frac{TVH_{captured}}{\left(TVH_{captured} + TVH_{uncaptured}\right)} \times 100 \qquad \text{(Eq. 1)}$$

Where:

CE = capture efficiency of the emission capture system vented to the add-on control device, percent

$TVH_{captured}$ = total mass of TVH captured by the emission capture system as measured at the inlet to the add-on control device during the emission capture efficiency test run, kg, determined according to paragraph (c)(2) of this section

$TVH_{uncaptured}$ = total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, kg, determined according to paragraph (c)(3) of this section.

(5) Determine the capture efficiency the emission capture system as the average of the capture efficiencies measured in the three test runs.

(d) *Alternative capture efficiency protocol.* As an alternative to the procedure specified in paragraph (c) of this section, you may determine capture efficiency using any other capture efficiency protocol and test methods that satisfy the criteria of either the data quality objective or lower control limit approach as described in appendix A to subpart KK of this part.

§ 63.9323 How do I determine the add-on control device emission destruction or removal efficiency?

You must use the procedures and test methods in this section to determine the add-on control device emission destruction or removal efficiency as part of the performance test required by § 63.9310. You must conduct three test runs as specified in § 63.7(e)(3), and each test run must last at least 1 hour.

(a) For all types of add-on control devices, use the test methods specified in paragraphs (a)(1) through (5) of this section.

(1) Use Method 1 or 1A of appendix A to 40 CFR part 60, as appropriate, to select sampling sites and velocity traverse points.

(2) Use Method 2, 2A, 2C, 2D, 2F, or 2G of appendix A to 40 CFR part 60, as appropriate, to measure gas volumetric flow rate.

(3) Use Method 3, 3A, or 3B of appendix A to 40 CFR part 60, as appropriate, for gas analysis to determine dry molecular weight. The ANSI/ASME PTC 19.10–1981 Part 10 is

an acceptable alternative to Method 3B (incorporated by reference, see § 63.14).

(4) Use Method 4 of appendix A to 40 CFR part 60, to determine stack gas moisture.

(5) Methods for determining gas volumetric flow rate, dry molecular weight, and stack gas moisture must be performed, as applicable, during each test run.

(b) Measure total gaseous organic mass emissions as carbon at the inlet and outlet of the add-on control device simultaneously, using either Method 25 or 25A of appendix A to 40 CFR part 60, as specified in paragraphs (b)(1) through (3) of this section. You must use the same method for both the inlet and outlet measurements.

(1) Use Method 25 of appendix A to 40 CFR part 60 if the add-on control device is an oxidizer, and you expect the total gaseous organic concentration as carbon to be more than 50 parts per million at the control device outlet.

(2) Use Method 25A of appendix A to 40 CFR part 60 if the add-on control device is an oxidizer, and you expect the total gaseous organic concentration as carbon to be 50 ppm or less at the control device outlet.

(c) For each test run, determine the total gaseous organic emissions mass flow rates for the inlet and the outlet of the add-on control device, using Equation 1 of this section. If there is more than one inlet or outlet to the add-on control device, you must calculate the total gaseous organic mass flow rate using Equation 1 of this section for each inlet and each outlet and then total all of the inlet emissions and total all of the outlet emissions.

$$M_f = Q_{sd} C_c (12)(0.0416)\left(10^{-6}\right) \qquad \text{(Eq. 1)}$$

Where:

M_f = total gaseous organic emissions mass flow rate, kg/hour (kg/h)

C_c = concentration of organic compounds as carbon in the vent gas, as determined by Method 25 or Method 25A, parts per million by volume (ppmv), dry basis

Q_{sd} = volumetric flow rate of gases entering or exiting the add-on control device, as determined by Method 2, 2A, 2C, 2D, 2F, or 2G, dry standard cubic meters/hour (dscm/h)

0.0416 = conversion factor for molar volume, kg-moles per cubic meter (mol/m^3) (@ 293 Kelvin [K] and 760 millimeters of mercury [mmHg]).

(d) For each test run, determine the add-on control device organic emissions destruction or removal efficiency, using Equation 2 of this section:

$$DRE = 100 \times \frac{M_{fi} - M_{fo}}{M_{fi}} \qquad \text{(Eq. 2)}$$

Where:

DRE = organic emissions destruction or removal efficiency of the add-on control device, percent

M_{fi} = total gaseous organic emissions mass flow rate at the inlet(s) to the add-on control device, using Equation 1 of this section, kg/h

M_{fo} = total gaseous organic emissions mass flow rate at the outlet(s) of the add-on control device, using Equation 1 of this section, kg/h.

(e) Determine the emission destruction or removal efficiency of the add-on control device as the average of the efficiencies determined in the three test runs and calculated in Equation 2 of this section.

§ 63.9324 How do I establish the emission capture system and add-on control device operating limits during the performance test?

During the performance test required by § 63.9310, you must establish the operating limits required by § 63.9302 according to this section, unless you have received approval for alternative monitoring and operating limits under § 63.8(f) as specified in § 63.9302.

(a) *Thermal oxidizers.* If your add-on control device is a thermal oxidizer, establish the operating limits according to paragraphs (a)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the combustion temperature at least once every 15 minutes during each of the three test runs. You must monitor the temperature in the firebox of the thermal oxidizer or immediately downstream of the firebox before any substantial heat exchange occurs.

(2) Use the data collected during the performance test to calculate and record the average combustion temperature maintained during the performance test. This average combustion temperature is the minimum operating limit for your thermal oxidizer.

(b) *Catalytic oxidizers.* If your add-on control device is a catalytic oxidizer, establish the operating limits according to either paragraphs (b)(1) and (2) or paragraphs (b)(3) and (4) of this section.

(1) During the performance test, you must monitor and record the temperature just before the catalyst bed and the temperature difference across the catalyst bed at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average temperature just before the catalyst bed and the average temperature difference across the catalyst bed maintained during the performance test. These are the minimum operating limits for your catalytic oxidizer.

(3) As an alternative to monitoring the temperature difference across the catalyst bed, you may monitor the temperature at the inlet to the catalyst bed and implement a site-specific inspection and maintenance plan for your catalytic oxidizer as specified in paragraph (b)(4) of this section. During the performance test, you must monitor and record the temperature just before the catalyst bed at least once every 15 minutes during each of the three test runs. Use the data collected during the performance test to calculate and record the average temperature just before the catalyst bed during the performance test. This is the minimum operating limit for your catalytic oxidizer.

(4) You must develop and implement an inspection and maintenance plan for your catalytic oxidizer(s) for which you elect to monitor according to paragraph (b)(3) of this section. The plan must address, at a minimum, the elements specified in paragraphs (b)(4)(i) through (iii) of this section.

(i) Annual sampling and analysis of the catalyst activity (*i.e.*, conversion efficiency) following the manufacturer's or catalyst supplier's recommended procedures.

(ii) Monthly inspection of the oxidizer system, including the burner assembly and fuel supply lines for problems and, as necessary, adjust the equipment to assure proper air-to-fuel mixtures.

(iii) Annual internal and monthly external visual inspection of the catalyst bed to check for channeling, abrasion, and settling. If problems are found, you must take corrective action consistent with the manufacturer's recommendation and conduct a new performance test to determine

destruction efficiency according to § 63.9323.

(c) *Emission capture system.* For each capture device that is not part of a PTE that meets the criteria of § 63.9322(a), establish an operating limit for either the gas volumetric flow rate or duct static pressure, as specified in paragraphs (c)(1) and (2) of this section. The operating limit for a PTE is specified in Table 3 to this subpart.

(1) During the capture efficiency determination required by § 63.9310, you must monitor and record either the gas volumetric flow rate or the duct static pressure for each separate capture device in your emission capture system at least once every 15 minutes during each of the three test runs at a point in the duct between the capture device and the add-on control device inlet.

(2) Calculate and record the average gas volumetric flow rate or duct static pressure for the three test runs for each capture device. This average gas volumetric flow rate or duct static pressure is the minimum operating limit for that specific capture device.

§ 63.9330 How do I demonstrate initial compliance with the emission limitation?

(a) You must demonstrate initial compliance with the emission limitation that applies to you according to Table 3 to this subpart.

(b) You must submit the Notification of Compliance Status containing results of the initial compliance demonstration according to the requirements in § 63.9345(c).

Continuous Compliance Requirements

§ 63.9335 How do I monitor and collect data to demonstrate continuous compliance?

(a) Except for monitor malfunctions, associated repairs, and required quality assurance or quality control activities (including, as applicable, calibration drift checks and required zero and high-level adjustments of the monitoring system), you must conduct all monitoring in continuous operation at all times the engine test cell/stand is operating.

(b) Do not use data recorded during monitor malfunctions, associated repairs, and required quality assurance or quality control activities for meeting the requirements of this subpart, including data averages and calculations. You must use all the data collected during all other periods in assessing the performance of the emission control device or in assessing emissions from the new or reconstructed affected source.

§ 63.9340 How do I demonstrate continuous compliance with the emission limitations?

(a) You must demonstrate continuous compliance with the emission limitation in Table 1 to this subpart that applies to you according to methods specified in Table 5 to this subpart.

(b) You must report each instance in paragraphs (b)(1) and (2) of this section. These instances are deviations from the emission limitation in this subpart and must be reported according to the requirements in § 63.9350.

(1) You must report each instance in which you did not meet the emission limitation that applies to you.

(2) You must report each instance in which you did not meet the requirements in Table 7 to this subpart that apply to you.

(c) *Startups, shutdowns, and malfunctions.* During periods of SSM of control device and associated monitoring equipment, you must operate in accordance with your SSMP.

(1) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of SSM of control devices and associated monitoring equipment are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the SSMP.

(2) The Administrator will determine whether deviations that occur during a period of SSM of control devices and associated monitoring equipment are violations, according to the provisions in § 63.6(e).

Notifications, Reports, and Records

§ 63.9345 What notifications must I submit and when?

(a) You must submit all of the notifications in §§ 63.8(e), 63.8(f)(4) and (6), and 63.9(b), (g)(1), (g)(2) and (h) that apply to you by the dates specified.

(b) If you own or operate a new or reconstructed test cell/stand used for testing internal combustion engines, you are required to submit an Initial Notification as specified in paragraphs (b)(1) through (3) of this section.

(1) As specified in § 63.9(b)(2), if you start up your new or reconstructed affected source before the effective date of this subpart, you must submit an Initial Notification not later than 120 calendar days after May 27, 2003.

(2) As specified in § 63.9(b), if you start up your new or reconstructed affected source on or after the effective date of this subpart, you must submit an Initial Notification not later than 120 calendar days after you become subject to this subpart.

(3) If you are required to submit an Initial Notification but are otherwise not affected by the requirements of this subpart, in accordance with § 63.9290(c), your notification should include the information in § 63.9(b)(2)(i) through (v) and a statement that your new or reconstructed engine test cell/stand has no additional requirements and explain the basis of the exclusion (for example, that the test cell/stand is used exclusively for testing internal combustion engines with rated power of less than 25 hp (19 kW)).

(c) If you are required to comply with the emission limitations in Table 1 to this subpart, you must submit a Notification of Compliance Status according to § 63.9(h)(2)(ii). For each initial compliance demonstration with the emission limitation, you must submit the Notification of Compliance Status before the close of business on the 30th calendar day following the completion of the initial compliance demonstration.

(d) You must submit a notification of initial performance evaluation of your CEMS or performance testing of your control device at least 60 calendar days before the performance testing/evaluation is scheduled to begin as required in § 63.8(e)(2).

§ 63.9350 What reports must I submit and when?

(a) If you own or operate a new or reconstructed affected source that must meet the emission limitation, you must submit a semiannual compliance report according to Table 6 to this subpart by the applicable dates specified in paragraphs (a)(1) through (6) of this section, unless the Administrator has approved a different schedule.

(1) The first semiannual compliance report must cover the period beginning on the compliance date specified in § 63.9295 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date specified in § 63.9295.

(2) The first semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified in § 63.9295.

(3) Each subsequent semiannual compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each new or reconstructed engine test cell/stand that is subject to permitting regulations pursuant to 40 CFR part 70 or 71, and if the permitting authority has established the date for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (a)(1) through (4) of this section.

(6) If you had an SSM of a control device or associated monitoring equipment during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in paragraphs § 63.10(d)(5)(i).

(b) If there is no deviation from the applicable emission limitation and the CEMS or CPMS was not out-of-control, according to § 63.8(c)(7), the semiannual compliance report must contain the information described in paragraphs (b)(1) through (4) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) A statement that no deviation from the emission limit occurred during the reporting period and that no CEMS or CPMS was out-of-control, according to § 63.8(c)(7).

(c) For each deviation from an emission limit, the semiannual compliance report must include the information in paragraphs (b)(1) through (3) of this section and the information included in paragraphs (c)(1) through (4) of this section.

(1) The date and time that each deviation started and stopped.

(2) The total operating time of each new or reconstructed engine test cell/stand during the reporting period.

(3) A summary of the total duration of the deviation during the reporting period (recorded in 4-hour periods), and the total duration as a percent of the total operating time during that reporting period.

(4) A breakdown of the total duration of the deviations during the reporting period into those that are due to control equipment problems, process problems, other known causes, and other unknown causes.

(d) For each CEMS or CPMS deviation, the semiannual compliance report must include the information in paragraphs (b)(1) through (3) of this section and the information included in paragraphs (d)(1) through (10) of this section.

(1) The date and time that each CEMS or CPMS was inoperative except for zero (low-level) and high-level checks.

(2) The date and time that each CEMS or CPMS was out-of-control including the information in § 63.8(c)(8).

(3) A summary of the total duration of CEMS or CPMS downtime during the reporting period (reported in 4-hour periods), and the total duration of CEMS or CPMS downtime as a percent of the total engine test cell/stand operating time during that reporting period.

(4) A breakdown of the total duration of CEMS or CPMS downtime during the reporting period into periods that are due to monitoring equipment malfunctions, nonmonitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes and other unknown causes.

(5) The monitoring equipment manufacturer(s) and model number(s) of each monitor.

(6) The date of the latest CEMS or CPMS certification or audit.

(7) The date and time period of each deviation from an operating limit in Table 2 to this subpart; date and time period of any bypass of the add-on control device; and whether each deviation occurred during a period of SSM or during another period.

(8) A summary of the total duration of each deviation from an operating limit in Table 2 to this subpart, each bypass of the add-on control device during the semiannual reporting period, and the total duration as a percent of the total source operating time during that semiannual reporting period.

(9) A breakdown of the total duration of the deviations from the operating limits in Table 2 to this subpart and bypasses of the add-on control device during the semiannual reporting period by identifying deviations due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(10) A description of any changes in CEMS, CPMS, or controls since the last reporting period.

(e) If you had an SSM of a control device or associated monitoring equipment during the semiannual reporting period that was not consistent with your SSMP, you must submit an immediate SSM report according to the requirements in § 63.10(d)(5)(ii).

§ 63.9355 What records must I keep?

(a) You must keep the records as described in paragraphs (a)(1) through (5) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirements in § 63.10(b)(2)(xiv).

(2) Records of performance evaluations as required in § 63.10(b)(2)(viii).

(3) Records of the occurrence and duration of each malfunction of the air pollution control equipment, if applicable, as required in § 63.10(b)(2)(ii).

(4) Records of all maintenance on the air pollution control equipment, if applicable, as required in § 63.10(b)(iii).

(5) The calculation of the mass of organic HAP emission reduction by emission capture systems and add-on control devices.

(b) For each CPMS, you must keep the records as described in paragraphs (b)(1) through (7) of this section.

(1) For each deviation, a record of whether the deviation occurred during a period of SSM of the control device and associated monitoring equipment.

(2) The records in § 63.6(e)(3)(iii) through (v) related to SSM.

(3) The records required to show continuous compliance with each operating limit specified in Table 2 to this subpart that applies to you.

(4) For each capture system that is a PTE, the data and documentation you used to support a determination that the capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and has a capture efficiency of 100 percent, as specified in § 63.9322(a).

(5) For each capture system that is not a PTE, the data and documentation you used to determine capture efficiency according to the requirements specified in §§ 63.9321 and 63.9322(b) through (e), including the records specified in paragraphs (b)(5)(i) and (ii) of this section that apply to you.

(i) Records for a gas-to-gas protocol using a temporary total enclosure or a building enclosure. Records of the mass of TVH emissions captured by the emission capture system as measured by Method 204B or C of appendix M to 40 CFR part 51 at the inlet to the add-on control device, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix

M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(ii) Records for an alternative protocol. Records needed to document a capture efficiency determination using an alternative method or protocol as specified in § 63.9322(e), if applicable.

(6) The records specified in paragraphs (b)(6)(i) and (ii) of this section for each add-on control device organic HAP destruction or removal efficiency determination as specified in § 63.9323.

(i) Records of each add-on control device performance test conducted according to §§ 63.9321, 63.9322, and 63.9323.

(ii) Records of the engine testing conditions during the add-on control device performance test showing that the performance test was conducted under representative operating conditions.

(7) Records of the data and calculations you used to establish the emission capture and add-on control device operating limits as specified in § 63.9324 and to document compliance with the operating limits as specified in Table 2 to this subpart.

(c) For each CEMS, you must keep the records as described in paragraphs (c)(1) through (4) of this section.

(1) Records described in § 63.10(b)(2)(vi) through (xi).

(2) Previous (*i.e.*, superceded) versions of the performance evaluation plan as required in § 63.8(d)(3).

(3) Request for alternatives to the relative accuracy test for CEMS as required in § 63.8(f)(6)(i), if applicable.

(4) The records in § 63.6(e)(3)(iii) through (v) related to SSM of the control device and associated monitoring equipment.

(d) You must keep the records required in Table 5 to this subpart to show continuous compliance with each emission limitation that applies to you.

§ 63.9360 In what form and how long must I keep my records?

(a) You must maintain all applicable records in such a manner that they can be readily accessed and are suitable for inspection according to § 63.10(b)(1).

(b) As specified in § 63.10(b)(1), you must keep each records for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must retain your records of the most recent 2 years on site, or your records must be accessible on site. Your records of the remaining 3 years may be retained off site.

Other Requirements and Information

§ 63.9365 What parts of the General Provisions apply to me?

Table 7 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

§ 63.9370 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the U.S. EPA, has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under section 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that cannot be delegated to State, local, or tribal agencies are described in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the emission limitations in § 63.9300 under § 63.6(g).

(2) Approval of major changes to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major changes to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.9375 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA; in 40 CFR 63.2, and in this section:

CAA means the Clean Air Act (42 U.S.C. 7401 *et seq.*, as amended by Public Law 101–549, 104 Statute 2399).

Area source means any stationary source of HAP that is not a major source as defined in this part.

Combustion turbine engine means a device in which air is compressed in a compressor, enters a combustion chamber, and is compressed further by the combustion of fuel injected into the combustion chamber. The hot compressed combustion gases then expand over a series of curved vanes or blades arranged on a central spindle that rotates.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limitations;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation in this subpart during malfunction, regardless or whether or not such failure is permitted by this subpart.

Engine means any internal combustion engine, any combustion turbine engine, or any rocket engine.

Engine Test Cell/Stand means any apparatus used for testing uninstalled stationary or uninstalled mobile (motive) engines.

Hazardous Air Pollutant (HAP) means any air pollutant listed in or pursuant to section 112(b) of the CAA.

Internal combustion engine means a device in which air enters a combustion chamber, is mixed with fuel, compressed in the chamber, and combusted. Fuel may enter the combustion chamber with the air or be injected into the combustion chamber. Expansion of the hot combustion gases in the chamber rotates a shaft, either through a reciprocating or rotary action. For purposes of this subpart, this definition does not include combustion turbine engines.

Major source, as used in this subpart, shall have the same meaning as in § 63.2.

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

Rated power means the maximum power output of an engine in use.

Potential to emit means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the stationary source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable.

Responsible official means responsible official as defined by 40 CFR 70.2.

Rocket engine means a device consisting of a combustion chamber in which materials referred to as propellants, which provide both the fuel and the oxygen for combustion, are burned. Combustion gases escape through a nozzle, providing thrust.

Uninstalled engine means an engine not installed in, or an integrated part of, the final product.

Tables to Subpart PPPPP of Part 63

TABLE 1 TO SUBPART PPPPP OF PART 63.—EMISSION LIMITATIONS

You must comply with the emission limits that apply to your affected source in the following table as required by § 63.9300:

For each new or reconstructed affected source located at a major source facility that is used in whole or in part for testing . . .	You must meet one of the following emission limitations:
1. internal combustion engines with rated power of 25 hp (19 kW) or more.	a. limit the concentration of CO or THC to 20 ppmvd or less (corrected to 15 percent O_2 content); or b. achieve a reduction in CO or THC of 96 percent or more between the inlet and outlet concentrations (corrected to 15 percent O_2 content) of the emission control device.

TABLE 2 TO SUBPART PPPPP OF PART 63.—OPERATING LIMITS

If you are required to comply with operating limits in § 63.9302, you must comply with the applicable operating limits in the following table:

For the following device . . .	You must meet the following operating limit . . .	and you must demonstrate continuous compliance with the operating limit by . . .
1. Thermal oxidizer	a. The average combustion temperature in any 3-hour period must not fall below the the combustion temperature limit established according to § 63.9324(a).	i. Collecting the combustion temperature data according to § 63.9306(c); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour average combustion temperature at or above the temperature limit.
2. Catalytic oxidizer	a. The average temperature measured just before the catalyst bed in any 3-hour period must not fall below the limit established according to § 63.9324(b).	i. Collecting the temperature data according to § 63.9306(c); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour average temperature before the catalyst bed at or above the temperature limit.
	b. Either ensure that the average temperature difference across the catalyst bed in any 3-hour period does not fall below the temperature difference limit established according to § 63.9324(b)(2) or develop and implement an inspection and maintenance plan according to § 63.9324(b)(3) and (4).	i. Either collecting the temperature data according to § 63.9306(c), reducing the data to 3-hour block averages, and maintaining the 3-hour average temperature difference at or above the temperature difference limit; or ii. Complying with the inspection and maintenance plan developed according to § 63.9324(b)(3) and (4).
3. Emission capture system that is a PTE according to § 63.9322(a).	a. The direction of the air flow at all times must be into the enclosure; and either	i. Collecting the direction of air flow; and either the facial velocity of air through all natural draft openings according to § 63.9306(d)(1) or the pressure drop across the enclosure according to § 63.9306(d)(2); and ii. Maintaining the facial velocity of air flow through all natural draft openings or the pressure drop at or above the facial velocity limit or pressure drop limit, and maintaining the direction of air flow into the enclosure at all times.
	b. The average facial velocity of air through all natural draft openings in the enclosure must be at least 200 feet per minute; or	Follow the requirements in 3ai and ii of this table.
	c. The pressure drop across the enclosure must be at least 0.007 inch H_2O, as established in Method 204 of appendix M to 40 CFR part 51.	Follow the requirements in 3ai and ii of this table.

TABLE 2 TO SUBPART PPPPP OF PART 63.—OPERATING LIMITS—Continued

If you are required to comply with operating limits in § 63.9302, you must comply with the applicable operating limits in the following table:

For the following device . . .	You must meet the following operating limit . . .	and you must demonstrate continuous compliance with the operating limit by . . .
4. Emission capture system that is not a PTE according to § 63.9322(a).	a. The average gas volumetric flow rate or duct static pressure in each duct between a capture device and add-on control device inlet in any 3-hour period must not fall below the average volumetric flow rate or duct static pressure limit established for that capture device according § 63.9306(d).	i. Collecting the gas volumetric flow rate or duct static pressure for each capture device according to § 63.9306(d); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour average gas volumetric flow rate or duct static pressure for each capture device at or above the gas volumetric flow rate or duct static pressure limit.

TABLE 3 TO SUBPART PPPPP OF PART 63.—REQUIREMENTS FOR INITIAL COMPLIANCE DEMONSTRATIONS

As stated in § 63.9321, you must demonstrate initial compliance with each emission limitation that applies to you according to the following table:

For each new or reconstructed affected source complying with . . .	You must . . .	Using . . .	According to the following requirements . . .
1. The CO or THC outlet concentration emission limitation.	a. Demonstrate CO or THC emissions are 20 ppmvd or less.	i. EPA Methods 3A and 10 of appendix A to 40 CFR part 60 for CO measurement or EPA Method 25A of appendix A to 40 CFR part 60 for THC measurement; or	You must demonstrate that the outlet concentration of CO or THC emissions from the test cell/stand or emission control device is 20 ppmvd or less, corrected to 15 percent O_2 content, using the first 4-hour rolling average after a successful performance evaluation.
		ii. A CEMS for CO or THC and O_2 at the outlet of the engine test cell/stand or emission control device.	This demonstration is conducted immediately following a successful performance evaluation of the CEMS as required in § 63.9320(b). The demonstration consists of the first 4-hour rolling average of measurements. The CO or THC concentration must be corrected to 15 percent O_2 content, dry basis using Equation 1 in § 63.9320.
2. The CO or THC percent reduction emission limitation.	a. Demonstrate a reduction in CO or THC of 96 percent or more.	i. You must conduct an initial performance test to determine the capture and control efficiencies of the equipment and to establish operating limits to be achieved on a continuous basis; or	You must demonstrate that the reduction in CO or THC emissions is at least 96 percent using the first 4-hour rolling average after a successful performance evaluation. Your inlet and outlet measurements must be on a dry basis and corrected to 15 percent O_2 content.
		ii. A CEMS for CO or THC and O_2 at both the inlet and outlet of the emission control device.	This demonstration is conducted immediately following a successful performance evaluation of the CEMS as required in § 63.9320(b). The demonstration consists of the first 4-hour rolling average of measurements. The inlet and outlet CO or THC concentrations must be corrected to 15 percent O_2 content using Equation 1 in § 63.9320. The reduction in CO or THC is calculated using Equation 2 in § 63.9320.

TABLE 4 TO SUBPART PPPPP OF PART 63.—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS

As stated in § 63.9330, you must demonstrate initial compliance with each emission limitation that applies to you according to the following table:

For the . . .	You have demonstrated initial compliance if . . .
1. CO or THC concentration emission limitation	The first 4-hour rolling average CO or THC concentration is 20 ppmvd or less, corrected to 15 percent O_2 content.
2. CO or THC percent reduction emission limitation	The first 4-hour rolling average reduction in CO or THC is 96 percent or more, dry basis, corrected to 15 percent O_2 content.

TABLE 5 TO SUBPART PPPPP OF PART 63.—CONTINUOUS COMPLIANCE WITH EMISSION LIMITATIONS

As stated in § 63.9340, you must demonstrate continuous compliance with each emission limitation that applies to you according to the following table:

For the . . .	You must . . .	By . . .
1. CO or THC concentration emission limitation	a. Demonstrate CO or THC emissions are 20 ppmvd or less over each 4-hour rolling averaging period.	i. Collecting the CPMS data according to § 63.9306(a), reducing the measurements to 1-hour averages; or ii. Collecting the CEMS data according to § 63.9307(a), reducing the measurements to 1-hour averages, correcting them to 15 percent O_2 content, dry basis, according to § 63.9320;
2. CO or THC percent reduction emission limitation.	a. Demonstrate a reduction in CO or THC of 96 percent or more over each 4-hour rolling averaging period.	i. Collecting the CPMS data according to § 63.9306(a), reducing the measurements to 1-hour averages; or ii. Collecting the CEMS data according to § 63.9307(b), reducing the measurements to 1-hour averages, correcting them to 15 percent O_2 content, dry basis, calculating the CO or THC percent reduction according to § 63.9320.

TABLE 6 TO SUBPART PPPPP OF PART 63.—REQUIREMENTS FOR REPORTS

As stated in § 63.9350, you must submit each report that applies to you according to the following table:

If you own or operate a new or reconstructed affected source that must comply with emission limitations, you must submit a . . .	The report must contain . . .	You must submit the report . . .
1. Compliance report	a. If there are no deviations from the emission limitations that apply to you, a statement that there were no deviations from the emission limitations during the reporting period.	Semiannually, according to the requirements in § 63.9350.
	b. If there were no periods during which the CEMS or CPMS were out of control as specified in § 63.8(c)(7), a statement that there were no periods during which the CEMS or CPMS was out of control during the reporting period.	Semiannually, according to the requirements in § 63.9350.
	c. If you have a deviation from any emission limitation during the reporting period, the report must contain the information in § 63.9350(c).	Semiannually, according to the requirements in § 63.9350.
	d. If there were periods during which the CEMS or CPMS were out of control, as specified in § 63.8(c)(7), that report must contain the information in § 63.9350(d).	Semiannually, according to the requirements in § 63.9350.
	e. If you had an SSM of a control device or associated monitoring equipment during the reporting period, the report must include the information in § 63.10(d)(5)(i).	Semiannually, according to the requirements in § 63.9350.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§ 63.1(a)(1)	Applicability	General applicability of the General Provisions.	Yes. Additional terms defined in § 63.9375.
§ 63.1(a)(2)–(4)	Applicability	Applicability of source categories	Yes.
§ 63.1(a)(5)	[Reserved].		
§ 63.1(a)(6)–(7)	Applicability	Contact for source category information; extension of compliance through early reduction.	Yes.
§ 63.1(a)(8)	Applicability	Establishment of State rules or programs.	No. Refers to State programs.
§ 63.1(a)(9)	[Reserved].		
§ 63.1(a)(10)–(14)	Applicability	Explanation of time periods, postmark deadlines.	Yes.
§ 63.1(b)(1)	Applicability	Initial applicability	Yes. Subpart PPPPP clarifies applicability at § 63.9285.
§ 63.1(b)(2)	Applicability	Title V operating permit-reference to part 70.	Yes. All major affected sources are required to obtain a Title V permit.
§ 63.1(b)(3)	Applicability	Record of applicability determination.	Yes.
§ 63.1(c)(1)	Applicability	Applicability after standards are set.	Yes. Subpart PPPPP clarifies the applicability of each paragraph of subpart A to sources subject to subpart PPPPP.
§ 63.1(c)(2)	Applicability	Title V permit requirement for area sources.	No. Area sources are not subject to subpart PPPPP.
§ 63.1(c)(3)	[Reserved].		
§ 63.1(c)(4)	Applicability	Extension of compliance for existing sources.	No. Existing sources are not covered by the substantive control requirements of subpart PPPPP.
§ 63.1(c)(5)	Applicability	Notification requirements for an area source becoming a major source.	Yes.
§ 63.1(d)	[Reserved].		
§ 63.1(e)	Applicability	Applicability of permit program before a relevant standard has been set.	Yes.
§ 63.2	Definitions	Definitions for Part 63 standards ..	Yes. Additional definitions are specified in § 63.9375.
§ 63.3	Units and Abbreviations	Units and abbreviations for Part 63 standards.	Yes.
§ 63.4	Prohibited Activities	Prohibited activities; compliance date; circumvention, severability.	Yes.
§ 63.5(a)	Construction/Reconstruction	Construction and reconstruction—applicability.	Yes.
§ 63.5(b)(1)	Construction/Reconstruction	Requirements upon construction or reconstruction.	Yes.
§ 63.5(b)(2)	[Reserved].		

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§ 63.5(b)(3)	Construction/Reconstruction	Approval of construction	Yes.
§ 63.5(b)(4)	Construction/Reconstruction	Notification of construction	Yes.
§ 63.5(b)(5)	Construction/Reconstruction	Compliance	Yes.
§ 63.5(b)(6)	Construction/Reconstruction	Addition of equipment	Yes.
§ 63.5(c)	[Reserved]		
§ 63.5(d)	Construction/Reconstruction	Application for construction reconstruction.	Yes.
§ 63.5(e)	Construction/Reconstruction	Approval of construction or reconstruction.	Yes.
§ 63.5(f)	Construction/Reconstruction	Approval of construction or reconstruction based on prior State review.	Yes.
§ 63.6(a)	Applicability	Applicability of standards and monitoring requirements.	Yes.
§ 63.6(b)(1)–(2)	Compliance Dates for New and Reconstructed Sources.	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for 112(f).	Yes.
§ 63.6(b)(3)	Compliance Dates for New and Reconstructed Sources.	Compliance dates for sources constructed or reconstructed before effective date.	No. Compliance is required by startup or effective date.
§ 63.6(b)(4)	Compliance Dates for New and Reconstructed Sources.	Compliance dates for sources also subject to § 112(f) standards.	Yes.
§ 63.6(b)(5)	Compliance Dates for New and Reconstructed Sources.	Notification	Yes.
§ 63.6(b)(6)	[Reserved].		
§ 63.6(b)(7)	Compliance Dates for New and Reconstructed Sources.	Compliance dates for new and reconstructed area sources that become major.	Yes.
§ 63.6(c)(1)–(2)	Compliance Dates for Existing Sources.	Effective date establishes compliance date.	No. Existing sources are not covered by the substantive control requirements of subpart PPPPP.
§ 63.6(c)(3)–(4)	[Reserved].		
§ 63.6(c)(5)	Compliance Dates for Existing Sources.	Compliance dates for existing area sources that becomes major.	Yes. If the area source become a major source by addition or reconstruction, the added or reconstructed portion will be subject to subpart PPPPP.
§ 63.6(d)	[Reserved].		
§ 63.6(e)(1)–(2)	Operation and Maintenance Requirements.	Operation and maintenance	Yes. Except that you are not required to have an SSMP for control devices and associated monitoring equipment.
§ 63.6(e)(3)	SSMP	1. Requirement for SSM and SSMP. 2. Content of SSMP.	Yes.You must develop an SSMP for each control device and associated monitoring equipment.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§ 63.6(f)(1)	Compliance Except During SSM ..	You must comply with emission standards at all times except during SSM of control devices or associated monitoring equipment.	Yes, but you must comply with emission standards at all times except during SSM of control devices and associated monitoring equipment only.
§ 63.6(f)(2)–(3)	Methods for Determining Compliance.	Compliance based on performance test, operation and maintenance plans, records, inspection.	Yes.
§ 63.6(g)(1)–(3)	Alternative Standard	Procedures for getting an alternative standard.	Yes.
§ 63.6(h)	Opacity/Visible Emission (VE) Standards.	Requirements for opacity/VE standards.	No. Subpart PPPPP does not establish opacity/VE standards and does not require continuous opacity monitoring systems (COMS).
§ 63.6(i)(1)–(14)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension.	No. Compliance extension provisions apply to existing sources, which do not have emission limitations in subpart PPPPP.
§ 63.6(j)	Presidential Compliance Exemption.	President may exempt source category from requirement to comply with rule.	Yes.
§ 63.7(a)(1)–(2)	Performance Test Dates	Dates for conducting initial performance testing and other compliance demonstrations: Must conduct within 180 days after first subject to rule.	Yes.
§ 63.7(a)(3)	Section 114 Authority	Administrator may require a performance test under CAA Section 114 at any time.	Yes.
§ 63.7(b)(1)	Notification Performance Test	Must notify Administrator 60 days before the test.	Yes.
§ 63.7(b)(2)	Notification of Rescheduling	If have to reschedule performance test, must notify Administrator 5 days before schedule date of rescheduled date.	Yes.
§ 63.7(c)	Quality Assurance/Test Plan	1. Requirement to submit site-specific test plan 60 days before the test or on date Administrator agrees with. 2. Test plan approval procedures 3. Performance audit requirements. 4. Internal and external QA procedures for testing.	Yes. Yes. Yes. Yes.
§ 63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
§ 63.7(e)(1)	Conditions for Conducting Performance Tests.	Performance tests must be conducted under representative conditions; cannot conduct performance tests during SSM; not a violation to exceed standard during SSM.	Yes.
§ 63.7(e)(2)	Conditions for Conducting Performance Tests.	Must conduct according to rule and EPA test methods unless Administrator approves alternative.	Yes.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§ 63.7(e)(3)	Test Run Duration	1. Must have three test runs of at least 1 hour each. 2. Compliance is based on arithmetic mean of three runs. 3. Conditions when data from an additional test run can be used.	Yes. Yes. Yes.
§ 63.7(e)(4)	Other Performance Testing	Administrator may require other testing under section 114 of the CAA.	Yes.
§ 63.7(f)	Alternative Test Method	Procedures by which Administrator can grant approval to use an alternative test method.	Yes.
§ 63.7(g)	Performance Test Data Analysis	1. Must include raw data in performance test report. 2. Must submit performance test data 60 days after end of test with the Notification of Compliance Status. 3. Keep data for 5 years	Yes. Yes. Yes.
§ 63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test.	Yes.
§ 63.8(a)(1)	Applicability of Monitoring Requirements.	Subject to all monitoring requirements in standard.	Yes. Subpart PPPPP contains specific requirements for monitoring at § 63.9325.
§ 63.8(a)(2)	Performance Specifications	Performance Specifications in appendix B of part 60 apply.	Yes.
§ 63.8(a)(3)	[Reserved]		
§ 63.8(a)(4)	Monitoring with Flares	Unless your rule says otherwise, the requirements for flares in 63.11 apply.	No. Subpart PPPPP does not have monitoring requirements for flares.
§ 63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative.	Yes.
§ 63.8(b)(2)–(3)	Multiple Effluents and Multiple Monitoring Systems.	1. Specific requirements for installing monitoring systems. 2. Must install on each effluent before it is combined and before it is released to the atmosphere unless Administrator approves otherwise. 3. If more than one monitoring system on an emission point, must report all monitoring system results, unless one monitoring system is a backup.	Yes. Yes. Yes.
§ 63.8(c)(1)	Monitoring System Operation and Maintenance.	Maintain monitoring system in a manner consistent with good air pollution control practices.	Yes.
§ 63.8(c)(1)(i)	Routine and Predictable CMS Malfunctions.	1. Follow the SSMP for routine repairs of CMS. 2. Keep parts for routine repairs of CMS readily available. 3. Reporting requirements for SSM when action is described in SSMP.	Yes. Yes. Yes.
§ 63.8(c)(1)(ii)	SSM of CMS Not in SSMP	Reporting requirements for SSM of CMS when action is not described in SSMP.	Yes.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§ 63.8(c)(1)(iii)	Compliance with Operation and Maintenance Requirements.	1. How Administrator determines if source complying with operation and maintenance requirements. 2. Review of source O&M procedures, records, manufacturer's instructions and recommendations, and inspection	Yes.
§ 63.8(c)(2)–(3)	Monitoring System Installation	1. Must install to get representative emission of parameter measurements. 2. Must verify operational status before or at performance test.	Yes. Yes.
§ 63.8(c)(4)	Continuous Monitoring System (CMS) Requirements.	1. CMS must be operating except during breakdown, out of control, repair, maintenance, and high-level calibration drifts. 2. COMS must have a minimum of one cycle of sampling and analysis for each successive 10-second period and one cycle of data recording for each successive 6-minute period. 3. CEMS must have a minimum of one cycle of operation for each successive 15-minute period.	No. Follow specific requirements in § 63.9335(a) and (b) of subpart PPPPP. No. Follow specific requirements in § 63.9335(a) and (b) of subpart PPPP. No. Follow specific requirements in § 63.9335(a) and (b) of subpart PPPPP.
§ 63.8(c)(5)	COMS Minimum Procedures	COMS minimum procedures	No. Subpart PPPPP does not have opacity/VE standards.
§ 63.8(c)(6)–(8)	CMS Requirements	Zero and high-level calibration check requirements, out-of-control periods.	Yes. Except that PPPP does not require COMS.
§ 63.8(d)	CMS Quality Control	1. Requirements for CMS quality control, including calibration, etc. 2. Must keep quality control plan on record for 5 years. Keep old versions for 5 years after revisions.	Yes. Yes.
§ 63.8(e)	CMS Performance Evaluation	Notification, performance evaluation test plan, reports.	Yes. Except for § 63.8(e)(5)(ii), which applies to COMS.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method	Procedures for Administrator to approve alternative monitoring.	Yes.
§ 63.8(f)(6)	Alternative to Relative Accuracy Test.	Procedures for Administrator to approve alternative relative accuracy tests for CEMS.	Yes.
§ 63.8(g)	Data Reduction	1. COMS 6-minute averages calculated over at least 36 evenly spaced data points. 2. CEMS 1-hour averages computed over at least 4 equally spaced data points	Yes. Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at § 63.9340.
§ 63.8(g)(5)	Data Reduction	Data that cannot be used in computing averages for CEMS and COMS.	No. Specific language is located at § 63.9335(a).
§ 63.9(a)	Notification Requirements	Applicability and State delegation	Yes.
§ 63.9(b)(1)–(5)	Initial Notifications	1. Submit notification subject 120 days after effective date.	Yes.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
		2. Notification of intent to construct/ reconstruct; notification of commencement of construct/ reconstruct; notification of startup. 3. Contents of each	Yes. Yes.
§ 63.9(c)	Request for Compliance Extension.	Can request if cannot comply by date or if installed BACT/LAER.	No. Compliance extensions do not apply to new or reconstructed sources.
§ 63.9(d)	Notification of Special Compliance Requirements for New Source.	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date.	Yes.
§ 63.9(e)	Notification of Performance Test	Notify Administrator 60 days prior	No. Subpart PPPPP does not require performance testing.
§ 63.9(f)	Notification of Opacity/VE Test	Notify Administrator 30 days prior	No. Subpart PPPPP does not have opacity/VE standards.
§ 63.9(g)(1)	Additional Notifications when Using CMS.	Notification of performance evaluation.	Yes.
§ 63.9(g)(2)	Additional Notifications when Using CMS.	Notification of use of COMS data	No. Subpart PPPPP does not contain opacity or VE standards.
§ 63.9(g)(3)	Additional Notifications when Using CMS.	Notification that exceeded criterion for relative accuracy.	Yes. If alternative is in use.
§ 63.9(h)(1)–(6)	Notification of Compliance Status	1. Contents 2. Due 60 days after end of performance test or other compliance demonstration, except for opacity/VE, which are due 30 days after. 3. When to submit to Federal vs. State authority.	Yes. Yes. Yes.
§ 63.9(i)	Adjustment of Submittal Deadlines.	Procedures for Administrator to approve change in when notifications must be submitted.	Yes.
§ 63.9(j)	Change in Previous Information	Must submit within 15 days after the change.	Yes.
§ 63.10(a)	Recordkeeping/Reporting	1. Applies to all, unless compliance extension. 2. When to submit to Federal vs. State authority. 3. Procedures for owners of more than one source.	Yes. Yes. Yes.
§ 63.10(b)(1)	Recordkeeping/Reporting	1. General requirements 2. Keep all records readily available. 3. Keep for 5 years	Yes. Yes. Yes.
§ 63.10(b)(2)(i)–(v)	Records Related to SSM	1. Occurrence of each of operation (process equipment). 2. Occurrence of each malfunction of air pollution equipment. 3. Maintenance on air pollution control equipment. 4. Actions during SSM 5. All information necessary to demonstrate conformance with the SSMP.	Yes. Yes. Yes. Yes. Yes.

TABLE 7 TO SUBPART PPPPP OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

As stated in 63.9365, you must comply with the General Provisions in §§63.1 through 63.15 that apply to you according to the following table:

Citation	Subject	Brief description	Applies to subpart PPPPP
§63.10(b)(2)(vi)–(xi)	CMS Records	Malfunctions, inoperative, out of control.	Yes.
§63.10(b)(2)(xii)	Records	Records when under waiver	Yes.
§63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test.	Yes.
§63.10(b)(2)(xiv)	Records	All documentation supporting initial notification and notification of compliance status.	Yes.
§63.10(b)(3)	Records	Applicability determinations	Yes.
§63.10(c)(1)–(6), (9)–(15)	Records	Additional records for CEMS	Yes.
§63.10(c)(7)–(8)	Records	Records of excess emissions and parameter monitoring exceedances for CMS.	No. Specific language is located at §63.9355 of subpart PPPPP.
§63.10(d)(1)	General Reporting Requirements	Requirement to report	Yes.
§63.10(d)(2)	Report of Performance Test Results.	When to submit to Federal or State authority.	Yes.
§63.10(d)(3)	Reporting Opacity or VE Observations.	What to report and when	No. Subpart PPPPP does not have opacity/VE standards.
§63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension.	No. Compliance extensions do not apply to new or reconstructed sources.
§63.10(d)(5)	SSM Reports	Contents and submission	Yes.
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Additional CMS reports	Yes.
§63.10(e)(2)(ii)	Additional CMS Reports	COMS-related report	No. Subpart PPPPP does not require COMS.
§63.10(e)(3)	Additional CMS Reports	Excess emissions and parameter exceedances reports.	No. Specific language is located in §63.9350 of subpart PPPPP.
§63.10(e)(4)	Additional CMS Reports	Reporting COMS data	No. Subpart PPPPP does not require COMS.
§63.10(f)	Waiver for Recordkeeping/Reporting.	Procedures for Administrator to waive.	Yes.
§63.11	Control Device Requirements	Requirements for flares	No. Subpart PPPPP does not specify use of flares for compliance.
§63.12	State Authority and Delegations	State authority to enforce standards.	Yes.
§63.13	Addresses of State Air Pollution Control Offices and EPA Regional Offices.	Addresses where reports, notifications, and requests are sent.	Yes.
§63.14	Incorporations by Reference	Test methods incorporated by reference.	Yes. ASTM D 6522–00 and ANSI/ASME PTC 19.10–1981 (incorporated by reference-See §63.14).
§63.15	Availability of Information and Confidentiality.	Public and confidential information	Yes.

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Part 73

[DA 03–1537; MM Docket No. 02–13; RM–10357, RM–10493*]

Radio Broadcasting Services; Bunnell and Palm Coast, FL

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: In response to a Notice of Proposed Rule Making, 67 FR 5961 (February 8, 2002) ("Notice"), this Report and Order allots Channel 254A to Palm Coast, Florida, and provides Palm Coast with its first local aural transmission service. This document also denies a mutually exclusive rulemaking request set forth in the Notice to allot the same channel to Bunnell, Florida. The Commission compared the merits of the two rulemaking proposals pursuant to the Commission's Revision of FM Assignment Policies and Procedures, 90 FCC 2d 88 (1982), and preferred the Palm Coast rulemaking proposal. The coordinates for Channel 254A at Palm Coast are 29–29–38 North Latitude and 81–09–45 West Longitude. This allotment has a site restriction of 11 kilometers (6.8 miles) southeast of Palm Coast.

DATES: Effective June 23, 2003.

FOR FURTHER INFORMATION CONTACT: R. Barthen Gorman, Media Bureau, (202) 418–2180.

SUPPLEMENTARY INFORMATION: This is a synopsis of the Commission's Report and Order, MM Docket No. 02–13, adopted May 7, 2003, and released May 9, 2003. The full text of this Commission decision is available for inspection and copying during normal business hours in the FCC's Reference Information Center at Portals II, 445 12th Street, SW., Room CY–A257, Washington, DC, 20554. The document may also be purchased from the Commission's duplicating contractor, Qualex International, Portals II, 445 12th Street, SW., Room CY–B402, Washington, DC, 20554, telephone (202) 863–2893. facsimile (202) 863–2898, or via e-mail *qualexint@aol.com*.

List of Subjects in 47 CFR Part 73

Radio, Radio broadcasting.

■ Part 73 of Title 47 of the Code of Federal Regulations is amended as follows:

PART 73—RADIO BROADCASTING SERVICES

■ 1. The authority citation for Part 73 reads as follows:

Authority: 47 U.S.C. 154, 303, 334, and 336.

§ 73.202 [Amended]

■ 2. Section 73.202(b), the Table of FM Allotments under Florida, is amended by adding Palm Coast, Channel 254A.

Federal Communications Commission.

Radio Broadcasting Services; Daisy, AR; Muldrow, OK; Rattan, OK and Trona, CA

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: This document grants four proposals that allot new FM channels to Daisy, Arkansas; Trona, California; Muldrow, Oklahoma; and Rattan, Oklahoma. The Audio Division, at the request of Gray Media Corporation, allots Channel 293C3 at Daisy, Arkansas, as the community's first local aural transmission service. *See* 68 FR 10682, March 6, 2003. Channel 293C3 can be allotted to Daisy, Arkansas, in compliance with the Commission's minimum distance separation requirements with a site restriction of 21.1 km (13.1 miles) northwest of Daisy. The coordinates for Channel 293C3 at Daisy, Arkansas, are 34–21–49 North Latitude and 93–54–48 West Longitude. A filing window for Channel 293C3 at Daisy, Arkansas, will not be opened at this time. Instead, the issue of opening this allotment for auction will be addressed by the Commission in a subsequent Order. *See* **SUPPLEMENTARY INFORMATION** *infra*.

DATES: Effective June 23, 2003.

FOR FURTHER INFORMATION CONTACT: Deborah Dupont, Media Bureau, (202) 418–2180.

SUPPLEMENTARY INFORMATION: This is a synopsis of the Commission's Report and Order, MB Docket Nos. 03–42, 03–30, 03–29, and 03–43, adopted May 7, 2003, and released May 9, 2003. The full text of this Commission decision is available for inspection and copying during normal business hours in the FCC Information Center, Portals II, 445 12th Street, SW., Room CY–A257, Washington, DC 20554. The complete text of this decision may also be purchased from the Commission's duplicating contractor, Qualex International, Portals II, 445 12th Street, SW., Room CY–B402, Washington, DC, 20554, (202) 863–2893, facsimile (202) 863–2898, or via e-mail *qualexint@aol.com*.

The Audio Division further allots, at the request of Dana J. Puopolos, Channel 255A at Trona, California, as the community's first local aural transmission FM service. *See* 68 FR 7962, February 19, 2003. Channel 255A can be allotted to Trona, California, in compliance with the Commission's minimum distance separation requirements with a site restriction of 6.8 km (4.2 miles) southeast of Trona. The coordinates for Channel 255A at Trona, California, are 35–43–51 North Latitude and 117–18–28 West Longitude. A filing window for Channel 255A at Trona, California, will not be opened at this time. Instead, the issue of opening this allotment for auction will be addressed by the Commission in a subsequent Order.

The Audio Division further allots, at the request of David P. Garland, Channel 286A at Muldrow, Oklahoma, as the community's first local aural transmission service. *See* 68 FR 7962, February 19, 2003. Channel 286A can be allotted to Muldrow, Oklahoma, in compliance with the Commission's minimum distance separation requirements with a site restriction of 10.02 km (6.52 miles) north of Muldrow. The coordinates for Channel 286A at Muldrow, Oklahoma, are 35–29–47 North Latitude and 94–36–04 West Longitude. A filing window for Channel 286A at Muldrow, Oklahoma, will not be opened at this time. Instead, the issue of opening this allotment for auction will be addressed by the Commission in a subsequent Order.

The Audio Division further allots, at the request of Gray Media Corporation, Channel 258A at Rattan, Oklahoma, as the community's first local aural transmission service. *See* 68 FR 10682, March 6, 2003. Channel 258A can be

National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR–2003–0002—FRL–7462–2]

RIN 2060–AH02

National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for wood building products surface coating operations. The final standards establish emission limitations, operating limits, and work practice requirements for all major sources that apply a surface coating to a wood building product to reduce certain organics listed as hazardous air pollutants (HAP) in section 112 of the Clean Air Act (CAA). These standards implement section 112(d) of the CAA by requiring all major sources to meet the HAP emission standards reflecting the application of the maximum achievable control technology (MACT).

Wood building products surface coating operations emit several HAP, including xylenes, toluene, ethyl benzene, ethylene glycol monobutyl ether (EGBE), other glycol ethers, methyl ethyl ketone (MEK), methyl isobutyl ketone (MIBK), methanol, styrene, and formaldehyde. We do not have the type of current detailed data on each of the facilities covered by the final rule and the people living around the facilities that would be necessary to conduct an analysis to determine the actual population exposures to the HAP emitted from these facilities and potential for resultant health effects. Therefore, we do not know the extent to which the adverse health effects described above occur in the populations surrounding these facilities. However, to the extent the adverse effects do occur, the final rule will reduce emissions and subsequent exposures. The final rule will reduce HAP emissions by approximately 4,400 megagrams per year (Mg/yr) (4,900 tons per year (tpy)) or by 63 percent from baseline.

EFFECTIVE DATE: May 28, 2003. The incorporation by reference of certain publications listed in the final rule is approved by the Director of the Federal Register as of May 28, 2003.

ADDRESSES: *Docket.* Docket ID No. OAR–2003–0002 (formerly Docket No. A–97–52) is located at the EPA Docket Center, EPA West, U.S. EPA (6102T), 1301 Constitution Avenue, NW., Room B–102, Washington, DC 20460.

Background Information Document. A background information document (BID) for the promulgated NESHAP may be obtained from the docket; the U.S. EPA Library (C267–01), Research Triangle Park, NC 27711, telephone (919) 541–2777; or from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161, telephone (703) 487–4650. Refer to "National Emission Standards for Hazardous Air Pollutants (NESHAP) for Wood Building Products (Surface Coating) Background Information for Final Standards' (EPA–453/R–03–003). The promulgation BID contains a summary of changes made to the standards since proposal, public comments made on the proposed standards, and EPA responses to the comments.

FOR FURTHER INFORMATION CONTACT: Mr. Lynn Dail, Coatings and Consumer Products Group, Emission Standards Division (C539–03), U.S. EPA, Research Triangle Park, NC 27711; telephone number (919) 541–2363; facsimile number (919) 541–5689; electronic mail (e-mail) address *dail.lynn@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The source category, which is divided into the five subcategories listed in Table 1 of this preamble, includes sources that apply coatings to wood building products. In general, these sources are covered under the North American Industrial Classification System (NAICS) codes listed in Table 1. However, sources classified under other NAICS codes may be subject to the final rule. Not all sources classified under the NAICS codes in Table 1 will be subject to the final rule because some of the classifications cover products outside the scope of the NESHAP for wood building products.

TABLE 1.—SUBCATEGORIES AND ENTITIES POTENTIALLY REGULATED BY THE FINAL RULE

Subcategory	NAICS	Examples of regulated entities include those sources that apply a surface coating to . . .
Exterior Siding and Primed Doorskins	321211, 321219, 321999[a]	Panel siding, trimboard, lap siding, trim associated with siding, and primed doorskins.
Flooring	321918, 321999[a]	Solid wood flooring, engineered wood flooring, and laminated flooring.
Interior Wall Paneling and Tileboard	321211, 321999[a]	Interior wall paneling or tileboard.
Other Interior Panels	321211, 321212, 321219, 321999[a]	Panels used for purposes other than interior wall paneling, such as perforated panels.
Doors, Windows, and Miscellaneous	321911, 321918, 321999[a]	Doors, finished doorskins, finished exterior siding, windows, and other miscellaneous wood products (including moulding and millwork).

[a] The subcategory of the NAICS code depends on the final end use of the product.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding subcategories and entities likely to be regulated by this action. To determine whether your coating operation is regulated by this action, you should examine the applicability criteria in § 63.4681 of the final rule.

Docket. The EPA has established an official public docket for this action under Docket ID No. OAR–2003–0002 (formerly Docket No. A–97–52). The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the EPA Docket Center, EPA West, Room B–102, 1301 Constitution Avenue, NW., Washington, DC 20460. The Docket Center is open from 8:30 a.m. to 4:30 p.m., Monday

through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Docket is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Access. You may access this **Federal Register** document electronically through the EPA Internet under the **Federal Register** listings at *http://www.epa.gov/edocket/.*

An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified above. Once in the system, select "search," then key in the appropriate docket identification number.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule also will be available on the WWW. Following the Administrator's signature, a copy of this action will be posted at *www.epa.gov/ttn/oarpg* on EPA's Technology Transfer Network (TTN) policy and guidance page for newly proposed or promulgated rules. The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. Under section 307(b)(1) of the CAA, judicial review of the final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 28, 2003. Under section 307(b)(2) of the CAA, the requirements established by the final rule may not be challenged separately in any civil or criminal proceedings brought by EPA to enforce these requirements.

Outline. The following outline is provided to aid in reading the preamble to the final rule.

I. Background
A. What is the source of authority for development of NESHAP?
B. What criteria did we use in the development of NESHAP?
II. What changes and clarifications have we made for the final standards?

H. Executive Order 13211, Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer and Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. The Flatwood Paneling (Surface Coating) category of major sources was listed on July, 16, 1992 (57 FR 31576) under the Surface Coating Processes industry group. The name of the source category was subsequently changed to Wood Building Products (Surface Coating) on November 18, 1999 (64 FR 63025) to reflect more accurately the types of surface coating operations currently used in the industry. Major sources of HAP are those that emit or have the potential to emit equal to or greater than 9.1 Mg/yr (10 tpy) of any one HAP or 22.7 Mg/yr (25 tpy) of any combination of HAP.

B. What Criteria Did We Use in the Development of NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new or reconstructed and existing major sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as the MACT.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the standard is set at a level that assures that all major sources achieve the level of control at least as stringent as that already achieved by the better-controlled and lower-emitting sources in each source category or subcategory. For new or reconstructed sources, the MACT floor cannot be less stringent than the emission control that is achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than standards for new or reconstructed sources, but they cannot be less stringent than the average emission limit achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on the consideration of the cost of achieving the emission reductions, any non-air quality health and environmental impacts, and energy requirements.

II. What Changes and Clarifications Have We Made for the Final Standards?

In response to the public comments received on the proposed standards, we made several changes for the final rule. The substantive comments, our responses, and associated rule edits are summarized in the following sections. A more detailed summary can be found in the Summary of Public Comments and Responses document, which is available from several sources (see **ADDRESSES** section).

A. Applicability

Several commenters requested a clarification of zero-HAP coatings, thinners, and cleaning solvents. They cited the Occupational Safety and Health Administration (OSHA) *de minimis* level for reporting HAP-containing materials as greater than 1

percent for noncarcinogens or greater than 0.1 percent for carcinogens. The use of this *de minimis* level for HAP reporting was implied because the data used to set the MACT floor was submitted under the same guidelines. Accordingly, language has been included in the final preamble and rule to clarify that coatings with HAP contents below 1 percent for noncarcinogens and 0.1 percent for carcinogens are considered to be zero-HAP materials.

Although affected sources are not required to report detailed HAP content information on these zero-HAP materials, inclusion of these materials could be beneficial to meeting the applicable rolling 12-month emission limit(s). Coatings that contain no HAP usually contain some amount of solid material that will help to lower the organic HAP emission rate for the 12-month compliance period.

Several commenters requested specific exclusions for products or coatings that may have been included in the MACT floor determination but do not fit into the wood building products surface coating source category. Specifically, commenters cited coatings called tempering oils (such as linseed, tall, tung, soy, otaseka, and other drying oils or mixtures of such oils) which would be regulated as part of the proposed plywood and composite wood products NESHAP (68 FR 1275, January 9, 2003). In response to these comments, we excluded drying or tempering oils from the final rule. Please refer to § 68.4681(c)(1) of the final rule which lists processes that will most likely be covered by the proposed plywood and composite wood products NESHAP.

Some commenters referred to specific products that they believed should not be subject to the requirements of the wood building products surface coating source category. These included asphalt-coated fiberboard and cellulosic ceiling tiles. Commenters asserted that neither product is coated with HAP-containing materials and that regulating such products would be burdensome for recordkeeping purposes.

We further evaluated the types of coatings and processes used to make asphalt-coated fiberboard, also called "builders board" or "insulation board," and found that only a few facilities in the United States make these products, with varying manufacturing and coating processes. With regards to the coatings used on fiberboard products, the asphalt material can be included as part of the emulsion used in the fiberboard forming or manufacturing process, or the asphalt (mixed with mineral spirits) can be applied to the fiberboard substrate. Depending on the company and the process, the coating can be applied before the final dryer or after the final dryer with the product allowed to air dry, usually outdoors on racks.

Ceiling tiles are usually coated using slurries of titanium dioxide and various clays. Although non-HAP wetting agents or defoamers are occasionally added, there are no organic solvents used. These coatings cure by drying and not by chemical reaction and are considered durable only for dry, non-contact indoor exposure.

Because of the small number of facilities coating these products and the fact that most of the coatings associated with these types of products are applied during the substrate forming process (*e.g.*, to the wet mat being formed) or prior to the final substrate drying operation, fiberboard coating operations (including those used in the manufacture of asphalt-coated fiberboard and ceiling tiles) would be covered under the proposed plywood and composite wood products NESHAP. For this reason, these products will not be subject to the final rule for the surface coating of wood building products.

Several commenters requested more research concerning the low-coating usage cutoff, suggesting that the cutoff should be higher. The low-usage cutoff was based on the total annual coating usage of the smallest facility in the MACT floor database. All facilities in the database have annual coating usages above 4,170 liters (1,100 gallons). Available data indicate that the coating application processes and control technologies being considered are appropriate for all sources with at least this level of coatings usage. Considering that the surveyed sources in the database included a cross section of various companies, products, and locations, we do not believe that collecting additional data would raise this cutoff. Therefore, no changes have been made to the low-coating usage cutoff.

While we cannot justify raising the low usage amount or establishing low usage cutoffs for individual subcategories, additional language has been included in the final rule to exempt sources that are not commercial manufacturers of wood building products. The final rule is intended to apply only to commercial manufacturers, which are the types of facilities represented in our database.

Several commenters requested exemptions for sources that laminate paper or vinyl to composite wood products. Although we agree with the commenters that HAP emissions from wood laminating processes are typically low at the present time, an exclusion is not justified because future coating technologies could increase HAP emissions. To further clarify applicability, laminates applied prior to pressing of the substrate would be covered by the proposed plywood and composite wood products NESHAP, and the laminates applied after pressing of the substrate are covered by the wood building products (surface coating) NESHAP.

Commenters stated that the proposed definition of "wood building product" excludes the majority of the wooden windows and doors manufactured due to the weight characteristic. In response, we have written the definition of "wood building product" to exclude the weight of glass components. A wood building product is now defined as any product that contains more than 50 percent by weight wood or wood fiber, excluding the weight of glass components, and is used in the construction, either interior or exterior, of a residential, commercial, or institutional building.

As a result of comments received, the application of the rule to antifungal coatings was evaluated. Because these coatings can be applied during many different stages of production, we have clarified the applicability of the final rule to these coatings. Antifungal coatings will be covered by the wood building products surface coating NESHAP if they are applied after the substrate manufacturing process.

Several commenters requested that the final rule be written such that the HAP limits apply only to HAP that are released to the atmosphere, recognizing that some HAP in the coatings are not emitted (*i.e.*, styrene, dibutylphthalate, ethyleneimines (aziridines), and Bis 2-ethylhexyl phthalate (DEHP)). The data collection activities and subsequent MACT floor determinations were made using the assumption that all volatile organic HAP are emitted, *i.e.*, organic HAP content of the coatings is equivalent to HAP emitted.

We realize that in a few cases, such as the four compounds identified by the commenters, our assumption is not totally accurate because a small fraction of the total HAP may be tied up in the coating. However, we believe that the 12-month rolling average emission limits provide an adequate time frame for such special coatings to be used and averaged in with the other coatings and still meet the emission limits.

Due to these reasons, we do not believe special compliance alternatives are warranted for a few compounds used in some coatings. Affected sources can use alternative test procedures to

demonstrate a lower HAP emissions value for a particular coating.

B. Overlap With Other NESHAP

Many commenters were concerned about the large potential for the wood building products surface coating source category to overlap with other NESHAP, specifically the promulgated wood furniture manufacturing NESHAP (60 FR 62930, December 7, 1995) and the proposed miscellaneous metal parts and products coating NESHAP (67 FR 52780, August 13, 2002). Two commenters wanted some way to consolidate all coating operations in order to be subject to only one NESHAP. One of these two commenters stated that 97 percent of the coatings used by his company, a window manufacturing facility, are applied to metal (aluminum) windows, and the remaining 3 percent of the coatings are applied to wood components of the windows. The second commenter said that 95 percent of the coatings used by his facility are applied to wood furniture components, and the remaining 5 percent of the coatings are applied to interior panels.

In response to these comments, we have included a provision to the applicability section of the final rule. This new language states that an affected source that could be subject to more than one coating NESHAP, and that has one type of surface coating operation that accounts for at least 95 percent of the total (annual) coating usage at the source, has the option of complying with the requirements of the predominant coating rule (including all applicable emissions limitations, operating limits, and work practice requirements) for all coating operations that would be subject to a NESHAP.

We are allowing the small amount of coating (less than 5 percent of the total usage) to be regulated at the same level(s) as the majority (at least 95 percent) of coating usage to simplify applicability determinations and recordkeeping and reporting for those sources. With this applicability provision, the two sources described above would be allowed to comply with the emission limits for the proposed miscellaneous metal parts NESHAP and the promulgated wood furniture manufacturing NESHAP, respectively, for all of their coating operations.

According to our data, very few sources will be able to take advantage of this predominant activity option. For this reason, we expect any emissions increase that could occur (where the emission limits in the predominant NESHAP are less stringent than the limits in the other applicable NESHAP) to be very small.

C. Subcategories

Several commenters requested additional guidance on the correct classification of moulding and trim. Originally, mouldings were classified according to the final use of the moulding. Commenters stated that the same moulding or trim could go around windows and doors, be used as baseboards, as trim between ceilings and walls, or as chair railing. To eliminate the classification of different types of moulding and trim into different subcategories, we have included all moulding and trim in one subcategory. However, this classification still excludes moulding and trim associated with wood cabinets and other types of wood furniture (which are subject to the promulgated wood furniture manufacturing NESHAP, subpart JJ). This change also involved the renaming of two subcategories. The proposed "windows and doors" subcategory has become the "doors, windows, and miscellaneous" subcategory and will include all moulding, trim, millwork, and miscellaneous products that do not fit in the other subcategories. The proposed "exterior siding, doorskins, and miscellaneous" subcategory has become the "exterior siding and primed doorskins" subcategory. As a result, the MACT floor emission limits were recalculated and are included in the final rule.

Several commenters were concerned with overlap among subcategories. The commenters described scenarios where facilities are coating multiple products, but did not provide data or specifics on any known facilities. Issues related to coating requirements for various products were considered when we developed the five subcategories and served as the basis for many of those decisions. According to our database, there are no facilities that are potentially subject to more than one subcategory emission limit. Because subcategories were created to accommodate unique differences in performance criteria that indicated a need for different HAP contents (based on the information provided by the various industry segments in the database), we believe it is not appropriate to combine operations under separate subcategories. Therefore, we are not allowing a source to choose one emission limit based on the amount of coating used in a predominant subcategory and apply that same limit to another subcategory.

Several commenters requested additional or reorganized subcategories to simplify enforcement. We do not agree with the commenters and believe the subcategorization scheme adopted for this source category is appropriate and complete. All subcategories were evaluated with respect to product performance requirements, associated coating usage, organic HAP emissions, coating application equipment, and control device applicability. Each subcategory showed technical differences within one or more of these criteria. For additional information, see Docket A–97–52.

Several commenters requested reevaluation of the MACT floors due to the addition of new products such as topcoated doorskins. These products require coatings with a higher level of HAP content or more layers of coatings than products used in the MACT analysis. Although separating these types of topcoated or finished doorskins from the "exterior siding and primed doorskins" subcategory could cause sources that coat doorskins to comply with two separate emission limits, we agree that the additional layers of coatings required for finished doorskins are likely to have higher HAP emissions than primed doorskins. We also agree that finished doorskins have more demanding and stringent performance requirements than primed-only doorskins. In response, we have included finished doorskins in the "doors, windows, and miscellaneous" subcategory where the exterior climate performance requirements associated with all doors and windows have been accounted for with the higher emission limits.

Several commenters also requested subcategories related to color coatings due to the increased use of these coatings since the MACT analysis was begun. Because the commenters offered no explanation for the differences between color and clear coatings, we can only consider the fact that business decisions were made to add color coatings. This alone is not a compelling technical reason to subcategorize differently or to change the MACT floors. The data used to determine subcategories and the applicable MACT floor level of control were the best information available to EPA at the time. Production is updated continuously for various reasons, and changing the MACT floor determination based on constantly changing conditions would not be appropriate.

D. MACT Limits

Several commenters disagreed with the zero HAP emission limits that were established for the NESHAP. Specifically, the commenters felt that the MACT limits should contain at least two significant figures to account for the

presence of a small amount of HAP in what we have described as non-HAP coatings. To address these concerns and to clarify that the MACT limits are not absolute zero for some new sources, the final rule includes a change in the metric units from kilogram HAP/liter solids to grams HAP/liter solids where the value is rounded to the nearest integer.

Several commenters argued that metric units should not be used to demonstrate compliance. The use of metric units instead of English units is based on Federal government policy (the Metric Conversion Act of 1975 as amended by the Omnibus Trade and Competitiveness Act of 1988). While metric units are included, compliance is not required through metric units because the MACT floor determination used English units. Accordingly, we have included language stating that compliance can be demonstrated using either English or metric units.

E. Test Methods

One commenter noticed that some ASTM test methods have been updated. The listed test methods have been updated and incorporated by reference in the final rule.

Several commenters asked for clarification on using methods specified by the NESHAP for determining certain qualities of the coatings, thinners, and cleaning materials. As a result, we included provisions in the final rule that owners or operators are allowed to submit an alternative technique if the test methods specified in the final rule are insufficient to determine the specified qualities. For mass fraction of organic HAP, the final rule has been written to allow resolution of any discrepancies between the test methods for determining the mass fraction of organic HAP versus formulation data through consultation with the regulatory compliance authority.

Many commenters also expressed confusion regarding the use of Method 24 as an alternative to Method 311. According to the commenters, Method 24 requires that the water content of the coating be determined and subtracted from the total volatile content. This determination contains greater variability than the limit in the final rule for existing and new sources that fall into the "other interior panels" and the "exterior siding and primed doorskins" subcategories and new sources that fall into the "interior panels and tileboard" subcategory. Therefore, the final rule includes the provision that Method 24 will not be used for those coatings with a water content that would result in an effective detection limit greater than the applicable emission limit.

Two commenters disagreed with the use of a helium gas pycnometer to determine the volume fraction of coating solids (which is required by ASTM D 6093). Section 63.4741(b) of the proposal provided two options for determining the volume fraction of coating solids (nonvolatiles) for each coating: (1) Use of either of the two referenced ASTM methods (D2697–86 (Reapproved 1998) or D6093–97), or (2) use of information from the supplier or manufacturer of the material. In response to the commenters' concerns, a third option has been included in the final rule that allows the amount of coating solids to be calculated using the total volatile matter content of the coating and the average density of the volatile matter in the coating. If these values cannot be determined using one of the specified methods, the owner or operator may submit an alternative technique for determining their values for approval by the Administrator.

Several commenters asked that the final rule clearly specify whether compliance demonstration calculations are to be rounded or truncated to the number of decimal places specified in the emission limit. The commenters recommended that results be truncated to three digits after the decimal.

In response, language has been included in the final rule that specifies that compliance is demonstrated by rounding the rolling 12-month emission rate (to two decimal places for English units and the nearest integer for metric units), and not by rounding the individual numbers used to determine the rolling 12-month rolling emission rate.

F. Cost and Economic Assumptions and Impacts

Due to changes in the MACT floor emission limits for the "other interior panels" subcategory and changes to the number of estimated affected sources in the "exterior siding and primed doorskins" and "doors, windows, and miscellaneous" subcategories, the overall industry cost impacts have changed to $22.5 million.

G. Compliance Procedures

Several commenters noted a discrepancy between the proposed § 63.4692(b)(ii) and (iii). Section 63.4692(b)(ii) reduces the data to block averages, but § 63.4692(b)(iii) maintains the 3-hour average combustion temperature at or above the limit. We made corresponding changes to Table 3 to Subpart QQQQ to Part 63 to read, "maintain the 3-hour block average" wherever warranted.

Several commenters disagreed with the omission of control devices other than thermal oxidation. The commenters recommended that provisions for biofilters and other innovative technologies be added to compliance Option 3. Compliance Option 3 does not preclude the use of biofilters or other control technologies. You may submit your request for any innovative control technology to the Administrator for approval. Plans for monitoring and recordkeeping requirements should be submitted along with such proposals.

Based on the type and level of HAP emissions at most wood building product surface coating operations, we do not consider biofilters as a likely control technology to be applied to such emission sources. Therefore, specific operating limits and compliance procedures for biofilters have not been included in the final rule. However, the proposed plywood and composite wood products rule (68 FR 1275, January 9, 2003) does include specific operating limits and compliance procedures for biofilters, and these can be used as examples when submitting your request for an alternative control technology.

H. Control Device Operating Limit Requirements

Several commenters stated that the proposed rule does not specify how to account for equipment start ups, shut downs or malfunctions in the calculation of the 3-hour averages used to determine compliance with operating limits for add-on control devices. The commenters suggested that the rule specify that the operating data collected when the control device is "not receiving emissions" not be included in the 3-hour average calculations. We have included language in the final rule to exclude monitoring data from the 3-hour average calculation that was generated during periods when the control device was not receiving emissions.

Several commenters disagreed with the requirement for periodically adjusting the air-to-fuel ratio for catalytic oxidizers. The commenters stated that adding this requirement to the inspection and maintenance plan has no performance benefit. The purpose of the inspection and maintenance plan is to assure that the catalytic oxidizer operates at the conditions that will achieve or exceed the emission destruction efficiency for the control device demonstrated by the performance test. Based on our review, we concluded that a requirement for

periodic adjustment of the air-to-fuel ratio is not needed to assure compliance of a catalytic oxidizer. We have written the final rule to exclude the requirement for periodically adjusting the air-to-fuel ratio in the inspection and maintenance plan.

Several commenters stated that the catalyst test procedures should be worked out between the facility and the catalyst test provider, not the manufacturer or supplier as specified in the inspection and maintenance plan requirements. We agree that the catalyst test providers should be consulted. The catalyst test provider will test the catalyst after the performance test to determine any catalyst degradation that may have occurred in the period after the performance testing. Although this is not required for compliance, it may be beneficial to test the catalyst at the time of the performance test to determine a baseline for future catalyst testing.

I. Startup, Shutdown, and Malfunction (SSM)

One commenter stated that bypass lines are often used in situations that are not considered malfunctions. In certain situations, operation of the control device is not always necessary to meet the emission limit. This situation can occur on a coating line that is used for coating operations covered by different compliance options conducted at different times. If the coatings used on one product comply with the applicable emission limit (*e.g.* compliant coatings option), the source may prefer to bypass the control device to lower annual expenses associated with operating the air pollution control system. This situation is not a malfunction and would not be addressed in the source's SSM plan.

The final rule explicitly states that requirements for the use of bypass lines apply during periods that "controlled" coating operations are being conducted. The language assures continuous compliance with the applicable emission limit at those sources electing to use Option 3 to comply with the emission limit using a capture and control device system that is equipped with a bypass line.

J. Recordkeeping and Reporting

Several commenters requested fewer recordkeeping and calculation requirements for coatings that have no HAP content. We agree that it is not necessary from the perspective of implementing and enforcing the final rule to require an owner or operator to perform all of the compliance calculation, recordkeeping, and reporting requirements specified in the final rule where the result will always be zero organic HAP per liter or gallon of coating solids.

For such zero-HAP materials, we have included a provision in § 63.4741(a)(1)(i) and (a)(4) of the final rule specifying that if the mass fraction of organic HAP in a coating is zero, as determined according to § 63.4741(a), then the source is not required to determine the volume fraction of coating solids and density or to calculate the organic HAP content. The following notification, reporting, and recordkeeping sections of the final rule were written to fully incorporate this provision: §§ 63.4710(c)(8)(i), 63.4720(a)(5)(ii), and 63.4730(c), (c)(2), (f), and (g).

III. What Are the Final Standards?

A. What Is the Source Category?

The final rule applies to you if you own or operate a commercial wood building products surface coating source that uses at least 4,170 liters (1,100 gallons) of coatings per year and is a major source, is located at a major source, or is part of a major source of HAP emissions, whether or not you manufacture the wood building product substrate. Surface coating operations alone are not required to be major sources of HAP emissions in order for the rule to apply. As long as some part of the total source causes it to be a major source (*e.g.*, the wood substrate manufacturing process), the surface coating operations would be subject to the final rule.

We have defined a wood building products surface coating source as any source engaged in the finishing or laminating of a wood building product. A wood building product is any product that contains more than 50 percent by weight wood or wood fiber, excluding the weight of glass components, and is used in the construction, either interior or exterior, of a residential, commercial, or institutional building. As explained later, we have established five subcategories in the wood building products surface coating source category: (1) Exterior siding and primed doorskins; (2) flooring; (3) interior wall paneling and tileboard; (4) other interior panels; and (5) doors, windows, and miscellaneous (see Table 1 of this preamble).

The final NESHAP requirements do not apply to the manufacture or application of surface coatings to prefabricated/premanufactured or mobile/modular homes. You are also not subject to the final rule if your wood building products surface coating operations are located at an area source. An area source of HAP is any source that has the potential to emit HAP but is not a major source. You may establish area source status by limiting the source's potential to emit HAP through appropriate mechanisms available through the permitting authority.

The source category does not include research or laboratory facilities; janitorial, building, and facility construction or maintenance operations; or hobby shops that are operated for personal rather than for commercial purposes. The source category does not include noncommercial coating operations or coating applications using handheld nonrefillable aerosol containers.

If an affected source has surface coating operations subject to the requirements of another NESHAP that account for at least 95 percent of the total (annual) coating usage for the source, the requirements, including all applicable emission limitations, operating limits, and work practices, of the predominant NESHAP can be applied to all coating operations that are subject to a NESHAP.

B. What Is the Affected Source?

We define an affected source as a stationary source, a group of stationary sources, or part of a stationary source to which a specific emission standard applies. The final rule defines the affected source as the collection of all operations associated with the surface coating of wood building products. These operations include preparation of a coating for application (*e.g.*, mixing with thinners); surface preparation of the wood building products; coating application, curing, and drying equipment; equipment cleaning; and storage, transfer, and handling of coatings, thinners, cleaning materials, and waste materials.

C. What Are the Emission Limits, Operating Limits, and Work Practice Standards?

Emission Limits. The final rule limits organic HAP emissions from each new or reconstructed affected source using the emission limits in Table 2 of this preamble. The emission limits for each existing affected source are given in Table 3 of this preamble. Affected sources may comply with the emission limits using either English or metric units. These limits are based on five subcategories that group similar operations and types of coatings. The final rule allows several compliance options to achieve the emission limits. You could comply by applying materials (coatings, thinners, and cleaning materials) that meet the

emission limits, either individually or collectively. You could also use a capture system and add-on control device to meet the emission limits, or you could comply by using a combination of these approaches.

TABLE 2.—EMISSION LIMITS FOR NEW OR RECONSTRUCTED AFFECTED SOURCES

For any affected source applying coating to . . .	The organic HAP emission limit you must meet, in grams (g) HAP/liter solids (pounds (lb) HAP/gallon solids), is:
Exterior siding and primed doorskins.	0 (0.00)
Flooring	0 (0.00)
Interior wall paneling or tileboard.	5 (0.04)
Other interior panels	0 (0.00)
Doors, windows, and miscellaneous.	57 (0.48)

TABLE 3.—EMISSION LIMITS FOR EXISTING AFFECTED SOURCES

For any affected source applying coating to . . .	The organic HAP emission limit you must meet, in g HAP/liter solids (lb HAP/gallon coating solids), is:
Exterior siding and primed doorskins.	7 (0.06)
Flooring	94 (0.78)
Interior wall paneling or tileboard	183 (1.53)
Other interior panels	20 (0.17)
Doors, windows, and miscellaneous.	231 (1.93)

Operating Limits. If you reduce emissions by using a capture system and add-on control device (other than a solvent recovery system for which you conduct a liquid-liquid material balance), the operating limits apply to you. These limits are site-specific parameter limits you determine during the initial performance test of the system. For capture systems that are not permanent total enclosures (PTE), you must establish average volumetric flow rates or duct static pressure limits for each capture device (or enclosure) in each capture system. For capture systems that are PTE, you must establish limits on average facial velocity or pressure drop across openings in the enclosure.

For thermal oxidizers, you must monitor the combustion temperature. For catalytic oxidizers, you must monitor the temperature immediately before and after the catalyst bed, or you must monitor the temperature before the catalyst bed and implement a site-specific inspection and maintenance plan for the catalytic oxidizer. For carbon adsorbers for which you do not conduct a liquid-liquid material balance, you must monitor the carbon bed temperature and the amount of steam or nitrogen used to desorb the bed. For condensers, you must monitor the outlet gas temperature from the condenser. For concentrators, you must monitor the temperature of the desorption concentrate stream and the pressure drop of the dilute stream across the concentrator.

All site-specific parameter limits that you establish must reflect operation of the capture system and control devices during a performance test that demonstrates achievement of the emission limit during representative operating conditions.

Work Practice Standards. If you use an emission capture system and control device for compliance, you must develop and implement a work practice plan to minimize organic HAP emissions from mixing operations, storage tanks and other containers, and handling operations for coatings, thinners, cleaning materials, and waste materials. The work practice plan must include steps to ensure that, at a minimum, all organic HAP coatings, thinners, cleaning materials, and waste materials are stored in closed containers; spills of organic HAP coatings, thinners, cleaning materials, and waste materials are minimized; organic HAP coatings, thinners, cleaning materials, and waste materials are conveyed from one location to another in closed containers or pipes; mixing vessels that contain organic HAP coatings and other materials are closed except when adding to, removing, or mixing the contents; and emissions of organic HAP are minimized during cleaning of storage, mixing, and conveying equipment.

If your affected source has an existing documented plan that incorporates steps taken to minimize emissions from the aforementioned sources, then your existing plan could be used to satisfy the requirement for a work practice plan.

If you use a capture system and control device for compliance, you must develop and operate according to a startup, shutdown, and malfunction plan (SSMP) during periods of SSM of the capture system and control device.

The General Provisions (40 CFR part 63, subpart A) also apply to you as indicated in the final rule. The General Provisions codify certain procedures and criteria for all 40 CFR part 63 NESHAP. The General Provisions contain administrative procedures, preconstruction review procedures for new sources, and procedures for conducting compliance-related activities such as notifications, reporting and recordkeeping, performance testing, and monitoring. The final rule refers to individual sections of the General Provisions to emphasize key sections that are relevant. However, unless specifically overridden in the final rule, all of the applicable General Provisions requirements apply to you.

D. What Are the Testing and Initial Compliance Requirements?

New or reconstructed affected sources must be in compliance upon initial startup of the affected source or by May 28, 2003, whichever is later. Existing affected sources must be in compliance with the final standards no later than May 29, 2006.

Compliance with the emission limits is based on a rolling 12-month organic HAP emission rate that is determined each month. Each 12-month period is a compliance period. The initial compliance period, therefore, is the 12-month period beginning on the compliance date. If the compliance date occurs on any day other than the first day of a month, then the initial compliance period begins on the compliance date and extends through the end of that month plus the following 12 months. We have defined "month" as a calendar month or a pre-specified period of 28 to 35 days to allow for flexibility at sources where data are based on a business accounting period.

Being "in compliance" means that the owner or operator of the affected source meets the requirements to achieve the emission limitations during the initial compliance period. At the end of the initial compliance period, the owner or operator must use the data and records generated to determine whether or not the affected source is in compliance with the organic HAP emission limit and other applicable requirements for that period. If the affected source does not meet the applicable limits and other requirements, it is out of compliance for the entire initial compliance period.

Emission Limits. There are several options for complying with the emission limits, and the testing and initial compliance requirements vary

accordingly. You may use different compliance options for different coating operations within the affected source and also for the same coating operation at different times.

Option 1: Compliance based on compliant materials. If you demonstrate compliance based on the use of compliant materials, you must determine the mass of organic HAP in each coating, thinner, and cleaning material used and the volume fraction of coating solids in each coating used each month during the compliance period. You must demonstrate that the organic HAP content of each coating meets the applicable emission limit, and that you use no thinners or cleaning materials that contain organic HAP.

To determine the mass fraction of organic HAP in coatings, thinners, and cleaning materials and the volume fraction of coating solids, you may either rely on manufacturer's data or on test results using the test methods listed below. You may use alternative test methods provided you get EPA approval in accordance with the General Provisions in 40 CFR 63.7(f).

- For mass fraction of organic HAP, use Method 311 of 40 CFR part 63, appendix A. If there are discrepancies between the methods for determining the mass fraction of organic HAP, they must be resolved through consultation with the regulatory compliance authority.
- The promulgated rule allows you to use non-aqueous volatile matter as a surrogate for organic HAP, which includes all organic HAP plus all other organic compounds, and excluding water. If you choose this option, then you must use Method 24 of 40 CFR part 60, appendix A.
- For volume fraction of coating solids, use one of these options: (1) Use either of the two referenced ASTM methods (D2697–86, 1998, or D6093–97); or (2) calculate using the total volatile matter content of the coating and the average density of the volatile matter in the coating. If the mass fraction of organic HAP in a coating is zero, as determined through test results or manufacturer's formulation data, then the source is not required to determine the volume fraction of coating solids and density or to calculate the organic HAP content.

To demonstrate initial compliance based on the material used, you must demonstrate that the organic HAP content of each coating meets the applicable emission limit, and that you use no organic HAP thinners or cleaning materials.

Option 2: Compliance based on the emission rate without add-on controls. If you demonstrate compliance based on the emission rate without add-on controls option, you must determine the mass fraction of organic HAP in all coatings, thinners, and cleaning materials and the volume fraction of coating solids used each month during the compliance period. You would use the same methods as described above for Option 1. You would also do the following.

- Determine the quantity of each coating, thinner, and cleaning material used.
- Calculate the total mass of organic HAP in all materials and total volume of coating solids used each month. You may subtract the total mass of organic HAP contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266.
- Calculate the total mass of organic HAP emissions and total volume of coating solids for the compliance period by adding together all the monthly values for mass of organic HAP and for volume of coating solids for the 12 months in the compliance period.
- Calculate the ratio of the total mass of organic HAP for the materials used to the total volume of coating solids used for the compliance period.
- Record the calculations and results and include them in your Notification of Compliance Status.

Option 3: Compliance based on the emission rate with add-on controls. If you use a capture system and add-on control device, other than a solvent recovery system for which you conduct a liquid-liquid material balance, you must meet the following testing and compliance requirements.

- Conduct an initial performance test to determine the capture and control efficiencies of the equipment and to establish operating limits to be achieved on a continuous basis. The performance test would have to be completed by the compliance date for existing sources and no later than 180 days after the compliance date for new or reconstructed affected sources.
- Determine the mass fraction of organic HAP in each material and the volume fraction of coating solids for each coating used each month of the compliance period.
- Calculate the total mass of organic HAP in all materials and total volume of coating solids used each month in the coating operation or group of coating operations. You may subtract from the total mass of organic HAP the amount contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266.
- Calculate the organic HAP emission reductions for the controlled coating operations using the capture and control efficiencies determined during the performance test and the total mass of organic HAP in materials used in controlled coating operations.
- Calculate the total mass of organic HAP emissions and total volume of coating solids for the compliance period by adding together all monthly values for mass of organic HAP and for volume of coating solids for the 12 months in the compliance period.
- Calculate the ratio of the total mass of organic HAP emissions to the total volume of coating solids used during the compliance period.
- Record the calculations and results and include them in the Notification of Compliance Status.

If you use a capture system and add-on control device, other than a solvent recovery system for which you conduct liquid-liquid material balances, you must determine both the efficiency of the capture system and the destruction or removal efficiency of the control device. To determine the capture efficiency, you must either verify the presence of a PTE using EPA Method 204 of 40 CFR part 51, appendix M (and all materials must be applied and dried within the enclosure); or use one of the protocols in § 63.4765 of the final rule to measure capture efficiency. If you have a PTE and all the materials are applied and dried within the enclosure and you route all exhaust gases from the enclosure to a control device, then you must assume 100 percent capture.

To determine the destruction or removal efficiency of the control device, you must conduct measurements of the inlet and outlet gas streams. The test would consist of three runs, each run lasting at least 1 hour, using the following EPA Methods in 40 CFR part 60, appendix A:

- Method 1 or 1A for selection of the sampling sites.
- Method 2, 2A, 2C, 2D, 2F, or 2G to determine the gas volumetric flow rate.
- Method 3, 3A, or 3B for gas analysis to determine dry molecular weight.
- Method 4 to determine stack moisture.
- Method 25 or 25A to determine organic volatile matter concentration. Alternatively, any other test method or data that have been validated according to the applicable procedures in Method 301 of 40 CFR part 63, appendix A, and approved by the Administrator, may be used.

If you use a solvent recovery system, you could determine the overall control efficiency using a liquid-liquid material balance instead of conducting an initial

performance test. If you use the material balance alternative, you must measure the amount of all materials used in the coating operations served by the solvent recovery system during each month of the compliance period and determine the volatile matter contained in these materials. You must measure the amount of volatile matter recovered by the solvent recovery system each month of the compliance period. Then you must compare the amount recovered for the 12-month compliance period to the amount used to determine the overall control efficiency, and apply this efficiency to the ratio of organic HAP to coating solids for the materials used. You must record the calculations and results and include them in your Notification of Compliance Status.

Operating Limits. As mentioned above, you must establish operating limits as part of the initial performance test of a capture system and control device, other than a solvent recovery system for which you conduct liquid-liquid material balances. The operating limits are the minimum or maximum (as applicable) values achieved for capture systems and control devices during the most recent performance test that demonstrated compliance with the emission limits.

The final rule specifies the parameters to monitor for the types of emission control systems commonly used in the industry. You must install, calibrate, maintain, and continuously operate all monitoring equipment according to the manufacturer's specifications and ensure that the continuous parameter monitoring systems (CPMS) meet the requirements in § 63.4768 of the final rule. If you use control devices other than those identified in the final rule, you must submit the operating parameters to be monitored to the Administrator for approval. The authority to approve the parameters to be monitored is retained by EPA and is not delegated to States.

If you use a thermal oxidizer, you must continuously monitor the appropriate temperature and record it at least every 15 minutes. The temperature monitor is placed in the firebox or in the duct immediately downstream of the firebox before any substantial heat exchange occurs. The operating limit would be the average temperature measured during the performance test and, for each consecutive 3-hour period, the average temperature would have to be at or above this limit.

If you use a catalytic oxidizer, you may choose from two methods to determine operating limits. In the first method, you must continuously monitor the temperature immediately before and after the catalyst bed and record it at least every 15 minutes. The operating limits would be the average temperature before the catalyst bed and the average temperature difference across the catalyst bed during the performance test and, for each 3-hour period, the average temperature and the average temperature difference would have to be at or above these limits. In the alternative method, you must continuously monitor the temperature immediately before the catalyst bed and record it at least every 15 minutes. The operating limit would be the average temperature before the catalyst bed during the performance test and, for each 3-hour period, the average temperature would have to be at or above these limits. As part of the alternative method, you must also develop and implement an inspection and maintenance plan for your catalytic oxidizer.

If you use a carbon adsorber and do not conduct liquid-liquid material balances to demonstrate compliance, you must monitor the carbon bed temperature after each regeneration and the total amount of steam or nitrogen used to desorb the bed for each regeneration. The operating limits would be the carbon bed temperature (not to be exceeded) and the amount of steam or nitrogen used for desorption (to be met as a minimum).

If you use a condenser, you must monitor the outlet gas temperature to ensure that the air stream is being cooled to a low enough temperature. The operating limit would be the average condenser outlet gas temperature measured during the performance test and, for each consecutive 3-hour period, the average temperature would have to be at or below this limit.

If you use a concentrator, you must monitor the desorption concentrate stream gas temperature and the pressure drop of the dilute stream across the concentrator. The operating limits would be the desorption concentrate gas stream temperature (to be met as a minimum) and the dilute stream pressure drop (not to be exceeded).

For each capture system that is not a PTE, you must establish operating limits for gas volumetric flow rate or duct static pressure for each enclosure or capture device. The operating limit would be the average volumetric flow rate or duct static pressure during the performance test, to be met as a minimum. For each capture system that is a PTE, the operating limit would require the average facial velocity of air through all natural draft openings to be at least 200 feet per minute or the pressure drop across the enclosure to be at least 0.007 inches water.

Work Practices. If you use the emission rate with add-on controls option, you must develop and implement on an ongoing basis a work practice plan for minimizing organic HAP emissions from storage, mixing, material handling, and waste handling operations. You must make the plan available for inspection if the Administrator requests to see it. We believe work practice standards are appropriate to further reduce emissions.

If your affected source has an existing documented plan that incorporates steps taken to minimize emissions from the aforementioned sources, then your existing plan may be used to satisfy the requirement for a work practice plan.

If you use a capture system and control device for compliance, you must develop and operate according to a SSMP during periods of SSM of the capture system and control device.

E. What Are the Continuous Compliance Requirements?

Emission Limits.

Option 1: Compliance based on compliant materials. If you demonstrate compliance with the emission limits based on compliant materials, you must demonstrate continuous compliance if, for each 12-month compliance period, the organic HAP content of each coating used does not exceed the applicable emission limit and you use no thinner or cleaning material that contains organic HAP. You must follow the same procedures for determining compliance that you used for the initial compliance period.

Option 2: Compliance based on the emission rate without add-on controls. If you demonstrate compliance with this option, you must demonstrate continuous compliance if, for each 12-month compliance period, the rolling 12-month emission rate is less than or equal to the applicable emission limit. You must follow the same procedures for calculating the rolling 12-month emission rate that you used for the initial compliance period.

Option 3: Compliance based on the emission rate with add-on controls. For each coating operation on which you use a capture system and control device other than a solvent recovery system for which you conduct a liquid-liquid material balance, the continuous parameter monitoring results for each month would affect your compliance determination. If the monitoring results indicate no deviations from the operating limits and bypass line requirements, you would assume the capture system and control device are

achieving the same percentage destruction or removal efficiency as they did during the most recent performance test when compliance was demonstrated. You would then apply this percentage reduction to the total mass of organic HAP in materials used in controlled coating operations to determine the rolling 12-month emission rate for those operations. If there were any deviations from the operating limits during the month or any bypasses of the control device, you must account for them in the calculation of the monthly emissions by assuming the capture system and control device were achieving zero emission reduction during the periods of deviation. Then, you would determine the rolling 12-month emission rate by dividing the total mass of organic HAP emissions by the total volume of coating solids used during the 12-month compliance period. Every month, you must calculate the emission rate for the previous 12-month period.

For each coating operation on which you use a solvent recovery system and conduct a liquid-liquid material balance each month, you must use the liquid-liquid material balance to determine control efficiency. To determine the overall control efficiency, you must measure the amount of all materials used during each month and determine the volatile matter content of these materials. You must also measure the amount of volatile matter recovered by the solvent recovery system during the month, calculate the overall control efficiency, and apply it to the total mass of organic HAP in the materials used to determine total organic HAP emissions. Then, you must determine the 12-month organic HAP emission rate in the same manner as described above.

Operating Limits. If you use an emission capture system and control device, the final rule requires you to achieve, on a continuous basis, the operating limits you establish during the performance test. If the continuous monitoring shows that the capture system and control device are operating outside the range of values established during the performance test, you have deviated from the established operating limits.

If you operate a capture and control system that is equipped with a bypass line, you must demonstrate that organic HAP emissions collected by the capture system are being routed to the control device at all times while controlled coating operations are being conducted. This demonstration is accomplished by monitoring for potential bypass of the control device. You may choose from the following four monitoring procedures:

- Flow control position indicator to provide a record of whether the exhaust stream is directed to the control device;
- Car-seal or lock-and-key valve closures to secure the bypass line valve in the closed position when the control device is operating;
- Valve closure monitoring to ensure any bypass line valve or damper is closed when the control device is operating; or
- Automatic shutdown system to stop the coating operation when flow is diverted from the control device.

If the bypass monitoring procedures indicate that emissions are not routed to the control device, you have deviated from the emission limits.

Work Practices. If you use the emission rate with add-on controls option, you must implement, on an ongoing basis, the work practice plan you developed during the initial compliance period. If you did not develop a plan for reducing organic HAP emissions or you do not implement the plan, this would be a deviation from the work practice standard.

If your affected source has an existing documented plan that incorporates steps taken to minimize emissions from the aforementioned sources, then your existing plan may be used to satisfy the requirement for a work practice plan.

If you use a capture system and control device for compliance, you must operate according to your SSMP during periods of SSM of the capture system and control device.

F. What Are the Notification, Recordkeeping, and Reporting Requirements?

You are required to comply with the applicable requirements in the NESHAP General Provisions, subpart A of 40 CFR part 63, as described in the final rule. The General Provisions notification requirements include: initial notifications, notification of performance test if you are complying using a capture system and control device, notification of compliance status, and additional notifications required for affected sources with continuous monitoring systems. The General Provisions also require certain records and periodic reports.

Initial Notifications. If the final rule applies to you, you must send a notification to the EPA Regional Office in the region where your source is located, and to your State agency, within 120 days after the date of initial startup or September 25, 2003, whichever is later. The report notifies us and your State agency that you have constructed a new source, reconstructed an existing source, or you have an existing source that is subject to the final rule. Thus, it allows you and the permitting authority to plan for compliance activities. You will also need to send a notification of planned construction or reconstruction of a source that would be subject to the final rule and apply for approval to construct or reconstruct.

Notification of Performance Test. If you demonstrate compliance by using a capture system and control device for which you do not conduct a liquid-liquid material balance, you must conduct a performance test. The performance test must be no later than 180 days after initial startup or November 24, 2003, whichever is later for a new or reconstructed affected source and no later than the compliance date for an existing affected source (May 29, 2006). You must notify us (or the delegated State or local agency) at least 60 calendar days before the performance test is scheduled to begin, as indicated in the General Provisions for the NESHAP.

Notification of Compliance Status. You must send us a Notification of Compliance Status within 30 days after the end of the initial compliance period. Your compliance procedures would depend on which compliance option you choose. In the notification, you must certify whether the affected source has complied with the promulgated standards, identify the option(s) you used to demonstrate initial compliance, and provide calculations supporting the compliance demonstration.

If you elect to comply by using a capture system and control device for which you conduct performance tests, you must provide the results of the tests. Your notification would also include the measured range of each monitored parameter and the operating limits established during the performance test, and information showing whether the source has complied with its operating limits during the initial compliance period.

Recordkeeping Requirements. You must keep records of reported information and all other information necessary to document compliance with the promulgated rule for 5 years. As required under the General Provisions, records for the 2 most recent years must be kept on-site; the other 3 years may be kept off-site. Records pertaining to the design and operation of the control and monitoring equipment must be kept for the life of the equipment.

Depending on the compliance option that you choose, you may need to keep

records of the organic HAP content, volatile matter content, coating solids content, and quantity of the coatings, thinners, and cleaning materials used during each compliance period.

If you demonstrate compliance by using a capture system and control device, you must keep records of the following:

- All required measurements, calculations, and supporting documentation needed to demonstrate compliance with the standards;
- All results of performance tests and parameter monitoring;
- All information necessary to demonstrate conformance with the requirements for minimizing emissions from mixing, storage, and handling operations for coatings, thinners, and cleaning materials;
- All information necessary to demonstrate conformance with the affected source's SSMP when the plan procedures are followed;
- The occurrence and duration of each SSM of the emission capture system and control device;
- Actions taken during SSM that are different from the procedures specified in the affected source's SSMP; and
- Each period during which a CPMS is malfunctioning or inoperative (including out-of-control periods).

The final rule requires you to collect and keep records according to certain minimum data requirements for the CPMS. Failure to collect and keep the specified minimum data would be a deviation that is separate from any emission limits, operating limits, or work practice standards.

Deviations, as determined from these records, must be recorded and also reported. A deviation is any instance when any requirement or obligation established by the final rule is not met, including but not limited to the emission limits, operating limits, and work practice standards.

If you use a capture system and control device to reduce organic HAP emissions, you must make your SSMP available upon request for inspection by the Administrator. The plan will stay in your records for the life of the affected source or until the affected source is no longer subject to the promulgated standards. If you revise the plan, you must keep the previous superceded versions on record for 5 years following the revision.

Periodic Reports. Each reporting year is divided into two semiannual reporting periods. If no deviations occur during a semiannual reporting period, you must submit a semiannual report stating that the affected source has been in continuous compliance. If deviations occur, you must include them in the report as follows:

- Report each deviation from the emission limits.
- Report each deviation from the work practice standards if you use an emission capture system and control device.
- If you use an emission capture system and control device other than a solvent recovery system for which you conduct liquid-liquid material balances, report each deviation from an operating limit and each time a bypass line diverts emissions from the control device to the atmosphere during a controlled coating operation.
- Report other specific information on the periods of time and details of deviations that occurred.

You must include in each semiannual report an identification of the compliance option(s) you used and of time periods when you changed to another option.

Other Reports. You must submit reports for periods of SSM of the capture system and control device. If the procedures you follow during any SSM are inconsistent with your plan, you must report those procedures with your semiannual reports in addition to immediate reports required by § 63.10(d)(5)(ii) of the NESHAP General Provisions.

IV. What Are the Environmental, Energy, Cost, and Economic Impacts?

A. What Are the Air Impacts?

The final rule will reduce nationwide organic HAP emissions from existing major sources by approximately 4,400 Mg/yr (4,900 tpy). This represents a reduction of 63 percent from the baseline organic HAP emissions of 7,000 Mg/yr (7,800 tpy).

B. What Are the Non-Air Health, Environmental, and Energy Impacts?

Based on information from the industry survey responses, we found no indication that the use of low- or no-organic-HAP content coatings, thinners, and cleaning materials at existing sources would result in any increase or decrease in non-air health, environmental, and energy impacts. There would be no change in utility requirements associated with the use of these materials, so there would be no change in the amount of energy consumed as a result of the material conversion. Also, there would be no significant change in the amount of materials used or the amount of waste produced.

C. What Are the Cost and Economic Impacts?

Total annual cost of compliance for the estimated 215 existing major sources was projected to be $22.5 million. Due to consolidation throughout the industry, there is not expected to be any net growth within the wood building products surface coating industry during the next 5 years. Therefore, there are no projected impacts for new sources.

We performed an economic impact assessment (EIA) to provide an estimate of the facility and market impacts of the final rule as well as the social costs. In general, we expect the economic impacts of the promulgated standards to be minimal, with expected price increases for affected wood building products surface coating facilities of only 0.04 percent.

For affected sources, the median profit margin will remain unchanged, with small entities being slightly more affected by the final rule. The median profit margin for small entities is expected to decrease from 2.8 percent to 2.7 percent while the median profit margin for large entities is expected to decrease from 3.1 percent to 3.0 percent. Therefore, we do not expect an adverse economic impact on the industry as a whole.

The distribution of costs across wood building products surface coating facilities is slanted toward the lower impact levels with many facilities incurring costs related only to annually recurring monitoring, recordkeeping, and reporting, and for only a few sources that choose to use their existing add-on controls, initial performance testing and parameter monitoring. The EIA indicates that these regulatory costs are expected to represent only 0.2 percent of the value of coating services, which should not cause producers to cease or alter their current operations. Hence, no firms or facilities are at risk of closure because of the promulgated standards. For more information, refer to the "Economic Impact Analysis for the Wood Building Products NESHAP" in the docket.

V. Statutory and Executive Order Reviews

A. Executive Order 12866, Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory

action" as one that is likely to result in standards that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that the final rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review."

B. Paperwork Reduction Act

The information collection requirements in the final rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 2034.02) and a copy may be obtained from Susan Auby by mail at the Collection Strategies Division (MD–2822T), U.S. EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov,* or by calling (202) 566–1672. A copy may also be downloaded from the internet at *http://www.epa.gov/icr.* The information requirements are not effective until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to EPA policies set forth in 40 CFR part 2, subpart B.

The final rule requires record maintenance of all coatings, thinners, and cleaning materials data and calculations used to demonstrate compliance. This information includes the volume of coatings and other materials used during each compliance period, mass fraction of organic HAP, density, and, for coatings only, volume fraction of coating solids (as applicable).

If an add-on control device is used, records will be kept of the capture efficiency of the capture device, destruction or removal efficiency of the control device, and the monitored operating parameters. In addition, records will be kept of each calculation of the affected sourcewide emissions for each compliance period and all data, calculations, test results, and other supporting information.

The monitoring, recordkeeping, and reporting burden for this collection (averaged over the first 3 years after the effective date of the final rule) is estimated to be approximately 2,200 labor hours per year at a total annual cost of $128,000. For sources assumed to use existing add-on control devices, this estimate includes a one-time performance test and report (with repeat tests where needed) and a one-time submission of a SSMP with semiannual reports for any event when the procedures in the plan were not followed. For all sources, this estimate includes training, reading the regulation, and recordkeeping. There are no capital/startup costs associated with the monitoring requirements.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information; processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule. The EPA has also determined that the rule will not have a significant economic impact on a substantial number of small entities. For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business whose parent company has a maximum of 500 employees according to Small Business Administration (SBA) size standards; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; or (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant impact on a substantial number of small entities. We have conducted an assessment of the standards on small businesses within the wood building products industries. Based on SBA size definitions for the affected industries (NAICS 321211—Hardwood Veneer and Plywood Manufacturing, NAICS 321212—Softwood Veneer and Plywood Manufacturing, NAICS 321219—Reconstituted Wood Product Manufacturing, NAICS 321911—Wood Window and Door Manufacturing, NAICS 321918—Other Millwork (including Flooring), NAICS 321999—All Other Miscellaneous Wood Product Manufacturing) and reported sales and employment data, EPA's survey identified four out of the 42 known facilities (four out of the 17 known companies) as being owned by small businesses that will be affected by the final rule. Small businesses own 10 percent of the facilities and 24 percent of the companies within the source category that will be affected by the final rule and are expected to incur 10 percent of the total industry compliance costs of $22.5 million. There are no small firms with compliance costs equal to or greater than 1 percent of their sales. The EPA believes the sample of firms included in this small entity analysis is representative of the small firms that may be affected by the promulgated rule.

The EPA also notes that, while economies of scale will require individual small firms to pay a somewhat higher proportion of revenues than large firms for compliance, the burden on most small firms is quite low nevertheless. The median compliance cost is well below 1 percent of sales for both small and large firms affected by the promulgated standards (0.18 percent and 0.02 percent of sales for small and large firms, respectively). For more information, please consult the report, "Economic Impact Analysis for the

Wood Building Products NESHAP," (Docket ID No. OAR–2003–0002, formerly Docket No. A–97–52).

Although the final rule will not have a significant economic impact on a substantial number of small entities, EPA nonetheless has tried to reduce the impact of the final rule on small entities, consistent with our obligations under the CAA. Along with soliciting input from small entities during the data-gathering phase of the rulemaking, three separate small business outreach activities were conducted. First, the Western States Air Resources Council was contacted about small business participation in a meeting held on October 12, 1999. (For more information, see the docket.) The second activity was a random screening of approximately 250 affected companies within the wood building products surface coating industry. Internet searches led to a list of ten possible affected small entities. These small entities were then invited to join a small business panel to assist in the development of the wood building products (surface coating) NESHAP. The third outreach program was conducted through SCOPe, which is a cooperative agreement between the EPA and the National Association of Schools of Public Affairs and Administration. Meetings are facilitated by local public affairs and administration faculty and are used to inform small entities of pending regulations. The informal meetings allow potentially affected facilities to voice concerns which are then communicated to the EPA prior to the rulemaking. According to outreach in Georgia, Oregon, North Carolina, and Pennsylvania, small entities are aware of low- or no-HAP coatings that have the potential to reduce HAP emissions. Many of the small entities currently use low- or no-HAP coatings and agree that they are often less expensive than higher-HAP options, do not affect the quality of the final product, and the choices are becoming more widespread. Therefore, small entities will not be adversely affected by the use of low- or no-HAP coatings.

Another aspect of the small business outreach was the participation in meetings that focus on impacts on small entities. The EPA representatives for the wood building products (surface coating) NESHAP have attended conferences and trade association meetings that have included small entities. By attending conferences sponsored by the Center for Advanced Wood Processing, the Laminating Materials Association, and RadTech International North America, and being involved in coatings-related industry and trade association meetings, information about the wood building products NESHAP has been shared with other communities concerned with impacts on small entities.

We believe these actions will significantly reduce the compliance burden for small entities, thereby mitigating potential impacts and preventing any duplication of effort. In addition, the final rule contains compliance options which give small entities flexibility in choosing the most cost effective and least burdensome alternative for their operations. For example, a facility could purchase and use low- or no-HAP coatings, thinners, and cleaning materials (*i.e.*, pollution prevention) that meet the standards rather than being required to purchase add-on control systems. The low- or no-HAP option can be demonstrated with minimum burden by using already-maintained purchase and usage records. No testing of materials is required, as the facility owners could show that their coatings meet the emission limits by providing formulation data supplied by the manufacturer. Furthermore, the final rule includes the minimum monitoring, recordkeeping, and reporting requirements needed for enforcement and compliance assurance.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more to State, local, and tribal governments, in the aggregate, or the private sector in any 1 year nor does the final rule significantly or uniquely impact small governments, because it contains no requirements that apply to such governments or impose obligations upon them. Thus, today's rule is not subject to the requirements of sections 202 and 205 of the UMRA.

E. Executive Order 13132, Federalism

Executive Order 13132, Federalism (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the affected sources are owned or operated by State governments. Thus, the requirements of section 6 of the Executive Order do not apply to the final rule.

F. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure

"meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175, because tribal governments do not own or operate any sources subject to the amendments. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045, "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997), applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045 because it is based on technology performance and not on health or safety risks.

H. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211, "Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use (66 FR 28355, May 22, 2001), because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. No. 104–113, (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (e.g., materials specifications, test methods, sampling procedures, business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

This rulemaking involves technical standards. The EPA cites the following standards in this final rule: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 24, 25, 25A, 204, 204A-F, and 311. Consistent with the NTTAA, EPA conducted searches to identify VCS in addition to these EPA methods. No applicable VCS were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, 204, 204A-F, and 311. The search and review results have been documented and are available in the docket (Docket ID No. OAR–2003–0002, formerly Docket No. A–97–52) of the final rule.

The three VCS were identified as acceptable alternatives to EPA test methods for the purposes of the rule.

The VCS ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," is cited in this rule for its manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas. This part of ANSI/ASME PTC 19.10–1981, Part 10, is an acceptable alternative to Method 3B.

The two VCS, ASTM D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings," and ASTM D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer," are cited in this rule as acceptable alternatives to EPA Method 24 for measuring volume of solids in coatings. Currently, Method 24 does not have a procedure for determining the volume of solids in coatings. These standards fill a void in EPA Method 24 which directs that volume solids content be calculated from the coating manufacturer's formulation. The final rule does allow for the use of the volume solids content values calculated from the coating manufacturer's formulation; however, test results (if available) will take precedence if the test results do not agree with the calculated values.

Six VCS: ASTM D1475–90, ASTM D2369–95, ASTM D3792–91, ASTM D4017–96a, ASTM D4457–85 (Reapproved 1991), and ASTM D5403–93, are already incorporated by reference (IBR) in EPA Method 24. In addition, we are separately specifying the use of ASTM D1475–90 for measuring the density of individual coating components, such as organic solvents.

Five VCS: ASTM D1979–91, ASTM D3432–89, ASTM D4747–87, ASTM D4827–93, and ASTM PS 9–94 are IBR in EPA Method 311.

In addition to the VCS we are using in the final rule, the search for emissions measurement procedures identified 14 other VCS. We determined that 11 of these 14 standards identified for measuring emissions of the HAP or surrogate subject to emission standards in the final rule were impractical alternatives to EPA test methods for the purposes of the final rule. Therefore, EPA does not intend to adopt these standards. (See Docket ID No. OAR–2003–0002, formerly Docket No. A–97–52, for further information on the methods.)

Sections 63.4730, 63.4741, 63.4761, 63.4765, 63.4766, and Table 3 to promulgated subpart QQQQ lists the EPA testing methods included in the final rule. Under § 63.8 of subpart A of the General Provisions, a source may apply to EPA for permission to use alternative monitoring in place of any of the EPA testing methods.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. § 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. The final rule is not a "major rule" as defined by 5 U.S.C. 804(2). The rule will be effective May 28, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of

Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Section 63.14 is amended by revising paragraphs (b)(24) and (25) and (i)(3) to read as follows:

§ 63.14 Incorporations by reference

* * * * *

(b) * * *

(24) ASTM D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings," IBR approved for §§ 63.4141(b)(1), 63.4741(b)(1), 63.4941(b)(1), and 63.5160(c).

(25) ASTM D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer," IBR approved for §§ 63.4141(b)(1), 63.4741(b)(1), 63.4941(b)(1), and 63.5160(c).

* * * * *

(i) * * *

(3) ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," IBR approved for §§ 63.865(b), 63.3360(e)(1)(iii), 63.4166(a)(3), 63.4766(a)(3), 63.4965(a)(3), 63.5160(d)(1)(iii), 63.9307(c)(2), and 63.9323(a)(3).

* * * * *

■ 3. Part 63 is amended by adding subpart QQQQ to read as follows:

Subpart QQQQ—National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products

Sec.

What This Subpart Covers

63.4680 What is the purpose of this subpart?
63.4681 Am I subject to this subpart?
63.4682 What parts of my plant does this subpart cover?
63.4683 When do I have to comply with this subpart?

Emission Limitations

63.4690 What emission limits must I meet?
63.4691 What are my options for meeting the emission limits?
63.4692 What operating limits must I meet?
63.4693 What work practice standards must I meet?

General Compliance Requirements

63.4700 What are my general requirements for complying with this subpart?
63.4701 What parts of the General Provisions apply to me?

Notifications, Reports, and Records

63.4710 What notifications must I submit?
63.4720 What reports must I submit?
63.4730 What records must I keep?
63.4731 In what form and for how long must I keep my records?

Compliance Requirements for the Compliant Material Option

63.4740 By what date must I conduct the initial compliance demonstration?
63.4741 How do I demonstrate initial compliance with the emission limitations?
63.4742 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate Without Add-On Controls Option

63.4750 By what date must I conduct the initial compliance demonstration?
63.4751 How do I demonstrate initial compliance with the emission limitations?
63.4752 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate With Add-On Controls Option

63.4760 By what date must I conduct performance tests and other initial compliance demonstrations?
63.4761 How do I demonstrate initial compliance?
63.4762 [Reserved]
63.4763 How do I demonstrate continuous compliance with the emission limitations?
63.4764 What are the general requirements for performance tests?
63.4765 How do I determine the emission capture system efficiency?
63.4766 How do I determine the add-on control device emission destruction or removal efficiency?
63.4767 How do I establish the emission capture system and add-on control device operating limits during the performance test?
63.4768 What are the requirements for continuous parameter monitoring system installation, operation, and maintenance?

Other Requirements and Information

63.4780 Who implements and enforces this subpart?
63.4781 What definitions apply to this subpart?

Tables to Subpart QQQQ of Part 63

Subpart QQQQ—National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products

What This Subpart Covers

§ 63.4680 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for wood building products surface coating sources. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§ 63.4681 Am I subject to this subpart?

(a) Except as provided in paragraphs (c) and (d) of this section, the source category to which this subpart applies is surface coating of wood building products, which means the application of coatings using, for example, roll coaters or curtain coaters in the finishing or laminating of any wood building product that contains more than 50 percent by weight wood or wood fiber excluding the weight of any glass components, and is used in the construction, either interior or exterior, of a residential, commercial, or institutional building. The wood building products source category includes the subcategories listed in paragraphs (a)(1) through (5) of this section.

(1) *Doors, windows, and miscellaneous.* The doors, windows, and miscellaneous subcategory includes doors, windows, finished doorskins, and door and window components such as millwork, moulding, or trim, and other miscellaneous wood building products including, but not limited to, all moulding and trim, shingles, and shutters.

(2) *Flooring.* The flooring subcategory includes solid wood flooring, engineered wood flooring, and wood laminate flooring.

(3) *Interior wall paneling and tileboard.* The interior wall paneling and tileboard subcategory includes interior wall paneling products. Tileboard is a premium interior wall paneling product.

(4) *Other interior panels.* The other interior panel subcategory includes panels that are sold for uses other than interior wall paneling, such as coated particleboard, hardboard, and perforated panels.

(5) *Exterior siding and primed doorskins.* The exterior siding and primed doorskins subcategory includes lap or panel siding, trimboard, and primed doorskins. Doorskins that are coated with more than primer are included in the doors, windows, and miscellaneous subcategory.

(b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.4682, that uses 4,170 liters (1,100 gallons) per year, or more, of coatings in the source category defined in paragraph (a) of this section and that is a major source, is located at a major source, or is part of a major source of emissions of hazardous air pollutants (HAP). A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (Mg) (10 tons) or more per year or any combination of HAP at a rate of 22.68 Mg (25 tons) or more per year.

(c) This subpart does not apply to surface coating and other operations that meet the criteria of paragraphs (c)(1) through (5) of this section.

(1) Surface coating in the processes identified in paragraphs (c)(1)(i) through (xi) of this section that are part of plywood and composite wood product manufacturing and would be subject to subpart DDDD of this part when promulgated:

(i) Edge seals applied to a reconstituted wood product or plywood.

(ii) Anti-skid coatings applied to reconstituted wood products.

(iii) Primers applied to waferboard or oriented strand board (OSB) siding at the site of manufacture of the waferboard or OSB siding.

(iv) Surface coating that occurs during the manufacture of fiberboard, including application of clay slurry, titanium dioxide, or asphalt coatings to fiberboard.

(v) Painting of company logo information on plywood or reconstituted wood products.

(vi) Application of trademarks and grade stamp to reconstituted wood products or plywood.

(vii) Application of nail lines to reconstituted wood products.

(viii) Synthetic patches, wood patches, and wood putty applied to plywood.

(ix) Application of concrete forming and other drying or tempering oils to wood building products.

(x) Veneer composing.

(xi) Application of shelving edge fillers to reconstituted wood products.

(2) Surface coating of wood furniture subject to subpart JJ of this part, including finishing, gluing, cleaning, and washoff operations associated with the production of wood furniture or wood furniture components. The surface coating of millwork and trim associated with cabinet manufacturing is also subject to subpart JJ of this part and not to this subpart.

(3) Surface coating that occurs during the manufacture of prefabricated homes and mobile/modular homes.

(4) Surface coating that occurs at research or laboratory facilities; janitorial, building, and facility construction or maintenance operations; or hobby shops that are operated for personal rather than for commercial purposes. The source category also does not include non-commercial coating operations or coating applications using handheld nonrefillable aerosol containers.

(5) Wood treatment or fire retardant operations located at wood building products sources that involve impregnating the wood product with the wood treatment chemicals or fire retardant by using a retort or other pressure vessel.

(d) If you have an affected source with surface coating operations subject to the requirements of another subpart of this part that account for at least 95 percent of the total (annual) coating usage for the affected source, you may demonstrate compliance with the requirements, including all applicable emission limit(s), for that subpart for the entire affected source.

§ 63.4682 What parts of my plant does this subpart cover?

(a) This subpart applies to each new, reconstructed, and existing affected source.

(b) The affected source is the collection of all of the items listed in paragraphs (b)(1) through (4) of this section that are used for surface coating of wood building products:

(1) All coating operations as defined in § 63.4781;

(2) All storage containers and mixing vessels in which coatings, thinners, and cleaning materials are stored or mixed;

(3) All manual and automated equipment and containers used for conveying coatings, thinners, and cleaning materials; and

(4) All storage containers and all manual and automated equipment and containers used for conveying waste materials generated by a coating operation.

(c) An affected source is a new affected source if its construction commenced after June 21, 2002, and the construction is of a completely new wood building products surface coating source where previously no wood building products surface coating source had existed.

(d) An affected source is reconstructed if you meet the criteria as defined in § 63.2.

(e) An affected source is existing if it is not new or reconstructed.

§ 63.4683 When do I have to comply with this subpart?

The date by which you must comply with this subpart is called the compliance date. The compliance date for each type of affected source is specified in paragraphs (a) through (c) of this section. The compliance date begins the initial compliance period during which you conduct the initial compliance demonstration described in §§ 63.4740, 63.4750, and 63.4760.

(a) For a new or reconstructed affected source, the compliance date is the applicable date in paragraph (a)(1) or (2) of this section:

(1) If the initial startup of your new or reconstructed affected source is before May 28, 2003, the compliance date is May 28, 2003.

(2) If the initial startup of your new or reconstructed affected source occurs after May 28, 2003, the compliance date is the date of initial startup of your affected source.

(b) For an existing affected source, the compliance date is the date 3 years after May 28, 2003.

(c) For an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP emissions, the compliance date is specified in paragraphs (c)(1) and (2) of this section.

(1) For any portion of the source that becomes a new or reconstructed affected source subject to this subpart, the compliance date is the date of initial startup of the affected source or May 28, 2003, whichever is later.

(2) For any portion of the source that becomes an existing affected source subject to this subpart, the compliance date is the date 1 year after the area source becomes a major source or 3 years after May 28, 2003, whichever is later.

(d) You must meet the notification requirements in § 63.4710 according to the dates specified in that section and in subpart A of this part. Some of the notifications must be submitted before the compliance dates described in paragraphs (a) through (c) of this section.

Emission Limitations

§ 63.4690 What emission limits must I meet?

(a) For a new or reconstructed affected source, you must limit organic HAP emissions to the atmosphere to no more than the applicable emission limit(s) in Table 1 to this subpart, determined according to the requirements in §§ 63.4741, 63.4751, or 63.4761.

(b) For an existing affected source, you must limit organic HAP emissions to the atmosphere to no more than the applicable emission limit(s) in Table 2 to this subpart, determined according to the requirements in § 63.4741, § 63.4751, or § 63.4761.

(c) If the affected source applies coatings to products that are in different subcategories as described in § 63.4681(a), then you must demonstrate initial and continuous compliance by selecting one of the approaches described in paragraphs (c)(1) and (2) of this section.

(1) Conduct separate compliance demonstrations for each applicable subcategory emission limit and reflect these separate determinations in notifications, reports, and records required by §§ 63.4710, 63.4720, and 63.4730, respectively.

(2) Demonstrate compliance with the most stringent of the applicable subcategory emission limits.

§ 63.4691 What are my options for meeting the emission limits?

You must include all coatings, thinners, and cleaning materials used in the affected source when determining whether the organic HAP emission rate is equal to or less than the applicable emission limit in § 63.4690. To make this determination, you must use at least one of the three compliance options listed in paragraphs (a) through (c) of this section. You may apply any of the compliance options to an individual coating operation or to multiple coating operations as a group or to the entire affected source. You may use different compliance options for different coating operations or at different times on the same coating operation. However, you may not use different compliance options at the same time on the same coating operation. If you switch between compliance options for any coating operation or group of coating operations, you must document this switch as required by § 63.4730(c), and you must report it in the next semiannual compliance report required in § 63.4720.

(a) *Compliant material option.* Demonstrate that the organic HAP content of each coating used in the coating operation(s) is less than or equal to the applicable emission limit(s) in § 63.4690, and that each thinner and each cleaning material used contains no organic HAP. You must meet all the requirements of §§ 63.4740, 63.4741, and 63.4742 to demonstrate compliance with the emission limit using this option.

(b) *Emission rate without add-on controls option.* Demonstrate that, based on the coatings, thinners, and cleaning materials used in the coating operation(s), the organic HAP emission rate for the coating operation(s) is less than or equal to the applicable emission limit(s) in § 63.4690, calculated as a rolling 12-month emission rate and determined on a monthly basis. You must meet all the requirements of §§ 63.4750, 63.4751, and 63.4752 to demonstrate compliance with the emission limit using this option.

(c) *Emission rate with add-on controls option.* Demonstrate that, based on the coatings, thinners, and cleaning materials used in the coating operation(s) and the emission reductions achieved by emission capture systems and add-on controls, the organic HAP emission rate for the coating operation(s) is less than or equal to the applicable emission limit(s) in § 63.4690, calculated as a rolling 12-month emission rate and determined on a monthly basis. If you use this compliance option, you must also demonstrate that all emission capture systems and add-on control devices for the coating operation(s) meet the operating limits required in § 63.4692, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4761(j), and that you meet the work practice standards required in § 63.4693. You must meet all the requirements of §§ 63.4760 through 63.4768 to demonstrate compliance with the emission limits, operating limits, and work practice standards using this option.

§ 63.4692 What operating limits must I meet?

(a) For any coating operation(s) on which you use the compliant material option or the emission rate without add-on controls option, you are not required to meet any operating limits.

(b) For any controlled coating operation(s) on which you use the emission rate with add-on controls option, except those for which you use a solvent recovery system and conduct a liquid-liquid material balance according to § 63.4761(j), you must meet the operating limits specified in Table 3 to this subpart. These operating limits apply to the emission capture and control systems on the coating operation(s) for which you use this option, and you must establish the operating limits during the performance test according to the requirements in § 63.4767. You must meet the operating limits at all times after you establish them.

(c) If you use an add-on control device other than those listed in Table 3 to this subpart, or wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of alternative monitoring under § 63.8(f).

§ 63.4693 What work practice standards must I meet?

(a) For any coating operation(s) on which you use the compliant material option or the emission rate without add-on controls option, you are not required to meet any work practice standards.

(b) If you use the emission rate with add-on controls option, you must develop and implement a work practice plan to minimize organic HAP emissions from the storage, mixing, and conveying of coatings, thinners, and cleaning materials used in, and waste materials generated by, the coating operation(s); or you must meet an alternative standard as provided in paragraph (d) of this section. The plan must specify practices and procedures to ensure that, at a minimum, the elements specified in paragraphs (b)(1) through (5) of this section are implemented. You must make the plan available upon request for inspection by the Administrator.

(1) All organic-HAP coatings, thinners, cleaning materials, and waste materials must be stored in closed containers.

(2) Spills of organic-HAP coatings, thinners, cleaning materials, and waste materials must be minimized.

(3) Organic-HAP coatings, thinners, cleaning materials, and waste materials must be conveyed from one location to another in closed containers or pipes.

(4) Mixing vessels that contain organic-HAP coatings and other materials must be closed except when adding to, removing, or mixing the contents.

(5) Emissions of organic-HAP must be minimized during cleaning of storage, mixing, and conveying equipment.

(c) If your affected source has an existing documented plan that incorporates steps taken to minimize emissions from the sources specified in paragraphs (b)(1) through (5) of this section, then your existing plan can be used to meet the requirement for a work

practice plan as specified in paragraph (b) of this section.

(d) As provided in § 63.6(g), we, the U.S. Environmental Protection Agency (U.S. EPA), may choose to grant you permission to use an alternative to the work practice standards in this section.

General Compliance Requirements

§ 63.4700 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations in this subpart as specified in paragraphs (a)(1) and (2) of this section.

(1) Any coating operation(s) for which you use the compliant material option or the emission rate without add-on controls option, as specified in § 63.4691(a) and (b), must be in compliance with the applicable emission limit in § 63.4690 at all times.

(2) Any coating operation(s) for which you use the emission rate with add-on controls option, as specified in § 63.4691(c), must be in compliance with the emission limitations as specified in paragraphs (a)(2)(i) through (iii) of this section.

(i) The coating operation(s) must be in compliance with the applicable emission limit in § 63.4690 at all times, except during periods of startup, shutdown, and malfunction (SSM).

(ii) The coating operation(s) must be in compliance with the operating limits for emission capture systems and add-on control devices required by § 63.4692 at all times, except during periods of SSM, and except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4761(j).

(iii) The coating operation(s) must be in compliance with the work practice standards in § 63.4693 at all times.

(b) You must always operate and maintain your affected source, including all air pollution control and monitoring equipment you use for purposes of complying with this subpart, according to the provisions in § 63.6(e)(1)(i).

(c) If your affected source uses an emission capture system and add-on control device, you must maintain a log detailing the operation and maintenance of the emission capture system, add-on control device, and continuous parameter monitors during the period between the compliance date specified for your affected source in § 63.4683 and the date when the initial emission capture system and add-on control device performance tests have been completed, as specified in § 63.4760. This requirement does not apply to a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4761(j) in lieu of conducting performance tests.

(d) If your affected source uses an emission capture system and add-on control device, you must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3). The SSMP must address startup, shutdown, and corrective actions in the event of a malfunction of the emission capture system or the add-on control device. The SSMP must also address any coating operation equipment that may cause increased emissions or that would affect capture efficiency if the process equipment malfunctions, such as conveyors that move parts among enclosures.

§ 63.4701 What parts of the General Provisions apply to me?

Table 4 to this subpart indicates which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

Notifications, Reports, and Records

§ 63.4710 What notifications must I submit?

(a) *General.* You must submit the notifications in §§ 63.7(b) and (c), 63.8(f)(4), and 63.9(b) through (e) and (h) that apply to you by the dates specified in those sections, except as provided in paragraphs (b) and (c) of this section.

(b) *Initial Notification.* You must submit the Initial Notification required by § 63.9(b) for a new or reconstructed affected source no later than 120 days after initial startup or 120 days after May 28, 2003, whichever is later. For an existing affected source, you must submit the Initial Notification no later than 120 days after May 28, 2003.

(c) *Notification of Compliance Status.* You must submit the Notification of Compliance Status required by § 63.9(h) no later than 30 calendar days following the end of the initial compliance period described in § 63.4740, § 63.4750, or § 63.4760 that applies to your affected source. The Notification of Compliance Status must contain the information specified in paragraphs (c)(1) through (9) of this section and in § 63.9(h).

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of the report and beginning and ending dates of the reporting period. The reporting period is the initial compliance period described in § 63.4740, § 63.4750, or § 63.4760 that applies to your affected source.

(4) Identification of the compliance option or options specified in § 63.4691 that you used on each coating operation in the affected source during the initial compliance period.

(5) Statement of whether or not the affected source achieved the emission limitations for the initial compliance period.

(6) If you had a deviation, include the information in paragraphs (c)(6)(i) and (ii) of this section.

(i) A description and statement of the cause of the deviation.

(ii) If you failed to meet the applicable emission limit in § 63.4690, include all the calculations you used to determine the grams organic HAP emitted per liter of coating solids used (pounds (lb) organic HAP emitted per gallon of coating solids used). You do not need to submit information provided by the materials suppliers or manufacturers, or test reports.

(7) For each of the data items listed in paragraphs (c)(7)(i) through (iv) of this section that is required by the compliance option(s) you used to demonstrate compliance with the emission limit, include an example of how you determined the value, including calculations and supporting data. Supporting data can include a copy of the information provided by the supplier or manufacturer of the example coating or material or a summary of the results of testing conducted according to § 63.4741(a), (b), or (c). You do not need to submit copies of any test reports.

(i) Mass fraction of organic HAP for one coating, for one thinner, and for one cleaning material.

(ii) Volume fraction of coating solids for one coating.

(iii) Density for one coating, one thinner, and one cleaning material, except that if you use the compliant material option, only the example coating density is required.

(iv) The amount of waste materials and the mass of organic HAP contained in the waste materials for which you are claiming an allowance in Equation 1 of § 63.4751.

(8) The calculation of grams organic HAP emitted per liter coating solids used (lb organic HAP emitted per gallon coating solids used) for the compliance option(s) you used, as specified in paragraphs (c)(8)(i) through (iii) of this section.

(i) For the compliant material option, provide an example calculation of the organic HAP content for one coating, using Equation 2 of § 63.4741.

(ii) For the emission rate without add-on controls option, provide the calculation of the total mass of organic HAP emissions for each month; the

calculation of the total volume of coating solids used each month; and the calculation of the 12-month organic HAP emission rate, using Equations 1 and 1A through 1C, 2, and 3, respectively, of § 63.4751.

(iii) For the emission rate with add-on controls option, provide the calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used each month, using Equations 1 and 1A through 1C of § 63.4751; the calculation of the total volume of coating solids used each month, using Equation 2 of § 63.4751; the calculation of the mass of organic HAP emission reduction each month by emission capture systems and add-on control devices, using Equations 1, 1A through 1D, 2, 3, and 3A through 3C of § 63.4761, as applicable; the calculation of the total mass of organic HAP emissions each month, using Equation 4 of § 63.4761; and the calculation of the 12-month organic HAP emission rate, using Equation 5 of § 63.4761.

(9) For the emission rate with add-on controls option, you must include the information specified in paragraphs (c)(9)(i) through (iv) of this section, except that the requirements in paragraphs (c)(9)(i) through (iii) of this section do not apply to solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4761(j).

(i) For each emission capture system, a summary of the data and copies of the calculations supporting the determination that the emission capture system is a permanent total enclosure (PTE) or a measurement of the emission capture system efficiency. Include a description of the protocol followed for measuring capture efficiency, summaries of any capture efficiency tests conducted, and any calculations supporting the capture efficiency determination. If you use the data quality objective (DQO) or lower confidence limit (LCL) approach, you must also include the statistical calculations to show you meet the DQO or LCL criteria in appendix A to subpart KK of this part. You do not need to submit complete test reports.

(ii) A summary of the results of each add-on control device performance test. You do not need to submit complete test reports.

(iii) A list of each emission capture system and add-on control device operating limits and a summary of the data used to calculate those limits.

(iv) A statement of whether or not you developed and implemented the work practice plan required by § 63.4693.

§ 63.4720 What reports must I submit?

(a) *Semiannual compliance reports.* You must submit semiannual compliance reports for each affected source according to the requirements of paragraphs (a)(1) through (7) of this section. The semiannual compliance reporting requirements may be satisfied by reports required under other parts of the Clean Air Act (CAA), as specified in paragraph (a)(2) of this section.

(1) *Dates.* Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must prepare and submit each semiannual compliance report according to the dates specified in paragraphs (a)(1)(i) through (iv) of this section. Note that the information reported for each of the months in the reporting period will be based on the last 12 months of data prior to the date of each monthly calculation.

(i) The first semiannual compliance report must cover the first semiannual reporting period which begins the day after the end of the initial compliance period described in § 63.4740, § 63.4750, or § 63.4760 that applies to your affected source and ends on June 30 or December 31, whichever occurs first following the end of the initial compliance period.

(ii) Each subsequent semiannual compliance report must cover the subsequent semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(iii) Each semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(iv) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the date specified in paragraph (a)(1)(iii) of this section.

(2) *Inclusion with title V report.* Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 40 CFR part 71 must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a semiannual compliance report pursuant to this section along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the semiannual compliance report includes all required information concerning deviations from any emission limitation in this subpart, its submission shall be deemed to satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submission of a semiannual compliance report shall not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permitting authority.

(3) *General requirements.* The semiannual compliance report must contain the information specified in paragraphs (a)(3)(i) through (v) of this section, and the information specified in paragraphs (a)(4) through (7) and (c)(1) of this section that is applicable to your affected source.

(i) Company name and address.

(ii) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(iii) Date of report and beginning and ending dates of the reporting period. The reporting period is the 6-month period ending on June 30 or December 31. Note that the information reported for each of the 6 months in the reporting period will be based on the last 12 months of data prior to the date of each monthly calculation.

(iv) Identification of the compliance option or options specified in § 63.4691 that you used on each coating operation during the reporting period. If you switched between compliance options during the reporting period, you must report the beginning and ending dates you used each option.

(v) If you used the emission rate without add-on controls or the emission rate with add-on controls compliance option (§ 63.4691(b) or (c)), the calculation results for each rolling 12-month organic HAP emission rate during the 6-month reporting period.

(4) *No deviations.* If there were no deviations from the emission limitations in §§ 63.4690, 63.4692, and 63.4693 that apply to you, the semiannual compliance report must include a statement that there were no deviations from the emission limitations during the reporting period. If you used the emission rate with add-on controls option and there were no periods during which the continuous parameter monitoring systems (CPMS) were out-of-control as specified in § 63.8(c)(7), the semiannual compliance report must include a statement that there were no periods during which the CPMS were

out-of-control during the reporting period.

(5) *Deviations: compliant material option.* If you used the compliant material option, and there was a deviation from the applicable emission limit in § 63.4690, the semiannual compliance report must contain the information in paragraphs (a)(5)(i) through (iv) of this section.

(i) Identification of each coating used that deviated from the emission limit, each thinner and cleaning material used that contained organic HAP, and the dates and time periods each was used.

(ii) The calculation of the organic HAP content (using Equation 2 of § 63.4741) for each coating identified in paragraph (a)(5)(i) of this section. You do not need to submit background data supporting this calculation (*e.g.*, information provided by coating suppliers or manufacturers, or test reports).

(iii) The determination of mass fraction of organic HAP for each coating, thinner, and cleaning material identified in paragraph (a)(5)(i) of this section. You do not need to submit background data supporting this calculation (*e.g.*, information provided by material suppliers or manufacturers, or test reports).

(iv) A statement of the cause of each deviation.

(6) *Deviations: emission rate without add-on controls option.* If you used the emission rate without add-on controls option and there was a deviation from the applicable emission limit in § 63.4690, the semiannual compliance report must contain the information in paragraphs (a)(6)(i) through (iii) of this section.

(i) The beginning and ending dates of each compliance period during which the 12-month organic HAP emission rate exceeded the applicable emission limit in § 63.4690.

(ii) The calculations used to determine the 12-month organic HAP emission rate for the compliance period in which the deviation occurred. You must provide the calculations for Equations 1, 1A through 1C, 2, and 3 in § 63.4751; and if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.4751(e)(4). You do not need to submit background data supporting these calculations (*e.g.*, information provided by materials suppliers or manufacturers, or test reports).

(iii) A statement of the cause of each deviation.

(7) *Deviations: emission rate with add-on controls option.* If you used the emission rate with add-on controls option and there was a deviation from an emission limitation (including any periods when emissions bypassed the add-on control device and were diverted to the atmosphere), the semiannual compliance report must contain the information in paragraphs (a)(7)(i) through (xiv) of this section. This includes periods of SSM during which deviations occurred.

(i) The beginning and ending dates of each compliance period during which the 12-month organic HAP emission rate exceeded the applicable emission limit in § 63.4690.

(ii) The calculations used to determine the 12-month organic HAP emission rate for each compliance period in which a deviation occurred. You must provide the calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used each month, using Equations 1 and 1A through 1C of § 63.4751; and, if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.4751(e)(4); the calculation of the total volume of coating solids used each month, using Equation 2 of § 63.4751; the calculation of the mass of organic HAP emission reduction each month by emission capture systems and add-on control devices, using Equations 1 and 1A through 1D of § 63.4761, and Equations 2, 3, and 3A through 3C of § 63.4761, as applicable; the calculation of the total mass of organic HAP emissions each month, using Equation 4 of § 63.4761; and the calculation of the 12-month organic HAP emission rate, using Equation 5 of § 63.4761. You do not need to submit the background data supporting these calculations (*e.g.*, information provided by materials suppliers or manufacturers, or test reports).

(iii) The date and time that each malfunction started and stopped.

(iv) A brief description of the CPMS.

(v) The date of the latest CPMS certification or audit.

(vi) The date and time that each CPMS was inoperative, except for zero (low-level) and high-level checks.

(vii) The date, time, and duration that each CPMS was out-of-control, including the information in § 63.8(c)(8).

(viii) The date and time period of each deviation from an operating limit in Table 3 to this subpart, date and time period of any bypass of the add-on control device, and whether each deviation occurred during a period of SSM or during another period.

(ix) A summary of the total duration of each deviation from an operating limit in Table 3 to this subpart, each bypass of the add-on control device during the semiannual reporting period, and the total duration as a percent of the total source operating time during that semiannual reporting period.

(x) A breakdown of the total duration of the deviations from the operating limits in Table 3 to this subpart and bypasses of the add-on control device during the semiannual reporting period by identifying deviations due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(xi) A summary of the total duration of CPMS downtime during the semiannual reporting period and the total duration of CPMS downtime as a percent of the total source operating time during that semiannual reporting period.

(xii) A description of any changes in the CPMS, coating operation, emission capture system, or add-on control device since the last semiannual reporting period.

(xiii) For each deviation from the work practice standards, a description of the deviation, the date and time period of the deviation, and the actions you took to correct the deviation.

(xiv) A statement of the cause of each deviation.

(b) *Performance test reports.* If you use the emission rate with add-on controls option, you must submit reports of performance test results for emission capture systems and add-on control devices no later than 60 days after completing the tests as specified in § 63.10(d)(2).

(c) *SSM reports.* If you used the emission rate with add-on controls option and you had an SSM during the semiannual reporting period, you must submit the reports specified in paragraphs (c)(1) and (2) of this section.

(1) If your actions were consistent with your SSMP, you must include the information specified in § 63.10(d) in the semiannual compliance report required by paragraph (a) of this section.

(2) If your actions were not consistent with your SSMP, you must submit an immediate SSM report as described in paragraphs (c)(2)(i) and (ii) of this section.

(i) You must describe the actions taken during the event in a report delivered by facsimile, telephone, or other means to the Administrator within 2 working days after starting actions that are inconsistent with the plan.

(ii) You must submit a letter to the Administrator within 7 working days after the end of the event, unless you have made alternative arrangements with the Administrator as specified in

§ 63.10(d)(5)(ii). The letter must contain the information specified in § 63.10(d)(5)(ii).

§ 63.4730 What records must I keep?

You must collect and keep records of the data and information specified in this section. Failure to collect and keep these records is a deviation from the applicable standard.

(a) A copy of each notification and report that you submitted to comply with this subpart, and the documentation supporting each notification and report.

(b) A current copy of information provided by materials suppliers or manufacturers, such as manufacturer's formulation data, or test data used to determine the mass fraction of organic HAP and density for each coating, thinner, and cleaning material and the volume fraction of coating solids for each coating. If you conducted testing to determine mass fraction of organic HAP, density, or volume fraction of coating solids, you must keep a copy of the complete test report. If you use information provided to you by the manufacturer or supplier of the material that was based on testing, you must keep the summary sheet of results provided to you by the manufacturer or supplier. You are not required to obtain the test report or other supporting documentation from the manufacturer or supplier.

(c) For each compliance period, the records specified in paragraphs (c)(1) through (4) of this section.

(1) A record of the coating operations at which you used each compliance option and the time periods (beginning and ending dates and times) you used each option.

(2) For the compliant material option, a record of the calculation of the organic HAP content for each coating, using Equation 2 of § 63.4741.

(3) For the emission rate without add-on controls option, a record of the calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used each month, using Equations 1, 1A through 1C, and 2 of § 63.4751; and, if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.4751(e)(4); the calculation of the total volume of coating solids used each month, using Equation 2 of § 63.4751; and the calculation of each 12-month organic HAP emission rate, using Equation 3 of § 63.4751.

(4) For the emission rate with add-on controls option, records of the calculations specified in paragraphs (c)(4)(i) through (v) of this section.

(i) The calculation of the total mass of organic HAP emissions for the coatings, thinners, and cleaning materials used each month, using Equations 1 and 1A through 1C of § 63.4751; and, if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.4751(e)(4).

(ii) The calculation of the total volume of coating solids used each month, using Equation 2 of § 63.4751.

(iii) The calculation of the mass of organic HAP emission reduction by emission capture systems and add-on control devices, using Equations 1 and 1A through 1D of § 63.4761, and Equations 2, 3, and 3A through 3C of § 63.4761, as applicable.

(iv) The calculation of the total mass of organic HAP emissions each month, using Equation 4 of § 63.4761.

(v) The calculation of each 12-month organic HAP emission rate, using Equation 5 of § 63.4761.

(d) A record of the name and volume of each coating, thinner, and cleaning material used during each compliance period.

(e) A record of the mass fraction of organic HAP for each coating, thinner, and cleaning material used during each compliance period.

(f) A record of the volume fraction of coating solids for each coating used during each compliance period.

(g) A record of the density for each coating used during each compliance period; and, if you use either the emission rate without add-on controls or the emission rate with add-on controls compliance option, the density for each thinner and cleaning material used during each compliance period.

(h) If you use an allowance in Equation 1 of § 63.4751 for organic HAP contained in waste materials sent to or designated for shipment to a treatment, storage, and disposal facility (TSDF) according to § 63.4751(e)(4), you must keep records of the information specified in paragraphs (h)(1) through (3) of this section.

(1) The name and address of each TSDF to which you sent waste materials for which you use an allowance in Equation 1 of § 63.4751; a statement of which subparts under 40 CFR parts 262, 264, 265, and 266 apply to the facility; and the date of each shipment.

(2) Identification of the coating operations producing waste materials included in each shipment and the month or months in which you used the allowance for these materials in Equation 1 of § 63.4751.

(3) The methodology used in accordance with § 63.4751(e)(4) to determine the total amount of waste materials sent to or the amount collected, stored, and designated for transport to a TSDF each month; and the methodology to determine the mass of organic HAP contained in these waste materials. This must include the sources for all data used in the determination, methods used to generate the data, frequency of testing or monitoring, and supporting calculations and documentation, including the waste manifest for each shipment.

(i) [Reserved]

(j) You must keep records of the date, time, and duration of each deviation.

(k) If you use the emission rate with add-on controls option, you must keep the records specified in paragraphs (k)(1) through (8) of this section.

(1) For each deviation, a record of whether the deviation occurred during a period of SSM.

(2) The records in § 63.6(e)(3)(iii) through (v) related to SSM.

(3) The records required to show continuous compliance with each operating limit specified in Table 3 to this subpart that applies to you.

(4) For each capture system that is a PTE, the data and documentation you used to support a determination that the capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and has a capture efficiency of 100 percent, as specified in § 63.4765(a).

(5) For each capture system that is not a PTE, the data and documentation you used to determine capture efficiency according to the requirements specified in §§ 63.4764 and 63.4765(b) through (e), including the records specified in paragraphs (k)(5)(i) through (iii) of this section that apply to you.

(i) *Records for a liquid-to-uncaptured-gas protocol using a temporary total enclosure or building enclosure.* Records of the mass of total volatile hydrocarbon (TVH) as measured by Method 204A or F of appendix M to 40 CFR part 51 for each material used in the coating operation, and the total TVH for all materials used during each capture efficiency test run, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(ii) *Records for a gas-to-gas protocol using a temporary total enclosure or a*

building enclosure. Records of the mass of TVH emissions captured by the emission capture system as measured by Method 204B or C of appendix M to 40 CFR part 51 at the inlet to the add-on control device, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(iii) *Records for an alternative protocol*. Records needed to document a capture efficiency determination using an alternative method or protocol as specified in § 63.4765(e), if applicable.

(6) The records specified in paragraphs (k)(6)(i) and (ii) of this section for each add-on control device organic HAP destruction or removal efficiency determination as specified in § 63.4766.

(i) Records of each add-on control device performance test conducted according to §§ 63.4764 and 63.4766.

(ii) Records of the coating operation conditions during the add-on control device performance test showing that the performance test was conducted under representative operating conditions.

(7) Records of the data and calculations you used to establish the emission capture and add-on control device operating limits as specified in § 63.4767 and to document compliance with the operating limits as specified in Table 3 to this subpart.

(8) A record of the work practice plan required by § 63.4693, and documentation that you are implementing the plan on a continuous basis.

§ 63.4731 In what form and for how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1). Where appropriate, the records may be maintained as electronic spreadsheets or as a database.

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on-site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You may keep the records off-site for the remaining 3 years.

Compliance Requirements for the Compliant Material Option

§ 63.4740 By what date must I conduct the initial compliance demonstration?

You must complete the initial compliance demonstration for the initial compliance period according to the requirements in § 63.4741. The initial compliance period begins on the applicable compliance date specified in § 63.4683 and ends on the last day of the 12th month following the compliance date. If the compliance date occurs on any day other than the first day of a month, then the initial compliance period extends through the end of that month plus the next 12 months. The initial compliance demonstration includes the calculations according to § 63.4741 and supporting documentation showing that during the initial compliance period, you used no coating with an organic HAP content that exceeded the applicable emission limit in § 63.4690, and that you used no thinners or cleaning materials that contained organic HAP.

§ 63.4741 How do I demonstrate initial compliance with the emission limitations?

You may use the compliant material option for any individual coating operation, for any group of coating operations in the affected source, or for all the coating operations in the affected source. You must use either the emission rate without add-on controls option or the emission rate with add-on controls option for any coating operation in the affected source for which you do not use this option. To demonstrate initial compliance using the compliant material option, the coating operation or group of coating operations must use no coating with an organic HAP content that exceeds the applicable emission limit in § 63.4690 and must use no thinner or cleaning material that contains organic HAP as determined according to this section. Any coating operation for which you use the compliant material option is not required to meet the operating limits or work practice standards required in §§ 63.4692 and 63.4693, respectively. To demonstrate initial compliance with the emission limitations using the compliant material option, you must meet all the requirements of this section for the coating operation or group of coating operations using this option. Use the procedures in this section on each coating, thinner, and cleaning material in the condition it is in when it is received from its manufacturer or supplier and prior to any alteration. You do not need to redetermine the mass of organic HAP in coatings, thinners, or cleaning materials that have been reclaimed onsite and reused in the coating operation(s) for which you use the compliant material option, provided these materials in their condition as received were demonstrated to comply with the compliant material option. If the mass fraction of organic HAP of a coating equals zero, determined according to paragraph (a) of this section, and you use the compliant material option, you are not required to comply with paragraphs (b) and (c) of this section for that coating.

(a) *Determine the mass fraction of organic HAP for each material used*. You must determine the mass fraction of organic HAP for each coating, thinner, and cleaning material used during the compliance period by using one of the options in paragraphs (a)(1) through (5) of this section.

(1) *Method 311 (appendix A to 40 CFR part 63)*. You may use Method 311 for determining the mass fraction of organic HAP. Use the procedures specified in paragraphs (a)(1)(i) and (ii) of this section when performing a Method 311 test. If these values cannot be determined using Method 311, the owner or operator shall submit an alternative technique for determining their values for approval by the Administrator.

(i) Count each organic HAP that is measured to be present at 0.1 percent by mass or more for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4), and at 1.0 percent by mass or more for other organic HAP compounds. For example, if toluene (not an OSHA carcinogen) is measured to be 0.5 percent of the material by mass, you do not have to count it. Express the mass fraction of each organic HAP you count as a value truncated to four places after the decimal point (*e.g.*, 0.379178412 truncates to 0.3791).

(ii) Calculate the total mass fraction of organic HAP in the test material by adding up the individual organic HAP mass fractions and truncating the result to three places after the decimal point (*e.g.*, 0.763).

(2) *Method 24 (appendix A to 40 CFR part 60)*. For coatings, you may use Method 24 to determine the mass fraction of nonaqueous volatile matter and use that value as a substitute for mass fraction of organic HAP. (Note: Method 24 is not appropriate for those coatings with a water content that would result in an effective detection

limit greater than the applicable emission limit.)

(3) *Alternative method.* You may use an alternative test method for determining the mass fraction of organic HAP once the Administrator has approved it. You must follow the procedure in § 63.7(f) to submit an alternative test method for approval.

(4) *Information from the supplier or manufacturer of the material.* You may rely on information other than that generated by the test methods specified in paragraphs (a)(1) through (3) of this section, such as manufacturer's formulation data, if it represents each organic HAP that is present at 0.1 percent by mass or more for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4), and at 1.0 percent by mass or more for other organic HAP compounds. For example, if toluene (not an OSHA carcinogen) is 0.5 percent of the material by mass, you do not have to count it. If there is a disagreement between such information and results of a test conducted according to paragraphs (a)(1) through (3) of this section, then the test method results will take precedence unless, after consultation, a regulated source could demonstrate to the satisfaction of the enforcement agency that the formulation data were correct.

(5) *Solvent blends.* Solvent blends may be listed as single components for some materials in data provided by manufacturers or suppliers. Solvent blends may contain organic HAP which must be counted toward the total organic HAP mass fraction of the materials. When test data and manufacturer's data for solvent blends are not available, you may use the default values for the mass fraction of organic HAP in these solvent blends listed in Table 5 or Table 6 to this subpart. If you use the tables, you must use the values in Table 5 for all solvent blends that match Table 5 entries, and you may only use Table 6 if the solvent blends in the materials you use do not match any of the solvent blends in Table 5 and you only know whether the blend is aliphatic or aromatic. However, if the results of a Method 311 (40 CFR part 63, appendix A) test indicate higher values than those listed on Table 5 or Table 6 to this subpart, the Method 311 results will take precedence.

(b) *Determine the volume fraction of coating solids for each coating.* You must determine the volume fraction of coating solids (liters of coating solids per liter of coating) for each coating used during the compliance period by one of the methods specified in paragraph (b)(1), (2), or (3) of this section.

(1) *ASTM Method D2697–86 (Reapproved 1998) or D6093–97.* You may use ASTM Method D2697–86 (Reapproved 1998), "Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings' (incorporated by reference, see § 63.14), or D6093–97, "Standard Test Method for Percent Volume Nonvolatile Matter in Clear or Pigmented Coatings Using a Helium Gas Pycnometer" (incorporated by reference, see § 63.14), to determine the volume fraction of coating solids for each coating. Divide the nonvolatile volume percent obtained with the methods by 100 to calculate volume fraction of coating solids. If these values cannot be determined using these methods, the owner operator may submit an alternative technique for determining their values for approval by the Administrator.

(2) *Information from the supplier or manufacturer of the material.* You may obtain the volume fraction of coating solids for each coating from the supplier or manufacturer.

(3) *Calculation of volume fraction of coating solids.* If the volume fraction of coating solids cannot be determined using the options in paragraphs (b)(1) and (2) of this section, you must determine it using Equation 1 of this section:

$$V_s = 1 - \left(\frac{m_{volatiles}}{D_{avg}} \right) \qquad \text{(Eq. 1)}$$

Where:

V_s = Volume fraction of coating solids, liters coating solids per liter coating.

$m_{volatiles}$ = Total volatile matter content of the coating, including HAP, volatile organic compounds (VOC), water, and exempt compounds, determined according to Method 24 in appendix A of 40 CFR part 60, grams volatile matter per liter coating.

D_{avg} = Average density of volatile matter in the coating, grams volatile matter per liter volatile matter, determined from test results using ASTM Method D1475–90 information from the supplier or manufacturer of the material, or reference sources providing density or specific gravity data for pure materials. If there is disagreement between ASTM Method D1475–90 test results and other information sources, the test results will take precedence.

(c) *Determine the density of each coating.* Determine the density of each coating used during the compliance period from test results using ASTM Method D1475–90 or information from the supplier or manufacturer of the material. If there is disagreement between ASTM Method D1475–90 test results and the supplier's or manufacturer's information, the test results will take precedence.

(d) *Calculate the organic HAP content of each coating.* Calculate the organic HAP content, grams organic HAP per liter coating solids, of each coating used during the compliance period, using Equation 2 of this section:

$$H_c = \frac{(D_c)(W_c)}{V_s} \qquad \text{(Eq. 2)}$$

Where:

H_c = Organic HAP content of the coating, grams organic HAP per liter coating solids.

D_c = Density of coating, grams coating per liter coating, determined according to paragraph (c) of this section.

W_c = Mass fraction of organic HAP in the coating, grams organic HAP per gram coating, determined according to paragraph (a) of this section.

V_s = Volume fraction of coating solids, liter coating solids per liter coating, determined according to paragraph (b) of this section.

(e) *Compliance demonstration.* The organic HAP content for each coating used during the initial compliance period, determined using Equation 2 of this section, must be less than or equal to the applicable emission limit in § 63.4690; and each thinner and cleaning material used during the initial compliance period must contain no organic HAP, determined according to paragraph (a) of this section. You must keep all records required by §§ 63.4730 and 63.4731. As part of the Notification of Compliance Status required in § 63.4710, you must identify the coating operation(s) for which you used the compliant material option and submit a statement that the coating operation(s) was (were) in compliance with the emission limitations during the initial compliance period because you used no coatings for which the organic HAP content exceeded the applicable emission limit in § 63.4690, and you used no thinners or cleaning materials that contained organic HAP, determined according to paragraph (a) of this section.

§ 63.4742 How do I demonstrate continuous compliance with the emission limitations?

(a) For each compliance period to demonstrate continuous compliance, you must use no coating for which the organic HAP content determined using Equation 2 of § 63.4741 exceeds the

applicable emission limit in § 63.4690; and use no thinner or cleaning material that contains organic HAP, determined according to § 63.4741(a). A compliance period consists of 12 months. Each month after the end of the initial compliance period described in § 63.4740 is the end of a compliance period consisting of that month and the preceding 11 months.

(b) If you choose to comply with the emission limitations by using the compliant material option, the use of any coating, thinner, or cleaning material that does not meet the criteria specified in paragraph (a) of this section is a deviation from the emission limitations that must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(5).

(c) As part of each semiannual compliance report required by § 63.4720, you must identify the coating operation(s) for which you used the compliant material option. If there were no deviations from the emission limitations in § 63.4690, submit a statement that the coating operation(s) was (were) in compliance with the emission limitations during the reporting period because you used no coating for which the organic HAP content exceeded the applicable emission limit in § 63.4690, and you used no thinner or cleaning material that contained organic HAP, determined according to § 63.4741(a).

(d) You must maintain records as specified in §§ 63.4730 and 63.4731.

Compliance Requirements for the Emission Rate Without Add-On Controls Option

§ 63.4750 By what date must I conduct the initial compliance demonstration?

You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4751. The initial compliance period begins on the applicable compliance date specified in § 63.4683 and ends on the last day of the 12th month following the compliance date. If the compliance date occurs on any day other than the first day of a month, then the initial compliance period extends through the end of that month plus the next 12 months. You must determine the mass of organic HAP emissions and volume of coating solids used each month and then calculate a 12-month organic HAP emission rate at the end of the initial 12-month compliance period. The initial compliance demonstration includes the calculations according to § 63.4751 and supporting documentation showing that during the initial compliance period the organic HAP emission rate was equal to or less than the applicable emission limit in § 63.4690.

§ 63.4751 How do I demonstrate initial compliance with the emission limitations?

You may use the emission rate without add-on controls option for any individual coating operation, for any group of coating operations in the affected source, or for all the coating operations in the affected source. You must use either the compliant material option or the emission rate with add-on controls option for any coating operation in the affected source for which you do not use this option. To demonstrate initial compliance using the emission rate without add-on controls option, the coating operation or group of coating operations must meet the applicable emission limit in § 63.4690. Any coating operation for which you use the emission rate without add-on controls option is not required to meet the operating limits or work practice standards required in §§ 63.4692 and 63.4693, respectively. You must meet all the requirements of this section to demonstrate initial compliance with the applicable emission limit in § 63.4690 for the coating operation(s). When calculating the organic HAP emission rate according to this section, do not include any coatings, thinners, or cleaning materials used on coating operations for which you use the compliant material option or the emission rate with add-on controls option. You do not need to redetermine the mass of organic HAP in coatings, thinners, or cleaning materials that have been reclaimed onsite and reused in the coating operation(s) for which you use the emission rate without add-on controls option.

(a) *Determine the mass fraction of organic HAP for each material.* Determine the mass fraction of organic HAP for each coating, thinner, and cleaning material used during each month according to the requirements in § 63.4741(a).

(b) *Determine the volume fraction of coating solids for each coating.* Determine the volume fraction of coating solids for each coating used during each month according to the requirements in § 63.4741(b).

(c) *Determine the density of each material.* Determine the density of each coating, thinner, and cleaning material used during each month from test results using ASTM Method D1475–90, information from the supplier or manufacturer of the material, or reference sources providing density or specific gravity data for pure materials. If there is disagreement between ASTM Method D1475–90 test results and such other information sources, the test results will take precedence.

(d) *Determine the volume of each material used.* Determine the volume (liters) of each coating, thinner, and cleaning material used during each month by measurement or usage records.

(e) *Calculate the mass of organic HAP emissions.* The mass of organic HAP emissions is the combined mass of organic HAP contained in all coatings, thinners, and cleaning materials used during each month minus the organic HAP in certain waste materials. Calculate it using Equation 1 of this section.

$$H_e = A + B + C - R_w \qquad \text{(Eq. 1)}$$

Where:

H_e = Total mass of organic HAP emissions during the month, grams.

A = Total mass of organic HAP in the coatings used during the month, grams, as calculated in Equation 1A of this section.

B = Total mass of organic HAP in the thinners used during the month, grams, as calculated in Equation 1B of this section.

C = Total mass of organic HAP in the cleaning materials used during the month, grams, as calculated in Equation 1C of this section.

R_w = Total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during the month, grams, determined according to paragraph (e)(4) of this section. (You may assign a value of zero to R_w if you do not wish to use this allowance.)

(1) Calculate the mass of organic HAP in the coatings used during the month, using Equation 1A of this section:

$$A = \sum_{i=1}^{m} \left(Vol_{c,i}\right)\left(D_{c,i}\right)\left(W_{c,i}\right) \qquad \text{(Eq. 1A)}$$

Where:

A = Total mass of organic HAP in the coatings used during the month, grams.

$Vol_{c,i}$ = Total volume of coating, i, used during the month, liters.

$D_{c,i}$ = Density of coating, i, grams coating per liter coating.

$W_{c,i}$ = Mass fraction of organic HAP in coating, i, grams organic HAP per gram coating.

m = Number of different coatings used during the month.

(2) Calculate the mass of organic HAP in the thinners used during the month, using Equation 1B of this section:

$$B = \sum_{j=1}^{n} (Vol_{t,j})(D_{t,j})(W_{t,j}) \qquad \text{(Eq. 1B)}$$

Where:

B = Total mass of organic HAP in the thinners used during the month, grams.

$Vol_{t,j}$ = Total volume of thinner, j, used during the month, liters.

$D_{t,j}$ = Density of thinner, j, grams per liter.

$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, grams organic HAP per gram thinner.

n = Number of different thinners used during the month.

(3) Calculate the mass of organic HAP in the cleaning materials used during the month using Equation 1C of this section:

$$C = \sum_{k=1}^{p} (Vol_{s,k})(D_{s,k})(W_{s,k}) \qquad \text{(Eq. 1C)}$$

Where:

C = Total mass of organic HAP in the cleaning materials used during the month, grams.

$Vol_{s,k}$ = Total volume of cleaning material, k, used during the month, liters.

$D_{s,k}$ = Density of cleaning material, k, grams per liter.

$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, grams organic HAP per gram material.

p = Number of different cleaning materials used during the month.

(4) If you choose to account for the mass of organic HAP contained in waste materials sent or designated for shipment to a hazardous waste TSDF in Equation 1 of this section, then you must determine it according to paragraphs (e)(4)(i) through (iv) of this section.

(i) You may include in the determination only waste materials that are generated by coating operations for which you use Equation 1 of this section and that will be treated or disposed of by a facility regulated as a TSDF under 40 CFR part 262, 264, 265, or 266. The TSDF may be either off-site or on-site. You may not include organic HAP contained in wastewater.

(ii) You must determine either the amount of the waste materials sent to a TSDF during the month or the amount collected and stored during the month and designated for future transport to a TSDF. Do not include in your determination any waste materials sent to a TSDF during a month if you have already included them in the amount collected and stored during that month or a previous month.

(iii) Determine the total mass of organic HAP contained in the waste materials specified in paragraph (e)(4)(ii) of this section.

(iv) You may use any reasonable methodology to determine the amount of waste materials and the total mass of organic HAP they contain, and you must document your methodology as required in § 63.4730(h). To the extent that waste manifests include this information, they may be used as part of the documentation of the amount of waste materials and mass of organic HAP contained in them.

(f) *Calculate the total volume of coating solids used.* Determine the total volume of coating solids used which is the combined volume of coating solids for all the coatings used during each month, using Equation 2 of this section:

$$V_{st} = \sum_{i=1}^{m} (Vol_{c,i})(V_{s,i}) \qquad \text{(Eq. 2)}$$

Where:

V_{st} = Total volume of coating solids used during the month, liters.

$Vol_{c,i}$ = Total volume of coating, i, used during the month, liters.

$V_{s,i}$ = Volume fraction of coating solids for coating, i, liter solids per liter coating, determined according to § 63.4741(b).

m = Number of coatings used during the month.

(g) *Calculate the organic HAP emission rate.* Calculate the organic HAP emission rate for the 12-month compliance period, grams organic HAP per liter coating solids used, using Equation 3 of this section:

$$H_{yr} = \frac{\sum_{y=1}^{12} H_e}{\sum_{y=1}^{12} V_{st}} \qquad \text{(Eq. 3)}$$

Where:

H_{yr} = Organic HAP emission rate for the 12-month compliance period, grams organic HAP per liter coating solids.

H_e = Total mass of organic HAP emissions, grams, from all materials used during month, y, as calculated by Equation 1 of this section.

V_{st} = Total volume of coating solids used during month, y, liters, as calculated by Equation 2 of this section.

y = Identifier for months.

(h) *Compliance demonstration.* The organic HAP emission rate for the initial 12-month compliance period, calculated using Equation 3 of this section, must be less than or equal to the applicable emission limit in § 63.4690. You must keep all records as required by §§ 63.4730 and 63.4731. As part of the Notification of Compliance Status required by § 63.4710, you must identify the coating operation(s) for which you used the emission rate without add-on controls option and submit a statement that the coating operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in § 63.4690, determined according to this section.

§ 63.4752 How do I demonstrate continuous compliance with the emission limitations?

(a) To demonstrate continuous compliance, the organic HAP emission rate for each compliance period, calculated using Equation 3 of § 63.4751, must be less than or equal to the applicable emission limit in § 63.4690. A compliance period consists of 12 months. Each month after the end of the initial compliance period described in § 63.4750 is the end of a compliance period consisting of that month and the preceding 11 months. You must perform the calculations in § 63.4751(a) through (g) on a monthly basis using data from the previous 12 months of operation.

(b) If the organic HAP emission rate for any 12-month compliance period exceeded the applicable emission limit in § 63.4690, this is a deviation from the emission limitations for that compliance period and must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(6).

(c) As part of each semiannual compliance report required by § 63.4720, you must identify the coating operation(s) for which you used the emission rate without add-on controls option. If there were no deviations from the emission limitations, you must submit a statement that the coating operation(s) was (were) in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in § 63.4690, determined according to § 63.4751(a) through (g).

(d) You must maintain records as specified in §§ 63.4730 and 63.4731.

Compliance Requirements for the Emission Rate With Add-On Controls Option

§ 63.4760 By what date must I conduct performance tests and other initial compliance demonstrations?

(a) *New and reconstructed affected sources.* For a new or reconstructed affected source, you must meet the requirements of paragraphs (a)(1) through (4) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4683. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4761(j), you must conduct a performance test of each capture system and add-on control device according to §§ 63.4764, 63.4765, and 63.4766, and establish the operating limits required by § 63.4692 no later than 180 days after the applicable compliance date specified in § 63.4683. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4761(j), you must initiate the first material balance no later than 180 days after the applicable compliance date specified in § 63.4683.

(2) You must develop and begin implementing the work practice plan required by § 63.4693 no later than the compliance date specified in § 63.4683.

(3) You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4761. The initial compliance period begins on the applicable compliance date specified in § 63.4683 and ends on the last day of the 12th month following the compliance date. If the compliance date occurs on any day other than the first day of a month, then the initial compliance period extends through the end of that month plus the next 12 months. You must determine the mass of organic HAP emissions and volume of coating solids used each month and then calculate a 12-month organic HAP emission rate at the end of the initial 12-month compliance period. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4764, 63.4765, and 63.4766; results of liquid-liquid material balances conducted according to § 63.4761(j); calculations according to § 63.4761 and supporting documentation showing that during the initial compliance period, the organic HAP emission rate was equal to or less than the emission limit in § 63.4690(a); the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4768; and documentation of whether you developed and implemented the work practice plan required by § 63.4693.

(4) You do not need to comply with the operating limits for the emission capture system and add-on control device required by § 63.4692 until after you have completed the performance tests specified in paragraph (a)(1) of this section. Instead, you must maintain a log detailing the operation and maintenance of the emission capture system, add-on control device, and continuous parameter monitors during the period between the compliance date and the performance test. You must begin complying with the operating limits for your affected source on the date you complete the performance tests specified in paragraph (a)(1) of this section. The requirements in this paragraph (a)(4) do not apply to solvent recovery systems for which you conduct liquid-liquid material balances according to the requirements in § 63.4761(j).

(b) *Existing affected sources.* For an existing affected source, you must meet the requirements of paragraphs (b)(1) through (3) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4683. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4761(j), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4764, 63.4765, and 63.4766 and establish the operating limits required by § 63.4692 no later than the applicable compliance date specified in § 63.4683. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4761(j), you must initiate the first material balance no later than the compliance date specified in § 63.4683.

(2) You must develop and begin implementing the work practice plan required by § 63.4693 no later than the compliance date specified in § 63.4683.

(3) You must complete the initial compliance demonstration for the initial compliance period according to the requirements of § 63.4761. The initial compliance period begins on the applicable compliance date specified in § 63.4683 and ends on the last day of the 12th month following the compliance date. If the compliance date occurs on any day other than the first day of a month, then the initial compliance period extends through the end of that month plus the next 12 months. You must determine the mass of organic HAP emissions and volume of coating solids used each month and then calculate a 12-month organic HAP emission rate at the end of the initial 12-month compliance period. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4764, 63.4765, and 63.4766; results of liquid-liquid material balances conducted according to § 63.4761(j); calculations according to § 63.4761 and supporting documentation showing that during the initial compliance period the organic HAP emission rate was equal to or less than the emission limit in § 63.4690(b); the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4768; and

documentation of whether you developed and implemented the work practice plan required by § 63.4693.

§ 63.4761 How do I demonstrate initial compliance?

(a) You may use the emission rate with add-on controls option for any coating operation, for any group of coating operations in the affected source, or for all of the coating operations in the affected source. You may include both controlled and uncontrolled coating operations in a group for which you use this option. You must use either the compliant material option or the emission rate without add-on controls option for any coating operation in the affected source for which you do not use the emission rate with add-on controls option. To demonstrate initial compliance, the coating operation(s) for which you use the emission rate with add-on controls option must meet the applicable emission limitations in §§ 63.4690, 63.4692, and 63.4693. You must meet all the requirements of this section to demonstrate initial compliance with the emission limitations. When calculating the organic HAP emission rate according to this section, do not include any coatings, thinners, or cleaning materials used on coating operations for which you use the compliant material option or the emission rate without add-on controls option. You do not need to redetermine the mass of organic HAP in coatings, thinners, or cleaning materials that have been reclaimed and reused in the coating operation(s) for which you use the emission rate with add-on controls option.

(b) *Compliance with operating limits.* Except as provided in § 63.4760(a)(4), and except for solvent recovery systems for which you conduct liquid-liquid material balances according to the requirements of § 63.4761(j), you must establish and demonstrate continuous compliance during the initial compliance period with the operating limits required by § 63.4692, using the procedures specified in §§ 63.4767 and 63.4768.

(c) *Compliance with work practice requirements.* You must develop, implement, and document your implementation of the work practice plan required by § 63.4693 during the initial compliance period, as specified in § 63.4730.

(d) *Compliance with emission limits.* You must follow the procedures in paragraphs (e) through (n) of this section to demonstrate compliance with the applicable emission limit in § 63.4690.

(e) *Determine the mass fraction of organic HAP, density, volume used, and volume fraction of coating solids.* Follow the procedures specified in § 63.4751(a) through (d) to determine the mass fraction of organic HAP, density, and volume of each coating, thinner, and cleaning material used during each month; and the volume fraction of coating solids for each coating used during each month.

(f) *Calculate the total mass of organic HAP emissions before add-on controls.* Using Equation 1 of § 63.4751, calculate the total mass of organic HAP emissions before add-on controls from all coatings, thinners, and cleaning materials used during each month in the coating operation or group of coating operations for which you use the emission rate with add-on controls option.

(g) *Calculate the organic HAP emission reduction for each controlled coating operation.* Determine the mass of organic HAP emissions reduced for each controlled coating operation during each month. The emission reduction determination quantifies the total organic HAP emissions that pass through the emission capture system and are destroyed or removed by the add-on control device. Use the procedures in paragraph (h) of this section to calculate the mass of organic HAP emission reduction for each controlled coating operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances. For each controlled coating operation using a solvent recovery system for which you conduct a liquid-liquid material balance, use the procedures in paragraph (j) of this section to calculate the organic HAP emission reduction.

(h) *Calculate the organic HAP emission reduction for each controlled coating operation not using liquid-liquid material balances.* For each controlled coating operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emission reduction, using Equation 1 of this section. The calculation applies the emission capture system efficiency and add-on control device efficiency to the mass of organic HAP contained in the coatings, thinners, and cleaning materials that are used in the coating operation served by the emission capture system and add-on control device during each month. For any period of time a deviation specified in § 63.4763(c) or (d) occurs in the controlled coating operation, including a deviation during a period of SSM, you must assume zero efficiency for the emission capture system and add-on control device. Equation 1 of this section treats the materials used during such a deviation as if they were used on an uncontrolled coating operation for the time period of the deviation.

$$H_c = (A_c + B_c + C_c - H_{unc})\left(\frac{CE}{100} \times \frac{DRE}{100}\right) \qquad \text{(Eq. 1)}$$

Where:

H_c = Mass of organic HAP emission reduction for the controlled coating operation during the month, grams.

A_c = Total mass of organic HAP in the coatings used in the controlled coating operation during the month, grams.

B_c = Total mass of organic HAP in the thinners used in the controlled coating operation during the month, grams, as calculated in Equation 1B of this section.

C_c = Total mass of organic HAP in the cleaning materials used in the controlled coating operation during the month, grams, as calculated in Equation 1C of this section.

H_{unc} = Total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations specified in § 63.4763(c) and (d) that occurred during the month in the controlled coating operation, grams, as calculated in Equation 1D of this section.

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent. Use the test methods and procedures specified in §§ 63.4764 and 63.4765 to measure and record capture efficiency.

DRE = Organic HAP destruction or removal efficiency of the add-on control device, percent. Use the test methods and procedures in §§ 63.4764 and 63.4766 to measure and record the organic HAP destruction or removal efficiency.

(1) Calculate the mass of organic HAP in the coatings used in the controlled coating operation, grams, using Equation 1A of this section:

$$A_c = \sum_{i=1}^{m} (Vol_{c,i})(D_{c,i})(W_{c,i}) \qquad \text{(Eq. 1A)}$$

Where:

A_c = Total mass of organic HAP in the coatings used in the controlled coating operation, grams.

$Vol_{c,i}$ = Total volume of coating, i, used during the month, liters.

$D_{c,i}$ = Density of coating, i, grams per liter.

$W_{c,i}$ = mass fraction of organic HAP in coating, i, grams per gram.

m = Number of different coatings used.

(2) Calculate the mass of organic HAP in the thinners used in the controlled coating operation, grams, using Equation 1B of this section:

$$B_c = \sum_{j=1}^{n} (Vol_{t,j})(D_{t,j})(W_{t,j}) \qquad \text{(Eq. 1B)}$$

Where:

B_c = Total mass of organic HAP in the thinners used in the controlled coating operation during the month, grams.

$Vol_{t,j}$ = Total volume of thinner, j, used during the month, liters.

$D_{t,j}$ = Density of thinner, j, grams per liter.

$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, grams per gram.

n = Number of different thinners used.

(3) Calculate the mass of organic HAP in the cleaning materials used in the controlled coating operation during the month, grams, using Equation 1C of this section:

$$C_c = \sum_{k=1}^{p} (Vol_{s,k})(D_{s,k})(W_{s,k}) \qquad \text{(Eq. 1C)}$$

Where:

C_c = Total mass of organic HAP in the cleaning materials used in the controlled coating operation during the month, grams.

$Vol_{s,k}$ = Total volume of cleaning material, k, used during the month, liters.

$D_{s,k}$ = Density of cleaning material, k, grams per liter.

$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, grams per gram.

p = Number of different cleaning materials used.

(4) Calculate the mass of organic HAP in the coatings, thinners, and cleaning materials used in the controlled coating operation during deviations specified in § 63.4763(c) and (d), using Equation 1D of this section:

$$H_{unc} = \sum_{h=1}^{q} (Vol_h)(D_h)(W_h) \qquad \text{(Eq. 1D)}$$

Where:

H_{unc} = Total mass of organic HAP in the coatings, thinners, and cleaning materials used during all deviations specified in § 63.4763(c) and (d) that occurred during the month in the controlled coating operation, grams.

Vol_h = Total volume of coating, thinner, or cleaning material, h, used in the controlled coating operation during deviations, liters.

D_h = Density of coating, thinner, or cleaning material, h, grams per liter.

W_h = mass fraction of organic HAP in coating, thinner, or cleaning material, h, grams organic HAP per gram coating.

q = Number of different coatings, thinners, or cleaning materials.

(i) [Reserved]

(j) *Calculate the organic HAP emission reduction for each controlled coating operation using liquid-liquid material balances.* For each controlled coating operation using a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emission reduction by applying the volatile organic matter collection and recovery efficiency to the mass of organic HAP contained in the coatings, thinners, and cleaning materials that are used in the coating operation controlled by the solvent recovery system during each month. Perform a liquid-liquid material balance for each month as specified in paragraphs (j)(1) through (6) of this section. Calculate the mass of organic HAP emission reduction by the solvent recovery system as specified in paragraph (j)(7) of this section.

(1) For each solvent recovery system, install, calibrate, maintain, and operate according to the manufacturer's specifications, a device that indicates the cumulative amount of volatile organic matter recovered by the solvent recovery system each month. The device must be initially certified by the manufacturer to be accurate to within ±2.0 percent of the mass of volatile organic matter recovered.

(2) For each solvent recovery system, determine the mass of volatile organic matter recovered for the month, grams, based on measurement with the device required in paragraph (j)(1) of this section.

(3) Determine the mass fraction of volatile organic matter for each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the month, grams volatile organic matter per gram coating. You may determine the volatile organic matter mass fraction using Method 24 of 40 CFR part 60, appendix A, or an EPA approved alternative method, or you may use information provided by the manufacturer or supplier of the coating. In the event of any inconsistency between information provided by the manufacturer or supplier and the results of Method 24 of 40 CFR part 60, appendix A, or an approved alternative method, the test method results will take precedence unless after consultation, a regulated source could demonstrate to the satisfaction of the enforcement agency that the formulation data were correct.

(4) Determine the density of each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the month, grams per liter, according to § 63.4751(c).

(5) Measure the volume of each coating, thinner, and cleaning material used in the coating operation controlled by the solvent recovery system during the month, liters.

(6) Each month, calculate the solvent recovery system's volatile organic matter collection and recovery efficiency, using Equation 2 of this section:

$$R_v = 100 \times \frac{M_{vr}}{\sum_{i=1}^{m}(Vol_i)(D_i)(WV_{c,i}) + \sum_{j=1}^{n}(Vol_j)(D_j)(WV_{t,j}) + \sum_{k=1}^{p}(Vol_k)(D_k)(WV_{s,k})} \qquad \text{(Eq. 2)}$$

Where:

R_v = Volatile organic matter collection and recovery efficiency of the solvent recovery system during the month, percent.

M_{vr} = Mass of volatile organic matter recovered by the solvent recovery system during the month, grams.

Vol_i = Volume of coating, i, used in the coating operation controlled by the solvent recovery system during the month, liters.

D_i = Density of coating, i, grams per liter.

$WV_{c,i}$ = Mass fraction of volatile organic matter for coating, i, grams volatile organic matter per gram coating.

Vol_j = Volume of thinner, j, used in the coating operation controlled by the solvent recovery system during the month, liters.

D_j = Density of thinner, j, grams per liter.

$WV_{t,j}$ = Mass fraction of volatile organic matter for thinner, j, grams volatile organic matter per gram thinner.

Vol_k = Volume of cleaning material, k, used in the coating operation controlled by the solvent recovery system during the month, liters.

D_k = Density of cleaning material, k, grams per liter.

$WV_{s,k}$ = Mass fraction of volatile organic matter for cleaning material, k, grams volatile organic matter per gram cleaning material.

m = Number of different coatings used in the coating operation controlled by the solvent recovery system during the month.

n = Number of different thinners used in the coating operation controlled by the solvent recovery system during the month.

p = Number of different cleaning materials used in the coating operation controlled by the solvent recovery system during the month.

(7) Calculate the mass of organic HAP emission reduction for the coating operation controlled by the solvent recovery system during the month, using Equation 3 of this section:

$$H_{CSR} = (A_{CSR} + B_{CSR} + C_{CSR})\left(\frac{R_v}{100}\right) \qquad \text{(Eq. 3)}$$

Where:

H_{CSR} = Mass of organic HAP emission reduction for the coating operation controlled by the solvent recovery system during the month, grams.

A_{CSR} = Total mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system, grams, calculated using Equation 3A of this section.

B_{CSR} = Total mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system, grams, calculated using Equation 3B of this section.

C_{CSR} = Total mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system, grams, calculated using Equation 3C of this section.

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system, percent, from Equation 2 of this section.

(i) Calculate the mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system, grams, using Equation 3A of this section:

$$A_{CSR} = \sum_{i=1}^{m}(Vol_{c,i})(D_{c,i})(W_{c,i}) \qquad \text{(Eq. 3A)}$$

Where:

A_{CSR} = Total mass of organic HAP in the coatings used in the coating operation controlled by the solvent recovery system during the month, grams.

$Vol_{c,i}$ = Total volume of coating, i, used during the month in the coating operation controlled by the solvent recovery system, liters.

$D_{c,i}$ = Density of coating, i, grams per liter.

$W_{c,i}$ = Mass fraction of organic HAP in coating, i, grams per gram.
m = Number of different coatings used.

(ii) Calculate the mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system, grams, using Equation 3B of this section:

$$B_{CSR} = \sum_{j=1}^{n} (Vol_{t,j})(D_{t,j})(W_{t,j}) \qquad \text{(Eq. 3B)}$$

Where:

B_{CSR} = Total mass of organic HAP in the thinners used in the coating operation controlled by the solvent recovery system during the month, grams.
$Vol_{t,j}$ = Total volume of thinner, j, used during the month in the coating operation controlled by the solvent recovery system, liters.
$D_{t,j}$ = Density of thinner, j, grams per liter.
$W_{t,j}$ = Mass fraction of organic HAP in thinner, j, grams per gram.
n = Number of different thinners used.

(iii) Calculate the mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system during the month, grams, using Equation 3C of this section.

$$C_{CSR} = \sum_{k=1}^{p} (Vol_{s,k})(D_{s,k})(W_{s,k}) \qquad \text{(Eq. 3C)}$$

Where:

C_{CSR} = Total mass of organic HAP in the cleaning materials used in the coating operation controlled by the solvent recovery system during the month, grams.
$Vol_{s,k}$ = Total volume of cleaning material, k, used during the month in the coating operation controlled by the solvent recovery system, liters.
$D_{s,k}$ = Density of cleaning material, k, grams per liter.
$W_{s,k}$ = Mass fraction of organic HAP in cleaning material, k, grams per gram.
p = Number of different cleaning materials used.

(k) *Calculate the total volume of coating solids used.* Determine the total volume of coating solids used, liters, which is the combined volume of coating solids for all the coatings used during each month in the coating operation or group of coating operations for which you use the emission rate with add-on controls option, using Equation 2 of § 63.4751.

(l) *Calculate the mass of organic HAP emissions for each month.* Determine the mass of organic HAP emissions, grams, during each month, using Equation 4 of this section.

$$H_{HAP} = H_e - \sum_{i=1}^{q} (H_{c,i}) - \sum_{j=1}^{r} (H_{CSR,j}) \qquad \text{(Eq. 4)}$$

Where:

H_{HAP} = Total mass of organic HAP emissions for the month, grams.
H_e = Total mass of organic HAP emissions before add-on controls from all the coatings, thinners, and cleaning materials used during the month, grams, determined according to paragraph (f) of this section.
$H_{c,i}$ = Total mass of organic HAP emission reduction for controlled coating operation, i, not using a liquid-liquid material balance, during the month, grams, from Equation 1 of this section.
$H_{CSR,j}$ = Total mass of organic HAP emission reduction for coating operation, j, controlled by a solvent recovery system using a liquid-liquid material balance, during the month, grams, from Equation 3 of this section.
q = Number of controlled coating operations not using a liquid-liquid material balance.
r = Number of coating operations controlled by a solvent recovery system using a liquid-liquid material balance.

(m) *Calculate the organic HAP emission rate for the 12-month compliance period.* Determine the organic HAP emission rate for the 12-month compliance period, grams organic HAP per liter coating solids used, using Equation 5 of this section:

$$H_{annual} = \frac{\sum_{y=1}^{12} H_{HAP,y}}{\sum_{y=1}^{12} V_{st,y}} \qquad \text{(Eq. 5)}$$

Where:

H_{annual} = Organic HAP emission rate for the 12-month compliance period, grams organic HAP per liter coating solids.
$H_{HAP,y}$ = Organic HAP emission rate for month, y, determined according to Equation 4 of this section.
$V_{st,y}$ = Total volume of coating solids, liters, used during month, y, from Equation 2 of § 63.4751.
y = Identifier for months.

(n) *Compliance demonstration.* To demonstrate initial compliance with the emission limit, the organic HAP emission rate, calculated using Equation 5 of this section, must be less than or equal to the applicable emission limit in § 63.4690. You must keep all records as required by §§ 63.4730 and 63.4731. As part of the Notification of Compliance Status required by § 63.4710, you must identify the coating operation(s) for which you used the emission rate with add-on controls option and submit a statement that the coating operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in § 63.4690, and you achieved the operating limits required by § 63.4692

and the work practice standards required by § 63.4693.

§ 63.4762 [Reserved]

§ 63.4763 How do I demonstrate continuous compliance with the emission limitations?

(a) To demonstrate continuous compliance with the applicable emission limit in § 63.4690, the organic HAP emission rate for each compliance period, calculated using Equation 5 of § 63.4761, must be equal to or less than the applicable emission limit in § 63.4690. A compliance period consists of 12 months. Each month after the end of the initial compliance period described in § 63.4760 is the end of a compliance period consisting of that month and the preceding 11 months. You must perform the calculations in § 63.4761 on a monthly basis using data from the previous 12 months of operation.

(b) If the organic HAP emission rate for any 12-month compliance period exceeded the applicable emission limit in § 63.4690, this is a deviation from the emission limitation for that compliance period and must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(7).

(c) You must demonstrate continuous compliance with each operating limit required by § 63.4692 that applies to you, as specified in Table 3 to this subpart.

(1) If an operating parameter is out of the allowed range specified in Table 3 to this subpart, this is a deviation from the operating limit that must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(7).

(2) If an operating parameter deviates from the operating limit specified in Table 3 to this subpart, then you must assume that the emission capture system and add-on control device were achieving zero efficiency during the time period of the deviation. For the purposes of completing the compliance calculations specified in § 63.4761(h), you must treat the materials used during a deviation on a controlled coating operation as if they were used on an uncontrolled coating operation for the time period of the deviation, as indicated in Equation 1 of § 63.4761.

(d) You must meet the requirements for bypass lines in § 63.4768(b) for controlled coating operations for which you do not conduct liquid-liquid material balances. If any bypass line is opened and emissions are diverted to the atmosphere when a controlled coating operation is running, this is a deviation that must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(7). For the purposes of completing the compliance calculations specified in § 63.4761(h), you must treat the materials used during a deviation on a controlled coating operation as if they were used on an uncontrolled coating operation for the time period of the deviation, as indicated in Equation 1 of § 63.4761.

(e) You must demonstrate continuous compliance with the work practice standards in § 63.4693. If you did not develop a work practice plan, or you did not implement the plan, or you did not keep the records required by § 63.4730(k)(8), this is a deviation from the work practice standards that must be reported as specified in §§ 63.4710(c)(6) and 63.4720(a)(7).

(f) As part of each semiannual compliance report required in § 63.4720, you must identify the coating operation(s) for which you used the emission rate with add-on controls option. If there were no deviations from the emission limitations, submit a statement that you were in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in § 63.4690, and you achieved the operating limits required by § 63.4692 and the work practice standards required by § 63.4693 during each compliance period.

(g) During periods of SSM of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency, you must operate in accordance with the SSMP required by § 63.4700(d).

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of SSM of the emission capture system, add-on control device, or coating operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the SSMP. The Administrator will determine whether deviations that occur during a period you identify as an SSM are violations, according to the provisions in § 63.6(e).

(i) [Reserved]

(j) You must maintain records as specified in §§ 63.4730 and 63.4731.

§ 63.4764 What are the general requirements for performance tests?

(a) You must conduct each performance test required by § 63.4760 according to the requirements in § 63.7(e)(1) and under the conditions in this section unless you obtain a waiver of the performance test according to the provisions in § 63.7(h).

(1) *Representative coating operation operating conditions.* You must conduct the performance test under representative operating conditions for the coating operation. Operations during periods of SSM, and during periods of nonoperation do not constitute representative conditions. You must record the process information that is necessary to document operating conditions during the test and explain why the conditions represent normal operation.

(2) *Representative emission capture system and add-on control device operating conditions.* You must conduct the performance test when the emission capture system and add-on control device are operating at a representative flow rate, and the add-on control device is operating at a representative inlet concentration. You must record information that is necessary to document emission capture system and add-on control device operating conditions during the test and explain why the conditions represent normal operation.

(b) You must conduct each performance test of an emission capture system according to the requirements in § 63.4765. You must conduct each performance test of an add-on control device according to the requirements in § 63.4766.

§ 63.4765 How do I determine the emission capture system efficiency?

You must use the procedures and test methods in this section to determine capture efficiency as part of the performance test required by § 63.4760.

(a) *Assuming 100 percent capture efficiency.* You may assume the capture system efficiency is 100 percent if both of the conditions in paragraphs (a)(1) and (2) of this section are met:

(1) The capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and directs all the exhaust gases from the enclosure to an add-on control device.

(2) All coatings, thinners, and cleaning materials used in the coating operation are applied within the capture system; coating solvent flash-off and coating, curing, and drying occurs within the capture system; and the removal or evaporation of cleaning materials from the surfaces they are applied to occurs within the capture system. For example, this criterion is not met if parts enter the open shop environment when being moved between a spray booth and a curing oven.

(b) *Measuring capture efficiency.* If the capture system does not meet both of the criteria in paragraphs (a)(1) and (2) of this section, then you must use one of the three protocols described in paragraphs (c), (d), and (e) of this section to measure capture efficiency. The capture efficiency measurements use TVH capture efficiency as a surrogate for organic HAP capture efficiency. For the protocols in paragraphs (c) and (d) of this section, the capture efficiency measurement must consist of three test runs. Each test run must be at least 3 hours in duration or the length of a production run, whichever is longer, up to 8 hours. For the purposes of this test, a production run means the time required for a single part to go from the beginning to the end of production, which includes surface preparation activities and drying or curing time.

(c) *Liquid-to-uncaptured-gas protocol using a temporary total enclosure or building enclosure.* The liquid-to-uncaptured-gas protocol compares the mass of liquid TVH in materials used in the coating operation to the mass of TVH emissions not captured by the emission capture system. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (c)(1) through (6) of this section to measure emission capture system efficiency using the liquid-to-uncaptured-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the coating operation where coatings, thinners, and cleaning materials are applied, and all areas where emissions from these applied coatings and materials subsequently occur, such as flash-off, curing, and drying areas. The areas of the coating operation where capture devices collect emissions for routing to an add-on control device, such as the entrance and exit areas of an oven or spray booth, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204A or 204F of appendix M to 40 CFR part 51 to determine the mass fraction of TVH liquid input from each coating, thinner, and cleaning material used in the coating operation during each capture efficiency test run. To make the determination, substitute TVH for each occurrence of the term volatile organic compounds (VOC) in the methods.

(3) Use Equation 1 of this section to calculate the total mass of TVH liquid input from all the coatings, thinners, and cleaning materials used in the coating operation during each capture efficiency test run.

$$TVH_{used} = \sum_{i=1}^{n} (TVH_i)(Vol_i)(D_i) \qquad \text{(Eq. 1)}$$

Where:

TVH_{used} = Mass of liquid TVH in materials used in the coating operation during the capture efficiency test run, grams.

TVH_i = Mass fraction of TVH in coating, thinner, or cleaning material, i, that is used in the coating operation during the capture efficiency test run, grams TVH per gram material.

Vol_i = Total volume of coating, thinner, or cleaning material, i, used in the coating operation during the capture efficiency test run, liters.

D_i = Density of coating, thinner, or cleaning material, i, grams material per liter material.

n = Number of different coatings, thinners, and cleaning materials used in the coating operation during the capture efficiency test run.

(4) Use Method 204D or E of appendix M to 40 CFR part 51 to measure the total mass, grams, of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D of appendix M to 40 CFR part 51 if the enclosure is a temporary total enclosure.

(ii) Use Method 204E of appendix M to 40 CFR part 51 if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound emitting operations inside the building enclosure, other than the coating operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(5) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system using Equation 2 of this section:

$$CE = \frac{(TVH_{used} - TVH_{uncaptured})}{TVH_{used}} \times 100 \qquad \text{(Eq. 2)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

TVH_{used} = Total mass of TVH liquid input used in the coating operation during the capture efficiency test run, grams.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, grams, determined according to paragraph (c)(4) of this section.

(6) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(d) *Gas-to-gas protocol using a temporary total enclosure or a building enclosure.* The gas-to-gas protocol compares the mass of TVH emissions captured by the emission capture system to the mass of TVH emissions not captured. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (d)(1) through (5) of this section to measure emission capture system efficiency using the gas-to-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the coating operation where coatings, thinners, and cleaning materials are applied, and all areas where emissions from these applied coatings and materials subsequently occur, such as

flash-off, curing, and drying areas. The areas of the coating operation where capture devices collect emissions generated by the coating operation for routing to an add-on control device, such as the entrance and exit areas of an oven or a spray booth, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204B or 204C of appendix M to 40 CFR part 51 to measure the total mass, grams, of TVH emissions captured by the emission capture system during each capture efficiency test run as measured at the inlet to the add-on control device. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) The sampling points for the Method 204B or 204C of appendix M to 40 CFR part 51 measurement must be upstream from the add-on control device and must represent total emissions routed from the capture system and entering the add-on control device.

(ii) If multiple emission streams from the capture system enter the add-on control device without a single common duct, then the emissions entering the add-on control device must be simultaneously measured in each duct, and the total emissions entering the add-on control device must be determined.

(3) Use Method 204D or 204E of appendix M to 40 CFR part 51 to measure the total mass, grams, of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D of appendix M to 40 CFR part 51 if the enclosure is a temporary total enclosure.

(ii) Use Method 204E of appendix M to 40 CFR part 51 if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound emitting operations inside the building enclosure, other than the coating operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(4) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system using Equation 3 of this section:

$$CE = \frac{TVH_{captured}}{\left(TVH_{captured} + TVH_{uncaptured}\right)} \times 100 \qquad \text{(Eq. 3)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

$TVH_{captured}$ = Total mass of TVH captured by the emission capture system as measured at the inlet to the add-on control device during the emission capture efficiency test run, grams, determined according to paragraph (d)(2) of this section.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, grams, determined according to paragraph (d)(3) of this section.

(5) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(e) *Alternative capture efficiency protocol.* As an alternative to the procedures specified in paragraphs (c) and (d) of this section, you may determine capture efficiency using any other capture efficiency protocol and test methods that satisfy the criteria of either the DQO or LCL approach as described in appendix A to subpart KK of this part.

§ 63.4766 How do I determine the add-on control device emission destruction or removal efficiency?

You must use the procedures and test methods in this section to determine the add-on control device emission destruction or removal efficiency as part of the performance test required by § 63.4760. You must conduct three test runs as specified in § 63.7(e)(3), and each test run must last at least 1 hour.

(a) For all types of add-on control devices, use the test methods specified in paragraphs (a)(1) through (5) of this section.

(1) Use Method 1 or 1A of appendix A to 40 CFR part 60, as appropriate, to select sampling sites and velocity traverse points.

(2) Use Method 2, 2A, 2C, 2D, 2F, or 2G of appendix A to 40 CFR part 60, as appropriate, to measure gas volumetric flow rate.

(3) Use Method 3, 3A, or 3B of appendix A to 40 CFR part 60, as appropriate, for gas analysis to determine dry molecular weight. You may also use as an alternative to Method 3B, the manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas in ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]" (incorporated by reference, see § 63.14).

(4) Use Method 4 of appendix A to 40 CFR part 60 to determine stack gas moisture.

(5) Methods for determining gas volumetric flow rate, dry molecular weight, and stack gas moisture must be performed, as applicable, during each test run.

(b) Measure total gaseous organic mass emissions as carbon at the inlet and outlet of the add-on control device simultaneously, using either Method 25 or 25A of appendix A to 40 CFR part 60, as specified in paragraphs (b)(1) through (3) of this section. You must use the same method for both the inlet and outlet measurements.

(1) Use Method 25 of appendix A to 40 CFR part 60 if the add-on control device is an oxidizer, and you expect the total gaseous organic concentration as carbon to be more than 50 parts per million (ppm) at the control device outlet.

(2) Use Method 25A of appendix A to 40 CFR part 60 if the add-on control device is an oxidizer, and you expect the total gaseous organic concentration as carbon to be 50 ppm or less at the control device outlet.

(3) Use Method 25A of appendix A to 40 CFR part 60 if the add-on control device is not an oxidizer.

(c) If two or more add-on control devices are used for the same emission stream, then you must measure emissions at the outlet of each device. For example, if one add-on control device is a concentrator with an outlet for the high-volume, dilute stream that has been treated by the concentrator, and a second add-on control device is an oxidizer with an outlet for the low-volume, concentrated stream that is treated with the oxidizer, you must measure emissions at the outlet of the

oxidizer and the high volume dilute stream outlet of the concentrator.

(d) For each test run, determine the total gaseous organic emissions mass flow rates for the inlet and the outlet of the add-on control device, using Equation 1 of this section. If there is more than one inlet or outlet to the add-on control device, you must calculate the total gaseous organic mass flow rate using Equation 1 of this section for each inlet and each outlet and then total all of the inlet emissions and total all of the outlet emissions.

$$M_f = Q_{sd} C_c (12)(41.6)\left(10^{-6}\right) \qquad \text{(Eq. 1)}$$

Where:

M_f = Total gaseous organic emissions mass flow rate, grams per hour (h).

C_c = Concentration of organic compounds as carbon in the vent gas, as determined by Method 25 or Method 25A, parts per million by volume (ppmv), dry basis.

Q_{sd} = Volumetric flow rate of gases entering or exiting the add-on control device, as determined by Method 2, 2A, 2C, 2D, 2F, or 2G, dry standard cubic meters/hour (dscm/h).

41.6 = Conversion factor for molar volume, gram-moles per cubic meter (mol/m^3) (@ 293 Kelvin (K) and 760 millimeters of mercury (mmHg)).

(e) For each test run, determine the add-on control device organic emissions destruction or removal efficiency, using Equation 2 of this section:

$$DRE = 100 \times \frac{M_{fi} - M_{fo}}{M_{fi}} \qquad \text{(Eq. 2)}$$

Where:

DRE = Organic emissions destruction or removal efficiency of the add-on control device, percent.

M_{fi} = Total gaseous organic emissions mass flow rate at the inlet(s) to the add-on control device, using Equation 1 of this section, grams/h.

M_{fo} = total gaseous organic emissions mass flow rate at the outlet(s) of the add-on control device, using Equation 1 of this section, grams/h.

(f) Determine the emission destruction or removal efficiency of the add-on control device as the average of the efficiencies determined in the three test runs and calculated in Equation 2 of this section.

§ 63.4767 How do I establish the emission capture system and add-on control device operating limits during the performance test?

During the performance test required by § 63.4760 and described in §§ 63.4764, 63.4765, and 63.4766, you must establish the operating limits required by § 63.4692 according to this section, unless you have received approval for alternative monitoring and operating limits under § 63.8(f) as specified in § 63.4692.

(a) *Thermal oxidizers.* If your add-on control device is a thermal oxidizer, establish the operating limits according to paragraphs (a)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the combustion temperature at least once every 15 minutes during each of the three test runs. You must monitor the temperature in the firebox of the thermal oxidizer or immediately downstream of the firebox before any substantial heat exchange occurs.

(2) Use the data collected during the performance test to calculate and record the average combustion temperature maintained during the performance test. This average combustion temperature is the minimum operating limit for your thermal oxidizer.

(b) *Catalytic oxidizers.* If your add-on control device is a catalytic oxidizer, establish the operating limits according to either paragraphs (b)(1) and (2) or paragraphs (b)(3) and (4) of this section.

(1) During the performance test, you must monitor and record the temperature before the catalyst bed and the temperature difference across the catalyst bed at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average temperature difference across the catalyst bed maintained during the performance test. This is the minimum operating limit for your catalytic oxidizer.

(3) As an alternative to monitoring the temperature difference across the catalyst bed, you may monitor the temperature at the inlet to the catalyst bed and implement a site-specific inspection and maintenance plan for your catalytic oxidizer as specified in paragraph (b)(4) of this section. During the performance test, you must monitor and record the temperature before the catalyst bed at least once every 15 minutes during each of the three test runs. Use the data collected during the performance test to calculate and record the average temperature before the catalyst bed during the performance test. This is the minimum operating limit for your catalytic oxidizer. (Note: For regenerative catalytic oxidizers, the inlet to the catalyst is defined as the general zone between the inlets to the catalyst beds located in the multiple regeneration towers; select either a monitoring location or multiple monitoring locations. If multiple monitoring locations are selected, either establish separate operating limits for each location or calculate an average of the multiple measurements and set a single operating limit.)

(4) You must develop and implement an inspection and maintenance plan for your catalytic oxidizer(s) for which you elect to monitor according to paragraph (b)(3) of this section. The plan must address, at a minimum, the elements specified in paragraphs (b)(4)(i) through (iii) of this section.

(i) Annual sampling and analysis of the catalyst activity (*i.e,* conversion efficiency) following the recommended procedures from the manufacturer, the catalyst supplier, or the catalyst test provider.

(ii) Monthly inspection of the oxidizer system, including the burner assembly and fuel supply lines for problems and, as necessary, adjust the equipment to assure proper air-to-fuel mixtures.

(iii) Annual internal and monthly external visual inspection of the catalyst bed to check for channeling, abrasion, and settling. If problems are found, you must take corrective action consistent with the manufacturer's recommendation and conduct a new performance test to determine destruction efficiency according to § 63.4766.

(c) *Carbon adsorbers.* If your add-on control device is a carbon adsorber, establish the operating limits according to paragraphs (c)(1) and (2) of this section.

(1) You must monitor and record the total regeneration desorbing gas (*e.g.,* steam or nitrogen) mass flow for each regeneration cycle, and the carbon bed temperature after each carbon bed regeneration and cooling cycle for the regeneration cycle either immediately preceding or immediately following the performance test.

(2) The operating limits for your carbon adsorber are the minimum total desorbing gas mass flow recorded

during the regeneration cycle, and the maximum carbon bed temperature recorded after the cooling cycle.

(d) *Condensers.* If your add-on control device is a condenser, establish the operating limits according to paragraphs (d)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the condenser outlet (product side) gas temperature at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average condenser outlet (product side) gas temperature maintained during the performance test. This average condenser outlet gas temperature is the maximum operating limit for your condenser.

(e) *Concentrators.* If your add-on control device includes a concentrator, you must establish operating limits for the concentrator according to paragraphs (e)(1) through (4) of this section.

(1) During the performance test, you must monitor and record the desorption concentrate stream gas temperature at least once every 15 minutes during each of the three runs of the performance test.

(2) Use the data collected during the performance test to calculate and record the average temperature. This is the minimum operating limit for the desorption concentrate gas stream temperature.

(3) During the performance test, you must monitor and record the pressure drop of the dilute stream across the concentrator at least once every 15 minutes during each of the three runs of the performance test.

(4) Use the data collected during the performance test to calculate and record the average pressure drop. This is the maximum operating limit for the dilute stream across the concentrator.

(f) *Emission capture system.* For each capture device that is not part of a PTE that meets the criteria of § 63.4765(a), establish an operating limit for either the gas volumetric flow rate or duct static pressure, as specified in paragraphs (f)(1) and (2) of this section. The operating limit for a PTE is specified in Table 3 to this subpart.

(1) During the capture efficiency determination required by § 63.4760 and described in §§ 63.4764 and 63.4765, you must monitor and record either the gas volumetric flow rate or the duct static pressure for each separate capture device in your emission capture system at least once every 15 minutes during each of the three test runs at a point in the duct between the capture device and the add-on control device inlet.

(2) Calculate and record the average gas volumetric flow rate or duct static pressure for the three test runs for each capture device. This average gas volumetric flow rate or duct static pressure is the minimum operating limit for that specific capture device.

§ 63.4768 What are the requirements for continuous parameter monitoring system installation, operation, and maintenance?

(a) *General.* You must install, operate, and maintain each CPMS specified in paragraphs (c), (e), (f), and (g) of this section according to paragraphs (a)(1) through (6) of this section. You must install, operate, and maintain each CPMS specified in paragraphs (b) and (d) of this section according to paragraphs (a)(3) through (5) of this section.

(1) The CPMS must complete a minimum of one cycle of operation for each successive 15-minute period. You must have a minimum of four equally spaced successive cycles of CPMS operation in 1 hour.

(2) You must determine the average of all recorded readings for each successive 3-hour period of the emission capture system and add-on control device operation.

(3) You must record the results of each inspection, calibration, and validation check of the CPMS.

(4) You must maintain the CPMS at all times and have available necessary parts for routine repairs of the monitoring equipment.

(5) You must operate the CPMS and collect emission capture system and add-on control device parameter data at all times that a controlled coating operation is operating, except during monitoring malfunctions, associated repairs, and required quality assurance or control activities (including, if applicable, calibration checks and required zero and span adjustments).

(6) You must not use emission capture system or add-on control device parameter data recorded during periods when the control device is not receiving emissions, monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities when calculating data averages. You must use all the data collected during all other periods in calculating the data averages for determining compliance with the emission capture system and add-on control device operating limits.

(7) A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the CPMS to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions. Any period for which the monitoring system is out-of-control and data are not available for required calculations is a deviation from the monitoring requirements.

(b) *Capture system bypass line.* You must meet the requirements of paragraphs (b)(1) and (2) of this section for each emission capture system that contains bypass lines that could divert emissions away from the add-on control device to the atmosphere.

(1) You must monitor or secure the valve or closure mechanism controlling the bypass line in a nondiverting position in such a way that the valve or closure mechanism cannot be opened without creating a record that the valve was opened. The method used to monitor or secure the valve or closure mechanism must meet one of the requirements specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) *Flow control position indicator.* Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow control position indicator that takes a reading at least once every 15 minutes and provides a record indicating whether the emissions are directed to the add-on control device or diverted from the add-on control device. The time of occurrence and flow control position must be recorded, as well as every time the flow direction is changed. The flow control position indicator must be installed at the entrance to any bypass line that could divert the emissions away from the add-on control device to the atmosphere.

(ii) *Car-seal or lock-and-key valve closures.* Secure any bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. You must visually inspect the seal or closure mechanism at least once every month to ensure that the valve is maintained in the closed position, and the emissions are not diverted away from the add-on control device to the atmosphere.

(iii) *Valve closure monitoring.* Ensure that any bypass line valve is in the closed (non-diverting) position through monitoring of valve position at least once every 15 minutes. You must inspect the monitoring system at least once every month to verify that the monitor will indicate valve position.

(iv) *Automatic shutdown system.* Use an automatic shutdown system in which the coating operation is stopped when flow is diverted by the bypass line away from the add-on control device to the atmosphere when the coating operation is running. You must inspect the automatic shutdown system at least once every month to verify that it will detect diversions of flow and shut down the coating operation.

(2) If any bypass line is opened and there was a deviation from the applicable emission limitation, you must include a description of why the bypass line was opened and the length of time it remained open in the semiannual compliance reports required in § 63.4720.

(c) *Thermal oxidizers and catalytic oxidizers.* If you are using a thermal oxidizer or catalytic oxidizer as an add-on control device (including those used with concentrators or with carbon adsorbers to treat desorbed concentrate streams), you must comply with the requirements in paragraphs (c)(1) through (3) of this section:

(1) For a thermal oxidizer, install a gas temperature monitor in the firebox of the thermal oxidizer or in the duct immediately downstream of the firebox before any substantial heat exchange occurs.

(2) For a catalytic oxidizer, you must install a gas temperature monitor in the gas stream immediately before the catalyst bed, and if you established operating limits according to § 63.4767(b)(1) and (2), also install a gas temperature monitor in the gas stream immediately after the catalyst bed.

(i) If you establish operating limits according to § 63.4767(b)(1) and (2), then you must install the gas temperature monitors both upstream and downstream of the catalyst bed. The temperature monitors must be in the gas stream immediately before and after the catalyst bed to measure the temperature difference across the bed.

(ii) If you establish operating limits according to § 63.4767(b)(3) and (4), then you must install a gas temperature monitor upstream of the catalyst bed. The temperature monitor must be in the gas stream immediately before the catalyst bed to measure the temperature.

(3) For all thermal oxidizers and catalytic oxidizers, you must meet the requirements in paragraphs (a) and (c)(3)(i) through (vii) of this section for each gas temperature monitoring device.

(i) Locate the temperature sensor in a position that provides a representative temperature.

(ii) Use a temperature sensor with a measurement sensitivity of 4 degrees Fahrenheit or 0.75 percent of the temperature value, whichever is larger.

(iii) Shield the temperature sensor system from electromagnetic interference and chemical contaminants.

(iv) If a gas temperature chart recorder is used, it must have a measurement sensitivity in the minor division of at least 20 degrees Fahrenheit.

(v) Perform an electronic calibration at least semiannually according to the procedures in the manufacturer's owners manual. Following the electronic calibration, you must conduct a temperature sensor validation check in which a second or redundant temperature sensor placed nearby the process temperature sensor must yield a reading within 30 degrees Fahrenheit of the process temperature sensor reading.

(vi) Conduct calibration and validation checks any time the sensor exceeds the manufacturer's specified maximum operating temperature range or install a new temperature sensor.

(vii) At least monthly, inspect components for integrity and electrical connections for continuity, oxidation, and galvanic corrosion.

(d) *Carbon adsorbers.* If you are using a carbon adsorber as an add-on control device, you must monitor the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each regeneration cycle, the carbon bed temperature after each regeneration and cooling cycle, and comply with paragraphs (a)(3) through (5) and (d)(1) and (2) of this section.

(1) The regeneration desorbing gas mass flow monitor must be an integrating device having a measurement sensitivity of plus or minus 10 percent capable of recording the total regeneration desorbing gas mass flow for each regeneration cycle.

(2) The carbon bed temperature monitor must have a measurement sensitivity of 1 percent of the temperature recorded or 1 degree Fahrenheit, whichever is greater, and must be capable of recording the temperature within 15 minutes of completing any carbon bed cooling cycle.

(e) *Condensers.* If you are using a condenser, you must monitor the condenser outlet (product side) gas temperature and comply with paragraphs (a) and (e)(1) and (2) of this section.

(1) The gas temperature monitor must have a measurement sensitivity of 1 percent of the temperature recorded or 1 degree Fahrenheit, whichever is greater.

(2) The temperature monitor must provide a gas temperature record at least once every 15 minutes.

(f) *Concentrators.* If you are using a concentrator, such as a zeolite wheel or rotary carbon bed concentrator, you must comply with the requirements in paragraphs (f)(1) and (2) of this section.

(1) You must install a temperature monitor in the desorption gas stream. The temperature monitor must meet the requirements in paragraphs (a) and (c)(3) of this section.

(2) You must install a device to monitor pressure drop across the zeolite wheel or rotary carbon bed. The pressure monitoring device must meet the requirements in paragraphs (a) and (f)(2)(i) through (vii) of this section.

(i) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure.

(ii) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion.

(iii) Use a gauge with a minimum tolerance of 0.5 inch of water or a transducer with a minimum tolerance of 1 percent of the pressure range.

(iv) Check the pressure tap daily.

(v) Using a manometer, check gauge calibration quarterly and transducer calibration monthly.

(vi) Conduct calibration checks any time the sensor exceeds the manufacturer's specified maximum operating pressure range or install a new pressure sensor.

(vii) At least monthly, inspect components for integrity, electrical connections for continuity, and mechanical connections for leakage.

(g) *Emission capture systems.* The capture system monitoring system must comply with the applicable requirements in paragraphs (g)(1) and (2) of this section.

(1) For each flow measurement device, you must meet the requirements in paragraphs (a) and (g)(1)(i) through (iv) of this section.

(i) Locate a flow sensor in a position that provides a representative flow measurement in the duct from each capture device in the emission capture system to the add-on control device.

(ii) Reduce swirling flow or abnormal velocity distributions due to upstream and downstream disturbances.

(iii) Conduct a flow sensor calibration check at least semiannually.

(iv) At least monthly, inspect components for integrity, electrical connections for continuity, and mechanical connections for leakage.

(2) For each pressure drop measurement device, you must comply with the requirements in paragraphs (a) and (g)(2)(i) through (vi) of this section.

(i) Locate the pressure sensor(s) in or as close to a position that provides a representative measurement of the pressure drop across each opening you are monitoring.

(ii) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion.

(iii) Check pressure tap pluggage daily.

(iv) Using an inclined manometer with a measurement sensitivity of

0.0002 inch water, check gauge calibration quarterly and transducer calibration monthly.

(v) Conduct calibration checks any time the sensor exceeds the manufacturer's specified maximum operating pressure range or install a new pressure sensor.

(vi) At least monthly, inspect components for integrity, electrical connections for continuity, and mechanical connections for leakage.

Other Requirements and Information

§ 63.4780 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the EPA, or a delegated authority such as your State, local, or tribal agency. If the EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the EPA, has the authority to implement and enforce this subpart. You should contact your EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the EPA Administrator and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section:

(1) Approval of alternatives to the work practice standards under § 63.4693.

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major changes to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.4781 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in 40 CFR 63.2, and in this section as follows:

Add-on control means an air pollution control device, such as a thermal oxidizer or carbon adsorber, that reduces pollution in an air stream by destruction or removal before discharge to the atmosphere.

Adhesive means any chemical substance that is applied for the purpose of bonding two surfaces together.

Block average is an average of data points collected over any specified, continuous 180-minute block of time (*e.g.*, a 3-hour block could be noon to 3 p.m., with a subsequent total of eight 3-hour blocks within a 24-hour period).

Capture device means a hood, enclosure, room, floor sweep, or other means of containing or collecting emissions and directing those emissions into an add-on air pollution control device.

Capture efficiency or *capture system efficiency* means the portion (expressed as a percentage) of the pollutants from an emission source that is delivered to an add-on control device.

Capture system means one or more capture devices intended to collect emissions generated by a coating operation in the use of coatings or cleaning materials, both at the point of application and at subsequent points where emissions from the coatings or cleaning materials occur, such as flashoff, drying, or curing. As used in this subpart, multiple capture devices that collect emissions generated by a coating operation are considered a single capture system.

Cleaning material means a solvent used to remove contaminants and other materials, such as dirt, grease, oil, and dried or wet coating (*e.g.*, depainting), from a substrate before or after coating application or from equipment associated with a coating operation, such as spray booths, spray guns, racks, tanks, and hangers. Thus, it includes any cleaning material used on substrates or equipment or both.

Coating means a material applied to a substrate for decorative, protective, or functional purposes. Such materials include, but are not limited to, paints, sealants, caulks, inks, adhesives, and maskants. Decorative, protective, or functional materials that consist only of protective oils for metal, acids, bases, or any combination of these substances are not considered coatings for the purposes of this subpart.

Coating operation means equipment used to apply cleaning materials to a substrate to prepare it for coating application or to remove dried coating (surface preparation), to apply coating to a substrate (coating application) and to dry or cure the coating after application, or to clean coating operation equipment (equipment cleaning). A single coating operation may include any combination of these types of equipment, but always includes at least the point at which a coating or cleaning material is applied and all subsequent points in the affected source where organic HAP emissions from that coating or cleaning material occur. There may be multiple coating operations in an affected source. Coating application with hand-held nonrefillable aerosol containers, touchup markers, or marking pens is not a coating operation for the purposes of this subpart.

Coating solids means the nonvolatile portion of the coating that makes up the dry film.

Continuous parameter monitoring system (CPMS) means the total equipment that may be required to meet the data acquisition and availability requirements of this subpart used to sample, condition (if applicable), analyze, and provide a record of coating operation, or capture system, or add-on control device parameters.

Controlled coating operation means a coating operation from which some or all of the organic HAP emissions are routed through an emission capture system and add-on control device.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to any emission limit, or operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, or operating limit, or work practice standard in this subpart during SSM, regardless of whether or not such failure is permitted by this subpart.

Emission limitation means an emission limit, operating limit, or work practice standard.

Enclosure means a structure that surrounds a source of emissions and captures and directs the emissions to an add-on control device.

Exempt compound means a specific compound that is not considered a VOC due to negligible photochemical reactivity. The exempt compounds are listed in 40 CFR 51.100(s).

Finished wood product means any wood building product to which a protective, decorative, or functional layer has been applied. Materials used include, but are not limited to, paints, stains, sealers, topcoats, basecoats, primers, enamels, inks, and adhesives.

Laminated wood product means any wood building product to which a protective, decorative, or functional layer has been bonded with an adhesive. Products that are produced by bonding layers to the substrate as a part of the substrate manufacturing process (prior

to pressing) are not considered laminated products under this subpart.

Manufacturer's formulation data means data on a material (such as a coating) that are supplied by the material manufacturer based on knowledge of the ingredients used to manufacture that material, rather than based on testing of the material with the test methods specified in § 63.4741. Manufacturer's formulation data may include, but are not limited to, information on density, organic HAP content, volatile organic matter content, and coating solids content.

Mass fraction of organic HAP means the ratio of the mass of organic HAP to the mass of a material in which it is contained, expressed as grams of organic HAP per gram of material.

Millwork means lumber that has been remanufactured into a wood building product or component such as door, window, and staircase part(s), or decorative trim.

Month means a calendar month or a pre-specified period of 28 days to 35 days to allow for flexibility in recordkeeping when data are based on a business accounting period.

Organic HAP content means the mass of organic HAP per volume of coating solids for a coating calculated using Equation 2 of § 63.4741. The organic HAP content is determined for the coating in the condition it is in when received from its manufacturer or supplier and does not account for any alteration after receipt.

Permanent total enclosure (PTE) means a permanently installed enclosure that meets the criteria of Method 204 of appendix M, 40 CFR part 51, for a PTE and that directs all the exhaust gases from the enclosure to an add-on control device.

Protective oil means an organic material that is applied to metal for the purpose of providing lubrication or protection from corrosion without forming a solid film. This definition of protective oil includes, but is not limited to, lubricating oils, evaporative oils (including those that evaporate completely), and extrusion oils.

Research or laboratory facility means a facility whose primary purpose is for research and development of new processes and products, that is conducted under the close supervision of technically trained personnel, and is not engaged in the manufacture of final or intermediate products for commercial purposes, except in a de minimis manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Startup, initial means the first time equipment is brought online in a source.

Surface preparation means use of a cleaning material on a portion of or all of a substrate. This includes use of a cleaning material to remove dried coating, which is sometimes called "depainting."

Temporary total enclosure means an enclosure constructed for the purpose of measuring the capture efficiency of pollutants emitted from a given source as defined in Method 204 of appendix M, 40 CFR part 51.

Thinner means an organic solvent that is added to a coating after the coating is received from the supplier.

Tileboard means hardboard that meets the specifications for Class I given by the standard ANSI/AHA A135.4–1995 as approved by the American National Standards Institute. The standard specifies requirements and test methods for water absorption, thickness swelling, modulus of rupture, tensile strength, surface finish, dimensions, squareness, edge straightness, and moisture content for five classes of hardboard. Tileboard is also known as Class I hardboard or tempered hardboard.

Total volatile hydrocarbon (TVH) means the total amount of nonaqueous volatile organic matter determined according to Methods 204 and 204A through 204F of appendix M to 40 CFR part 51 and substituting the term TVH each place in the methods where the term VOC is used. The TVH includes both VOC and non-VOC.

Uncontrolled coating operation means a coating operation from which none of the organic HAP emissions are routed through an emission capture system and add-on control device.

Volatile organic compound (VOC) means any compound defined as VOC in 40 CFR 51.100(s).

Volume fraction of coating solids means the ratio of the volume of coating solids (also known as volume of nonvolatiles) to the volume of coating; liters of coating solids per liter of coating.

Wastewater means water that is generated in a coating operation and is collected, stored, or treated prior to being discarded or discharged.

Wood building product means any product that contains more than 50 percent by weight wood or wood fiber, excluding the weight of any glass components, and is used in the construction, either interior or exterior, of a residential, commercial, or institutional building.

Tables to Subpart QQQQ of Part 63

TABLE 1 TO SUBPART QQQQ OF PART 63.—EMISSION LIMITS FOR NEW ORRECONSTRUCTED AFFECTED SOURCES

[You must comply with the emission limits that apply to your affected source in the following table as required by § 63.4690]

If the affected source applies coating to products in the following subcategory. . .	Then, the organic HAP emission limit for the affected source, in gramsHAP/liter solids (lb HAP/gal solids)[1,2] is:
1. Exterior siding and primed doorskins.	0 (0.00)
2. Flooring	0 (0.00)
3. Interior wall paneling or tileboard.	5 (0.04)
4. Other interior panels	0 (0.00)
5. Doors, windows, and miscellaneous.	57 (0.48)

[1] Determined as a rolling 12-month emission rate according to the requirements in § 63.4741, § 63.4751, or § 63.4761, as applicable.

[2] If the affected source applies coatings to products in more than one of the subcategories listed in the table, then you must determine the applicable emission limit according to § 63.4690(c).

TABLE 2 TO SUBPART QQQQ OF PART 63.—EMISSION LIMITS FOR EXISTING AFFECTED SOURCES

[You must comply with the emission limits that apply to your affected source in the following table as required by § 63.4690]

If the affected source applies coating to products in the following subcategory. . .	Then, the organic HAP emission limit for the affected source, in gramsHAP/liter solids (lb HAP/gal solids)[1,2] is:
1. Exterior siding and primed doorskins.	7 (0.06)
2. Flooring	93 (0.78)
3. Interior wall paneling or tileboard.	183 (1.53)
4. Other interior panels	20 (0.17)
5. Doors, windows, and miscellaneous.	231 (1.93)

[1] Determined as a rolling 12-month emission rate according to the requirements in § 63.4741, § 63.4751, or § 63.4761, as applicable.

[2] If the affected source applies coatings to products in more than one of the subcategories listed in the table, then you must determine the applicable emission limit according to § 63.4690(c).

TABLE 3 TO SUBPART QQQQ OF PART 63.—OPERATING LIMITS IF USING THE EMISSION RATE WITH ADD-ON CONTROLS OPTION

[If you are required to comply with operating limits by § 63.4692, you must comply with the applicable operating limits in the following table]

For the following device . . .	You must meet the following operating limit . . .	And you must demonstrate continuous compliance with the operating limit by . . .
1. Thermal oxidizer	a. The average combustion temperature in any 3-hour period must not fall below the combustion temperature limit established according to § 63.4767(a).	i. Collecting the combustion temperature data according to § 63.4768(c); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block average combustion temperature at or above the temperature limit.
2. Catalytic oxidizer	a. The average temperature difference measured across the catalyst bed in any 3-hour period must not fall below the limit established according to § 63.4767(b); or	i. Collecting the temperature data according to § 63.4768(c); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block temperature difference across the catalyst bed at or above the temperature limit.
	b. Ensure that the inlet temperature of the catalyst bed in any 3-hour period does not fall below the temperature limit established according to § 63.4767(b)(2) and develop and implement an inspection and maintenance plan according to § 63.4767(b)(3) and (4).	i. Collecting the temperature data according to § 63.4768(c), reducing the data to 3-hour block averages, and maintaining the 3-hour average temperature at or above the temperature limit; and ii. Complying with the inspection and maintenance plan developed according to § 63.4767(b)(3) and (4).
3. Carbon absorber	a. The total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each carbon bed regeneration cycle must not fall below the total regeneration desorbing gas mass flow limit established according to § 63.4767(c).	i. Measuring the total regeneration desorbing gas (*e.g.*, steam or nitrogen) mass flow for each regeneration cycle according to § 63.4768(d); and ii. Maintaining the total regeneration desorbing gas mass flow at or above the mass flow limit.
	b. The temperature of the carbon bed, after completing each regeneration and any cooling cycle, must not exceed the carbon bed temperature limit established according to § 63.4767(c).	i. Measuring the temperature of the carbon bed, after completing each regeneration and any cooling cycle, according to § 63.4768(d); and ii. Operating and carbon beds such that each carbon bed is not returned to service until completing each regeneration and any cooling cycle until the recorded temperature of the carbon bed is at or below the temperature limit.
4. Condenser	a. The average condenser outlet (product side) gas temperature in any 3-hour period must not exceed the temperature limit established according to § 63.4767(d).	i. Collecting the condenser outlet (product side) gas temperature according to § 63.4768(e); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block average gas temperature at the outlet at or below the temperature limit.
5. Emission capture system that is a PTE according to § 63.4765(a).	a. The direction of the air flow at all times must be into the enclosure; and either.	i. Collecting the direction of the air flow; and either the facial velocity of air through all natural draft openings according to § 63.4768(g)(1) or the pressure drop across the enclosure according to § 63.4768(g)(2); and ii. Maintaining the facial velocity of air flow through all natural draft openings or the pressure drop at or above the facial velocity limit or pressure drop limit, and maintaining the direction of air flow into the enclosure at all times.
	b. The average facial velocity of air through all natural draft openings in the enclosure must be at least 200 feet per minute; or	i. See items 5.a.i and 5.a.ii.
	c. The pressure drop across the enclosure must be at least 0.007 inch H_2O, as established in Method 204 of appendix M to 40 CFR part 51.	i. See items 5.a.i and 5.a.ii.
6. Emission capture system that is not a PTE according to § 63.4765(a).	a. The average gas volumetric flow rate or duct static pressure in each duct between a capture device and add-on control device inlet in any 3-hour period must not fall below the average volumetric flow rate or duct static pressure limit established for that capture device according to § 63.4767(f).	i. Collecting the gas volumetric flow gas or duct static pressure for each capture device according to § 63.4768(g); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block average gas volumetric flow rate or duct static pressure for each capture device at or above the gas volumetric flow rate or duct static pressure limit
7. Concentrators, including zeolite wheels and rotary carbon absorbers.	The average gas temperature of the desorption concentrate stream in any 3-hour period must not fall below the limit established according to § 63.4767(e); and	i. Collecting the temperature data according to § 63.4768(f); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block average temperature at or above the temperature limit.

TABLE 3 TO SUBPART QQQQ OF PART 63.—OPERATING LIMITS IF USING THE EMISSION RATE WITH ADD-ON CONTROLS OPTION—Continued

[If you are required to comply with operating limits by §63.4692, you must comply with the applicable operating limits in the following table]

For the following device . . .	You must meet the following operating limit . . .	And you must demonstrate continuous compliance with the operating limit by . . .
	b. The average pressure drop of the dilute stream across the concentrator in any 3-hour period must not exceed the limit established according to §63.4767(e).	i. Collecting the pressure drop data according to §63.4768(f); and ii. Reducing the pressure drop data to 3-hour block averages; and iii. Maintaining the 3-hour block average pressure drop at or below at the pressure drop limit.

TABLE 4 TO SUBPART QQQQ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART QQQQ OF PART 63

[You must comply with the applicable General Provisions requirements according to the following table]

Citation	Subject	Applicable to subpart QQQQ	Explanation
§63.1(a)(1)–(14)	General Applicability	Yes.	
§63.1(b)(1)–(3)	Initial Applicability Determination	Yes	Applicability to subpart QQQQ is also specified in §63.4681.
§63.1(c)(1)	Applicability After Standard Established.	Yes.	
§63.1(c)(2)–(3)	Applicability of Permit Program for Area Sources.	No	Area sources are not subject to subpart QQQQ.
§63.1(c)(4)–(5)	Extensions and Notifications	Yes.	
§63.1(e)	Applicability of Permit Program Before Relevant Standard is Set.	Yes.	
§63.2	Definitions	Yes	Additional definitions are specified in §63.4781.
§63.3(a)–(c)	Units and Abbreviations	Yes.	
§63.4(a)(1)–(5)	Prohibited Activities	Yes.	
§63.4(b)–(c)	Circumvention/Severability	Yes.	
§63.5(a)	Construction/Reconstruction	Yes.	
§63.5(b)(1)–(6)	Requirements for Existing, Newly Constructed, and Reconstructed Sources.	Yes.	
§63.5(d)	Application for Approval of Construction/Reconstruction.	Yes.	
§63.5(e)	Approval of Construction/Reconstruction.	Yes.	
§63.5(f)	Approval of Construction/Reconstruction Based on Prior State Review.	Yes.	
§63.6(a)	Compliance With Standards and Maintenance Requirements—Applicability.	Yes.	
§63.6(b)(1)–(7)	Compliance Dates for New and Reconstructed Sources.	Yes	§63.4683 specifies the compliance dates.
§63.6(c)(1)–(5)	Compliance Dates for Existing Sources.	Yes	§63.4683 specifies the compliance dates.
§63.6(e)(1)–(2)	Operation and Maintenance	Yes.	
§63.6(e)(3)	SSMP	Yes	Only sources using an add-on control device to comply with the standard must complete SSMP.
§63.6(f)(1)	Compliance Except During SSM	Yes	Applies only to sources using an add-on control device to comply with the standard.
§63.6(f)(2)–(3)	Methods for Determining Compliance.	Yes.	
§63.6(g)(1)–(3)	Use of an Alternative Standard	Yes.	
§63.6(h)	Compliance With Opacity/Visible Emission Standards.	No	Subpart QQQQ does not establish opacity standards and does not require continuous opacity monitoring systems (COMS).
§63.6(i)(1)–(16)	Extension of Compliance	Yes.	
§63.6(j)	Presidential Compliance Exemption	Yes.	
§63.7(a)(1)	Performance Test Requirements—Applicability.	Yes	Applies to all affected sources. Additional requirements for performance testing are specified in §§63.4764, 63.4765, and 63.4766.

TABLE 4 TO SUBPART QQQQ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART QQQQ OF PART 63—Continued

[You must comply with the applicable General Provisions requirements according to the following table]

Citation	Subject	Applicable to subpart QQQQ	Explanation
§ 63.7(a)(2)	Performance Test Requirements—Dates.	Yes	Applies only to performance tests for capture system and control device efficiency at sources using these to comply with the standard. § 63.4760 specifies the schedule for performance test requirements that are earlier than those specified in § 63.7(a)(2).
§ 63.7(a)(3)	Performance Tests Required By the Administrator.	Yes.	
§ 63.7(b)–(e)	Performance Test Requirements—Notification, Quality Assurance, Facilities Necessary for Safe Testing, Conditions During Test.	Yes	Applies only to performance tests for capture system and add-on control device efficiency at sources using these to comply with the standard.
§ 63.7(f)	Performance Test Requirements—Use of Alternative Test Method.	Yes	Applies to all test methods except those used to determine capture system efficiency.
§ 63.7(g)–(h)	Performance Test Requirements—Data Analysis, Recordkeeping, Reporting, Waiver of Test.	Yes	Applies only to performance tests for capture system and add-on control device efficiency at sources using these to comply with the standard.
§ 63.8(a)(1)–(3)	Monitoring Requirements—Applicability.	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standard. Additional requirements for monitoring are specified in § 63.4768.
§ 63.8(a)(4)	Additional Monitoring Requirements	No	Subpart QQQQ does not have monitoring requirements for flares.
§ 63.8(b)	Conduct of Monitoring	Yes.	
§ 63.8(c)(1)–(3)	Continuous Monitoring System (CMS) Operation and Maintenance.	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standard.Additional requirements for CMS operations and maintenance are specified in § 63.4768.
§ 63.8(c)(4)	CMSs	No	§ 63.4768 specifies the requirements for the operation of CMS for capture systems and add-on control devices at sources using these to comply.
§ 63.8(c)(5)	COMS	No	Subpart QQQQ does not have opacity for visible emission standards.
§ 63.8(c)(6)	CMS Requirements	No	§ 63.4768 specifies the requirements for monitoring systems for capture systems and add-on control devices at sources using these to comply.
§ 63.8(c)(7)	CMS Out-of-Control Periods	Yes.	
§ 63.8(c)(8)	CMS Out-of-Control Periods Reporting.	No	§ 63.4720 requires reporting of CMS out-of-control periods.
§ 63.8(d)–(e)	Quality Control Program and CMS Performance Evaluation.	No	Subpart QQQQ does not require the use of continuousemissions monitoring systems.
§ 63.8(f)(1)–(5)	Use of an Alternative Monitoring Method.	Yes.	
§ 63.8(f)(6)	Alternative to Relative Accuracy Test.	No	Subpart QQQQ does not require the use of continuous emissions monitoring systems.
§ 63.8(g)(1)–(5)	Data Reduction	No	§§ 63.4767 and 63.4768 specify monitoring data reduction.
§ 63.9(a)–(d)	Notification Requirements	Yes.	
§ 63.9(e)	Notification of Performance Test	Yes	Applies only to capture system and add-on controldevice performance tests at sourcesusing these to comply with the standard.
§ 63.9(f)	Notification of Visible Emissions/Opacity Test.	No	Subpart QQQQ does not have opacity or visible emission standards.
§ 63.9(g)(1)–(3)	Additional Notifications When Using CMS.	No	Subpart QQQQ does require the use of continuous emissions monitoring systems.
§ 63.9(h)	Notification of Compliance Status	Yes	§ 63.4710 specifies the dates for submitting the notification of compliance status.
§ 63.9(i)	Adjustment of Submittal Deadlines	Yes.	
§ 63.9(j)	Change in Previous Information	Yes.	
§ 63.10(a)	Recordkeeping/Reporting—Applicability and General Information.	Yes.	
§ 63.10(b)(1)	General Recordkeeping Requirements.	Yes	Additional requirements are specified in §§ 63.4730 and63.4731.
§ 63.10(b)(2)(i)–(v)	Recordkeeping Relevant to SSM Periods and CMS.	Yes	Requirements for SSM records only apply to add-on control devices used to comply with the standard.
§ 63.10(b)(2)(vi)–(xi)		Yes.	

TABLE 4 TO SUBPART QQQQ OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART QQQQ OF PART 63—Continued

[You must comply with the applicable General Provisions requirements according to the following table]

Citation	Subject	Applicable to subpart QQQQ	Explanation
§ 63.10(b)(2)(xii)	Records	Yes.	
§ 63.10(b)(2)(xiii)		No	Subpart QQQQ does not require the use of continuous emissions monitoring systems.
§ 63.10(b)(2)(xiv)		Yes.	
§ 63.10(b)(3)	Recordkeeping Requirements for Applicability Determinations.	Yes.	
§ 63.10(c)(1)–(6)	Additional Recordkeeping Requirements for Sources with CMS.	Yes.	
§ 63.10(c)(7)–(8)		No	The same records are required in § 63.4720(a) (7).
§ 63.10(c)(9)–(15)		Yes.	
§ 63.10(d)(1)	General Reporting Requirements	Yes	Additional requirements are specified in § 63.4720.
§ 63.10(d)(2)	Report of Performance Test Results	Yes	Additional requirements are specified in § 63.4720(b).
§ 63.10(d)(3)	Reporting Opacity or Visible Emissions Observations.	No	Subpart QQQQ does not require opacity or visible emissions observations.
§ 63.10(d)(4)	Progress Reports for Sources With Compliance Extensions.	Yes.	
§ 63.10(d)(5)	SSM Reports	Yes	Applies only to add-on control devices at sources using these to comply with the standard.
§ 63.10(e)(1)–(2)	Additional CMS Reports	No	Subpart QQQQ does not require the use of continuous emissions monitoring systems.
§ 63.10(e)(3)	Excess Emissions/CMS Performance Reports.	No	§ 63.4720(b) specifies the contents of periodic compliance reports.
§ 63.10(e)(4)	COMS Data Reports	No	Subpart QQQQ does not specify requirements for opacity or COMS.
§ 63.10(f)	Recordkeeping/Reporting Waiver	Yes.	
§ 63.11	Control Device Requirements/Flares.	No	Subpart QQQQ does not specify use of flares for compliance.
§ 63.12	State Authority and Delegations	Yes.	
§ 63.13	Addresses	Yes.	
§ 63.14	Incorporation by Reference	Yes	Test Methods ANSI/ASME PTC 19.10–1981, Part 10, ASTM D2697–86 (Reapproved 1998), and ASTM D6093–97 (incorporated by reference, see § 63.14).
§ 63.15	Availability of Information/Confidentiality.	Yes.	

TABLE 5 TO SUBPART QQQQ OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS

[You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data]

Solvent/solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
1. Toluene	108–88–3	1.0	Toluene.
2. Xylene(s)	1330–20–7	1.0	Xylenes, ethylbenzene.
3. Hexane	110–54–3	0.5	n-hexane.
4. n-Hexane	110–54–3	1.0	n-hexane.
5. Ethylbenzene	100–41–4	1.0	Ethylbenzene.
6. Aliphatic 140		0	None.
7. Aromatic 100		0.02	1% xylene, 1% cumene.
8. Aromatic 150		0.09	Naphthalene.
9. Aromatic naphtha	64742–95–6	0.02	1% xylene, 1% cumene.
10. Aromatic solvent	64742–94–5	0.1	Naphthalene.
11. Exempt mineral spirits	8032–32–4	0	None.
12. Ligroines (VM & P)	8032–32–4	0	None.
13. Lactol spirits	64742–89–6	0.15	Toluene.
14. Low aromatic white spirit	64742–82–1	0	None.
15. Mineral spirits	64742–88–7	0.01	Xylenes.
16. Hydrotreated naphtha	64742–48–9	0	None.
17. Hydrotreated light distillate	64742–47–8	0.001	Toluene.
18. Stoddard solvent	8052–41–3	0.01	Xylenes.
19. Super high-flash naphtha	64742–95–6	0.05	Xylenes.
20. Varsol® solvent	8052–49–3	0.01	0.5% xylenes, 0.5% ethylbenzene.
21. VM & P naphtha	64742–89–8	0.06	3% toluene, 3% xylene.

TABLE 5 TO SUBPART QQQQ OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS—Continued

[You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data]

Solvent/solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
22. Petroleum distillate mixture	68477–31–6	0.08	4% naphthalene, 4% biphenyl.

TABLE 6 TO SUBPART QQQQ OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR PETROLEUM SOLVENT GROUPS [a]

[You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data]

Solvent type	Average organic HAP mass fraction	Typical organic HAP, percent by mass
Aliphatic [b]	0.03	1% xylene, 1% toluene, and 1% ethylbenzene.
Aromatic [c]	0.06	4% xylene, 1% toluene, and 1% ethylbenzene.

[a] Use this table only if the solvent blend does not match any of the solvent blends in Table 5 to this subpart and you only know whether the blend is aliphatic or aromatic.

[b] *E.g.*, Mineral Spirits 135, Mineral Spirits 150 EC, Naphtha, Mixed Hydrocarbon, Aliphatic Hydrocarbon, Aliphatic Naphtha, Naphthol Spirits, Petroleum Spirits, Petroleum Oil, Petroleum Naphtha, Solvent Naphtha, Solvent Blend.

[c] *E.g.*, Medium-flash Naphtha, High-flash Naphtha, Aromatic Naphtha, Light Aromatic Naphtha, Light Aromatic Hydrocarbons, Aromatic Hydrocarbons, Light Aromatic Solvent.

National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[OAR2003–0014—FRL–7461–9]

RIN 2060–AG98

National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action promulgates national emission standards for hazardous air pollutants (NESHAP) for existing and new fabric and other textile coating, printing, slashing, dyeing, and finishing operations. The final standards implement section 112(d) of the Clean Air Act (CAA) by requiring all major sources to meet the hazardous air pollutants (HAP) emission standards reflecting the application of the maximum achievable control technology (MACT).

The EPA has estimated that there are approximately 135 major source facilities in the printing, coating, and dyeing of fabrics and other textiles source category. The principal HAP emitted by these sources include toluene, methyl ethyl ketone (MEK), methanol, xylenes, methyl isobutyl ketone (MIBK), methylene chloride, trichloroethylene, n-hexane, glycol ethers (ethylene glycol), and formaldehyde. The final rule will reduce nationwide organic HAP emissions from major sources by approximately 4,100 tons per year or about 60 percent from baseline emissions.

Exposure to these substances has been demonstrated to cause adverse health effects such as irritation of the eye, lung, and mucous membranes, effects on the central nervous system, and damage to the liver. The EPA has classified two of the HAP, methylene chloride and trichloroethylene, as probable or possible human carcinogens. We do not have the type of current detailed data on each of the facilities covered by the final rule and the people living around the facilities that would be necessary to conduct an analysis to determine the actual population exposures to the HAP emitted from these facilities and potential for resultant health effects. Therefore, we do not know the extent to which the adverse health effects described above occur in the populations surrounding these facilities. However, to the extent the adverse effects do occur, the final rule will reduce emissions and subsequent exposures.

DATES: May 29, 2003. The incorporation by reference of certain publications listed in today's final rule is approved by the Director of the Federal Register as of May 29, 2003.

ADDRESSES: *Docket.* Docket ID No. OAR–2003–0014 (formerly Docket No. A–97–51) is located at the EPA Docket Center, EPA West, U.S. EPA (6102T), 1301 Constitution Ave., NW., Room B102, Washington, DC 20460.

Background Information Document. A background information document (BID) for the promulgated NESHAP may be obtained from the docket; the U.S. EPA Library (C267–01), Research Triangle Park, NC 27711, telephone (919) 541–2777; or from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161, telephone (703) 487–4650. Refer to "National Emission Standards for Hazardous Air Pollutants (NESHAP) for Source Category: Printing, Coating, and Dyeing of Fabrics and Other Textiles—Background Information for Promulgated Standards" (EPA–453/R–03–006). The promulgation BID contains a summary of public comments made on the proposed standards and the EPA responses to the comments.

FOR FURTHER INFORMATION CONTACT: For information concerning applicability and rule determinations, contact your State or local air pollution control agency representative or the appropriate EPA Regional Office Representative. For information concerning the analyses performed in developing the final rule, contact Mr. Paul Almodóvar, Coatings and Consumer Products Group (C539–03), Emission Standards Division, U.S. EPA, Research Triangle Park, NC 27711; telephone number (919) 541–0283; facsimile number (919) 541–5689; electronic mail (e-mail) address: *almodovar.paul@epa.gov.*

SUPPLEMENTARY INFORMATION: *Regulated Entities.* The source category definition includes sources that engage in the coating, printing, slashing, dyeing, or finishing of any fabric or other textile. In general, such sources are covered under the North American Industrial Classification System (NAICS) codes. However, sources classified under other NAICS codes may be subject to the final standards if they meet the applicability criteria. Not all sources classified under the NAICS codes in the following table are subject to the final rule because some of the classifications cover products outside the scope of the NESHAP for printing, coating, and dyeing of fabrics and other textiles.

Categories and entities potentially regulated by this action include:

Category	NAICS code	Examples of regulated entities
Industry	31321	Broadwoven fabric mills.
	31322	Narrow fabric mills and Schiffli machine embroidery.
	313241	Weft knit fabric mills.
	313311	Broadwoven fabric finishing mills.
	313312	Textile and fabric finishing (except broadwoven fabric) mills.
	313320	Fabric coating mills.
	314110	Carpet and rug mills.
	326220	Rubber and plastics hoses and belting and manufacturing.
	339991	Gasket, packing, and sealing device manufacturing.
Federal government	.....	Not affected.
State/local/tribal government	.....	Not affected.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether your operation is regulated by this action, you should examine the applicability criteria in § 63.4281 of the final rule. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Docket. The EPA has established an official public docket for this action under Docket ID No. OAR–2003–0014 (formerly Docket No. A–97–51). The official public docket consists of the documents specifically referenced in

this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the EPA Docket Center, EPA West, Room B–102, 1301 Constitution Avenue, NW., Washington, DC 20460. The Docket Center is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Docket is (202) 566–1742. A reasonable fee may be charged for copying docket materials.

Electronic Access. You may access this **Federal Register** document electronically through the EPA Internet under the **Federal Register** listings at *http://www.epa.gov/edocket/.*

An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified above. Once in the system, select "search," then key in the appropriate docket identification number.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of the final rule will also be available on the WWW through EPA's Technology Transfer Network (TTN). Following signature by the EPA Administrator, a copy of the final rule will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Judicial Review. This action constitutes final administrative action on the proposed NESHAP for printing, coating, and dyeing of fabrics and other textiles (67 FR 45054, July 11, 2002). Under CAA section 307(b)(1), judicial review of the final rule is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by July 28, 2003. Only those objections to the final rule which were raised with reasonable specificity during the period for public comment may be raised during judicial review. Under CAA section 307(b)(2), the requirements established by today's final rule may not be challenged later in civil or criminal proceedings brought by EPA to enforce the requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. What Is the Source of Authority for Development of NESHAP?
B. What Criteria Are Used in the Development of NESHAP?
II. What Changes and Clarifications Have we Made to the Proposed Standards?
A. Applicability
B. Overlap With Other Rules
C. Affected Source
D. Emission Limits and Options
E. General Compliance Requirements
F. Requirements for Compliance Options
III. Summary of the Final Rule
A. What Source Categories and Subcategories Are Affected by the Final Rule?
B. What Is the Affected Source?
C. What Are the Emission Limits, Operating Limits, and Other Standards?
D. What Are the Testing and Initial Compliance Requirements?
E. What Are the Continuous Compliance Provisions?
F. What Are the Notification, Recordkeeping, and Reporting Requirements?
IV. Summary of Environmental, Energy, and Economic Impacts
A. What Are the Air Impacts?
B. What Are the Cost Impacts?
C. What Are the Economic Impacts?
D. What Are the Non-Air Health, Environmental, and Energy Impacts?
V. Statutory and Executive Order Reviews

H. Executive Order 13211: Actions that Significantly Affect Energy Supply, Distribution, or Use
I. National Technology Transfer Advancement Act
J. Congressional Review Act

I. Background

A. What Is the Source of Authority for Development of NESHAP?

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of HAP and to establish NESHAP for the listed source categories and subcategories. The Printing, Coating, and Dyeing of Fabrics source category was listed on July 16, 1992 (57 FR 31576) under the Surface Coating Processes industry group. We proposed standards for and revised the title of this source category to Printing, Coating, and Dyeing of Fabrics and Other Textiles on July 11, 2002 (67 FR 45054). The title was revised to clarify the applicability of the standards to organic HAP-emitting operations performed on textile substrates including, but not limited to, fabric.

A major source of HAP is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit considering controls, in the aggregate, 10 tons per year (tpy) or more of any one HAP or 25 tpy of any combination of HAP. An area source is any stationary source of HAP that is not a major source.

B. What Criteria Are Used in the Development of NESHAP?

Section 112 of the CAA requires that we establish NESHAP for the control of HAP from both new and existing major sources. The CAA requires the NESHAP to reflect the maximum degree of reduction in emissions of HAP that is achievable. This level of control is commonly referred to as the MACT, for maximum achievable control technology.

The MACT floor is the minimum control level allowed for NESHAP and is defined under section 112(d)(3) of the CAA. In essence, the MACT floor ensures that the standard is set at a level that assures that all major sources achieve the level of control already achieved by the better-controlled and lower-emitting sources in each source category or subcategory. For new sources, the MACT standards cannot be less stringent than the emission control that is achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than standards for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources).

In developing MACT, we also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on the consideration of the cost of achieving the emissions reductions, any non-air health and environmental impacts, and energy requirements.

II. What Changes and Clarifications Have We Made to the Proposed Standards?

In response to public comments received on the proposed standards, we made several changes in developing the final rule. The substantive comments and our responses and rule changes are summarized in the following sections. A more detailed summary of comments and responses can be found in the BID for the final rule which is available from several sources (see **ADDRESSES**).

A. Applicability

We have made several changes to clarify the applicability of the final rule to certain coating, printing, slashing, dyeing, and finishing operations. We have also made changes to clarify which other web surface coating operations are not subject to the requirements of this final rule.

One commenter requested that we clarify the intent of proposed exemptions for research and development facilities from the rule requirements. The commenter believes the word facility and the definition of research or laboratory facility could be read to mean that the research or laboratory facility must be a facility separate from any facility that is doing commercial coating, dyeing, etc., in order to be exempt from subpart OOOO applicability. Typically in this source category, research and development activities are conducted on web coating and printing lines or dyeing and finishing operations located within a manufacturing plant. These research and development operations are co-located with manufacturing lines in order to test the product at the same manufacturing variables (*e.g.*, temperature and humidity) as those of the products currently being used. Therefore, the final rule language has been written to reflect this. The use of the terms research or laboratory operations, rather than facilities, will also make this language consistent with the affected source description in the final rule. A corresponding change has also been made to the definition of research or laboratory facility to reflect this change.

One commenter observed that the proposal preamble described exemptions to the proposed rule for certain tape and tire manufacturing activities covered by the NESHAP for Paper and Other Web Coating and the NESHAP for Tire Manufacturing MACT, respectively. The commenter pointed out that the proposed rule text failed to mention any of these exemptions. These explicit exemptions were inadvertently omitted from the proposed rule language. The final rule has been written to include the appropriate exemptions.

Three commenters expressed concern that, as proposed, the final rule could be interpreted to apply to synthetic fiber manufacturing operations. We have written the final rule to clarify that coating, slashing, dyeing, and finishing operations that are part of a synthetic fiber manufacturing process, and are part of the affected source of another NESHAP, such as the Group IV Polymers and Resins NESHAP (40 CFR 63, subpart JJJ) are not subject to the requirements of the final rule. For example, finishes that are applied in an affected source to which subpart JJJ applies are not subject to the requirements of the final rule.

One commenter noted the preamble to the proposed rule stated that coating and printing operations conducted at ambient temperatures and not involving drying or curing equipment are not subject to the provisions of the rule. The commenter requested that this language be included in the applicability section of the final regulation. In order to clarify the applicability of the final rule to web coating and printing operations conducted at ambient temperatures, the final rule has been written to exclude web coating or printing operations that do not involve drying or curing equipment such as ovens, tenter frames, steam cans, or dryers from the requirements of the final rule. Web coating and printing operations that dry at ambient temperatures are not representative of the coating and printing operations in the database used to determine the MACT floor for the coating and printing subcategory. These low-production rate operations make up only a small segment of the overall coating and printing industry. It was also determined that the emission capture and control technologies applicable to these operations would be considerably different (because of temperature, concentration, and flow rate differences) than those operations involving drying and curing equipment which are the basis of the MACT floor determination.

B. Overlap With Other Rules

Two commenters pointed out that the preamble text of the proposed rule created duplicate applicability for some sources, *i.e.*, web coating lines that coat paper and other web substrates as well as fabric and other textile substrates. The commenters requested clarification on which NESHAP would apply to web coating lines that coat both types of substrate. The Paper and Other Web Coating NESHAP applies to web coating lines engaged in the coating of fabric for use in flexible packaging, pressure sensitive tapes and abrasive materials. The final rule has been written to clarify that web coating lines where both fabric and other webs are coated for use in flexible packaging, pressure sensitive tapes or abrasive materials or where fabric is being laminated to a paper and other web substrate are subject to 40 CFR 63, subpart JJJJ, and not today's final rule.

For other web coating lines engaged in the coating of fabric and other webs on the same web coating line, we have written in a provision to the final rule whereby a source can determine which MACT standard they must comply with based on the predominant surface coating activity conducted on the web coating line. Predominant activity has been determined to be 90 percent or more of the mass of substrate coated. For example, a web coating line that coats 90 percent paper and 10 percent fabric substrates would have to comply with the Paper and Other Web NESHAP (40 CFR 63, subpart JJJJ).

C. Affected Source

Seven commenters stated that the proposed rule was inconsistent with regard to its applicability to cleaning materials and preparation activities. The commenters requested revisions to the proposed rule related to its applicability to cleaning materials and preparation activities. We agree with the commenters that the final rule should not regulate cleaning materials and preparation materials in the slashing or the dyeing and finishing subcategories. Slashing and dyeing and finishing operations are aqueous processes, and, therefore, the cleaning materials and preparation activities used in these operations do not contain organic HAP. The most common cleaning material used in these operations is water. The final rule has been written to clarify that cleaning and preparation materials used in the slashing and the dyeing and finishing subcategories are not regulated materials.

D. Emission Limits and Options

Seven commenters requested that an add-on control compliance option be included in the final rule for the dyeing and finishing subcategory. The commenters pointed out that as the industry moves from mass base goods production to specialized niche production, and as new products and technologies are developed and implemented, flexibility in the production process will be the key to the survival of this industry. We agree

with the commenters, and, therefore, in order to provide more compliance flexibility with the emission limits, the final rule has been written to include an emission rate with add-on control device compliance option for the dyeing and finishing subcategory.

Numerous comments were received concerning high molecular weight, high boiling point, and highly water-soluble organic HAP from dyeing and finishing sources that are not emitted in the dyeing and finishing process but are discharged to the wastewater. This class of organic HAP has a low emission potential (*i.e.*, low Henry's Law constant) and also are typically readily biodegraded; as a result they are not emitted to the atmosphere in wastewater collection and treatment operations. The commenters requested that the final rule should allow sources to take into account in their compliance demonstrations organic HAP that are discharged to the wastewater and not emitted to the atmosphere. The final rule has been written to allow a dyeing and finishing affected source to account for organic HAP that are discharged to wastewater. An equivalent emission rate compliance option has been written in the final rule, and a procedure has been added to account for the mass of organic HAP contained in wastewater discharged to a publically owned treatment works (POTW) or onsite secondary wastewater treatment.

In order to be able to use the equivalent emission rate compliance option, a source must make an initial compliance demonstration that at least 90 percent of the mass of organic HAP contained in dyeing and finishing materials applied in the affected source is discharged to the wastewater; and that the total organic HAP emissions from the dyeing and finishing affected source are less than 10 tpy. The source must also document that the affected wastewater streams are discharged to a POTW or treated onsite in a treatment system that includes at least secondary treatment with biological treatment processes.

E. Requirements for Compliance Options

Several commenters asserted that the proposed rule did not include a compliance option for the web coating and printing subcategory which takes into account processes that use reactive materials that are not emitted to the atmosphere. The final rule has been written to allow the use of EPA Method 24 of 40 CFR part 60 Appendix A, for multi-component coatings with reactive materials to determine the mass fraction of non-aqueous volatile matter. This empirical value can be used as a substitute for the mass fraction of organic HAP calculated from the sum of organic HAP in each coating component. Also, you may submit an alternative technique for approval by the Administrator, *e.g.*, stack testing with an enclosure to quantify the organic HAP actually emitted from the web coating process.

Several commenters requested that the compliance period for affected sources using the emission rate compliance option be changed to a 12-month rolling average period. Four of the commenters also submitted plant specific data demonstrating the extreme variability within both the coating and printing and the dyeing and finishing subcategories over time. The commenters asserted that a 12-month rolling average would take into account the seasonal variations in this industry and would better reflect the data used to set the MACT floor. Upon review of the data submitted by the commenters, the final rule has been written to allow a 12-month rolling average compliance period for sources using the emission rate compliance option. This would allow for the month-to-month variability in organic HAP content of coating, dyeing, and finishing materials.

Several commenters stated that the proposed rule was unclear as to how the compliance averaging calculations for dyeing materials are to be performed. The final rule language has been written to clarify that these compliance averaging calculations for dyeing materials should include only regulated materials as received from the manufacturer or supplier, and prior to any on-site alteration of the material (*e.g.*, mixing with solvent); and, that water added in a mixing operation is not a regulated material and should not be included in the determination of the total mass of dyeing and finishing materials applied during the compliance period. This would be consistent with how the MACT floors for this subcategory were calculated.

III. Summary of the Final Rule

A. What Source Categories and Subcategories Are Affected by the Final Rule?

The final rule applies to you if you own or operate a fabric or other textile coating, printing, slashing, dyeing, or finishing operation or group of such operations that is a major source, or is located at a major source, or is part of a major source of HAP emissions, whether or not you manufacture the substrate. The coating, printing, slashing, dyeing, or finishing operations themselves are not required to be major sources of HAP emissions in order for them to be covered by the final rule. As long as some part of the facility where the operations are located (*e.g.*, a process boiler or manufacturing operation associated with production of the final product) causes it to be a major source, the coating, printing, slashing, dyeing, and finishing operations are subject to the standards.

Any major HAP-emitting facility that performs coating, printing, slashing, dyeing, or finishing of fabric or other textiles is in this source category. As defined in the final rule, fabric or other textiles includes, but is not limited to, yarn, fiber, cord, thread, fabric and textile products, tents, roofing, soft baggage, marine fabric, drapery linings, flexible hoses, hot-air balloons, and awnings. The source category includes three subcategories (web coating and printing, slashing, and dyeing and finishing) as described in the following paragraphs.

The web coating and printing subcategory encompasses coating activities and equipment used to apply semi-liquid coating material to one or both sides of a textile web substrate. Once the coating is dried (and cured, if necessary) it bonds with the substrate to form a continuous solid film for decorative, protective, or functional purposes. Similarly, the web coating and printing subcategory includes printing activities and equipment used to apply color and patterns to textile substrates, usually in the form of a paste. After application of the printing material, the substrate is treated with steam, heat, or chemicals to fix the color.

The slashing subcategory includes the yarn preparation process performed on warp yarn prior to weaving. Slashing is the application of a chemical solution (known as sizing) to a yarn in a water solution followed by squeezing (dewatering) and drying.

The dyeing and finishing subcategory includes the equipment and operations involved in two separate but related processes that are both performed at some sources, while only one or the other is performed at other sources. Dyes and finishes are applied to yarn, fiber, cord, thread, or fabric in aqueous solutions and then dried. Dyeing is the application of color to the whole body of a textile substrate. Finishing is a process performed after dyeing that improves the appearance and/or usefulness of a textile substrate.

You are not subject to the final rule if your coating, printing, slashing, dyeing, or finishing operation is located at an area source. An area source of HAP

is any facility that has the potential to emit HAP but is not a major source. You may establish area source status by limiting the source's potential to emit HAP through appropriate mechanisms available through your permitting authority.

Exclusions from the source category include coating, printing, slashing, dyeing or finishing at a source using only coating, printing, slashing, dyeing, finishing, thinning, and cleaning materials that contain no organic HAP as defined in the final rule; coating, printing, slashing, dyeing, or finishing that occurs in a research or laboratory operation or that is part of a janitorial, building, and facility maintenance operation; coating, printing, slashing, dyeing, or finishing used by a facility and not for commerce, unless organic HAP emissions from these operations equal or exceed the facility major source HAP emissions threshold; a web coating line that applies coatings to both paper and fabric and other textile substrates used in flexible packaging, pressure sensitive tape or abrasive materials or where fabric is being laminated to a paper; a web coating line that applies coatings to tire cord and that also sometimes applies coatings to textile cord used in the production of belts and hoses; a coating, slashing, dyeing, or finishing operation that is conducted during a synthetic fiber manufacturing process included in the affected source of a NESHAP under 40 CFR 63; and a web coating or printing operation conducted at ambient temperatures and that does not involve drying or curing equipment such as, ovens, tenter frames, steam cans, or dryers; and coating, printing, slashing, dyeing, or finishing operations performed on-site at installations owned or operated by the Armed Forces of the United States (including the Coast Guard and the National Guard of any State).

Web coating lines engaged in the coating of fabric and other webs on the same web coating line, must comply with the NESHAP applicable to the web coating line based on predominant surface coating activity conducted on the web coating line. Predominant activity has been determined to be 90 percent or more of the mass of substrate coated. For example, a web coating line that coats 90 percent paper and 10 percent fabric substrates would have to comply with the Paper and Other Web NESHAP (40 CFR 63, subpart JJJJ).

B. What Is the Affected Source?

An affected source is a stationary source, a group of stationary sources, or part of a stationary source to which a specific emission standard applies. The final rule defines the affected source for each subcategory respectively, as the collection of all equipment associated with the web coating and printing, the slashing, or the dyeing and finishing performed on a textile substrate. For the purpose of defining the affected source, the textile substrate includes staple fibers and filaments suitable for conversion to or use as yarns, or for the preparation of woven, knit, or nonwoven fabrics; yarns made from natural or manufactured fibers; fabrics and other manufactured products made from staple fibers and filaments and from yarn; and garments and other articles fabricated from fibers, yarns, or fabrics. Also for each subcategory, the specific regulated materials are defined. Regulated materials are the organic HAP-containing materials that are the source of organic HAP emissions limited by the requirements of the NESHAP.

The affected source for the web coating and printing subcategory includes: All web coating and printing equipment used to apply cleaning materials to a substrate on the coating or printing line to prepare it for coating or printing material application, to apply coating or printing materials to a substrate and to dry or cure the coating or printing materials after application by exposure to heat or radiation (coating or printing material drying or curing); equipment used to clean web coating/printing operation equipment; all containers used for storage and vessels used for mixing coating, printing, thinning, or cleaning materials; all equipment and containers used for conveying coating, printing, thinning, or cleaning materials; all containers used for storage and all equipment and containers used for conveying waste materials generated by a web coating or printing operation; and all equipment, structures, and devices used to convey, treat, or dispose of wastewater streams or residuals generated by a web coating or printing operation. The regulated materials for the coating and printing subcategory are the coating, printing, thinning and cleaning materials used in the affected source.

The affected source for the slashing subcategory includes: All slashing equipment used to apply and dry size on warp yarn; all containers used for storage and vessels used for mixing slashing materials; all equipment and containers used for conveying slashing materials; all containers used for storage and all equipment and containers used for conveying waste materials generated by a slashing operation; and all equipment, structures, and devices used to convey, treat, or dispose of wastewater streams or residuals generated by a slashing operation. The regulated materials for the slashing subcategory are the slashing materials used in the affected source.

The affected source for the dyeing and finishing subcategory includes: All dyeing and finishing equipment used to apply dyeing or finishing materials, to fix dyeing materials to the substrate, to rinse the textile substrate, or to dry or cure the dyeing or finishing materials; all containers used for storage and vessels used for mixing dyeing or finishing materials; all equipment and containers used for conveying dyeing or finishing materials; all containers used for storage and all equipment and containers used for conveying waste materials generated by a dyeing or finishing operation; and all equipment, structures, and devices used to convey, treat, or dispose of wastewater streams or residuals generated by a dyeing or finishing operation. The regulated materials for the dyeing and finishing subcategory are the dyeing and finishing materials used in the affected source.

C. What Are the Emission Limits, Operating Limits, and Other Standards?

Today's final rule limits organic HAP emissions from coating, printing, slashing, dyeing, and finishing operations. The final rule includes emission limits, operating limits, and work practice standards. Emission limits are established for the web coating and printing, slashing, and dyeing and finishing subcategories. Operating limits and work practice standards are established for the web coating and printing, and the dyeing and finishing subcategories.

1. *Emission Limits.* In the web coating and printing subcategory, today's final rule provides you the option of limiting organic HAP emissions to the atmosphere from each new and reconstructed affected source to one of the following three specified levels: (1) At least a 98 percent organic HAP overall control efficiency (OCE limit); (2) no more than 0.08 kilograms (kg) organic HAP/kg of coating solids applied (0.08 pound (lb) organic HAP/lb of coating solids applied) during each 12-month compliance period (emission rate limit); or (3) if you are using an oxidizer to control organic HAP emissions, operate the oxidizer such that an outlet organic HAP concentration of no greater than 20 parts per million by volume (ppmv) on a dry basis is achieved and maintain the efficiency of the capture system at 100 percent (outlet concentration limit). The organic HAP emission limits for each existing affected source in the web

coating and printing subcategory are: (1) To achieve at least a 97 percent OCE limit; (2) an emission rate limit of no more than 0.12 kg organic HAP/kg of coating solids applied (0.12 lb organic HAP/lb of coating solids applied) in each 12-month compliance period; or (3) if you are using an oxidizer to control organic HAP emissions, operate the oxidizer to achieve the outlet concentration limit of no greater than 20 ppmv on a dry basis and maintain the efficiency of the capture system at 100 percent.

You may choose from several compliance options in the final rule to achieve the web coating and printing emission limits. You can comply through a pollution prevention approach by applying regulated materials that meet the emission rate limits, either individually (compliant material option) or collectively (emission rate without add-on controls option), during each compliance period. Second, you can use a capture system and add-on control device to meet either the applicable organic HAP OCE limit or emission rate limit. Third, you can use a 100 percent efficient capture system and an oxidizer that reduces organic HAP emissions to no more than 20 ppmv.

In the slashing subcategory, we are requiring each new, reconstructed and existing affected source to emit no organic HAP. This is not an absolute zero organic HAP limit since the compliance procedures specify that to determine organic HAP emissions, you count only organic HAP present in the materials you use at 0.1 percent by mass or more for Occupational Safety and Health Administration (OSHA)-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1 percent or more for other organic HAP compounds. To comply with the slashing organic HAP emission limits, you must apply only materials that individually meet the standard during each compliance period.

In the dyeing and finishing subcategory, we are limiting organic HAP emissions from each new, reconstructed and existing affected source that conducts dyeing operations only or both dyeing and finishing operations to no more than 0.016 kg organic HAP per kg of dyeing material used (0.016 lb organic HAP per lb of dyeing material used) for each 12-month compliance period. You can comply with the dyeing and finishing organic HAP emission rate by applying materials that meet the emission rate, either individually or collectively, during each 12-month compliance period. Each new, reconstructed and existing affected source that conducts only finishing operations is required to emit no more than 0.0003 kg of organic HAP per kg of finishing materials.

We are also including an equivalent emission rate option in the dyeing and finishing subcategory. In order to be able to use the equivalent emission rate compliance option, you must demonstrate that at least 90 percent of the mass of organic HAP contained in dyeing and finishing materials applied in the dyeing and finishing affected source are discharged to a wastewater treatment system and not emitted to the atmosphere; and that the total organic HAP emissions from the dyeing and finishing affected source must be less than 10 tons per year. To demonstrate continuous compliance you must document that your dyeing/finishing affected source operates within the operating scenarios used to demonstrate initial compliance and that affected wastewater streams are discharged to a POTW or treated onsite in a wastewater treatment system with biological treatment. You also must maintain purchase records showing that organic HAP emissions do not exceed 10 tons for each 12-month compliance period.

2. *Operating Limits.* If you reduce emissions from web coating and printing or dyeing and finishing operations by using a capture system and add-on control device (other than a solvent recovery system for which you conduct a liquid-liquid material balance), the operating limits apply to you. These limits are site-specific parameter limits that you determine during the initial performance test of the emission control system. For capture systems, you must develop a capture system monitoring plan. The monitoring plan must identify the operating parameter to be monitored, explain why this parameter is appropriate for demonstrating ongoing compliance, and identify the specific monitoring procedures. In the plan, you must specify operating limits for the capture system operating parameter that demonstrate compliance with the applicable emission standard in the final rule. The monitoring plan must be available for inspection by your permitting authority upon request.

For thermal oxidizers, you must monitor the temperature in the firebox. For catalytic oxidizers, you either monitor the temperature at the inlet to the catalyst bed and the temperature difference across the catalyst bed, or you monitor the temperature at the inlet to the catalyst bed and prepare and implement an inspection and maintenance plan that includes periodic catalyst activity checks. For a control device other than an oxidizer or if you wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of an alternative monitoring method.

The site-specific parameter limits that you establish must reflect operation of the capture system and add-on control devices during a performance test that demonstrates achievement of the emission limits during representative operating conditions.

3. *Work Practice Standards.* If you use an emission capture system and add-on control device for compliance, you are required to develop and implement a work practice plan to minimize organic HAP emissions from mixing operations, storage tanks and other containers, and handling operations for regulated materials and waste materials.

4. *Operations During Startup, Shutdown, or Malfunction.* If you use a capture system and add-on control device for compliance, you are required to develop and operate according to a startup, shutdown, and malfunction plan (SSMP) during periods of startup, shutdown, or malfunction of the capture system and add-on control device.

5. *General Provisions.* The General Provisions (40 CFR part 63, subpart A) also apply to you as indicated in the final rule. The General Provisions codify certain procedures and criteria for all 40 CFR part 63 NESHAP. The General Provisions contain administrative procedures, preconstruction review procedures for new sources, and procedures for conducting compliance-related activities such as notifications, reporting and recordkeeping, performance testing, and monitoring. The final rule refers to individual sections of the General Provisions to emphasize key sections that are relevant. However, unless specifically overridden in the final rule, all of the applicable General Provisions requirements apply to you.

D. What Are the Testing and Initial Compliance Requirements?

1. *Compliance Dates.* Existing affected sources will have to be in compliance with today's final rule no later than May 30, 2006. New and reconstructed affected sources will have to be in compliance upon startup of the affected source or by May 29, 2003, whichever is later.

Except for affected sources required to conduct performance tests, the initial compliance period for the compliant material option or the organic HAP overall control efficiency and oxidizer outlet organic HAP concentration options begins on the compliance date

and ends on the last day of the first full month following the compliance date. For affected sources required to conduct performance tests, the initial compliance period ends on the last day of the first full month following the performance test if the performance test is conducted later than the compliance date (the final rule allows the test to be conducted up to 180 days later).

Except for affected sources required to conduct performance tests, the initial compliance period for the emission rate without add-on controls option and the emission rate with add-on controls option begins on the compliance date and ends on the last day of the 12th full month following the compliance date. For affected sources required to conduct performance tests, the initial compliance period ends on the last day of the 12th full month following the performance test if the performance test is conducted later than the compliance date (the final rule allows the test to be conducted up to 180 days later).

Being in compliance means that the owner or operator of the affected source meets the requirements to achieve the emission limitations during the initial compliance period. At the end of the initial compliance period, the owner or operator will use the data and records generated to determine whether or not the affected source is in compliance with the organic HAP emission limit and other applicable requirements for that period. If the affected source does not meet the emission limit and other applicable requirements, it is out of compliance for the entire initial compliance period.

2. *Emission Limits.* With the exception of the slashing emission limit, there are several options for complying with the various emission limits specified in today's rule; the testing and initial compliance requirements vary accordingly. You will be able to use different compliance options for different coating, printing, dyeing, and finishing operations in the affected source for each subcategory and also for the same operation at different times, with the exception of the equivalent emission rate option for the dyeing and finishing affected source. If you choose to apply the equivalent emission rate option to your dyeing and finishing operations, it must be applied to the entire dyeing and finishing affected source.

3. *Compliance Based on Materials Applied in the Affected Source.* If you demonstrate compliance with the web coating and printing emission limits based on the materials applied, you must determine the mass of organic HAP and the mass fraction of solids in all materials applied during the initial compliance period. You are required to demonstrate either that the organic HAP content of each coating and printing material meets the applicable emission limit and that you apply no organic HAP-containing thinning or cleaning materials (compliant material option); or that the total mass of organic HAP in all coating, printing, thinning, and cleaning materials applied divided by the total mass of solids in coating and printing materials applied meets the applicable emission limit (emission rate without add-on controls option).

The compliant material option is a pollution prevention option that allows you to easily demonstrate compliance by applying only low-organic HAP or non-organic HAP coating and printing materials. If you apply coating and printing materials that, based on their organic HAP content, individually meet the kg (lb) organic HAP emitted per kg (lb) solids applied levels in the applicable emission limits of the final rule and you apply only non-organic HAP thinners and other additives and cleaning materials, this compliance option is available to you. For this option, we have minimized recordkeeping and reporting requirements. You demonstrate compliance by using readily available purchase records containing manufacturer's formulation data to determine the organic HAP content of each coating, printing, or other material and the amount of each material applied. You do not need to perform any detailed emission rate calculations.

To demonstrate compliance with the compliant material option, you must demonstrate that the organic HAP content of each coating and printing material applied meets the applicable emission limit in the final rule, and that you applied no organic HAP-containing thinning or cleaning materials. For example, if you are using the compliant materials option for your existing source, you must demonstrate that: (1) Each coating and printing material applied has an organic HAP content no greater than 0.12 kg (0.12 lb) organic HAP per kg (lb) solids applied, (2) and that you applied no organic HAP-containing thinning or cleaning materials. Note that no organic HAP is not intended to mean a zero concentration. Materials that contain no organic HAP as defined in the final rule mean materials that contain organic HAP levels below typical reporting levels. These typical reporting levels only count organic HAP that are present at 0.1 percent or more by mass for OSHA-defined carcinogens and at 1.0 percent or more by mass for other compounds.

To determine the mass fraction of organic HAP in coating, printing, thinning, and cleaning materials and the mass fraction of solids in coating and printing materials, you may rely on manufacturer's formulation data. You are not required to perform tests or analysis of the material if formulation data are available. Alternatively, you can use results from the test methods listed below. You may also use alternative test methods provided you get EPA approval in accordance with 40 CFR 63.7(f). However, if there is any inconsistency between the test method results (either EPA's or an approved alternative) and manufacturer's data, the test method results would prevail for compliance and enforcement purposes.

- For mass fraction of organic HAP, you use EPA Method 311 of 40 CFR part 63, appendix A;
- The final rule allows you to use nonaqueous volatile matter as a surrogate for organic HAP, which would include all organic HAP plus all other organic compounds, and excluding water. If you choose this option, you use EPA Method 24 of 40 CFR part 60, appendix A; and
- For mass fraction of solids, you use EPA Method 24 of 40 CFR part 60, appendix A.

For multi-component coatings with reactive materials, the final rule allows the use of EPA Method 24 on the coating as applied to determine the mass fraction of non-aqueous volatile matter. You may use that value as a substitute for the mass fraction of organic HAP determined from the sum of organic HAP in each coating component. Also, you may submit an alternative technique for approval by the Administrator, (*e.g.*, stack testing with an enclosure) to quantify the organic HAP actually emitted from the coating process.

The emission rate without add-on controls option is a pollution prevention option where you can demonstrate compliance based on the organic HAP contained in the mix of coating, printing, thinning, and cleaning materials you apply. This option allows you the flexibility to apply some individual coating or printing materials that do not individually meet the emission limit if you apply other low-organic HAP or non-organic HAP coating or printing materials such that overall emissions from the affected source during the compliance period meet the emission limit.

To demonstrate initial compliance with the emission rate limit without

add-on controls option, you are required to:

- Determine the quantity of each coating, printing, thinning, and cleaning material you applied.
- Calculate the mass of organic HAP in each coating, printing, thinning, and cleaning material you applied using the same types of data and methods previously described for the compliant material option.
- Determine the mass fraction of solids for each coating and printing material you applied using the same types of data or methods described for the compliant material option.
- Calculate the total mass of organic HAP in all regulated materials applied and total mass of solids for all coating and printing materials applied. You may subtract from the total mass of organic HAP the amount contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266.
- Calculate the ratio of the total mass of organic HAP to the total mass of solids for the regulated materials applied.
- Record the calculations and results and include them in your Notification of Compliance Status.

Note that if you choose to use this option for a particular web coating/printing operation or group of operations rather than for an entire affected source, you must calculate the organic HAP emission rate using just the materials applied in that operation or group. You are required to separately demonstrate compliance for all other operations in the affected source.

To demonstrate compliance with the slashing emission limits, you must use the compliant material option and demonstrate that each slashing material applied during the initial compliance period contains no organic HAP. As was noted regarding thinning or cleaning materials applied in web coating/printing operations, no organic HAP is not intended to mean a zero concentration. Materials that contain no organic HAP should be interpreted to mean materials that contain organic HAP levels below the levels defined in the final rule, which (as previously noted) are typical reporting levels.

To demonstrate compliance with the dyeing and finishing emission limits, you are required to demonstrate either that the organic HAP content of each dyeing and finishing material applied meets the applicable emission limit (compliant material option), or that the total mass of organic HAP in all dyeing and finishing materials applied divided by the total mass of dyeing and finishing materials applied meets the applicable emission limit (emission rate without add-on controls option).

As previously described for web coating/printing operations, the compliant material option is a pollution prevention option that allows you to easily demonstrate compliance by applying only low-organic HAP or non-organic HAP dyeing and finishing materials. To demonstrate compliance with the compliant material option, you must demonstrate that the organic HAP content of each dyeing and finishing material applied meets the applicable emission limit in the final rule. To determine the mass of organic HAP in dyeing and finishing materials, you must rely on manufacturer's formulation data. You are not required to perform tests or analysis of the material.

Again as previously described for web coating/printing operations, the emission rate without add-on controls option is a pollution prevention option where you can demonstrate compliance based on the organic HAP contained in the mix of dyeing and finishing materials you apply. This option allows you more flexibility than the compliant material option, but requires the calculation of the emission rate each month, for that month and the preceding 11 months. To demonstrate initial compliance with the emission rate without add-on controls option, you are required to:

- Determine the mass of each dyeing and finishing material you applied.
- Calculate the mass of organic HAP in each dyeing and finishing material you applied.
- Calculate the total mass of organic HAP in all regulated materials and the total mass of all regulated materials applied for the compliance period. You may subtract from the total mass of organic HAP the amount contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266. You also may subtract from the total mass of organic HAP the amount demonstrated to be discharged to wastewater treatment and not emitted to the atmosphere, in accordance with the final rule requirements.
- Calculate the ratio of the total mass of organic HAP in the regulated materials applied to the total mass of regulated materials applied.
- Record the calculations and results and include them in your Notification of Compliance Status.

Note that if you choose to use this option for a particular dyeing/finishing operation or group of operations rather than for an entire affected source, you would calculate the organic HAP emission rate using just the affected materials applied in that operation or group. You would need to separately demonstrate compliance for all other operations in the affected source.

You may also choose to use the equivalent emission rate option for your dyeing/finishing affected source. If you choose to use the equivalent emission rate option, it must be applied to the entire affected source; you may not use any other compliance option provided for any dyeing/finishing operation in your dyeing/finishing affected source.

In order to be able to use the equivalent emission rate option, you must demonstrate that at least 90 percent of the mass of organic HAP contained in dyeing and finishing materials applied in the dyeing/finishing affected source are discharged to the wastewater treatment system and not emitted to the atmosphere; and the total organic HAP emissions from the dyeing/finishing affected source must be less than 10 tons per year.

To demonstrate initial compliance with the equivalent emission rate option, you are required to:

- Determine the average organic HAP concentration of each affected wastewater stream using EPA Methods 305, 624, 625, 1624, 1625; other EPA methods; or methods other than EPA methods in accordance with specified requirements. You must consider the actual or anticipated production over the compliance period and include all wastewater streams generated by the affected dyeing/finishing operation(s) during this period. A performance test must be performed to characterize the wastewater stream generated for each operating scenario (in terms of factors affecting the fraction of organic HAP discharged to the wastewater, such as the type of substrate, the type and mass fraction of organic HAP entering the dyeing/finishing operation, and the process temperature and pressure) during the compliance period.
- Determine the mass flow rate of each wastewater stream using knowledge of the wastewater, historical records, or measurement.
- Document the wastewater is either discharged to a POTW or treated onsite in a treatment system that includes at least secondary treatment with biological treatment processes.
- Determine the mass of organic HAP contained in all of the wastewater streams characterized by the performance testing.
- Determine the fraction of organic HAP applied in the dyeing/finishing affected source that is discharged to the

wastewater. At least 90 percent of the organic HAP applied must be discharged to the wastewater.

• Determine the organic HAP emissions from the dyeing/finishing affected source. Organic HAP emissions must be less than 10 tons per year.

• Record the calculations and results and include them in your Notification of Compliance Status.

4. *Compliance Based on Using a Capture System and Add-on Control Device.* If you use a capture system and add-on control device on a web coating/printing operation, other than a solvent recovery system for which you conduct a liquid-liquid material balance, you must determine the capture and control efficiencies of the equipment or the oxidizer outlet organic HAP concentration. For the organic HAP emission rate limit, you also must determine the mass fraction of organic HAP and the mass fraction of solids in all materials applied during the initial compliance period. You are required to demonstrate either that the organic HAP OCE is greater than or equal to the applicable organic HAP OCE limit, that the oxidizer outlet organic HAP concentration is no greater than 20 ppmv on a dry basis and the efficiency of the capture system is 100 percent, or that the capture and control system reduces organic HAP emissions to a level no greater than the applicable emission rate limit in the final rule.

If you use a solvent recovery system for which you conduct a liquid-liquid material balance, you are required to demonstrate either that the organic HAP OCE determined by material balance during the initial compliance period is greater than or equal to the applicable organic HAP OCE limit or that the solvent recovery system reduces organic HAP emissions to a level no greater than the applicable emission rate limit.

The testing and initial compliance requirements associated with determining the OCE of the capture system and add-on control device are summarized in the following paragraphs.

If you use a capture system and add-on control device, other than a solvent recovery system for which you conduct material balances, you are required to conduct an initial performance test to determine the capture and control efficiencies of the equipment (or the capture efficiency of the capture system and the oxidizer outlet organic HAP concentration) and to establish operating limits to be achieved on a continuous basis. The performance test must be completed no later than 180 days after the compliance date for affected sources. If you are demonstrating compliance with the applicable emission rate limit with add-on controls, you must schedule the performance test in time to obtain the results for use in calculating your emission rate for the initial compliance period.

You must determine both the efficiency of the capture system and either the organic HAP emission reduction efficiency of the add-on control device or the outlet organic HAP concentration of the oxidizer. To determine the capture efficiency, you must either verify the presence of a permanent total enclosure (PTE) using EPA Method 204 of 40 CFR part 51, appendix M (and all materials must be applied and dried or cured within the enclosure); or use one of three protocols in the final rule to measure capture efficiency. If you have a PTE and all regulated materials are applied and dried or cured within the enclosure and you route all exhaust gases from the enclosure to an add-on control device, then you assume 100 percent capture. To demonstrate compliance with the oxidizer outlet organic HAP concentration limit, 100 percent capture is required.

To determine the organic HAP emission reduction efficiency of the add-on control device, you must conduct measurements of the inlet and outlet gas streams. Only the outlet gas stream must be measured to determine outlet organic HAP concentration. The performance test must consist of three runs, each run lasting 1 hour, using the following EPA Methods in 40 CFR part 60, appendix A:

• Method 1 or 1A for selection of the sampling sites.

• Method 2, 2A, 2C, 2D, 2F, or 2G to determine the gas volumetric flow rate.

• Method 3, 3A, or 3B for gas analysis to determine dry molecular weight. You may also use as an alternative to Method 3B, the manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas in ANSI/ASME PTC 19.10–1981.

• Method 4 to determine stack moisture.

• Method 25 or 25A to determine organic volatile matter concentration. You must use Method 25A to demonstrate compliance with the oxidizer outlet organic HAP concentration limit because the limit is less than 50 ppmw. Alternatively, any other test method or data that have been validated according to the applicable procedures in Method 301 of 40 CFR part 63, appendix A, and approved by the Administrator, could be used.

If you use a solvent recovery system, you may determine the OCE using a liquid-liquid material balance instead of conducting an initial performance test. If you use the material balance alternative, you are required to measure the amount of all regulated materials applied during the initial compliance period and determine the total volatile matter contained in these materials. You must also measure the amount of volatile matter recovered by the solvent recovery system during the compliance period. Then you must compare the amount recovered to the amount used to determine the OCE. You must record the calculations and results and include them in your Notification of Compliance Status.

Additional testing and initial compliance requirements associated with demonstrating compliance using the emission rate with add-on controls option are as follows:

• Determine the mass fraction of organic HAP in each coating, printing, thinning, and cleaning material applied and the mass fraction of solids in coating and printing materials applied during the initial compliance period, as described previously.

• Calculate the total mass of organic HAP in all regulated materials and total mass of solids for all coating and printing materials. You may subtract from the total mass of organic HAP the amount contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266.

• Calculate the organic HAP emissions reductions from the controlled web coating or printing operations using the capture and control efficiencies determined during the performance test or the materials balance for the compliance period and the total mass of organic HAP in regulated materials applied in controlled web coating and printing operations.

• Calculate the ratio of the total mass of organic HAP emissions to the total mass of solids for the regulated materials applied during the initial compliance period.

• Record the calculations and results and include them in your Notification of Compliance Status.

• Develop and implement a work practice plan to minimize emissions from storage, mixing, and handling of organic HAP-containing materials.

If you choose to comply with the organic HAP emission rate limit by using a capture system and add-on control device on a dyeing/finishing operation, other than a solvent recovery system for which you conduct a liquid-liquid material balance, you must

determine the capture and control efficiencies of the equipment. You also must determine the mass fraction of organic HAP and the mass of all dyeing and finishing materials applied during the initial compliance period. You are required to demonstrate that the capture and control system reduces organic HAP emissions to a level no greater than the applicable emission rate limit in the final rule.

If you use a solvent recovery system for which you conduct a liquid-liquid material balance, you are required to demonstrate that the solvent recovery system reduces organic HAP emissions to a level no greater than the applicable emission rate limit.

The testing and initial compliance requirements associated with determining the OCE of the capture system and add-on control device are summarized in the following paragraphs.

If you use a capture system and add-on control device, other than a solvent recovery system for which you conduct material balances, you are required to conduct an initial performance test to determine the capture and control efficiencies of the equipment and to establish operating limits to be achieved on a continuous basis. The performance test must be completed no later than 180 days after the compliance date for affected sources. To demonstrate compliance with the applicable emission rate limit with add-on controls, you must schedule the performance test in time to obtain the results for use in calculating your emission rate for the initial compliance period.

You must determine both the efficiency of the capture system and the organic HAP emission reduction efficiency of the add-on control device. To determine the capture efficiency, you must either verify the presence of a PTE using EPA Method 204 of 40 CFR part 51, appendix M (and all materials must be applied and dried or cured within the enclosure); or use one of three protocols in the final rule to measure capture efficiency. If you have a PTE and all dyeing and finishing materials are applied and dried or cured within the enclosure and you route all exhaust gases from the enclosure to an add-on control device, then you assume 100 percent capture.

To determine the organic HAP emission reduction efficiency of the add-on control device, you must conduct measurements of the inlet and outlet gas streams. The performance test will consist of three runs, each run lasting 1 hour, using the following EPA Methods in 40 CFR part 60, appendix A:

- Method 1 or 1A for selection of the sampling sites.
- Method 2, 2A, 2C, 2D, 2F, or 2G to determine the gas volumetric flow rate.
- Method 3, 3A, or 3B for gas analysis to determine dry molecular weight. You may also use as an alternative to Method 3B, the manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas in ANSI/ASME PTC 19.10–1981.
- Method 4 to determine stack moisture.
- Method 25 or 25A to determine organic volatile matter concentration. Alternatively, any other test method or data that have been validated according to the applicable procedures in Method 301 of 40 CFR part 63, appendix A, and approved by the Administrator, could be used.

If you use a solvent recovery system, you may determine the OCE using a liquid-liquid material balance instead of conducting an initial performance test. If you use the material balance alternative, you are required to measure the amount of all dyeing and finishing materials applied during the initial compliance period and determine the total volatile matter contained in these materials. You must also measure the amount of volatile matter recovered by the solvent recovery system during the compliance period. Then you must compare the amount recovered to the amount used to determine the OCE. You must record the calculations and results and include them in your Notification of Compliance Status.

Additional testing and initial compliance requirements associated with demonstrating compliance using the emission rate with add-on controls option are as follows:

- Determine the mass fraction of organic HAP in each dyeing and finishing material applied and the mass of each dyeing and finishing material applied during the initial compliance period, as described previously.
- Calculate the total mass of organic HAP in all dyeing and finishing materials. You may subtract from the total mass of organic HAP the amount contained in waste materials you send to a hazardous waste treatment, storage, and disposal facility regulated under 40 CFR part 262, 264, 265, or 266. You also may subtract from the total mass of organic HAP the amount demonstrated to be discharged to wastewater and not emitted to the atmosphere, in accordance with the final rule requirements.
- Calculate the organic HAP emissions reductions from the controlled dyeing or finishing operations using the capture and control efficiencies determined during the performance test or the materials balance for the compliance period and the total mass of organic HAP in dyeing and finishing materials applied in controlled dyeing and finishing operations.
- Calculate the ratio of the total mass of organic HAP emissions to the total mass of dyeing and finishing materials applied during the initial compliance period.
- Record the calculations and results and include them in your Notification of Compliance Status.
- Develop and implement a work practice plan to minimize emissions from storage, mixing, and handling of organic HAP-containing materials.

5. *Operating Limits.* As mentioned above, you must establish operating limits as part of the initial performance test of a capture system and add-on control device, other than a solvent recovery system for which you conduct liquid-liquid material balances. The operating limits are the minimum or maximum (as applicable) values achieved for capture systems and add-on control devices during the performance test, conducted under representative conditions, that demonstrated compliance with the emission limits.

The final rule specifies the parameters to monitor for the types of add-on control devices commonly used in the industry. You are required to install, calibrate, maintain, and continuously operate all monitoring equipment according to the manufacturer's specifications and ensure that the continuous parameter monitoring systems (CPMS) meet the requirements in the final rule. If you use add-on control devices other than those identified in the final rule, you must submit the operating parameters to be monitored to the Administrator for approval. The authority to approve the parameters to be monitored is retained by EPA and is not delegated to States.

If you use a thermal or catalytic oxidizer, you must continuously monitor the appropriate temperature and record it at least every 15 minutes. For thermal oxidizers, the temperature monitor is placed in the firebox or in the duct immediately downstream of the firebox before any substantial heat exchange occurs. The operating limit is the average temperature measured during the performance test, and for each consecutive 3-hour period the average temperature must be at or above this limit. For catalytic oxidizers, temperature monitors are placed at the nearest feasible point to the inlet and outlet of the catalyst bed. The operating

limits are the average temperature at the inlet to the catalyst bed and the average temperature difference across the catalyst bed during the performance test. For each 3-hour period, the average temperature and the average temperature difference must be at or above these limits. Alternatively, you are allowed to meet only the temperature limit at the inlet to the catalyst bed if you develop and implement an inspection and maintenance plan that includes periodic catalyst activity checks.

For each capture system you must conduct monitoring according to your monitoring plan, as described previously in this preamble.

6. Work Practices. If you use a capture system and add-on control device for compliance, you are required to develop and implement on an ongoing basis a work practice plan for minimizing organic HAP emissions to the atmosphere from storage, mixing, material handling, and waste handling operations. This plan must include a description of all steps taken to minimize emissions from these sources (*e.g.*, using closed storage containers, practices to minimize emissions during filling and transfer of contents from containers, using spill minimization techniques, placing solvent-laden cloths in closed containers immediately after use, etc.). You must make the plan available for inspection if the Administrator requests to see it.

7. *Operations During Startup, Shutdown, or Malfunction.* If you use a capture system and add-on control device for compliance, you are required to develop and operate according to a SSMP during periods of startup, shutdown, or malfunction of the capture system and add-on control device.

E. What Are the Continuous Compliance Provisions?

1. *Emission Limits.* If you demonstrate compliance with the emission limits for slashing based on the materials purchased (compliant material option), you will demonstrate continuous compliance if, for each compliance period, the organic HAP content of each slashing material purchased meets the emission limits. You will use manufacturer's data to demonstrate compliance each compliance period as you did for the initial compliance period.

If you demonstrate compliance with the emission limits for web coating and printing based on the materials applied, you will demonstrate continuous compliance if, for each compliance period, either you apply only coating and printing materials that meet the applicable emission limit and only non-organic HAP thinning and cleaning materials (compliant material option); or the ratio of total mass of organic HAP to total mass of solids in coating and printing materials applied is less than or equal to the emission limits (emission rate without add-on controls option). You follow the same procedures for calculating the organic HAP to coating and printing solids ratio that you used for the initial compliance period.

If you demonstrate compliance with the emission limits for dyeing and finishing based on the materials applied, you will demonstrate continuous compliance if, for each compliance period, either the organic HAP content of each dyeing and finishing material applied meets the applicable emission limit (compliant material option) or the total mass of organic HAP in all dyeing and finishing materials applied divided by the total mass of dyeing and finishing materials applied meets the applicable emission limit (emission rate without add-on controls option). You follow the same procedures for determining the mass of organic HAP in all materials applied during the compliance period that you used for the initial compliance period.

If you demonstrate compliance with the equivalent emission rate for dyeing and finishing, you will demonstrate continuous compliance, if for each 12-month compliance period, you operate within the operating scenarios for which wastewater streams were characterized during the initial compliance period, you document that affected wastewater streams were discharged to a POTW or treated onsite in a treatment system that includes at least secondary treatment with biological treatment processes, and organic HAP emissions from the dyeing/finishing affected source are less than 10 tons per year.

For each web coating or printing operation on which you use a capture system and add-on control device, other than solvent recovery for which you conduct a liquid-liquid material balance, the continuous parameter monitoring results for each compliance period will affect your compliance determination. If the monitoring results indicate no deviations from the operating limits and there were no bypasses of the add-on control device, you would assume the capture system and add-on control device are achieving the same emission reduction as they did during the performance test in which the operating limits were established. If you are demonstrating compliance with either the organic HAP OCE option or the emission rate with add-on controls option, you would then apply the OCE to the total mass of organic HAP in regulated materials applied in controlled web coating or printing operations to determine the mass of organic HAP emissions from those operations for the compliance period. If there were any deviations from the operating limits during the compliance period or any bypasses of the add-on control device, you must account for them in the calculation of the applicable emission rate by assuming the capture system and add-on control device were achieving zero emission reduction during the periods of deviation.

For each web coating and printing operation on which you use a solvent recovery system and conduct a liquid-liquid material balance each compliance period, you will use the liquid-liquid material balance to determine the emission rate. You will be required to measure the amount of all regulated materials applied during each compliance period and determine the volatile matter content of these materials. You will also measure the amount of volatile matter recovered by the solvent recovery system during the compliance period and calculate the weight percent of organic HAP applied that was emitted to determine compliance with the organic HAP OCE option. If you are complying with the emission rate with add-on controls option, you must apply the OCE to the total mass of organic HAP in the regulated materials applied to determine total organic HAP emissions as input to the compliance demonstration.

For each dyeing and finishing operation on which you use a capture system and add-on control device, other than solvent recovery for which you conduct a liquid-liquid material balance, to comply with the emission rate with add-on controls option, the continuous parameter monitoring results for each compliance period will affect your compliance determination. If the monitoring results indicate no deviations from the operating limits and there were no bypasses of the add-on control device, you will assume the capture system and add-on control device are achieving the same emission reduction as they did during the performance test in which the operating limits were established. You will then apply the OCE to the total mass of organic HAP in dyeing and finishing materials applied in controlled dyeing and finishing operations to determine the mass of organic HAP emissions from those operations for the compliance period. If there were any deviations from the operating limits during the compliance period or any bypasses of the add-on control device, you must

account for them in the calculation of the applicable emission rate by assuming the capture system and add-on control device were achieving zero emission reduction during the periods of deviation.

For each dyeing and finishing operation on which you use a solvent recovery system and conduct a liquid-liquid material balance each compliance period, you will use the liquid-liquid material balance to determine the emission rate. You will be required to measure the amount of all dyeing and finishing materials applied during each compliance period and determine the volatile matter content of these materials. You will also measure the amount of volatile matter recovered by the solvent recovery system during the compliance period and calculate the weight percent of organic HAP used that was emitted to determine the organic HAP OCE. You must apply the OCE to the total mass of organic HAP in the dyeing and finishing materials applied to determine total organic HAP emissions as input to the compliance demonstration.

2. *Operating Limits.* If you use an emission capture system and add-on control device, the final rule requires you to achieve on a continuous basis the operating limits you establish during the performance test. If the continuous monitoring shows that the capture system and/or add-on control device are operating outside the range of values established during the performance test, you have deviated from the established operating limits.

If you operate a capture system and add-on control device with bypass lines that could allow emissions to bypass the add-on control device, you must demonstrate that organic HAP emissions collected by the capture system are routed to the add-on control device by monitoring for potential bypass of the add-on control device. You may choose from the following four monitoring procedures:

- Flow control position indicator to provide a record of whether the exhaust stream is directed to the add-on control device;
- Car-seal or lock-and-key valve closures to secure the bypass line valve in the closed position when the add-on control device is operating;
- Valve closure continuous monitoring to ensure any bypass line valve or damper is closed when the add-on control device is operating; or
- Automatic shutdown system to stop the web coating/printing or dyeing/finishing operation when flow is diverted from the add-on control device.

A deviation has occurred for any period of time the bypass monitoring procedures indicate that emissions are not routed to the add-on control device.

3. *Work Practices.* If you use an emission capture system and add-on control device for compliance, you are required to implement on an ongoing basis the work practice plan you developed during the initial compliance period. If you did not develop a plan for reducing organic HAP emissions or you do not implement the plan, this would be a deviation from the work practice standard.

4. *Operations During Startup, Shutdown, and Malfunction.* If you use a capture system and add-on control device for compliance, you are required to develop and operate according to a SSMP during periods of startup, shutdown, and malfunction of the capture system and add-on control device.

F. What Are the Notification, Recordkeeping, and Reporting Requirements?

You are required to comply with the applicable requirements in subpart A of 40 CFR part 63, as described in the final rule. The General Provisions notification requirements include: initial notifications, notification of performance test if you are complying using a capture system and add-on control device, notification of compliance status, and additional notifications required for affected sources with continuous monitoring systems. The General Provisions also require certain records and periodic reports.

1. *Initial Notifications.* If you own or operate an existing affected source, you are required to send a notification to the EPA Regional Office in the Region where your affected source is located and to your State agency no later than June 2, 2004. For new and reconstructed sources, you must send the notification within 120 days after the date of initial startup or September 26, 2003, whichever is later. The report notifies us and your State agency that you have an existing affected source that is subject to the final standards, or that you have constructed a new affected source. Thus, it allows you and the permitting authority to plan for compliance activities. You also need to send a notification of planned construction or reconstruction of a source that would be subject to the final rule and apply for approval to construct or reconstruct.

2. *Notification of Performance Test.* If you demonstrate compliance by using a capture system and add-on control device for which you do not conduct a liquid-liquid material balance, you must conduct a performance test. The performance test is required within 180 days of the compliance date for an existing affected source. For a new or reconstructed affected source, the performance test would be required no later than 180 days after initial startup or November 25, 2003, whichever is later. You must notify us (or the delegated State or local agency) at least 60 calendar days before the performance test is scheduled to begin and submit a report of the performance test results no later than 60 days after the test.

3. *Notification of Compliance Status.* You must send us a Notification of Compliance Status within 30 days after the end of the initial compliance period. In the notification, you must certify whether each affected source has complied with the final standards, identify the option(s) you used to demonstrate initial compliance, summarize the data and calculations supporting the compliance demonstration, and provide information on any deviations from the emission limits, operating limits, or other requirements.

If you elect to comply by using a capture system and add-on control device for which you conduct performance tests, you must provide the results of the tests. Your notification must also include the measured range of each monitored parameter, the operating limits established during the performance test, and information showing whether the source has complied with its operating limits during the initial compliance period.

4. *Recordkeeping Requirements.* You are required to keep records of reported information and all other information necessary to document compliance with the final rule for 5 years. As required under the General Provisions, records for the 2 most recent years must be kept on-site; the other 3 years' records may be kept off-site. Records pertaining to the design and operation of the emission control and monitoring equipment must be kept for the life of the equipment. You need to keep all documentation supporting initial notifications and notifications of compliance status. If your affected source is complying with the slashing emission limits, you are required to keep purchase records of the organic HAP content of each slashing material.

Depending on the compliance option that you choose for your affected source complying with the dyeing and finishing or web coating and printing emission limits, you must keep records of the following:

• Organic HAP content, volatile matter content, coating and printing materials solids content, and quantity of the dyeing, finishing, coating, printing, thinning, and cleaning materials used during each compliance period.

• For the equivalent emission rate option for the dyeing and finishing subcategory, documentation that your dyeing/finishing affected source operated within the operating scenarios used to demonstrate initial compliance, affected wastewater streams were discharged to a POTW or treated onsite in a treatment system that includes at least secondary treatment with biological treatment processes, and organic HAP emissions from the affected source were less than 10 tpy.

• For the emission rate (with or without add-on controls) compliance options, calculations of your emission rate for each compliance period.

If your affected source is in the web coating and printing or the dyeing and finishing subcategory and you demonstrate compliance by using a capture system and add-on control device, you would also need to keep records of the following:

• All required measurements, calculations, and supporting documentation needed to demonstrate compliance with the standards.

• All results of performance tests and parameter monitoring.

• All information necessary to demonstrate conformance with your plan for minimizing emissions from mixing, storage, and waste handling operations.

• All information necessary to demonstrate conformance with the affected source's SSMP when the plan procedures are followed.

• The occurrence and duration of each startup, shutdown, or malfunction of the emission capture system and add-on control device.

• Actions taken during startup, shutdown, and malfunction that are different from the procedures specified in the affected source's SSMP.

• Each period during which a CPMS is malfunctioning or inoperative (including out-of-control periods).

The final rule requires you to collect and keep records according to certain minimum data requirements for the CPMS. Failure to collect and keep the specified minimum data is a deviation that is separate from any emission limits, operating limits, or work practice standards.

Deviations, as determined from these records, need to be recorded and also reported. A deviation is any instance when any requirement or obligation established by the final rule including, but not limited to, the emission limits, operating limits, and work practice standards, is not met.

If you use a capture system and add-on control device to reduce organic HAP emissions, you have to make your SSMP available for inspection if the Administrator requests to see it. The plan must stay in your records for the life of the affected source or until the source is no longer subject to the final standards. If you revise the plan, you need to keep the previous superseded versions on record for 5 years following the revision.

5. *Periodic Reports.* Each reporting year is divided into two semiannual reporting periods. If no deviations occur during a semiannual reporting period, you must submit a semiannual report stating that the affected source has been in continuous compliance. If deviations occur, you must include them in the report as follows:

• Report each deviation from the emission limit.

• Report each deviation from the work practice standards if you use an emission capture system and add-on control device.

• If you use an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, report each deviation from an operating limit and each time a bypass line diverts emissions from the add-on control device to the atmosphere.

• Report other specific information on the periods of time the deviations occurred.

You also are required to include in each semiannual report an identification of the compliance option(s) you used for each affected source and any time periods when you changed to another compliance option.

6. *Other Reports.* You are required to submit reports for periods of startup, shutdown, or malfunction of the capture system and add-on control device. If the procedures you follow during any startup, shutdown, or malfunction are inconsistent with your SSMP, you must report those procedures with your semiannual reports in addition to immediate reports required by 40 CFR 63.10(d)(5)(ii).

IV. Summary of Environmental, Energy, and Economic Impacts

The final rule will affect an estimated 135 major sources that perform coating, printing, slashing, dyeing and finishing operations. The impacts are presented relative to a baseline reflecting the level of control prior to the final rule. Due to consolidation throughout the industry, there is expected to be little growth within the printing, coating and dyeing industry during the next 5 years. Only three new coating sources and no new printing, slashing, dyeing, or finishing sources are projected. For more information on how impacts were estimated, see the docket for the final rule.

A. What Are the Air Impacts?

We estimated that compliance with the emission limits in the final rule will result in reductions of nationwide organic HAP emissions of 4,100 tpy (3,700 Megagrams per year (Mg/yr)). This represents a reduction of 60 percent from the baseline organic HAP emissions of 6,800 tpy (6,200 Mg/yr). The primary air impacts by subcategory associated with implementation of the final rule are:

Subcategory	Emissions before NESHAP (tpy)	Emissions after NESHAP (tpy)	Emission reduction (tpy)	Percent reduction (%)
Web coating and Printing	5,570	2,390	3,180	57
Dyeing and Finishing	900	160	750	83
Slashing	350	170	170	50
Source Category Nationwide Total	6,820	2,720	4,100	60

B. What Are the Cost Impacts?

We have estimated the costs related to complying with the emission limitations and meeting the monitoring, recordkeeping, and reporting requirements. The costs to comply with the emission limitations include the costs of adding or upgrading emission control systems; the increased cost of compliant, low-formaldehyde permanent press finishes; and the cost of performance testing emission control systems. We have assumed for this analysis that all sources with affected slashing and dyeing operations will comply through the use of reformulated slashing, dyeing, thinning, and cleaning materials, and that these materials can be utilized without the need for capital expenditures. Annual costs for meeting the monitoring, recordkeeping, and reporting requirements of the final rule have also been included.

To comply with the final rule, web coating and printing affected sources that are not currently in compliance will likely use either upgraded existing emission control systems or new emission control systems. We estimated the capital and annual costs of carbon adsorbers, thermal oxidizers, catalytic oxidizers and coating rooms, using model plants based on information in our facility database. We examined the current level of control reported by each source in the database to determine control measures and associated model plant costs required to achieve compliance with the final rule's emission limits. Control costs estimated for the database sources were extrapolated to nationwide totals.

The dyeing and finishing compliance options are based on the use of low-organic HAP materials. Qualitative information concerning pollution prevention measures gathered from stakeholder meetings and site visits indicated that there would be substantial costs incurred in reducing the formaldehyde content of permanent press resins. We used information collected from a research and marketing company and textile chemical suppliers to estimate the incremental cost to produce finished fabric, using a compliant resin versus a formaldehyde resin. The incremental cost was applied to the quantity of fabric estimated to currently be finished with non-compliant formaldehyde resins.

Performance testing costs for coating and printing sources using add-on control systems to comply with the final rule include the labor hours required to conduct performance testing and monitoring on each emission capture system and add-on control device used and to develop the associated data elements for recordkeeping and reporting purposes. Recordkeeping and reporting includes all labor hours related to installing recordkeeping and reporting systems, developing SSMP, initial notification, compliance status notification, performance test notification, performance test report, materials usage tracking, training personnel, and monitoring deviations and SSMP reports and recordkeeping.

We estimate total capital costs to comply with the emission standards for the approximately 135 existing major sources to be $18.8 million, and nationwide annualized costs to be $14.5 million. These nationwide annualized costs include approximately $5.6 million associated with add-on control systems for web coating and printing operations, $7.5 million in costs associated with finishing material usage, and $1.4 million in monitoring, reporting, and recordkeeping costs.

The only new source costs will be for the three projected new coating sources. We have assumed that new coating sources will not install controls beyond those required for new source review, and these controls will meet the new source limit in the final rule. Therefore, we have assumed that these sources will not incur capital costs as a result of the final rule. The annual costs to comply with the monitoring, recordkeeping, and reporting requirements in the final rule for these new sources are estimated at $13,000.

C. What Are the Economic Impacts?

We prepared an economic impact analysis to evaluate the impacts the final rule would have on the producers and consumers of fabric and other textiles coating, printing, dyeing and finishing products, and society as a whole. The economic analysis determines total social costs, which take into account changes in behavior by producers, consumers, and foreign competitors of fabric products due to the imposition of compliance costs from the final rule.

Based on comments submitted by the industry, we modified our economic model to reflect strong international competition that may prevent domestic producers in the fabric finishing market from increasing prices. The model assumes that any change in domestic production in this market will be passed to foreign producers. The fabric coatings market is assumed to be able to increase prices to a minimal extent. Based on the estimated compliance costs of the final rule and the predicted changes in the coating and finishing markets, the estimated annualized social cost of the final rule is projected to be $14.5 million (2000 dollars).

It is projected that domestic producers in the fabric and textile industries will absorb $12.9 million out of the total social cost, while only $1.6 million will be passed through to consumers (in the fabric coatings market only). Domestic production in the fabric finishing market is predicted to decrease by 0.02 percent and, thus, transfer production to foreign producers, which represents an increase of 6.48 percent of total foreign production. With a minimal price increase in the fabric coatings market, domestic production is estimated to decrease by 0.08 percent, while foreign production is estimated to increase by 0.04 percent.

For new sources, it can be reasonably assumed that the investment decision to enter the coating, printing, dyeing and finishing industry may be slightly altered as a result of this final rule; however, other factors will weigh more heavily in this decision. For example, current economic trends have shown a continuous decline of the textile market as more manufacturing moves abroad. Only three new coating sources are projected to come online in the 5 years following promulgation of the final rule, and no additional printing, slashing, dyeing or fabric finishing sources are projected in the next 5 years. The three new coating sources that are projected to come online will incur a total of only $13,000 in annual costs to meet the requirements of the final rule.

Quantified economic impacts of the final rule on printed, dyed, and slashed fabric products were not calculated in the economic impact analysis because the compliance costs for the sources that produce these products are minimal and relate only to monitoring, recordkeeping, and reporting activities. Based on a qualitative analysis of the printing, dyeing, and slashing markets, we have determined that the impact on the prices and quantities of these products would be insignificant. For more information, refer to the "Economic Impact Analysis of the Final Textile Coating, Printing, Dyeing and Finishing NESHAP" in the docket for the final rule.

D. What Are the Non-Air Health, Environmental, and Energy Impacts?

Based on information from industry survey responses, we found no indication that the use of low-organic HAP content coating, printing, slashing, dyeing, finishing, thinning, and cleaning materials at existing sources will result in any increase or decrease in non-air health, environmental, and energy impacts. There will be no change

in the utility requirements associated with the use of these materials, so there will be no change in the amount of energy consumed as a result of the material conversion. Also, there will be no significant change in the amount of materials used or the amount of waste produced.

Non-air environmental and energy impacts will result from the installation of new and the upgrade of existing add-on controls by affected sources in the web coating and printing subcategory. Affected sources adding carbon adsorber systems will require increased cooling water usage for the condenser used to recover organic HAP from the regenerated carbon, and in certain situations for spray towers to cool the gas entering the carbon adsorber. The estimated increase in nationwide total cooling water usage will be 70.3 million gallons per year. The cooling water is assumed not to result in wastewater. There will be a small increase in water usage for steam to regenerate carbon. The steam used to regenerate carbon yields water requiring wastewater treatment. The estimated increase in nationwide total wastewater generation will be 3.8 million gallons per year.

Affected sources using existing catalytic oxidizers to comply with the final rule probably will be required to install larger volumes of catalysts and to replace the catalysts more frequently than current replacement cycles to maintain high performance levels, resulting in a small increase in solid waste generation. Similarly, affected sources that currently do not operate emission control systems and that install catalytic oxidizers to comply with the final rule will increase solid waste generation. Sometimes the spent catalyst is regenerated by the manufacturer for reuse. Activated carbon used in carbon adsorbers is returned to the manufacturer at the end of its useful life and converted to other salable products. Little solid waste impact is expected from this source.

Energy requirements for implementation of the compliance options for web coating and printing affected sources will include electricity to collect and treat ventilation air, electricity to light PTE, and natural gas to provide supplemental fuel for stable operation of oxidizers. The estimated increase in nationwide total electricity usage will be almost 2.8 million kilowatt hours per year, and the estimated nationwide total natural gas usage will increase by about 195 million standard cubic feet per year.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and, therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligation of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that the final rule is not a "significant regulatory action" under the terms of Executive Order 12866, and is therefore not subject to OMB review.

B. Paperwork Reduction Act

The information collection requirements in the final rule have been submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501, *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 2071.02) and a copy may be obtained from Susan Auby by mail at the Collection Strategies Division (2822T), U.S. EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460, by e-mail at *auby.susan@epa.gov*, or by calling (202) 566–1672. A copy may also be downloaded off the Internet at *http://www.epa.gov/icr*. The information requirements are not enforceable until OMB approves them.

The information requirements are based on notification, recordkeeping, and reporting requirements in the General Provisions (40 CFR part 63, subpart A), which are mandatory for all operators subject to national emission standards. These recordkeeping and reporting requirements are specifically authorized by section 114 of the CAA (42 U.S.C. 7414). All information submitted to EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies set forth in 40 CFR part 2, subpart B.

The final rule requires maintaining records of all coating, printing, slashing, dyeing, finishing, thinning, and cleaning materials data and calculations used to determine compliance. This information includes the amount (kg) used during each monthly compliance period, mass fraction organic HAP, and, for coating and printing materials only, mass fraction of solids.

If an add-on control device is used, records must be kept of the capture efficiency of the capture system, destruction or removal efficiency of the add-on control device, and the monitored operating parameters. In addition, records must be kept of each calculation of the affected sourcewide emissions for each compliance period and all data, calculations, test results, and other supporting information used to determine this value.

The annual public monitoring, recordkeeping, and reporting burden for this collection (averaged over the first 3 years after May 29, 2003 is estimated to total 213 labor hours per affected source at a total annual cost of $1.4 million. This estimate includes, for affected sources with existing or newly-installed add-on control systems, a one-time performance test and report (with repeat tests where needed), one-time submission of a SSMP with semiannual reports for any event when the procedures in the plan were not followed, semiannual compliance status reports, and recordkeeping. There are no capital/startup costs associated with the monitoring requirements.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information

unless it displays a currently valid OMB control number. The OMB control numbers for EPA's rules are listed in 40 CFR part 9 and 48 CFR chapter 15. The OMB control number for the information collection requirements in this final rule will be listed in an amendment to 40 CFR part 9 in a subsequent **Federal Register** document after OMB approves the ICR.

C. Regulatory Flexibility Act

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with the final rule. The EPA has also determined that the final rule will not have a significant economic impact on a substantial number of small entities. For the purposes of assessing the impacts of today's final rule on small entities, small entity is defined as: (1) A small business according to Small Business Administration (SBA) size standards by NAICS code ranging from 500 to 1,000 employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

We applied the definition of a small business as provided by the SBA at 13 CFR 121, and classified by the NAICS. The firms owning sources directly affected by the final rule are generally classified by the NAICS codes 313210 (Broadwoven Fabric Mills), 313311 (Broadwoven Fabric Finishing Mills), 313320 (Fabric Coating Mills), and 313312 (Textile and Fabric Finishing (except Broadwoven Fabric) Mills).

The SBA defines small businesses in NAICS codes 313210, 313311, and 313320 as those with fewer than 1,000 employees (as described in (1) above). In NAICS code 313312, the SBA defines a small business as one with fewer than 500 employees. In the past several years, production in the textile manufacturing industry has become more capital intensive, thus utilizing smaller numbers of employees. This leads a substantial fraction of the companies in the fabric and other textiles coating, printing, finishing, dyeing, and slashing source category to be considered small businesses based on SBA's small business size standards.

After considering the economic impacts of today's final rule on small entities, EPA has concluded that this action will not have a significant impact on a substantial number of small entities. We have identified 40 small companies classified as owning coating operations by NAICS 313320. Of these 40 small coating companies, 22 (55 percent) are projected to face zero compliance costs. Fifteen (37.5 percent) face costs less than 1 percent of their sales, and two (5 percent) have cost-to-sales ratios between 1 and 3 percent. One (2.5 percent) of these companies has a cost-to-sales ratio that exceeds 3 percent (3.2 percent).

For the dyeing and finishing subcategory, the engineering analysis determined that at most five finishing businesses representing seven facilities, would face positive compliance costs in order to meet the requirements specified by the final rule. Of these five firms, we were able to identify one company as large. Therefore, four small businesses face compliance costs associated with the final rule.

We did not possess sufficient data to identify the five finishing facilities expected to face compliance costs, so the small business analysis for finishers consisted of a sensitivity analysis of cost-to-sales ratios using minimum, mean, median, and maximum estimated compliance costs for finishing facilities. Sales data were available for 58 percent of all small entities subject to the final rule. Using median compliance cost estimates for finishing sources, we found that three companies had cost-to-sales ratios between 1 and 3 percent and none had a cost-to-sales ratio exceeding 3 percent.

For the small and large companies that engage in dyeing and slashing, compliance costs are limited to monitoring, recordkeeping, and reporting costs. Based on a qualitative analysis, we conclude that the cost will be minimal.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that the final rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The maximum total annualized cost of the final rule for any year has been estimated to be $14.5 million. Thus, today's final rule is not subject to the requirements of sections 202 and 205 of the UMRA. In addition, EPA has determined that the final rule contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments or impose obligations upon them. Therefore, today's final rule is not subject to the requirements of section 203 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The final rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national

government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. It has been determined that the final rule does not have "federalism implications" because it does not meet the necessary criteria. Thus, Executive Order 13132 does not apply to the final rule. Although section 6 of Executive Order 13132 does not apply to the rule, EPA did consult with State and local officials to enable them to provide timely input in the development of the final rule.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." The final rule does not have tribal implications, as specified in Executive Order 13175. No tribal governments own or operate printing, coating, and dyeing affected sources. Thus, Executive Order 13175 does not apply to the final rule.

G. Executive Order 13045: Protection of Children From Environmental Health & Safety Risks

Executive Order 13045, "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997) applies to any rule that: (1) Is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, EPA must evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final rule is not subject to Executive Order 13045 because it is based on technology performance and not on health or safety risks. Furthermore, the rule has been determined not to be "economically significant" as defined under Executive Order 12866.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

The final rule is not subject to Executive Order 13211, "Actions Concerning Regulations that Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

As noted in the proposed rule, section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, Public Law No. 104–113, § 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The VCS are technical standards (*e.g.*, material specifications, test methods, sampling procedures, and business practices) that are developed or adopted by VCS bodies. The NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency does not use available and applicable VCS.

This rulemaking involves technical standards. The EPA cites the following standards in this final rule: EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 24, 25, 25A, 204, 204A through F, and 311. Consistent with the NTTAA, EPA conducted searches to identify VCS in addition to these EPA methods. No applicable VCS were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, 204, 204A through F and 311. The search and review results have been documented and are placed in the docket (Docket ID No. OAR–2003–0014, formerly Docket No. A–97–51) for the final rule.

The VCS ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses" [Part 10, Instruments and Apparatus]," is cited in this rule for its manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas. This part of ANSI/ASME PTC 19.10–1981, Part 10, is an acceptable alternative to Method 3B.

Six VCS: ASTM D1475–90, ASTM D2369–95, ASTM D3792–91, ASTM D4017–96a, ASTM D4457–85 (Reapproved 1991), and ASTM D5403–93 are already incorporated by reference (IBR) in EPA Method 24. Five VCS: ASTM D1979–91, ASTM D3432–89, ASTM D4747–87, ASTM D4827–93, and ASTM PS 9–94 are IBR in EPA Method 311.

The search for emissions measurement procedures identified 16 other VCS. The EPA has not adopted these standards as alternatives in the final rule. The use of these VCS would be impractical or inconsistent with applicable law due to lack of equivalency, detail, quality assurance/quality control requirements or because they are still under development. Our search and review results are available in the docket (Docket ID No. OAR–2003–0014, formerly Docket No. A–97–51).

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing the final rule and other required information to the United States Senate, the United States House of Representatives, and the Comptroller General of the United States prior to publication of the final rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2). The rule will be effective May 29, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: February 28, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons stated in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. Section § 63.14 is amended by revising paragraph (i)(3). The revision reads as follows:

§ 63.14 Incorporations by reference.

* * * * *

(i) * * *

(3) ANSI/ASME PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]," IBR approved for §§ 63.865(b), 63.3360(e)(1)(iii), 63.4166(a)(3), § 63.4362(a)(3), § 63.4766(a)(3), 63.4965(a)(3), § 53.5160(d)(1)(iii), 63.9307(c)(2), and 63.9323(a)(3).

■ 3. Part 63 is amended by adding subpart OOOO to read as follows:

Subpart OOOO—National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles

What This Subpart Covers

Sec.
63.4280 What is the purpose of this subpart?
63.4281 Am I subject to this subpart?
63.4282 What parts of my plant does this subpart cover?
63.4283 When do I have to comply with this subpart?

Emission Limitations

63.4290 What emission limits must I meet?
63.4291 What are my options for meeting the emission limits?
63.4292 What operating limits must I meet?
63.4293 What work practice standards must I meet?

General Compliance Requirements

63.4300 What are my general requirements for complying with this subpart?
63.4301 What parts of the General Provisions apply to me?

Notifications, Reports, and Records

63.4310 What notifications must I submit?
63.4311 What reports must I submit?
63.4312 What records must I keep?
63.4313 In what form and for how long must I keep my records?

Compliance Requirements for the Compliant Material Option

63.4320 By what date must I conduct the initial compliance demonstration?
63.4321 How do I demonstrate initial compliance with the emission limitations?
63.4322 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate Without Add-On Controls Option

63.4330 By what date must I conduct the initial compliance demonstration?
63.4331 How do I demonstrate initial compliance with the emission limitations?
63.4332 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Emission Rate With Add-On Controls Option

63.4340 By what date must I conduct performance tests and other initial compliance demonstrations?
63.4341 How do I demonstrate initial compliance?
63.4342 How do I demonstrate continuous compliance with the emission limitations?

Compliance Requirements for the Organic HAP Overall Control Efficiency and Oxidizer Outlet Organic HAP Concentration Options

63.4350 By what date must I conduct performance tests and other initial compliance demonstrations?
63.4351 How do I demonstrate initial compliance?
63.4352 How do I demonstrate continuous compliance with the emission limitations?

Performance Testing and Monitoring Requirements

63.4360 What are the general requirements for performance tests?
63.4361 How do I determine the emission capture system efficiency?
63.4362 How do I determine the add-on control device emission destruction or removal efficiency?
63.4363 How do I establish the add-on control device operating limits during the performance test?
63.4364 What are the requirements for CPMS installation, operation, and maintenance?

Other Requirements and Information

63.4370 Who implements and enforces this subpart?
63.4371 What definitions apply to this subpart?

Tables to Subpart OOOO of Part 63

Table 1 to Subpart OOOO of Part 63. Emission Limits for New or Reconstructed and Existing Affected Sources in the Printing, Coating, and Dyeing of Fabrics and Other Textiles Source Category
Table 2 to Subpart OOOO of Part 63. Operating Limits if Using Add-On Control Devices and Capture System
Table 3 to Subpart OOOO of Part 63. Applicability of General Provisions to Subpart OOOO
Table 4 to Subpart OOOO of Part 63. Default Organic HAP Mass Fraction for Solvents and Solvent Blends
Table 5 to Subpart OOOO of Part 63. Default Organic HAP Mass Fraction for Petroleum Solvent Groups

Subpart OOOO—National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles

What This Subpart Covers

§ 63.4280 What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for fabric and other textiles printing, coating and dyeing operations. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§ 63.4281 Am I subject to this subpart?

(a) Except as provided in paragraphs (c) and (d) of this section, the source category to which this subpart applies is the printing, coating, slashing, dyeing or finishing of fabric and other textiles, and it includes the subcategories listed in paragraphs (a)(1) through (3) of this section.

(1) The coating and printing subcategory includes any operation that coats or prints fabric or other textiles. Coating and printing operations are defined in § 63.4371. Coated and printed substrates are used in products including, but not limited to, architectural structures, apparel, flexible hoses, hot-air balloons, lightweight liners, luggage, military fabric, rainwear, sheets, tents, threads and V-belts. The coating and printing subcategory includes any fabric or other textile web coating line that also performs coating on another substrate unless such coating is specifically excluded from this subpart by another NESHAP in this part or is exempted from the requirements of this subpart based on the criteria in paragraph (e) of this section. Web coating lines exclusively dedicated to coating or printing fabric and other textiles are subject to this subpart.

(2) The slashing subcategory includes any operation with slashing operations as defined in § 63.4371. In the slashing process, sizing compounds are applied to warp yarn to bind the fiber together and stiffen the yarn to provide abrasion resistance during weaving.

(3) The dyeing and finishing subcategory includes any operation that dyes or finishes a fabric or other textiles. Dyeing and finishing operations are defined in § 63.4371. Dyed and finished textiles are used in a wide range of products including, but not limited to, apparel, carpets, high-performance industrial fabrics, luggage, military fabrics, outer wear, sheets, towels, and threads.

(b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.4282, that is a major source, is located at a major source, or is part of a major source of hazardous air pollutants (HAP). Major source is defined in § 63.2 of this part.

(c) This subpart does not apply to coating, printing, slashing, dyeing, or finishing operations that meet any of the

criteria of paragraphs (c)(1) through (5) of this section.

(1) Coating and printing, slashing, or dyeing and finishing operations conducted at a source that uses only regulated materials that contain no organic HAP as defined in § 63.4371.

(2) Coating, printing, slashing, dyeing, or finishing that occurs at research or laboratory operations or that is part of janitorial, building, and facility maintenance operations.

(3) Coating, printing, slashing, dyeing, or finishing operations used by a facility and not for commerce, unless organic HAP emissions from the coating, printing, slashing, dyeing or finishing operations are as high as the major source HAP emissions specified in paragraph (b) of this section.

(4) Fabric and other textile substrate web coating or printing operations conducted at ambient temperatures that do not involve drying or curing equipment such as ovens, tenter frames, steam cans, or dryers.

(5) Coating, printing, slashing, dyeing, or finishing operations performed on-site at installations owned or operated by the Armed Forces of the United States (including the Coast Guard and the National Guard of any State).

(d) Web coating lines specified in paragraphs (d)(1) through (3) of this section are not part of the affected source of this subpart.

(1) Any web coating operation that is part of the affected source of subpart JJJJ of this part (national emission standards for hazardous air pollutants for paper and other web coating). This would include any web coating line that coats both a paper and other web substrate and a fabric or other textile substrate for use in flexible packaging, pressure sensitive tape and abrasive materials, or any web coating line laminating a fabric substrate to paper.

(2) Any web coating operation that is part of the affected source of subpart XXXX of this part (NESHAP for tire manufacturing). This would include any web coating line that applies coatings to both tire cord and to textile cord used in the production of belts and hoses.

(3) Coating, slashing, dyeing, or finishing operations at a synthetic fiber manufacturing facility included in the affected source of another subpart of this part, such as subpart F (NESHAP for the synthetic organic chemical manufacturing industry) or subpart JJJ (NESHAP for group IV polymers and resins).

(e) Any web coating line that coats both fabric and other textiles, and another substrate such as paper, must comply with the subpart of this part that applies to the predominant activity conducted on the affected source. Predominant activity for this subpart is 90 percent of the mass of substrate coated during the compliance period. (For example, a web coating line that coats 90 percent or more of a paper substrate, and 10 percent or less of a fabric or other textile substrate, would be subject to 40 CFR 63, subpart JJJJ.)

§ 63.4282 What parts of my plant does this subpart cover?

(a) This subpart applies to each new, reconstructed, and existing affected source within each of the three subcategories listed in § 63.4281(a).

(b) The affected source for the web coating and printing subcategory is the collection of all of the items listed in paragraphs (b)(1) through (5) of this section that are used in fabric and other textiles web coating and printing operations. The regulated materials for the web coating and printing subcategory are the coating, printing, thinning and cleaning materials used in the affected source.

(1) All web coating and printing equipment used to apply cleaning materials to a substrate on the coating or printing line to prepare it for coating or printing material application, to apply coating or printing materials to a substrate and to dry or cure the coating or printing materials, or equipment used to clean web coating/printing operation equipment;

(2) All containers used for storage and vessels used for mixing coating, printing, thinning, or cleaning materials;

(3) All equipment and containers used for conveying coating, printing, thinning, or cleaning materials;

(4) All containers used for storage, and all equipment and containers used for conveying waste materials generated by a coating or printing operation; and

(5) All equipment, structures, and/or devices(s) used to convey, treat, or dispose of wastewater streams or residuals generated by a coating or printing operation.

(c) The affected source for the slashing subcategory is the collection of all of the items listed in paragraphs (c)(1) through (5) of this section that are used in slashing operations. The regulated materials for the slashing subcategory are the slashing materials used in the affected source.

(1) All slashing equipment used to apply and dry size on warp yarn;

(2) All containers used for storage and vessels used for mixing slashing materials;

(3) All equipment and containers used for conveying slashing materials;

(4) All containers used for storage and all equipment and containers used for conveying waste materials generated by a slashing operation; and

(5) All equipment, structures, and/or devices(s) used to convey, treat, or dispose of wastewater streams or residuals generated by a slashing operation.

(d) The affected source for the dyeing and finishing subcategory is the collection of all of the items listed in paragraphs (d)(1) through (5) of this section that are used in dyeing and finishing operations. The regulated materials for the dyeing and finishing subcategory are the dyeing and finishing materials used in the affected source.

(1) All dyeing and finishing equipment used to apply dyeing or finishing materials, to fix dyeing materials to the substrate, to rinse the textile substrate, or to dry or cure the dyeing or finishing materials;

(2) All containers used for storage and vessels used for mixing dyeing or finishing materials;

(3) All equipment and containers used for conveying dyeing or finishing materials;

(4) All containers used for storage, and all equipment and containers used for conveying, waste materials generated by a dyeing or finishing operation; and

(5) All equipment, structures, and/or devices(s) used to convey, treat, or dispose of wastewater streams or residuals generated by a dyeing or finishing operation.

(e) An affected source is a new source if it meets the criteria in paragraph (e)(1) of this section and the criteria in either paragraph (e)(2) or (3) of this section.

(1) You commenced the construction of the source after July 11, 2002.

(2) The web coating and printing, slashing, or dyeing and finishing operation is performed at a source where no web coating and printing, slashing, or dyeing and finishing operation was previously performed.

(3) The web coating and printing, slashing, or dyeing and finishing operation is performed in a subcategory in which no web coating and printing, slashing, or dyeing and finishing operation was previously performed.

(f) An affected source is reconstructed if you meet the criteria as defined in § 63.2.

(g) An affected source is existing if it is not new or reconstructed.

§ 63.4283 When do I have to comply with this subpart?

The date by which you must comply with this subpart is called the compliance date. The compliance date for each type of affected source is specified in paragraphs (a) through (c) of this section. The compliance date begins

the initial compliance period during which you conduct the initial compliance demonstration described in §§ 63.4320, 63.4330, 63.4340, and 63.4350.

(a) For a new or reconstructed affected source, the compliance date is the applicable date in paragraph (a)(1) or (2) of this section:

(1) If the initial startup of your new or reconstructed affected source is before May 29, 2003, the compliance date is May 29, 2003.

(2) If the initial startup of your new or reconstructed affected source occurs after May 29, 2003, the compliance date is the date of initial startup of your affected source.

(b) For an existing affected source, the compliance date is the date 3 years after May 29, 2003.

(c) For an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP emissions, the compliance date is specified in paragraphs (c)(1) and (2) of this section.

(1) For any portion of the source that becomes a new or reconstructed affected source subject to this subpart, the compliance date is the date of initial startup of the affected source or May 29, 2003, whichever is later.

(2) For any portion of the source that becomes an existing affected source subject to this subpart, the compliance date is the date 1 year after the area source becomes a major source or 3 years after May 29, 2003, whichever is later.

(d) You must meet the notification requirements in § 63.4310 according to the dates specified in that section and in subpart A of this part. Some of the notifications must be submitted before the compliance dates described in paragraphs (a) through (c) of this section.

Emission Limitations

§ 63.4290 What emission limits must I meet?

You must meet the emission limit for the subcategory or subcategories present in your facility. The three subcategories are: Web coating and printing, slashing, and dyeing and finishing. Table 1 to this subpart presents the emission limits for a new or reconstructed affected source and for an existing affected source in each subcategory.

§ 63.4291 What are my options for meeting the emission limits?

You must include all regulated materials (as defined in § 63.4371) used in the affected source when determining whether the organic HAP emission rate is equal to or less than the applicable emission limit in Table 1 to this subpart. To make this determination, you must use at least one of the compliance options for the subcategory listed in paragraphs (a) through (c) of this section.

(a) *Web coating and printing.* You may apply any one of the compliance options in paragraphs (a)(1) through (5) of this section to an individual web coating/printing operation, or to multiple web coating/printing operations in the affected source as a group, or to the entire affected source in the web coating and printing subcategory. You may use different compliance options for different web coating/printing operations or at different times on the same web coating/printing operation. However, you may not use different compliance options at the same time on the same web coating/printing operation. If you switch between compliance options for any web coating/printing operation or group of operations, you must document this switch as required by § 63.4312(c), and you must report it in the next semiannual compliance report required in § 63.4311.

(1) *Compliant material option.* Demonstrate that the organic HAP content, as purchased, of each coating and printing material applied in the web coating/printing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart, and that each thinning and cleaning material as purchased contains no organic HAP (as defined in § 63.4371). You must meet all the requirements of §§ 63.4320, 63.4321, and 63.4322 to demonstrate compliance with the applicable emission limit using this option.

(2) *Emission rate without add-on controls option.* Demonstrate that, based on the regulated materials applied in the web coating/printing operation(s), the organic HAP emission rate for the web coating/printing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart, calculated as a rolling 12-month average emission rate. You must meet all the requirements of §§ 63.4330, 63.4331, and 63.4332 to demonstrate compliance with the applicable emission limit using this option.

(3) *Emission rate with add-on controls option.* Demonstrate that, based on the regulated materials applied in the web coating/printing operation(s) and the organic HAP emissions reductions achieved by emission capture systems and add-on controls, the organic HAP emission rate for the web coating/printing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart, calculated as a rolling 12-month average emission rate. If you use this compliance option, you must also demonstrate that all capture systems and control devices for the web coating/printing operation(s) meet the operating limits required in § 63.4292, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4341(e)(5), and that you meet the work practice standards required in § 63.4293. You must meet all the requirements of §§ 63.4340 through 63.4342 and 63.4360 through 63.4364 to demonstrate compliance with the emission limits, operating limits, and work practice standards using this option.

(4) *Organic HAP overall control efficiency option.* Demonstrate that, based on the organic HAP emission capture and add-on control efficiencies achieved, the organic HAP overall control efficiency is greater than or equal to the applicable organic HAP overall control efficiency limit in Table 1 to this subpart. If you use this compliance option, you must also demonstrate that all capture systems and control devices for the web coating/printing operation(s) meet the operating limits required in § 63.4292, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), and that you meet the work practice standards required in § 63.4293. You must meet all the requirements of §§ 63.4350 through 63.4352 and 63.4360 through 63.4364 to demonstrate compliance with the applicable emission limits, operating limits, and work practice standards using this option.

(5) *Oxidizer outlet organic HAP concentration limit.* If you use an oxidizer to control organic HAP emissions, demonstrate that the oxidizer is operated such that the outlet organic HAP concentration is no greater than 20 parts per million by volume (ppmv) on a dry basis, and that the efficiency of the capture system is 100 percent. If you use this compliance option, you must also demonstrate that all capture systems and oxidizers for the web coating/printing operation(s) meet the operating limits required in § 63.4292, and that you meet the work practice standards required in § 63.4293. You must meet all the requirements of §§ 63.4350 through 63.4352 and 63.4360 through 63.4364 to demonstrate compliance with the applicable emission limits, operating limits, and work practice standards using this option.

(b) *Slashing.* You must use the compliant material option to demonstrate that the mass fraction of organic HAP in each slashing material

as purchased for the slashing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart. You must meet all the requirements of §§ 63.4320, 63.4321, and 63.4322 to demonstrate compliance with the applicable emission limit.

(c) *Dyeing and Finishing.* You may apply any one of the compliance options in paragraphs (c)(1) through (3) of this section to an individual dyeing/finishing operation, or to multiple dyeing/finishing operations in the affected source as a group, or to the entire affected source in the dyeing and finishing subcategory. You may use different compliance options for different dyeing/finishing operations or at different times on the same dyeing/finishing operation. However, you may not use different compliance options at the same time on the same dyeing/finishing operation. If you switch between compliance options for any dyeing/finishing operation or group of operations, you must document this switch as required by § 63.4312(c), and you must report it in the next semiannual compliance report required in § 63.4311. If you choose to apply the compliance option in paragraph (c)(4) to your dyeing/finishing operations, it must be applied to the entire affected source in the dyeing and finishing subcategory. You may not apply any of the compliance options in paragraphs (c)(1) through (3) of this section to any dyeing/finishing operation in the affected source if you use the equivalent emission rate limit in paragraph (c)(4) for your dyeing/finishing affected source.

(1) *Compliant material option.* Demonstrate that the mass fraction of organic HAP, as purchased, of each dyeing and finishing material applied in the dyeing/finishing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart. You must meet all the requirements of §§ 63.4320, 63.4321, and 63.4322 to demonstrate compliance with the applicable emission limit using this option.

(2) *Emission rate without add-on controls option.* Demonstrate that, based on the dyeing and finishing materials applied in the dyeing/finishing operation(s), the organic HAP emission rate for the dyeing operation(s), the organic HAP emission rate for the finishing operation(s) or the combined organic HAP emission rate for dyeing and finishing is less than or equal to the applicable emission limit(s) in Table 1 to this subpart, calculated as a rolling 12-month average emission rate. You must meet all the requirements of §§ 63.4330, 63.4331, and 63.4332 to demonstrate compliance with the applicable emission limit(s) using this option.

(3) *Emission rate with add-on controls option.* Demonstrate that, based on the dyeing and finishing materials applied in the dyeing/finishing operation(s) and the organic HAP emissions reductions achieved by emission capture systems and add-on controls, the organic HAP emission rate for the dyeing/finishing operation(s) is less than or equal to the applicable emission limit in Table 1 to this subpart, calculated as a rolling 12-month average emission rate. If you use this compliance option, you must also demonstrate that all capture systems and control devices for the dyeing/finishing operation(s) meet the operating limits required in § 63.4292, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4341(f)(5), and that you meet the work practice standards required in § 63.4293. You must meet all the requirements of §§ 63.4340 through 63.4342 and 63.4360 through 63.4364 to demonstrate compliance with the emission limits, operating limits, and work practice standards using this option.

(4) *Equivalent emission rate option.* Demonstrate that the dyeing and finishing affected source meets all the requirements of paragraphs (4)(i) through (iv) of this paragraph.

(i) The fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to the wastewater is at least 90 percent, determined according to § 63.4331(d).

(ii) The wastewater is discharged to a POTW or onsite secondary wastewater treatment.

(iii) The total organic HAP emissions from your dyeing/finishing affected source are less than 10 tons per year, as calculated in Equation 4 of § 63.4331.

(iv) You must meet the applicable requirements of § 63.4330 and maintain records in accordance with § 63.4312(c)(2)(iv) to demonstrate compliance with the equivalent emission rate option.

§ 63.4292 What operating limits must I meet?

(a) For any web coating/printing operation, slashing operation, or dyeing/finishing operation on which you use the compliant material option; web coating/printing operation or dyeing/finishing operation on which you use the emission rate without add-on controls option; or dyeing/finishing affected source on which you use the equivalent emission rate limit option, you are not required to meet any operating limits.

(b) For any controlled web coating/printing operation or dyeing/finishing operation on which you use the emission rate with add-on controls option, or controlled web coating/printing operation on which you use the organic HAP overall control efficiency option or the oxidizer outlet organic HAP concentration option, except those web coating/printing operations for which you use a solvent recovery system and conduct a liquid-liquid material balance according to § 63.4341(e)(5) and those dyeing/finishing operations for which you use a solvent recovery system and conduct a liquid-liquid material balance according to § 63.4341(f)(5), you must meet the operating limits specified in Table 2 of this subpart. These operating limits apply to the emission capture and control systems on the web coating/printing operation(s) and dyeing/finishing operations for which you use this option, and you must establish the operating limits during the performance test according to the procedures in § 63.4363. You must meet the operating limits at all times after you establish them.

(c) If you use an add-on control device other than those listed in Table 2 of this subpart, or wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of alternative monitoring under § 63.8(f).

§ 63.4293 What work practice standards must I meet?

(a) For any slashing operation, you are not required to meet any work practice standards. For any web coating/printing operation(s) or dyeing/finishing operation(s) on which you use the compliant material option or the emission rate without add-on controls option, you are not required to meet any work practice standards. For any dyeing/finishing affected source on which you use the equivalent emission rate option, you are not required to meet any work practice standards.

(b) If you use either the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option for a web coating/printing operation; or you use the emission rate with add-on controls option for a dyeing/finishing operation; you must develop and implement a work practice plan to minimize organic HAP emissions from the storage, mixing, and conveying of regulated materials used in, and waste materials generated by, the coating/printing or

dyeing/finishing operations for which you use this option; or you must meet an alternative standard as provided in paragraph (c) of this section. The plan must specify practices and procedures to ensure that, at a minimum, the elements specified in paragraphs (b)(1) through (5) of this section are implemented.

(1) All organic-HAP-containing regulated materials and waste materials must be stored in closed containers.

(2) Spills of organic-HAP-containing regulated materials, and waste materials must be minimized.

(3) Organic-HAP-containing regulated materials and waste materials must be conveyed from one location to another in closed containers or pipes.

(4) Mixing vessels which contain organic-HAP-containing regulated materials must be closed except when adding to, removing, or mixing the contents.

(5) Emissions of organic HAP must be minimized during cleaning of web coating/printing or dyeing/finishing storage, mixing, and conveying equipment.

(c) As provided in § 63.6(g), you may request approval from the Administrator to use an alternative to the work practice standards in this section.

General Compliance Requirements

§ 63.4300 What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emission limitations in this subpart as specified in paragraphs (a)(1) through (4) of this section.

(1) Any web coating/printing, slashing, or dyeing/finishing operation(s) for which you use the compliant material option, as specified in § 63.4291(a)(1), (b), or (c)(1) must be in compliance with the applicable emission limit in Table 1 to this subpart at all times.

(2) Any web coating/printing or dyeing/finishing operation(s) for which you use the emission rate without add-on controls option, as specified in § 63.4291(a)(2) or (c)(2), must be in compliance with the applicable emission limit in Table 1 to this subpart for all compliance periods.

(3) Any web coating/printing or dyeing/finishing operation(s) for which you use the emission rate with add-on controls option, as specified in § 63.4291(a)(3) or (c)(3), and any web coating/printing operation(s) for which you use either the organic HAP overall control efficiency option, as specified in § 63.4291(a)(4), or the oxidizer outlet organic HAP concentration option, as specified in § 63.4291(a)(5), must be in compliance with the emission limitations as specified in paragraphs (a)(3)(i) through (iii) of this section.

(i) The web coating/printing or dyeing/finishing operation(s) must be in compliance with the applicable emission limit in Table 1 to this subpart or comply with the startup, shutdown, and malfunction plan at all times.

(ii) Each controlled web coating/printing or dyeing/finishing operation must be in compliance with the operating limits for emission capture systems and add-on control devices required by § 63.4292 for all averaging time periods except for solvent recovery systems for which you conduct liquid-liquid material balances according to §§ 63.4341(e)(5) or (f)(5) or 63.4351(d)(5).

(iii) Each controlled web coating/printing or dyeing/finishing operation must be in compliance with the work practice standards in § 63.4293 at all times.

(4) Any dyeing/finishing affected source for which you use the equivalent emission rate option, as specified in § 63.4291(c)(4), must operate within the operating scenarios, as defined in § 63.4371, for which you determined the fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to wastewater according to § 63.4331(d) at all times.

(b) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i).

(c) If your affected source uses an emission capture system and add-on control device, you must develop and implement a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). The plan must address the startup, shutdown, and corrective actions in the event of a malfunction of the emission capture system or the add-on control device. The plan must also address any web coating/printing or dyeing/finishing operation equipment such as conveyors that move the substrate among enclosures that may cause increased emissions or that would affect capture efficiency if the process equipment malfunctions.

§ 63.4301 What parts of the General Provisions apply to me?

Table 3 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.15 apply to you.

Notifications, Reports, and Records

§ 63.4310 What notifications must I submit?

(a) You must submit the notifications in §§ 63.7(b) and (c), 63.8(f)(4), and 63.9(b) through (e) and (h) that apply to you by the dates specified in those sections, except as provided in paragraphs (b) and (c) of this section.

(b) *Initial Notification.* You must submit the Initial Notification required by § 63.9(b) for a new or reconstructed affected source no later than 120 days after initial startup or 120 days after May 29, 2003, whichever is later. For an existing affected source, you must submit the Initial Notification no later than 1 year after May 29, 2003.

(c) *Notification of Compliance Status.* You must submit the Notification of Compliance Status required by § 63.9(h) no later than 30 calendar days following the end of the initial compliance period described in §§ 63.4320, 63.4330, 63.4340, or 63.4350 that applies to your affected source. The Notification of Compliance Status must contain the information specified in paragraphs (c)(1) through (9) of this section and in § 63.9(h).

(1) Company name and address.

(2) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of the report and beginning and ending dates of the reporting period. The reporting period is the initial compliance period described in §§ 63.4320, 63.4330, 63.4340, or 63.4350 that applies to your affected source.

(4) Identification of the compliance option or options specified in § 63.4291 that you used during the initial compliance period on each web coating/printing operation in each web coating/printing affected source, on each slashing operation in each slashing affected source, and on each dyeing/finishing operation in each dyeing/finishing affected source.

(5) Statement of whether or not the affected source achieved the emission limitations for the initial compliance period.

(6) If you had a deviation, include the information in paragraphs (c)(6)(i) and (ii) of this section.

(i) A description, and statement of the cause of, the deviation.

(ii) If you failed to meet the applicable emission limit in Table 1 to this subpart, include all the calculations you used to determine the kilogram (kg) organic HAP emitted per kg of solids applied in coating and printing material or the weight percent organic HAP compounds

in slashing, dyeing or finishing material to demonstrate your failure to meet the applicable emission limit. You do not need to submit information provided by the materials suppliers or manufacturers or test reports.

(7) For each of the data items listed in paragraphs (c)(7)(i) through (iii) of this section that is required by the compliance option(s) you used to demonstrate compliance with the emission limit, include an example of how you determined the value, including calculations and supporting data. Supporting data can include a copy of the information provided by the supplier or manufacturer of the example regulated material or a summary of the results of testing conducted according to § 63.4321(e)(1) or (2). You do not need to submit copies of any test reports.

(i) Mass fraction of organic HAP and mass fraction of solids for one coating or printing formulation including thinning materials, mass fraction of organic HAP for one cleaning material and mass fraction of organic HAP for all of the regulated materials as purchased used in one slashing operation or dyeing/ finishing operation.

(ii) Mass of coating or printing formulation used in web coating/ printing operation or of dyeing and finishing materials used in the dyeing/ finishing operation during the compliance period.

(iii) The amount of waste materials and the mass of organic HAP contained in the waste materials for which you are claiming an allowance in Equation 1 or 4 of § 63.4331.

(iv) The mass of organic HAP in the dyeing and finishing materials applied during the compliance period and the mass of organic HAP in wastewater discharged to a POTW or receiving onsite secondary treatment for which you are claiming an allowance in Equation 4 of § 63.4331.

(8) The calculation of kg organic HAP per kg of coating and printing solids applied and of kg organic HAP per kg of dyeing and finishing material as purchased for the compliance option(s) you use, as specified in paragraphs (c)(8)(i) through (vii) of this section.

(i) For the compliant material option as specified in § 63.4291(a)(1) for web coating/printing operations, provide an example calculation of the organic HAP content for one coating and one printing material, as appropriate, using Equation 1 of § 63.4321.

(ii) For the emission rate without add-on controls option as specified in § 63.4291(a)(2) for web coating/printing operations, provide the calculation of the total mass of organic HAP emissions; the calculation of the total mass of coating and printing solids applied; and the calculation of the organic HAP emission rate, using Equations 1, 2, and 3, respectively, of § 63.4331.

(iii) For the emission rate without add-on controls option as specified in § 63.4291(c)(2) for dyeing/finishing operations, provide the calculation of the total mass of organic HAP emissions; the calculation of the total mass of dyeing and finishing materials applied; and the calculation of the organic HAP emission rate, using Equations 4, 5, and 6, respectively, of § 63.4331.

(iv) For the emission rate with add-on controls option as specified in § 63.4291(a)(3) for web coating/printing operations, provide the calculation of the total mass of organic HAP emissions before add-on controls using Equation 1 of § 63.4331, and the calculation of the organic HAP emission rate using Equation 4 of § 63.4341.

(v) For the emission rate with add-on controls option as specified in § 63.4291(c)(3) for dyeing/finishing operations, provide the calculation of the mass of organic HAP emissions before add-on controls using Equation 4 of § 63.4331, and the calculation of the organic HAP emission rate using Equation 8 of § 63.4341.

(vi) For the organic HAP overall control efficiency option as specified in § 63.4291(a)(4), provide the calculation of the total mass of organic HAP emissions before add-on controls using Equation 1 of § 63.4331 and the calculation of the organic HAP overall control efficiency using Equation 1 of § 63.4351.

(vii) For the equivalent emission rate option as specified in § 63.4291(c)(4), provide the calculation of the fraction of organic HAP applied in affected processes that is discharged to wastewater according to § 63.4331(d), the calculation of the total organic HAP emissions from your dyeing/finishing affected source using Equation 4 of § 63.4331, and documentation that organic HAP containing wastewater is either discharged to a POTW or treated onsite in a treatment system that includes at least secondary treatment.

(9) For the emission rate with add-on controls option as specified in § 63.4291(a)(3) and (c)(3), the organic HAP overall control efficiency option as specified in § 63.4291(a)(4), and the oxidizer outlet organic HAP concentration option as specified in § 63.4291(a)(5), for each controlled web coating/printing or dyeing/finishing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances according to §§ 63.4341(e)(5) or (f)(5) or 63.4351(d)(5), you must include the information specified in paragraphs (c)(9)(i) through (iv) of this section.

(i) For each emission capture system, a summary of the data and copies of the calculations supporting the determination that the emission capture system is a permanent total enclosure (PTE) or a measurement of the emission capture system efficiency. If you are demonstrating compliance with the oxidizer outlet organic HAP concentration option, the emission capture system must be a PTE. Include a description of the protocol followed for measuring capture efficiency, summaries of any capture efficiency tests conducted, and any calculations supporting the capture efficiency determination. If you use the data quality objective (DQO) or lower confidence limit (LCL) approach, you must also include the statistical calculations to show you meet the DQO or LCL criteria in appendix A to subpart KK of this part. You do not need to submit complete test reports.

(ii) A summary of the results of each add-on control device performance test. You do not need to submit complete test reports.

(iii) A list of each emission capture system's and add-on control device's operating limits and a summary of the data used to calculate those limits.

(iv) A statement of whether or not you developed and implemented the work practice plan required by § 63.4293 and the startup, shutdown and malfunction plan required by § 63.4300.

§ 63.4311 What reports must I submit?

(a) *Semiannual compliance reports.* You must submit semiannual compliance reports for each affected source according to the requirements of paragraphs (a)(1) through (8) of this section. The semiannual compliance reporting requirements of this section may be satisfied by reports required under other parts of the Clean Air Act (CAA), as specified in paragraph (a)(2) of this section.

(1) *Dates.* Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must prepare and submit each semiannual compliance report according to the dates specified in paragraphs (a)(1)(i) through (iv) of this section.

(i) The first semiannual compliance report must cover the first semiannual reporting period which begins the day after the end of the initial compliance period described in §§ 63.4320, 63.4330,

63.4340, or 63.4350 that applies to your affected source and ends on June 30 or December 31, whichever date is the first date at least 6 months after the end of the initial compliance period.

(ii) Each subsequent semiannual compliance report must cover the subsequent semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(iii) Each semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(iv) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the date specified in paragraph (a)(1)(iii) of this section.

(2) *Inclusion with title V report.* Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 40 CFR part 71 must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a semiannual compliance report pursuant to this section along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the semiannual compliance report includes all required information concerning deviations from any emission limitation in this subpart, its submission shall be deemed to satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submission of a semiannual compliance report shall not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permitting authority.

(3) *General requirements.* The semiannual compliance report must contain the information specified in paragraphs (a)(3)(i) through (v) of this section, and the information specified in paragraphs (a)(4) through (8) and (c)(1) of this section that is applicable to your affected source. If your affected source is a slashing operation(s), you are only required to report the information in paragraphs (a)(3)(i) through (iii) of this section and the information in paragraph (a)(4) or (a)(5) of this section, as applicable.

(i) Company name and address.

(ii) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(iii) Date of report and beginning and ending dates of the reporting period. The reporting period is the 6-month period ending on June 30 or December 31.

(iv) Identification of the compliance option or options specified in § 63.4291 that you used on each web coating/printing and dyeing/finishing operation during the reporting period. If you switched between compliance options during the reporting period, you must report the beginning and ending dates you used each option.

(v) If you used the emission rate without add-on controls, the emission rate with add-on controls, or the organic HAP overall control efficiency compliance option for web coating/printing operations (§ 63.4291(a)(2), (3), or (4)), or the emission rate without add-on controls or the emission rate with add-on controls compliance option for dyeing/finishing operations (§ 63.4291(c)(2) or (c)(3)), the calculation results for each compliance period ending each month during the 6-month reporting period.

(4) *No deviations.* If there were no deviations from the emission limitations in Table 1 to this subpart and §§ 63.4292, and 63.4293 that apply to you, the semiannual compliance report must include a statement that there were no deviations from the emission limitations during the reporting period. If you use the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option and there were no periods during which the continuous parameter monitoring systems (CPMS) were out-of-control as specified in § 63.8(c)(7), the semiannual compliance report must include a statement that there were no periods during which the CPMS were out-of-control during the reporting period.

(5) *Deviations: compliant material option.* If you use the compliant material option, and there was a deviation from the applicable organic HAP content requirements in Table 1 to this subpart, the semiannual compliance report must contain the information in paragraphs (a)(5)(i) through (iv) of this section.

(i) Identification of each coating, printing, slashing, dyeing or finishing material applied that deviated from the emission limit and each thinning or cleaning material applied in web coating/printing operations that contained organic HAP, and the dates and time periods each was applied.

(ii) The calculation of the organic HAP content using Equation 1 of § 63.4321 for each coating or printing material identified in paragraph (a)(5)(i) of this section. You do not need to submit background data supporting this calculation (*e.g.*, information provided by material suppliers or manufacturers, or test reports).

(iii) The determination of mass fraction of organic HAP for each regulated material identified in paragraph (a)(5)(i) of this section. You do not need to submit background data supporting this calculation (*e.g.*, information provided by material suppliers or manufacturers, or test reports).

(iv) A statement of the cause of each deviation.

(6) *Deviations: emission rate without add-on controls option.* If you use the emission rate without add-on controls option and there was a deviation from the applicable emission limit in Table 1 to this subpart, the semiannual compliance report must contain the information in paragraphs (a)(6)(i) through (iii) of this section.

(i) The beginning and ending dates of each compliance period during which the organic HAP emission rate exceeded the applicable emission limit in Table 1 to this subpart.

(ii) The calculations used to determine the organic HAP emission rate for the compliance period in which the deviation occurred. You must submit the calculations for Equations 1, 1A and 1B, 2, and 3 in § 63.4331 for web coating/printing operations; and for Equations 4, 4A, 5, and 6 in § 63.4331 for dyeing/finishing operations; and if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.4331(a)(4)(iii) or (b)(3)(ii); and, for dyeing/finishing operations, if applicable, the mass of organic HAP in wastewater streams calculation for Equation 7 in § 63.4331. You do not need to submit background data supporting these calculations (*e.g.*, information provided by materials suppliers or manufacturers, or test reports).

(iii) A statement of the cause of each deviation.

(7) *Deviations: add-on controls options.* If you use one of the add-on controls options in § 63.4291(a) or (c) and there was a deviation from an emission limitation (including any periods when emissions bypassed the

add-on control device and were diverted to the atmosphere), the semiannual compliance report must contain the information in paragraphs (a)(7)(i) through (xv) of this section. This includes periods of startup, shutdown, and malfunction during which deviations occurred.

(i) The beginning and ending dates of each compliance period during which the organic HAP emission rate exceeded the applicable emission limit in Table 1 to this subpart.

(ii) If you use the emission rate option, the calculations used to determine the organic HAP emission rate for each compliance period in which a deviation occurred. You must submit the calculations that apply to you, including Equations 1, 1A, 1B, and 2 of § 63.4331 and Equations 1, 1A, 1B, 1C, 2, 3, 3A and 3B and 4 of § 63.4341 for web coating/printing operations; and Equations 4, 4A, 5, and 7 of § 63.4331 and Equations 5, 5A, 5B, 6, 7, and 8 of § 63.4341 for dyeing/finishing operations. You do not need to submit the background data supporting these calculations (*e.g.*, information provided by materials suppliers or manufacturers, or test reports).

(iii) If you use the organic HAP overall control efficiency option, the calculations used to determine the organic HAP overall control efficiency for each compliance period in which a deviation occurred. You must submit the calculations that apply to you, including Equations 1, 1A, and 1B of § 63.4331; Equations 1, 1A, 1B, 1C, 2, 3, 3A, and 3B of § 63.4341; and Equation 1 of § 63.4351. You do not need to submit the background data supporting these calculations (*e.g.*, test reports).

(iv) The date and time that each malfunction started and stopped.

(v) A brief description of the CPMS.

(vi) The date of the latest CPMS certification or audit.

(vii) The date and time that each CPMS was inoperative, except for zero (low-level) and high-level checks.

(viii) The date, time, and duration that each CPMS was out-of-control, including the information in § 63.8(c)(8).

(ix) The date and time period of each deviation from an operating limit in Table 2 to this subpart, date and time period of any bypass of the add-on control device, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(x) A summary of the total duration of each deviation from an operating limit in Table 2 to this subpart and each bypass of the add-on control device during the semiannual reporting period and the total duration as a percent of the total source operating time during that semiannual reporting period.

(xi) A breakdown of the total duration of the deviations from the operating limits in Table 2 to this subpart and bypasses of the add-on control device during the semiannual reporting period into those that were due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

(xii) A summary of the total duration of CPMS downtime during the semiannual reporting period and the total duration of CPMS downtime as a percent of the total source operating time during that semiannual reporting period.

(xiii) A description of any changes in the CPMS, web coating/printing or dyeing/finishing operation, emission capture system, or add-on control device since the last semiannual reporting period.

(xiv) For each deviation from the work practice standards, a description of the deviation, the date and time period duration of the deviation, and the actions you took to correct the deviation.

(xv) A statement of the cause of each deviation.

(8) *Deviations: Equivalent Emission Rate Option.* If you use the equivalent emission rate option, and there was a deviation from the operating scenarios, as defined in § 63.4371, used to demonstrate initial compliance, the semiannual compliance report must contain the information in paragraphs (a)(i) through (iv) of this section.

(i) The beginning and ending dates of each compliance period during which the deviation occurred.

(ii) If the deviation consisted of failure to treat the organic HAP containing wastewater by a biological treatment process, an explanation of the deviation, the duration of the deviation, and the determination of the mass of organic HAP that was discharged in the wastewater that was not treated by a biological treatment process.

(iii) The determination of the fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to the wastewater according to § 63.4331(d).

(iv) The calculation of the total organic HAP emissions from your dyeing/finishing affected source using Equation 4 of § 63.4331.

(b) *Performance test reports.* If you use one of the add-on control options in § 63.4291(a) or (c), you must submit reports of performance test results for emission capture systems and add-on control devices no later than 60 days after completing the tests as specified in § 63.10(d)(2).

(c) *Startup, shutdown, malfunction reports.* If you use one of the add-on control options in § 63.4291(a) or (c) and you have a startup, shutdown, or malfunction during the semiannual reporting period, you must submit the reports specified in paragraphs (c)(1) and (2) of this section.

(1) If your actions were consistent with your startup, shutdown, and malfunction plan, you must include the information specified in § 63.10(d) in the semiannual compliance report.

(2) If your actions were not consistent with your startup, shutdown, and malfunction plan, you must submit an immediate startup, shutdown, and malfunction report as described in paragraphs (c)(2)(i) and (ii) of this section as required by paragraph (a) of this section.

(i) You must describe the actions taken during the event in a report delivered by facsimile, telephone, or other means to the Administrator within 2 working days after starting actions that are inconsistent with the plan.

(ii) You must submit a letter to the Administrator within 7 working days after the end of the event, unless you have made alternative arrangements with the Administrator as specified in § 63.10(d)(5)(ii). The letter must contain the information specified in § 63.10(d)(5)(ii).

§ 63.4312 What records must I keep?

You must collect and keep a record of the data and information specified in this section. Failure to collect and keep these records is a deviation from the applicable standard.

(a) A copy of each notification and report that you submitted to comply with this subpart, and the documentation supporting each notification and report.

(b) A current copy of information provided by materials suppliers or manufacturers, such as manufacturer's formulation data or test data used to determine the mass fraction of organic HAP for coating, printing, slashing, dyeing, finishing, thinning, and cleaning materials; and the mass fraction of solids for coating and printing materials. If you conducted testing to determine mass fraction of organic HAP of coating materials or the mass fraction of solids of coating materials, you must keep a copy of the complete test report. If you use information provided to you by the manufacturer or supplier of the material that was based on testing, you must keep the summary sheet of results provided to you by the manufacturer or

supplier. You are not required to obtain the test report or other supporting documentation from the manufacturer or supplier.

(c) For each compliance period, the records specified in paragraph (c)(1) of this section for web coating/printing operations and the records specified in paragraph (c)(2) of this section for dyeing/finishing operations.

(1) A record of the web coating/printing operations on which you used each compliance option and the time periods (beginning and ending dates) you used each option. For each month, a record of all required calculations for the compliance option(s) you used, as specified in paragraphs (c)(1)(i) through (iv) of this section.

(i) For the compliant material option, a record of the calculation of the organic HAP content, as purchased, for each coating and printing material applied, using Equation 1 of § 63.4321.

(ii) For the emission rate without add-on controls option, a record of the calculation of the total mass of organic HAP emissions for the coating, printing, thinning and cleaning materials applied each compliance period using Equations 1, 1A, and 1B of § 63.4331 and, if applicable, the calculation used to determine the mass of organic HAP in waste materials according to § 63.4331(a)(4)(iii); the calculation of the total mass of the solids contained in all coating and printing materials applied each compliance period using Equation 2 of § 63.4331; and the calculation of the organic HAP emission rate for each compliance period using Equation 3 of § 63.4331.

(iii) For the emission rate with add-on controls option, a record of the calculation of the total mass of organic HAP emissions before add-on controls for the coating, printing, thinning and cleaning materials applied each compliance period using Equations 1, 1A, and 1B of § 63.4331 and, if applicable, the calculation used to determine the mass of organic HAP in waste materials according to § 63.4331(a)(4)(iii); the calculation of the total mass of the solids contained in all coating and printing materials applied each compliance period using Equation 2 of § 63.4331; the calculation of the mass of organic HAP emission reduction by emission capture systems and add-on control devices using Equations 1, 1A, 1B, and 1C of § 63.4341 and Equations 2, 3, 3A, and 3B of § 63.4341, as applicable; and the calculation of the organic HAP emission rate for each compliance period using Equation 4 of § 63.4341.

(iv) For the organic HAP overall control efficiency option or the oxidizer outlet organic HAP concentration option, the records specified in paragraph (j) of this section.

(2) A record of the dyeing/finishing operations on which you used each compliance option and the time periods (beginning and ending dates) you used each option. For each month, a record of all required calculations for the compliance option(s) you used, as specified in paragraphs (c)(2)(i) through (iv) of this section.

(i) For the compliant material option, a purchase record of the mass fraction of organic HAP for each dyeing, and finishing material applied, according to § 63.4321(e)(1)(iv).

(ii) For the emission rate without add-on controls option, the calculation for the total mass of organic HAP emissions for the dyeing and finishing materials applied each compliance period using Equations 4 and 4A of § 63.4331 and, if applicable, the calculations used to determine the mass of organic HAP in waste materials according to § 63.4331(b)(3)(ii) and the mass of organic HAP contained in wastewater discharged to a POTW or treated onsite prior to discharge according to § 63.4331(b)(3)(iii); the calculation of the total mass of dyeing and finishing materials applied each compliance period using Equation 5 of § 63.4331; and the calculation of the organic HAP emission rate for each compliance period using Equation 6 of § 63.4331.

(iii) For the emission rate with add-on controls option, a record of the calculation of the total mass of organic HAP emissions before add-on controls for the dyeing and finishing materials applied each compliance period using Equations 4 and 4A of § 63.4331 and, if applicable, the calculation used to determine the mass of organic HAP in waste materials according to § 63.4331(b)(3)(ii) and the determination of the mass of organic HAP contained in wastewater discharged to a POTW or treated onsite prior to discharge according to § 63.4331(b)(3)(iii); the calculation of the total mass of dyeing and finishing materials applied each compliance period using Equation 5 of § 63.4331; the calculation of the mass of organic HAP emission reduction by emission capture systems and add-on control devices using Equations 5, 5A, and 5B of § 63.4341 and Equations 6, 7, and 7A of § 63.4341, as applicable; and the calculation of the organic HAP emission rate for each compliance period using Equation 8 of § 63.4341.

(iv) For the equivalent emission rate option, a record that your dyeing/finishing affected source operated within the operating scenarios used to demonstrate initial compliance, documentation that affected wastewater was either discharged to a POTW or to onsite secondary treatment, and the calculation of the total organic HAP emissions from your dyeing/finishing affected source for each compliance period using Equation 4 of § 63.4331.

(d) A record of the name and mass of each regulated material applied in the web coating and printing subcategory and the dyeing and finishing subcategory during each compliance period. If you are using the compliant material option for all regulated materials at the source, you may maintain purchase records for each material used rather than a record of the mass used.

(e) A record of the mass fraction of organic HAP for each regulated material applied during each compliance period.

(f) A record of the mass fraction of coating and printing solids for each coating and printing material applied during each compliance period.

(g) If you use an allowance in Equation 1 or 4 of § 63.4331 for organic HAP contained in waste materials sent to, or designated for shipment to, a treatment, storage, and disposal facility (TSDF) according to § 63.4331(a)(4)(iii) or (b)(3)(ii), you must keep records of the information specified in paragraphs (g)(1) through (3) of this section.

(1) The name and address of each TSDF to which you sent waste materials for which you used an allowance in Equation 1 or 4 of § 63.4331, a statement of which subparts under 40 CFR parts 262, 264, 265, and 266 apply to the facility, and the date of each shipment.

(2) Identification of the web coating/printing or dyeing/finishing operations producing waste materials included in each shipment and the compliance period(s) in which you used the allowance for these materials in Equation 1 or 4, respectively, of § 63.4331.

(3) The methodology used in accordance with § 63.4331(a)(3)(iii) or (b)(4)(ii) to determine the total amount of waste materials sent to or the amount collected, stored, and designated for transport to a TSDF each compliance period; and the methodology to determine the mass of organic HAP contained in these waste materials. This must include the sources for all data used in the determination, methods used to generate the data, frequency of testing or monitoring, and supporting calculations and documentation, including the waste manifest for each shipment.

(h) If you use an allowance in Equation 4 of § 63.4331 for organic HAP contained in wastewater discharged to a POTW or treated onsite prior to

discharge according to § 63.4331(c), you must keep records of the information specified in paragraphs (h)(1) and (2) of this section.

(1) Documentation that the wastewater was either discharged to a POTW or onsite secondary wastewater treatment.

(2) Calculation of the allowance, WW, using the fraction of organic HAP applied in affected processes that is discharged to the wastewater determined from the most recent performance test and the mass of organic HAP in the dyeing and finishing materials applied during the compliance period, A, calculated in Equation 4 of § 63.4331.

(i) You must keep records of the date, time, and duration of each deviation.

(j) If you use the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option, you must keep the records specified in paragraphs (j)(1) through (8) of this section.

(1) For each deviation, a record of whether the deviation occurred during a period of startup, shutdown, or malfunction.

(2) The records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

(3) The records required to show continuous compliance with each operating limit specified in Table 2 to this subpart that applies to you.

(4) For each capture system that is a PTE, the data and documentation you used to support a determination that the capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and has a capture efficiency of 100 percent, as specified in § 63.4361(a).

(5) For each capture system that is not a PTE, the data and documentation you used to determine capture efficiency according to the requirements specified in §§ 63.4360 and 63.4361(b) through (e) including the records specified in paragraphs (j)(5)(i) through (iii) of this section that apply to you.

(i) *Records for a liquid-to-fugitive protocol using a temporary total enclosure or building enclosure.* Records of the mass of total volatile hydrocarbon (TVH) as measured by Method 204A or F of appendix M to 40 CFR part 51 for each regulated material applied in the web coating/printing or dyeing/finishing operation, and the total TVH for all materials applied during each capture efficiency test run, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run, as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(ii) *Records for a gas-to-gas protocol using a temporary total enclosure or a building enclosure.* Records of the mass of TVH emissions captured by the emission capture system as measured by Method 204B or C of appendix M to 40 CFR part 51 at the inlet to the add-on control device, including a copy of the test report. Records of the mass of TVH emissions not captured by the capture system that exited the temporary total enclosure or building enclosure during each capture efficiency test run as measured by Method 204D or E of appendix M to 40 CFR part 51, including a copy of the test report. Records documenting that the enclosure used for the capture efficiency test met the criteria in Method 204 of appendix M to 40 CFR part 51 for either a temporary total enclosure or a building enclosure.

(iii) *Records for an alternative protocol.* Records needed to document a capture efficiency determination using an alternative method or protocol as specified in § 63.4361(e), if applicable.

(6) The records specified in paragraphs (j)(6)(i) and (ii) of this section for each add-on control device organic HAP destruction or removal efficiency determination or oxidizer outlet organic HAP concentration determination as specified in § 63.4362.

(i) Records of each add-on control device performance test conducted according to §§ 63.4360 and 63.4362.

(ii) Records of the web coating/printing or dyeing/finishing operation conditions during the add-on control device performance test showing that the performance test was conducted under representative operating conditions.

(7) Records of the data and calculations you used to establish the emission capture and add-on control device operating limits as specified in § 63.4363 and to document compliance with the operating limits as specified in Table 2 to this subpart.

(8) A record of the work practice plan required by § 63.4293 and documentation that you are implementing the plan on a continuous basis.

§ 63.4313 In what form and for how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to § 63.10(b)(1). Where appropriate, the records may be maintained as electronic spreadsheets or as a database.

(b) As specified in § 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to § 63.10(b)(1). You may keep the records off site for the remaining 3 years.

Compliance Requirements for the Compliant Material Option

§ 63.4320 By what date must I conduct the initial compliance demonstration?

You must complete the compliance demonstration for the initial compliance period according to the requirements in § 63.4321. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the first full month after the compliance date. The initial compliance demonstration includes the calculations according to § 63.4321 and supporting documentation showing that, during the initial compliance period, the organic HAP content of each coating and printing material you applied and the mass fraction of organic HAP in each slashing, dyeing, and finishing material you applied did not exceed the applicable limit in Table 1 to this subpart, and documentation that in web coating/printing operations you applied only thinners and cleaners that contained no organic HAP as defined in § 63.4371.

§ 63.4321 How do I demonstrate initial compliance with the emission limitations?

(a) You may use the compliant material option for any individual web coating/printing operation, for any group of web coating/printing operations in the affected source, or for all the web coating/printing operations in the affected source. You must use either the emission rate without add-on controls option, the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option for any web coating/printing operation(s) in the affected source for which you do not use this option. For a web coating/printing affected source to demonstrate initial compliance using the compliant

material option, the web coating/printing operation or group of web coating/printing operations must apply no coating or printing material with an organic HAP content that exceeds the applicable emission limit in Table 1 to this subpart and must apply only thinning or cleaning material that contains no organic HAP, as defined in § 63.4371.

(b) You must use the compliant material option for each slashing affected source, as required in Table 1 to this subpart. For a slashing affected source to demonstrate initial compliance using the compliant material option, the slashing operation or group of slashing operations must apply only slashing material with no organic HAP as defined in § 63.4371.

(c) You may use the compliant material option for any individual dyeing/finishing operation, for any group of dyeing/finishing operations in the affected source, or for all the dyeing/finishing operations in the affected source. You must use either the emission rate without add-on controls option or the emission rate with add-on controls option for any dyeing/finishing operations in the affected source for which you do not use this option. You may not use the compliant material option for any dyeing/finishing operation in a dyeing/finishing affected source for which you use the equivalent emission rate option. For a dyeing/finishing affected source to demonstrate initial compliance using the compliant material option, the dyeing/finishing operation or group of dyeing/finishing operations must apply no dyeing or finishing material with a mass fraction of organic HAP that exceeds the applicable emission limit in Table 1 to this subpart.

(d) Any web coating/printing operation, slashing operation, or dyeing/finishing operation for which you use the compliant material option is not required to meet the operating limits or work practice standards required in §§ 63.4292 and 63.4293, respectively.

(e) To demonstrate initial compliance with the emission limitations using the compliant material option, you must meet all the requirements of this section for any web coating/printing operation, slashing operation, or dyeing/finishing operation using this option. Use the applicable procedures in this section on each regulated material in the condition it is in when it is received from its manufacturer or supplier and prior to any alteration. You do not need to redetermine the organic HAP content of regulated materials that are reclaimed onsite and reused in the web coating/printing operation, slashing operation, or dyeing/finishing operation for which you use the compliant material option, provided these regulated materials in their condition as received were demonstrated to comply with the compliant material option.

(1) *Determine the mass fraction of organic HAP for each material.* You must determine the mass fraction of organic HAP for each regulated material applied during the compliance period by using one of the options in paragraphs (e)(1)(i) through (v) of this section. You must use the option in paragraph (e)(1)(iv) of this section for each printing, slashing, dyeing, or finishing material applied during the compliance period.

(i) *Method 311 (appendix A to 40 CFR part 63).* You may use Method 311 for determining the mass fraction of organic HAP. Use the procedures specified in paragraphs (e)(1)(i)(A) and (B) of this section when performing a Method 311 test.

(A) Count each organic HAP that is measured to be present at 0.1 percent by mass or more for Occupational Safety and Health Administration (OSHA)-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1.0 percent by mass or more for other compounds. For example, if toluene (not an OSHA carcinogen) is measured to be 0.5 percent of the material by mass, you don't have to count it. Express the mass fraction of each organic HAP you count as a value truncated to no more than four places after the decimal point (*e.g.*, 0.3791).

(B) Calculate the total mass fraction of organic HAP in the regulated material being tested by adding up the individual organic HAP mass fractions and truncating the result to no more than three places after the decimal point (*e.g.*, 0.763).

(ii) *Method 24 (appendix A to 40 CFR part 60).* You may use Method 24 to determine the mass fraction of nonaqueous volatile matter and use that value as a substitute for mass fraction of organic HAP. For a multi-component coating with reactive chemicals, you may use Method 24 on the coating as applied to determine the mass fraction of nonaqueous volatile matter and use that value as a substitute for the mass fraction of organic HAP determined from the sum of organic HAP in each component.

(iii) *Alternative method.* You may use an alternative test method for determining the mass fraction of organic HAP, mass fraction of solids, or fraction of organic HAP emitted from a reactive coating once the Administrator has approved it. You must follow the procedure in § 63.7(f) to submit an alternative test method for approval.

(iv) *Information from the supplier or manufacturer of the material.* You may rely on information other than that generated by the test methods specified in paragraphs (e)(1)(i) through (iii) of this section, such as manufacturer's formulation data, if it represents each organic HAP that is present at 0.1 percent by mass or more for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1.0 percent by mass or more for other compounds. For example, if toluene (not an OSHA carcinogen) is 0.5 percent of the material by mass, you do not have to count it. If there is a disagreement between such information and results of a test conducted according to paragraphs (e)(1)(i) through (iii) of this section on coating, thinning, or cleaning material, then the test method results will take precedence. Information from the supplier or manufacturer of the printing, slashing, dyeing, or finishing material is sufficient for determining the mass fraction of organic HAP.

(v) *Solvent blends.* Solvent blends may be listed as single components for some materials in data provided by manufacturers or suppliers. Solvent blends may contain organic HAP which must be counted toward the total organic HAP mass fraction of the materials. When test data and manufacturer's data for solvent blends are not available, you may use the default values for the mass fraction of organic HAP in these solvent blends listed in Table 4 or 5 to this subpart. If you use the tables, you must use the values in Table 4 for all solvent blends that match Table 4 entries, and you may only use Table 5 if the solvent blends in the materials you use do not match any of the solvent blends in Table 4 and you only know whether the blend is aliphatic or aromatic. However, if the results of a Method 311 test indicate higher values than those listed on Table 4 or 5 to this subpart, the Method 311 results will take precedence.

(2) *Determine the mass fraction of solids for each coating and printing material.* You must determine the mass fraction of solids (kg of solids per kg of coating or printing material) for each coating material applied during the compliance period by a test or by information provided by the supplier or the manufacturer of the material, as specified in paragraphs (e)(2)(i) through (iii) of this section. If test results obtained according to paragraph (e)(2)(i) or (ii) of this section for a coating material do not agree with the information obtained under paragraph (e)(2)(iii) of this section, the test results

will take precedence. To determine mass fraction of solids for each printing material applied during the compliance period, you should use information provided by the supplier or manufacturer of the material, as specified in paragraph (e)(2)(iii) of this section.

(i) *Method 24 (appendix A to 40 CFR part 60).* You may use Method 24 for determining the mass fraction of solids of coating materials.

(ii) *Alternative method.* You may use an alternative test method for determining solids content of each coating material once the Administrator has approved it. You must follow the procedure in § 63.7(f) to submit an alternative test method for approval.

(iii) *Information from the supplier or manufacturer of the material.* You may obtain the mass fraction of solids for each coating and printing material from the supplier or manufacturer. If there is disagreement between such information and the test method results for a coating material, then the test method results will take precedence.

(3) *Calculate the organic HAP content of each coating or printing material.* Calculate the organic HAP content, kg organic HAP per kg of solids, of each coating and printing material applied during the compliance period, using Equation 1 of this section:

$$H_c = (W_c)/(W_f) \qquad \text{(Eq. 1)}$$

Where:

H_c = Organic HAP content of the coating or printing material, kg organic HAP per kg solids in the coating or printing material.

W_c = Mass fraction of organic HAP in the coating or printing material, kg organic HAP per kg material, determined according to paragraph (e)(1) of this section.

W_f = Mass fraction of solids in coating or printing material, kg solids per kg of coating or printing material, determined according to paragraph (e)(2) of this section.

(4) *Compliance demonstration.* The calculated organic HAP content for each coating and printing material applied during the initial compliance period must be less than or equal to the applicable emission limit in Table 1 to this subpart, and each thinning and cleaning material applied during the initial compliance period must contain no organic HAP as defined in § 63.4371. Each slashing material applied during the initial compliance period must contain no organic HAP as defined in § 63.4371. The mass fraction of organic HAP for each dyeing and finishing material applied during the initial compliance period, determined according to paragraph (e)(1)(iv) of this section, must be less than or equal to the applicable emission limit in Table 1 to this subpart. You must keep all records required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required in § 63.4310, you must:

(i) Identify any web coating/printing operation, slashing operation, and dyeing/finishing operation for which you used the compliant material option;

(ii) Submit a statement that the web coating/printing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because you applied no coating and printing material for which the organic HAP content exceeds the applicable emission limit in Table 1 to this subpart, and you applied only thinning materials and cleaning materials that contained no organic HAP, as defined in § 63.4371;

(iii) Submit a statement that the slashing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because you applied only slashing materials that contained no organic HAP, as defined in § 63.4371; and

(iv) Submit a statement that the dyeing/finishing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because you applied no dyeing and finishing material for which the mass fraction of organic HAP exceeds the applicable emission limit in Table 1 to this subpart.

§ 63.4322 How do I demonstrate continuous compliance with the emission limitations?

(a) For each compliance period, to demonstrate continuous compliance, you must apply no coating or printing material for which the organic HAP content determined using Equation 1 of § 63.4321, exceeds the applicable emission limit in Table 1 to this subpart. For each compliance period, to demonstrate continuous compliance, you must apply only slashing material that contains no organic HAP as defined in § 63.4371. For each compliance period, to demonstrate continuous compliance, you must apply no dyeing or finishing material for which the mass fraction of organic HAP, determined according to the requirements of § 63.4321(e)(1)(iv), exceeds the applicable emission limit in Table 1 to this subpart. For each compliance period, you must apply only thinning or cleaning materials that contain no organic HAP (as defined in § 63.4371) in a coating/printing affected source. Each month following the initial compliance period described in § 63.4320 is a compliance period.

(b) If you choose to comply with the emission limitations by using the compliant material option, the application of any regulated material that does not meet the criteria specified in paragraph (a) of this section is a deviation from the emission limitations that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(5).

(c) As part of each semiannual compliance report required by § 63.4311, you must identify any web coating/printing operation, slashing operation, or dyeing/finishing operation for which you used the compliant material option. If there were no deviations from the applicable emission limit in Table 1 to this subpart, submit a statement that, as appropriate, the web coating/printing operations were in compliance with the emission limitations during the reporting period because you applied no coating or printing material for which the organic HAP content exceeded the applicable emission limit in Table 1 to this subpart, and you applied only thinning and cleaning materials that contained no organic HAP (as defined in § 63.4371) in a web coating/printing affected source; the slashing operations were in compliance with the emission limitations during the reporting period because you applied only slashing materials with no organic HAP (as defined in § 63.4371) in a slashing affected source; and the dyeing/finishing operations were in compliance with the emission limitations during the reporting period because you applied no dyeing or finishing material for which the mass fraction of organic HAP exceeded the applicable emission limit in Table 1 to this subpart.

(d) You must maintain records as specified in §§ 63.4312 and 63.4313.

Compliance Requirements for the Emission Rate Without Add-On Controls Option

§ 63.4330 By what date must I conduct the initial compliance demonstration?

You must complete the compliance demonstration for the initial compliance period according to the requirements of § 63.4331. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the 12th full month after the compliance date. The initial compliance demonstration includes the calculations according to § 63.4331 and supporting documentation showing that for web coating/printing operations, the organic HAP emission rate for the initial

compliance period was equal to or less than the applicable emission limit in Table 1 to this subpart and for dyeing/finishing operations, the mass fraction of organic HAP for the initial compliance period was less than or equal to the applicable emission limit in Table 1 to this subpart.

§ 63.4331 How do I demonstrate initial compliance with the emission limitations?

(a) For web coating/printing operations, you may use the emission rate without add-on controls option for any individual web coating/printing operation, for any group of web coating/printing operations in the affected source, or for all the web coating/printing operations as a group in the affected source. You must use either the compliant material option, the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option for any web coating/printing operation in the affected source for which you do not use this option. To demonstrate initial compliance using the emission rate without add-on controls option, the web coating/printing operation or group of web coating/printing operations must meet the applicable emission limit in Table 1 to this subpart but is not required to meet the operating limits or work practice standards in §§ 63.4292 and 63.4293, respectively. You must meet all the requirements of paragraphs (a)(1) through (7) of this section to demonstrate initial compliance with the applicable emission limit in Table 1 to this subpart for the web coating/printing operation(s). When calculating the organic HAP emission rate according to this section, do not include any coating, printing, thinning, or cleaning materials applied on web coating/printing operations for which you use the compliant material option, the emission rate with add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option. Use the procedures in this section on each regulated material in the condition it is in when it is received from its manufacturer or supplier and prior to any alteration.

(1) *Determine the mass fraction of organic HAP for each material.* Determine the mass fraction of organic HAP for each coating, printing, thinning, and cleaning material applied during the compliance period according to the requirements in § 63.4321(e)(1).

(2) *Determine the mass fraction of solids for each material.* Determine the mass fraction of solids (kg of solids per kg of coating or printing material) for each coating and printing material applied during the compliance period according to the requirements in § 63.4321(e)(2).

(3) *Determine the mass of each material.* Determine the mass (kg) of each coating, printing, thinning, or cleaning material applied during the compliance period by measurement or usage records.

(4) *Calculate the mass of organic HAP emissions.* The mass of organic HAP emissions is the combined mass of organic HAP contained in all coating, printing, thinning, and cleaning materials applied during the compliance period minus the organic HAP in certain waste materials. Calculate the mass of organic HAP emissions using Equation 1 of this section:

$$H_e = A + B - R_w \qquad \text{(Eq. 1)}$$

Where:

H_e = Mass of organic HAP emissions during the compliance period, kg.

A = Total mass of organic HAP in the coating and printing materials applied during the compliance period, kg, as calculated in Equation 1A of this section.

B = Total mass of organic HAP in the thinning and cleaning materials applied during the compliance period, kg, as calculated in Equation 1B of this section.

R_w = Total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during the compliance period, kg, determined according to paragraph (a)(4)(iii) of this section. (You may assign a value of zero to R_w if you do not wish to use this allowance.)

(i) Calculate the kg organic HAP in the coating and printing materials applied during the compliance period using Equation 1A of this section:

$$A = \sum_{i=1}^{m} \left(M_{c,i}\right)\left(W_{c,i}\right) \qquad \text{(Eq. 1A)}$$

Where:

A = Total mass of organic HAP in the coating and printing materials applied during the compliance period, kg.

$M_{c,i}$ = Total mass of coating or printing material, i, applied during the compliance period, kg.

$W_{c,i}$ = Mass fraction of organic HAP in coating or printing material, i, kg organic HAP per kg of material.

m = Number of different coating and printing, materials applied during the compliance period.

(ii) Calculate the kg of organic HAP in the thinning and cleaning materials applied during the compliance period using Equation 1B of this section:

$$B = \sum_{j=1}^{n} \left(M_{t,j}\right)\left(W_{t,j}\right) \qquad \text{(Eq. 1B)}$$

Where:

B = Total mass of organic HAP in the thinning and cleaning materials applied during the compliance period, kg.

$M_{t,j}$ = Total mass of thinning or cleaning material, j, applied during the compliance period, kg.

$W_{t,j}$ = Mass fraction of organic HAP in thinning or cleaning material, j, kg organic HAP per kg thinning or cleaning material.

n = Number of different thinning and cleaning materials applied during the compliance period.

(iii) If you choose to account for the mass of organic HAP contained in waste materials sent or designated for shipment to a hazardous waste TSDF in Equation 1 of this section, then you must determine it according to paragraphs (a)(4)(iii)(A) through (D) of this section.

(A) You may include in the determination only waste materials that are generated by web coating/printing operations in the affected source for which you use Equation 1 of this section and that will be treated or disposed of by a facility that is regulated as a TSDF under 40 CFR part 262, 264, 265, or 266. The TSDF may be either off-site or on-site. You may not include organic HAP contained in wastewater.

(B) You must determine either the amount of the waste materials sent to a TSDF during the compliance period or the amount collected and stored during the compliance period designated for future transport to a TSDF. Do not include in your determination any waste materials sent to a TSDF during a compliance period if you have already included them in the amount collected and stored during that compliance period or a previous compliance period.

(C) Determine the total mass of organic HAP contained in the waste materials specified in paragraph (a)(4)(iii)(B) of this section.

(D) You must document the methodology you use to determine the amount of waste materials and the total mass of organic HAP they contain, as required in § 63.4312(g). To the extent that waste manifests include this, they may be used as part of the documentation of the amount of waste materials and mass of organic HAP contained in them.

(5) *Calculate the total mass of coating and printing solids.* Determine the total

mass of coating and printing solids applied, kg, which is the combined mass of the solids contained in all the coating and printing materials applied during the compliance period, using Equation 2 of this section:

$$H_t = \sum_{i=1}^{m} (M_{c,i})(W_{f,i}) \quad \text{(Eq. 2)}$$

Where:

H_t = Total mass of solids contained in coating and printing materials applied during the compliance period, kg.

$M_{c,i}$ = Mass of coating or printing material, i, applied during the compliance period, kg.

$W_{f,i}$ = mass fraction of solids in coating or printing material, i, applied during the compliance period, kg solids per kg of coating or printing material.

m = Number of coating and printing materials applied during the compliance period.

(6) Calculate the organic HAP emission rate for the compliance period, kg organic HAP emitted per kg solids used, using Equation 3 of this section:

$$H_{yr} = \frac{H_e}{H_t} \quad \text{(Eq. 3)}$$

Where:

H_{yr} = Organic HAP emission rate for the compliance period, kg of organic HAP emitted per kg of solids in coating and printing materials applied.

H_e = Total mass organic HAP emissions from all coating, printing, thinning, and cleaning materials applied during the compliance period, kg, as calculated by Equation 1 of this section.

H_t = Total mass of coating and printing solids in materials applied during the compliance period, kg, as calculated by Equation 2 of this section.

(7) *Compliance demonstration.* The organic HAP emission rate for the initial compliance period must be less than or equal to the applicable emission limit in Table 1 to this subpart. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the web coating/printing operation(s) for which you used the emission rate without add-on controls option and submit a statement that the web coating/printing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than, or equal to, the applicable emission limit in Table 1 to this subpart.

(b) For dyeing and finishing operations, you may use the emission rate without add-on controls option for any individual dyeing/finishing operation, for any group of dyeing/finishing operations in the affected source, or for dyeing/finishing operations as a group in the affected source. You must use either the compliant material option or the emission rate with add-on controls option for any dyeing/finishing operation in the affected source for which you do not use this option. You may not use the emission rate without add-on controls option for any dyeing/finishing operation in a dyeing/finishing affected source for which you use the equivalent emission rate option. To demonstrate initial compliance using the emission rate without add-on controls option, the dyeing/finishing operation or group of operations must meet the applicable emission limit in Table 1 to this subpart but is not required to meet the operating limits or work practice standards in §§ 63.4292 and 63.4293, respectively. You must meet all the requirements of paragraphs (b)(1) through (6) of this section to demonstrate initial compliance with the applicable emission limit in Table 1 to this subpart for the dyeing/finishing operation(s). When calculating the organic HAP emission rate according to this section, do not include any dyeing and finishing materials applied on dyeing/finishing operations for which you use the compliant material option or the emission rate with add-on controls option. Use the procedures in this section on each regulated material in the condition it is in when it is received from its manufacturer or supplier and prior to any alteration. Water added in mixing at the affected source is not a regulated material and should not be included in the determination of the total mass of dyeing and finishing materials applied during the compliance period, using Equation 5 of this section.

(1) *Determine the mass fraction of organic HAP for each material.* Determine the mass fraction of organic HAP for each dyeing and finishing material applied during the compliance period according to the requirements in § 63.4321(e)(1)(iv).

(2) *Determine the mass of each material.* Determine the mass (kg) of each dyeing and finishing material applied during the compliance period by measurement or usage records.

(3) *Calculate the mass of organic HAP emissions.* The mass of organic HAP emissions is the combined mass of organic HAP contained in all dyeing and finishing materials applied during the compliance period minus the organic HAP in certain waste materials and wastewater streams. Calculate the mass of organic HAP emissions using Equation 4 of this section:

$$H_e = A - R_w - WW \quad \text{(Eq. 4)}$$

Where:

H_e = Mass of organic HAP emissions during the compliance period, kg.

A = Total mass of organic HAP in the dyeing and finishing materials applied during the compliance period, kg, as calculated in Equation 4A of this section.

R_w = Total mass of organic HAP in waste materials sent or designated for shipment to a hazardous waste TSDF for treatment or disposal during the compliance period, kg, determined according to paragraph (b)(3)(ii) of this section. (You may assign a value of zero to R_w if you do not wish to use this allowance.)

WW = Total mass of organic HAP in wastewater discharged to a POTW or receiving onsite secondary treatment during the compliance period, kg, determined according to paragraph (b)(3)(iii) of this section. (You may assign a value of zero to WW if you do not wish to use this allowance.)

(i) Calculate the kg organic HAP in the dyeing and finishing materials applied during the compliance period using Equation 4A of this section:

$$A = \sum_{i=1}^{m} (M_{c,i})(W_{c,i}) \quad \text{(Eq. 4A)}$$

Where:

A = Total mass of organic HAP in the dyeing and finishing materials applied during the compliance period, kg.

$M_{c,i}$ = Mass of dyeing or finishing material, i, applied during the compliance period, kg.

$W_{c,i}$ = Mass fraction of organic HAP in dyeing or finishing material, i, kg organic HAP per kg of material.

m = Number of dyeing and finishing materials applied during the compliance period.

(ii) If you choose to account for the mass of organic HAP contained in waste materials sent or designated for shipment to a hazardous waste TSDF in Equation 4 of this section, then you must determine it according to paragraphs (b)(3)(ii)(A) through (D) of this section.

(A) You may include in the determination only waste materials that are generated by dyeing/finishing

operations in the affected source for which you use Equation 4 of this section and that will be treated or disposed of by a facility that is regulated as a TSDF under 40 CFR part 262, 264, 265, or 266. The TSDF may be either off-site or on-site. You may not include organic HAP contained in wastewater.

(B) You must determine either the amount of the waste materials sent to a TSDF during the compliance period or the amount collected and stored during the compliance period designated for future transport to a TSDF. Do not include in your determination any waste materials sent to a TSDF during a compliance period if you have already included them in the amount collected and stored during that compliance period or a previous compliance period.

(C) Determine the total mass of organic HAP contained in the waste materials specified in paragraph (b)(3)(ii)(B) of this section.

(D) You must document the methodology you use to determine the amount of waste materials and the total mass of organic HAP they contain, as required in § 63.4312(g). To the extent that waste manifests include this, they may be used as part of the documentation of the amount of waste materials and mass of organic HAP contained in them.

(iii) If you choose to account for the mass of organic HAP contained in wastewater discharged to a POTW or treated onsite prior to discharge in Equation 4 of this section, then you must determine it according to paragraph (c) of this section.

(4) *Calculate the total mass of dyeing and finishing materials.* Determine the total mass of dyeing and finishing materials applied, kg, which is the combined mass of all the dyeing and finishing materials applied during the compliance period, using Equation 5 of this section:

$$M_t = \sum_{i=1}^{m} \left(M_{c,i} \right) \qquad \text{(Eq. 5)}$$

Where:

M_t = Total mass of dyeing and finishing materials applied during the compliance period, kg.

$M_{c,i}$ = Mass of dyeing or finishing material, i, applied during the compliance period, kg.

m = Number of dyeing and finishing materials applied during the compliance period.

(5) Calculate the organic HAP emission rate, kg organic HAP emitted per kg dyeing and finishing material applied, using Equation 6 of this section:

$$H_{yr} = \frac{H_e}{M_t} \qquad \text{(Eq. 6)}$$

Where:

H_{yr} = The organic HAP emission rate for the compliance period, kg of organic HAP emitted per kg of dyeing and finishing materials.

H_e = Total mass of organic HAP emissions during the compliance period, kg, as calculated by Equation 4 of this section.

M_t = Total mass of dyeing and finishing materials applied during the compliance period, kg, as calculated by Equation 5 of this section.

(6) *Compliance demonstration.* The organic HAP emission rate for the initial compliance period must be less than or equal to the applicable emission limit in Table 1 to this subpart. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the dyeing/finishing operation(s) for which you used the emission rate without add-on controls option and submit a statement that the dyeing/finishing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in Table 1 to this subpart.

(i) If your affected source performs only dyeing operations, paragraphs (b)(1) through (5) of this section apply to dyeing materials only, and you must demonstrate compliance with the emission limit in Table 1 to this subpart for dyeing operations.

(ii) If your affected source performs only finishing operations, paragraphs (b)(1) through (5) of this section apply to finishing materials only, and you must demonstrate compliance with the emission limit in Table 1 to this subpart for finishing operations.

(iii) If your affected source performs both dyeing and finishing operations, paragraphs (b)(1) through (5) of this section apply to dyeing and finishing materials combined, and you must demonstrate compliance with the emission limit in Table 1 to this subpart for dyeing and finishing operations.

(c) If you choose to account for the mass of organic HAP contained in wastewater discharged to a POTW or treated onsite prior to discharge in Equation 4 of this section, then you must determine it according to paragraphs (c)(1) through (5) of this section. You may include in the determination only wastewater streams that are generated by dyeing/finishing operations in the affected source for which you use Equation 4 of this section. You must determine the mass of organic HAP from the average organic HAP concentration and mass flow rate of each wastewater stream generated by the affected dyeing/finishing operation (or group of dyeing/finishing operations discharging to a common wastewater stream) for which you use this allowance. You must consider the actual or anticipated production over the compliance period and include all wastewater streams generated by the affected dyeing/finishing operation(s) during this period. A performance test of the organic HAP loading to the wastewater shall be performed for each operating scenario, as defined in § 63.4371, during the compliance period.

(1) *Procedure to determine average organic HAP concentration.* You must determine the average organic HAP concentration, H_w, of each wastewater stream according to paragraphs (c)(1)(i) through (vi) of this section.

(i) *Sampling.* Wastewater samples may be grab samples or composite samples. Samples shall be taken at approximately equally spaced time intervals over a 1-hour period (or over the period that wastewater is being discharged from a batch process if it is shorter than a 1-hour period). Each 1-hour period constitutes a run, and a performance test shall consist of a minimum of 3 runs.

(ii) *Methods.* You may use any of the methods specified in paragraphs (c)(1)(ii)(A) through (E) of this section to determine the organic HAP content of the wastewater stream. The method shall be an analytical method for wastewater which has the organic HAP compound discharged to the wastewater as a target analyte.

(A) *Method 305.* Use procedures specified in Method 305 of 40 CFR part 63, appendix A.

(B) *Methods 624 and 625.* Use procedures specified in Method 624 and Method 625 of 40 CFR part 136, appendix A and comply with the sampling protocol requirements specified in paragraph (c)(1)(iii) of this section. If these methods are used to analyze one or more compounds that are not on the method's published list of approved compounds, the Alternative Test Procedure specified in 40 CFR 136.4 and 136.5 shall be followed. For Method 625, make corrections to the compounds for which the analysis is being conducted based on the accuracy as recovery factors in Table 7 of the method.

(C) *Methods 1624 and 1625.* Use procedures specified in Method 1624

and Method 1625 of 40 CFR part 136, appendix A and comply with the sampling protocol requirements specified in paragraph (c)(1)(iii) of this section. If these methods are used to analyze one or more compounds that are not on the method's published list of approved compounds, the Alternative Test Procedure specified in 40 CFR 136.4 and 136.5 shall be followed.

(D) *Other EPA method(s).* Use procedures specified in the method and comply with the requirements specified in paragraphs (c)(1)(iii) and either paragraph (c)(1)(iv)(A) or (B) of this section.

(E) *Methods other than EPA method.* Use procedures specified in the method and comply with the requirements specified in paragraphs (c)(1)(iii) and paragraph (c)(1)(iv)(A) of this section.

(iii) *Sampling plan.* If you have been expressly referred to this paragraph by provisions of this subpart, you shall prepare a sampling plan. Wastewater samples shall be collected using sampling procedures which minimize loss of organic compounds during sample collection and analysis and maintain sample integrity. The sampling plan shall include procedures for determining recovery efficiency of the relevant organic HAP. An example of an example sampling plan would be one that incorporates similar sampling and sample handling requirements to those of Method 25D of 40 CFR part 60, appendix A. You shall maintain the sampling plan at the facility.

(iv) *Validation of methods.* You shall validate EPA methods other than Methods 305, 624, 625, 1624, 1625 using the procedures specified in paragraph (c)(1)(iv)(A) or (B) of this section.

(A) *Validation of EPA methods and other methods.* The method used to measure organic HAP concentrations in the wastewater shall be validated according to section 5.1 or 5.3, and the corresponding calculations in section 6.1 or 6.3, of Method 301 of appendix A of this part. The data are acceptable if they meet the criteria specified in section 6.1.5 or 6.3.3 of Method 301 of appendix A of this part. If correction is required under section 6.3.3 of Method 301 of appendix A of this part, the data are acceptable if the correction factor is within the range 0.7 to 1.30. Other sections of Method 301 of appendix A of this part are not required.

(B) *Validation for EPA methods.* Follow the procedures as specified in "Alternative Validation Procedure for EPA Waste Methods" 40 CFR part 63, appendix D.

(v) *Calculate the average concentration.* You shall calculate the average concentration for each individually speciated organic HAP compound by adding the individual values determined for the specific compound in each sample and dividing by the number of samples.

(vi) *Adjustment for concentrations determined downstream of the point of determination.* You shall make corrections to the specific compound average concentration or total organic HAP average concentration when the concentration is determined downstream of the point of determination at a location where either wastewater streams from outside of the affected dyeing/finishing operation or group of dyeing/finishing operations have been mixed with the affected wastewater stream or one or more affected wastewater streams have been treated. You shall make the adjustments either to the individual data points or to the final average organic HAP concentration.

(2) *Procedures to determine mass flow rate.* For each operating scenario, as defined in § 63.4371, for which you have determined the organic HAP content of the wastewater stream, you shall determine the annual average mass flow rate, F_w, of the wastewater stream either at the point of determination or downstream of the point of determination with adjustment for flow rate changes made according to paragraph (c)(2)(ii) of this section. The annual average mass flow rate for the wastewater stream shall be representative of actual or anticipated operation of the dyeing/finishing operation(s) generating the wastewater over the compliance period. You must determine the annual average mass flow rate of each wastewater stream according to paragraphs (c)(2)(i) and (ii) of this section.

(i) *Procedures.* The procedures specified in paragraphs (c)(2)(i)(A) through (C) of this section are considered acceptable procedures for determining the mass flow rate. They may be used in combination, and no one procedure shall take precedence over another.

(A) *Knowledge of the wastewater.* You may use knowledge of the wastewater stream and/or the process to determine the annual average mass flow rate. You shall use the maximum expected annual average production capacity of the dyeing/finishing operation(s), knowledge of the process, and/or mass balance information to either estimate directly the average wastewater mass flow rate for the compliance period or estimate the total wastewater mass flow for the compliance period and then factor the total mass by the percentage of time in the compliance period the operating scenario is expected to represent. Where you use knowledge to determine the annual average mass flow rate, you shall provide sufficient information to document the mass flow rate.

(B) *Historical records.* You may use historical records to determine the average annual mass flow rate. Derive the highest annual average mass flow rate of wastewater from historical records representing the most recent 5 years of operation, or if the dyeing/finishing operation(s) has(have) been in service for less than 5 years but at least 1 year, from historical records representing the total operating life of the process unit. Where historical records are used to determine the annual average mass flow rate, you shall provide sufficient information to document the mass flow rate.

(C) *Measurement of mass flow rate.* If you elect to measure mass flow rate, you shall comply with the requirements of this paragraph. Measurements shall be made at the point of determination, or at a location downstream of the point of determination with adjustments for mass flow rate changes made according to paragraph (c)(2)(ii) of this section. Where measurement data are used to determine the annual average mass flow rate, you shall provide sufficient information to document the mass flow rate.

(ii) *Adjustment for flow rates determined downstream of the point of determination.* You shall make corrections to the average annual mass flow rate of a wastewater stream when it is determined downstream of the point of determination at a location where either wastewater streams from outside of the affected dyeing/finishing operation or group of dyeing/finishing operations have been mixed with the affected wastewater stream or one or more wastewater streams have been treated. You shall make corrections for such changes in the annual average mass flow rate.

(3) *Wastewater treatment.* You shall document that the wastewater is either discharged to a POTW or onsite secondary wastewater treatment.

(4) *Determine the mass of organic HAP in the affected wastewater.* Determine the total mass of organic HAP, WW, contained in the wastewater streams characterized by the procedures in paragraphs (c)(1) and (2) of this section, using Equation 7 of this section:

$$WW = \sum_{k=1}^{o} \left(H_{w,k}\right)\left(F_{w,k}\right) \times 10^{-3} \quad \text{(Eq. 7)}$$

Where:

WW = The total mass of organic HAP contained in the wastewater streams characterized by the procedures in paragraphs (c)(1) and (2) of this section, kg/yr

$H_{w,k}$ = Average organic HAP concentration of wastewater stream k, ppmw

$F_{w,k}$ = Annual average mass flow rate of wastewater stream k, Mg/yr

o = Number of wastewater streams characterized by the procedures in paragraphs (c)(1) and (2) of this section.

This is your allowance for organic HAP discharged to wastewater and not emitted to the atmosphere, WW in Equation 4.

(5) *Determine the fraction of organic HAP applied that is discharged to the wastewater.* For the purpose of taking credit for the wastewater allowance in continuous compliance demonstrations, determine the fraction of organic HAP applied in affected dyeing/finishing processes that is discharged to the wastewater, *i.e.*, divide WW by the mass of organic HAP in the dyeing and finishing materials applied during the compliance period, A, as calculated in Equation 4A of this section. The wastewater allowance for this fraction of organic HAP that is not emitted from the affected dyeing/finishing operation(s) may be taken for each compliance period that the operating scenario, as defined in § 63.4371, does not change from conditions during the performance test in a way that could increase the fraction of organic HAP emitted (*e.g.*, an increase in process temperature or decrease in process pressure or a change in the type or mass fraction of organic HAP entering the dyeing/finishing operation.) The allowance, WW, must be calculated by multiplying the fraction of organic HAP applied in affected processes that is discharged to the wastewater determined from the most recent performance test by the mass of organic HAP in the dyeing and finishing materials applied during the compliance period, A, as calculated in Equation 4A of this section.

(d) If you are determining the fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to the wastewater, to demonstrate compliance with the equivalent emission rate option of § 63.4291(c)(4), then you must determine it according to paragraphs (d)(1) through (5) of this section. You must include in the determination only wastewater streams generated by dyeing/finishing operations in your affected source. You shall determine the mass of organic HAP from the average organic HAP concentration and mass flow rate of each wastewater stream generated by each dyeing/finishing operation (or group of dyeing/finishing operations discharging to a common wastewater stream) in your affected source. You shall consider the actual or anticipated production over the compliance period and include all wastewater streams generated by the affected dyeing/finishing operation(s) during this period. A performance test of the organic HAP loading to the wastewater shall be conducted for each operating scenario, as defined in § 63.4371, during the compliance period.

(1) *Procedure to determine average organic HAP concentration.* You must determine the average organic HAP concentration of each wastewater stream according to paragraphs (c)(1)(i) through (vi) of this section.

(2) *Procedures to determine mass flow rate.* For each operating scenario, as defined in § 63.4371, for which you have determined the organic HAP content of the wastewater stream, you shall determine the annual average mass flow rate of the wastewater stream either at the point of determination, or downstream of the point of determination with adjustment for flow rate changes made according to paragraph (c)(2)(ii) of this section. The annual average mass flow rate for the wastewater stream shall be representative of actual or anticipated operation of the dyeing/finishing operation(s) generating the wastewater over the compliance period. You must determine the annual average mass flow rate of each wastewater stream according to paragraphs (c)(2)(i) and (ii) of this section.

(3) *Wastewater treatment.* You shall document that the wastewater is either discharged to a POTW or onsite secondary wastewater treatment.

(4) *Determine the mass of organic HAP in the affected wastewater.* Determine the total mass of organic HAP, WW, contained in the wastewater streams characterized by the procedures in paragraphs (d)(1) and (2) of this section, using Equation 7 of this section.

(5) *Determine the fraction of organic HAP applied that is discharged to the wastewater.* Determine the fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to the wastewater, *i.e.*, divide WW by the mass of organic HAP in the dyeing and finishing materials applied during the compliance period, A, as calculated in Equation 4A of this section. One of the conditions that must be met to demonstrate compliance with the equivalent emission rate option is that the fraction of organic HAP applied in your dyeing/finishing affected source that is discharged to the wastewater must be at least 90 percent.

§ 63.4332 How do I demonstrate continuous compliance with the emission limitations?

(a) To demonstrate continuous compliance, the organic HAP emission rate for each compliance period, determined according to § 63.4331(a) for web coating/printing operations and according to § 63.4331(b) for dyeing/finishing operations, must be less than or equal to the applicable emission limit in Table 1 to this subpart. Each month following the initial compliance period described in § 63.4330 is a compliance period consisting of that month and the preceding 11 months. You must perform the calculations in § 63.4331 on a monthly basis.

(b) If the organic HAP emission rate for any compliance period exceeded the applicable emission limit in Table 1 to this subpart, this is a deviation from the emission limitations for that compliance period and must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(6).

(c) As part of each semiannual compliance report required by § 63.4311, you must identify any web coating/printing operation or dyeing/finishing operation for which you used the emission rate without add-on controls option. If there were no deviations from the applicable emission limit in Table 1 to this subpart, you must submit a statement that, as appropriate, the web coating/printing operations or the dyeing/finishing operations were in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in Table 1 to this subpart.

(d) You must maintain records as specified in §§ 63.4312 and 63.4313.

Compliance Requirements for the Emission Rate With Add-On Controls Option

§ 63.4340 By what date must I conduct performance tests and other initial compliance demonstrations?

(a) *New and reconstructed affected sources.* For a new or reconstructed affected source, you must meet the requirements of paragraphs (a)(1) through (4) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4283. Except for solvent recovery

systems for which you conduct liquid-liquid material balances according to § 63.4341(e)(5) or (f)(5), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4360, 63.4361, and 63.4362, and establish the operating limits required by § 63.4292, within 180 days of the applicable compliance date specified in § 63.4283. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4341(e)(5) or (f)(5), you must initiate the first material balance no later than the applicable compliance date specified in § 63.4283.

(2) You must develop and begin implementing the work practice plan required by § 63.4293 no later than the compliance date specified in § 63.4283.

(3) You must complete the compliance demonstration for the initial compliance period according to the requirements of § 63.4341. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the 12th full month after the compliance date, or the date you conduct the performance tests of the emission capture systems and add-on control devices, or initiate the first liquid-liquid material balance for a solvent recovery system, whichever is later. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4360, 63.4361, and 63.4362; results of liquid-liquid material balances conducted according to § 63.4341(e)(5) or (f)(5); calculations according to § 63.4341 and supporting documentation showing that during the initial compliance period the organic HAP emission rate was equal to or less than the applicable emission limit in Table 1 to this subpart; the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4364; and documentation of whether you developed and implemented the work practice plan required by § 63.4293.

(4) You do not need to comply with the operating limits for the emission capture system and add-on control device required by § 63.4292 until after you have completed the performance tests specified in paragraph (a)(1) of this section. Instead, you must maintain a log detailing the operation and maintenance of the emission capture system, add-on control device, and continuous parameter monitors during the period between the compliance date and the performance test. You must begin complying with the operating limits for your affected source on the date you complete the performance tests specified in paragraph (a)(1) of this section. This requirement does not apply to solvent recovery systems for which you conduct liquid-liquid material balances according to the requirements of § 63.4341(e)(5) or (f)(5).

(b) *Existing sources.* For an existing affected source, you must meet the requirements of paragraphs (b)(1) through (3) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4283. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4341(e)(5) or (f)(5), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4360, 63.4361, and 63.4362, and establish the operating limits required by § 63.4292, within 180 days of the compliance date specified in § 63.4283. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4341(e)(5) or (f)(5), you must initiate the first material balance no later than the compliance date specified in § 63.4283.

(2) You must develop and begin implementing the work practice plan required by § 63.4293 no later than the compliance date specified in § 63.4283.

(3) You must complete the compliance demonstration for the initial compliance period according to the requirements of § 63.4341. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the 12th full month after the compliance date. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4360, 63.4361, and 63.4362; results of liquid-liquid material balances conducted according to § 63.4341(e)(5) or (f)(5); calculations according to § 63.4561 and supporting documentation showing that during the initial compliance period the organic HAP emission rate was equal to or less than the applicable emission limit in Table 1 to this subpart; the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4364; and documentation of whether you developed and implemented the work practice plan required by § 63.4293.

§ 63.4341 How do I demonstrate initial compliance?

(a) You may use the emission rate with add-on controls option for any individual web coating/printing operation, for any group of web coating/printing operations in the affected source, or for all of the web coating/printing operations in the affected source. You may include both controlled and uncontrolled web coating/printing operations in a group for which you use this option. You must use either the compliant material option, the emission rate without add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option for any web coating/printing operation in the affected source for which you do not use the emission rate with add-on controls option. To demonstrate initial compliance, any web coating/printing operation for which you use the emission rate with add-on controls option must meet the applicable emission limitations in Table 1 to this subpart, and in §§ 63.4292 and 63.4293. You must meet all the requirements of paragraphs (a), (c), (d), and (e) of this section. When calculating the organic HAP emission rate according to this section, do not include any coating, printing, thinning, or cleaning materials applied on web coating/printing operations for which you use the compliant material option, the emission rate without add-on controls option, the organic HAP overall control efficiency option, or the oxidizer outlet organic HAP concentration option. You do not need to redetermine the mass of organic HAP in coating, printing, thinning, or cleaning materials that have been reclaimed onsite and reused in the web coating/printing operation(s) for which you use the emission rate with add-on control option.

(b) You may use the emission rate with add-on controls option for any individual dyeing/finishing operation, for any group of dyeing/finishing operations in the affected source, or for all of the dyeing/finishing operations in the affected source. You may include both controlled and uncontrolled dyeing/finishing operations in a group for which you use this option. You must use either the compliant material option or the emission rate without add-on controls option for any dyeing/finishing operation in the affected source for which you do not use the emission rate with add-on controls option. You may not use the emission rate with add-on controls option for any dyeing/finishing operation in a dyeing/finishing affected source for which you use the equivalent

emission rate option. To demonstrate initial compliance, any dyeing/finishing operation for which you use the emission rate with add-on controls option must meet the applicable emission limitations in Table 1 to this subpart, and in §§ 63.4292 and 63.4293. You must meet all the requirements of paragraphs (b), (c), (d), and (f) this section. When calculating the organic HAP emission rate according to this section, do not include any dyeing or finishing materials applied on dyeing/finishing operations for which you use the compliant material option or the emission rate without add-on controls option. You do not need to redetermine the mass of organic HAP in dyeing or finishing materials that have been reclaimed onsite and reused in the dyeing/finishing operation(s) for which you use the emission rate with add-on controls option.

(c) *Compliance with operating limits.* Except as provided in § 63.4340(a)(4), and except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4341(e)(5) or (f)(5), you must establish and demonstrate continuous compliance during the initial compliance period with the operating limits required by § 63.4292, using the procedures specified in §§ 63.4363 and 63.4364.

(d) *Compliance with work practice requirements.* You must develop, implement, and document your implementation of the work practice plan required by § 63.4293 during the initial compliance period as specified in § 63.4312.

(e) *Compliance with web coating/printing emission limits.* You must follow the procedures in paragraphs (e)(1) through (8) of this section to demonstrate compliance with the applicable web coating/printing emission limit in Table 1 to this subpart.

(1) *Determine the mass fraction of organic HAP, the mass fraction of solids, and mass of materials.* Follow the procedures specified in § 63.4331(a)(1), (2), and (3) to determine the mass fraction of organic HAP for each coating, printing, thinning, and cleaning material applied during the compliance period; the mass fraction of solids for each coating and printing material applied during the compliance period; and mass of each coating, printing, thinning, and cleaning material applied during the compliance period.

(2) *Calculate the mass of organic HAP emissions before add-on controls.* Using Equation 1 of § 63.4331, calculate the mass of organic HAP emissions before add-on controls from all coating, printing, thinning, and cleaning materials applied during the compliance period minus the organic HAP in certain waste materials in the web coating/printing operation or group of web coating/printing operations for which you use the emission rate with add-on controls.

(3) *Calculate the organic HAP emissions reductions for each controlled web coating/printing operation.* Determine the mass of organic HAP emissions reduced for each controlled web coating/printing operation during the compliance period. The emissions reductions determination quantifies the total organic HAP emissions that pass through the emission capture system and are destroyed or removed by the add-on control device. Use the procedures in paragraph (e)(4) of this section to calculate the mass of organic HAP emissions reductions for each controlled web coating/printing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances. For each controlled web coating/printing operation using a solvent recovery system for which you conduct a liquid-liquid material balance, use the procedures in paragraph (e)(5) of this section to calculate the organic HAP emissions reductions.

(4) *Calculate the organic HAP emission reduction for each controlled web coating/printing operation not using liquid-liquid material balance.* For each controlled web coating/printing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emissions reductions using Equation 1 of this section. The equation applies the emission capture system efficiency and add-on control device efficiency to the mass of organic HAP contained in the coating, printing, thinning, and cleaning materials applied in the web coating/printing operation served by the emission capture system and add-on control device during the compliance period. For any period of time a deviation specified in § 63.4342(c) or (d) occurs in the controlled web coating/printing operation, including a deviation during startup, shutdown, or malfunction, then you must assume zero efficiency for the emission capture system and add-on control device. Equation 1 of this section treats the coating, printing, thinning, and cleaning materials applied during such a deviation as if they were used on an uncontrolled web coating/printing operation for the time period of the deviation.

$$H_C = (A_I + B_I - H_{UNC})\left(\frac{CE}{100} \times \frac{DRE}{100}\right) \qquad \text{(Eq. 1)}$$

Where:

H_C = Mass of organic HAP emission reduction for the controlled web coating/printing operation during the compliance period, kg.

A_I = Total mass of organic HAP in the coating and printing materials applied in the controlled web coating/printing operation during the compliance period, kg, as calculated in Equation 1A of this section.

B_I = Total mass of organic HAP in the thinning and cleaning materials applied in the controlled web coating/printing operation during the compliance period, kg, as calculated in Equation 1B of this section.

H_{UNC} = Total mass of organic HAP in the coating, printing, thinning, and cleaning materials applied during all deviations specified in § 63.4342(c) and (d) that occurred during the compliance period in the controlled web coating/printing operation, kg, as calculated in Equation 1C of this section.

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent. Use the test methods and procedures specified in §§ 63.4360 and 63.4361 to measure and record capture efficiency.

DRE = Organic HAP destruction or removal efficiency of the add-on control device, percent. Use the test methods and procedures in §§ 63.4360 and 63.4362 to measure and record the organic HAP destruction or removal efficiency.

(i) Calculate the total mass of organic HAP in the coating and printing materials applied in the controlled web

coating/printing operation(s) during the compliance period, kg, using Equation 1A of this section:

$$A_I = \sum_{i=1}^{m} (M_{c,i})(W_{c,i}) \quad \text{(Eq. 1A)}$$

Where:

A_I = Total mass of organic HAP in the coating and printing materials applied in the controlled web coating/printing operation(s) during the compliance period, kg.

$M_{c,i}$ = Mass of coating or printing material, i, applied during the compliance period, kg.

$W_{c,i}$ = Mass fraction of organic HAP in coating or printing material, i, kg per kg.

m = Number of different coating and printing materials applied during compliance period.

(ii) Calculate the total mass of organic HAP in the thinning and cleaning materials applied in the controlled web coating/printing operation(s) during the compliance period, kg, using Equation 1B of this section:

$$B_I = \sum_{j=1}^{n} (M_{t,j})(W_{t,j}) \quad \text{(Eq. 1B)}$$

Where:

B_I = Total mass of organic HAP in the thinning and cleaning materials applied in the controlled web coating/printing operation(s) during the compliance period, kg.

$M_{t,j}$ = Total mass of thinning or cleaning material, j, applied during the compliance period, kg.

$W_{t,j}$ = Mass fraction of organic HAP in thinning or cleaning material, j, kg per kg.

n = Number of different thinning and cleaning materials applied during the compliance period.

(iii) Calculate the mass of organic HAP in the coating, printing, thinning, and cleaning materials applied in the controlled web coating/printing operation during deviations specified in § 63.4342(c) and (d), using Equation 1C of this section.

$$H_{UNC} = \sum_{h=1}^{q} (M_h)(W_h) \quad \text{(Eq. 1C)}$$

Where:

H_{UNC} = Total mass of organic HAP in the coating, printing, thinning, and cleaning materials applied during all deviations specified in § 63.4342 (c) and (d) that occurred during the compliance period in the controlled web coating/printing operation, kg.

M_h = Total mass of coating, printing, thinning, or cleaning material, h, applied in the controlled web coating/printing operation during deviations, kg.

W_h = Mass fraction of organic HAP in coating, printing, thinning, or cleaning material, h, kg organic HAP per kg material.

q = Number of different coating, printing, thinning, and cleaning materials applied and used.

(5) *Calculate the organic HAP emissions reductions for controlled web coating/printing operation using liquid-liquid material balances.* For each controlled web coating/printing operation using a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emissions reductions by applying the volatile organic matter collection and recovery efficiency to the mass of organic HAP contained in the coating, printing, thinning, and cleaning materials applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period. Perform a liquid-liquid material balance for the compliance period as specified in paragraphs (e)(5)(i) through (v) of this section. Calculate the mass of organic HAP emissions reductions by the solvent recovery system as specified in paragraph (e)(5)(vi) of this section.

(i) For each solvent recovery system, install, calibrate, maintain, and operate according to the manufacturer's specifications, a device that indicates the cumulative amount of volatile organic matter recovered by the solvent recovery system for the compliance period. The device must be initially certified by the manufacturer to be accurate to within ±2.0 percent of the mass of volatile organic matter recovered.

(ii) For each solvent recovery system, determine the mass of volatile organic matter recovered for the compliance period, kg, based on measurement with the device required in paragraph (e)(5)(i) of this section.

(iii) Determine the mass fraction of volatile organic matter for each coating, printing, cleaning, and thinning material applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg volatile organic matter per kg coating, printing, cleaning, and thinning material. You may determine the volatile organic matter mass fraction using Method 24 of 40 CFR part 60, appendix A, or an EPA approved alternative method, or you may use information provided by the manufacturer or supplier of the coating or printing material. In the event of any inconsistency between information provided by the manufacturer or supplier and the results of Method 24 of 40 CFR part 60, appendix A, or an approved alternative method, the test method results will govern.

(iv) Measure the mass of each coating, printing, thinning, and cleaning material applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg.

(v) For the compliance period, calculate the solvent recovery system's volatile organic matter collection and recovery efficiency using Equation 2 of this section:

$$R_V = 100 \frac{M_{VR}}{\sum_{i=1}^{m} M_i WV_{c,i} + \sum_{j=1}^{n} M_j WV_{t,j}} \quad \text{(Eq. 2)}$$

Where:

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system during the compliance period, percent.

M_{VR} = Mass of volatile organic matter recovered by the solvent recovery system during the compliance period, kg.

M_i = Mass of coating or printing material, i, applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg.

$WV_{c,i}$ = Mass fraction of volatile organic matter for coating or printing material, i, kg volatile organic matter per kg coating or printing material.

M_j = Mass of thinning or cleaning material, j, applied in the web coating/printing operation controlled by the solvent recovery

system during the compliance period, kg.

$WV_{t,j}$ = Mass fraction of volatile organic matter for thinning or cleaning material, j, kg volatile organic matter per kg thinning or cleaning material.

m = Number of different coating and printing materials applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period.

n = Number of different thinning and cleaning materials applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period.

(vi) Calculate the mass of organic HAP emission reductions for the web coating/printing operation controlled by the solvent recovery system during the compliance period using Equation 3 of this section and according to paragraphs (e)(5)(vi)(A) and (B) of this section:

$$H_{CSR} = \left(A_{CSR} + B_{CSR}\right)\left(\frac{R_V}{100}\right) \quad \text{(Eq. 3)}$$

Where:

H_{CSR} = Mass of organic HAP emission reduction for the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg.

A_{CSR} = Total mass of organic HAP in the coating and printing material applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg, calculated using Equation 3A of this section.

B_{CSR} = Total mass of organic HAP in the thinning and cleaning materials applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg, calculated using Equation 3B of this section.

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system, percent, from Equation 2 of this section.

(A) Calculate the total mass of organic HAP in the coating and printing materials applied in the web coating/printing operation(s) controlled by the solvent recovery system during the compliance period, kg, using Equation 3A of this section:

$$A_{CSR} = \sum_{i=1}^{m}\left(M_{c,i}\right)\left(W_{c,i}\right) \quad \text{(Eq. 3A)}$$

Where:

A_{CSR} = Total mass of organic HAP in the coating and printing materials applied in the web coating/printing operations(s) controlled by the solvent recovery system during the compliance period, kg.

$M_{c,i}$ = Mass of coating or printing material, i, applied during the compliance period in the web coating/printing operation(s) controlled by the solvent recovery system, kg.

$W_{c,i}$ = Mass fraction of organic HAP in coating or printing material, i, kg per kg.

m = Number of different coating and printing materials applied during compliance period.

(B) Calculate the total mass of organic HAP in the thinning and cleaning materials applied in the web coating/printing operation(s) controlled by the solvent recovery system during the compliance period, kg, using Equation 3B of this section:

$$B_{CSR} = \sum_{j=1}^{n}\left(M_{t,j}\right)\left(W_{t,j}\right) \quad \text{(Eq. 3B)}$$

Where:

B_{CSR} = Total mass of organic HAP in the thinning and cleaning materials applied in the web coating/printing operation(s) controlled by the solvent recovery system during the compliance period, kg.

$M_{t,j}$ = Total mass of thinning or cleaning material, j, applied during the compliance period in the web coating/printing operation(s) controlled by the solvent recovery system, kg.

$W_{t,j}$ = Mass fraction of organic HAP in thinning or cleaning material, j, kg per kg.

n = Number of different thinning and cleaning materials applied during the compliance period.

(6) *Calculate the total mass of coating and printing solids.* Determine the total mass of coating and printing solids applied, kg, which is the combined mass of the solids contained in all the coating and printing material applied during the compliance period in the web coating/printing operation(s) for which you use the emission rate with add-on controls option, using Equation 2 of § 63.4331.

(7) *Calculate the organic HAP emission rate with add-on controls for the compliance period.* Determine the organic HAP emission rate with add-on controls for the compliance period, kg organic HAP emitted per kg solids applied during the compliance period, using Equation 4 of this section.

$$H_{HAP} = \frac{H_e - \sum_{i=1}^{q}\left(H_{C,i}\right) - \sum_{j=i}^{r}\left(H_{CSR,j}\right)}{H_t} \quad \text{(Eq. 4)}$$

Where:

H_{HAP} = Organic HAP emission rate with add-on controls for the compliance period, kg organic HAP emitted per kg solids applied.

H_e = Total mass of organic HAP emissions before add-on controls from all the coating, printing, thinning, and cleaning materials applied during the compliance period, kg, determined according to paragraph (e)(2) of this section.

$H_{C,i}$ = Total mass of organic HAP emissions reduction for controlled web coating/printing operation, i, not using a liquid-liquid material balance, during the compliance period, kg, from Equation 1 of this section.

$H_{CSR,j}$ = Total mass of organic HAP emissions reduction for web coating/printing operation, j, controlled by a solvent recovery system using a liquid-liquid material balance, during the compliance period, kg, from Equation 3 of this section.

H_t = Total mass of coating and printing solids applied during the compliance period, kg, from Equation 2 of § 63.4331.

q = Number of controlled web coating/printing operations not using a liquid-liquid material balance.

r = Number of web coating/printing operations controlled by a solvent recovery system using a liquid-liquid material balance.

(8) *Compliance demonstration.* To demonstrate initial compliance with the emission limit, the organic HAP emission rate with add-on controls for the compliance period, calculated using Equation 4 of this section, must be less

than or equal to the applicable emission limit in Table 1 to this subpart. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the web coating/printing operation(s) for which you used the emission rate with add-on controls option and submit a statement that the web coating/printing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in Table 1 to this subpart, and that you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293.

(f) *Compliance with dyeing/finishing emission limits.* You must follow the procedures in paragraphs (f)(1) through (8) of this section to demonstrate compliance with the applicable dyeing/finishing emission limit in Table 1 to this subpart.

(1) *Determine the mass fraction of organic HAP and mass of materials.* Follow the procedures specified in § 63.4331(b)(1) and (2) to determine the mass fraction of organic HAP for each dyeing and finishing material applied and mass of each dyeing and finishing material applied during the compliance period.

(2) *Calculate the mass of organic HAP emissions before add-on controls.* Using Equation 4 of § 63.4331, calculate the mass of organic HAP emissions before add-on controls from all dyeing and finishing materials applied during the compliance period minus the organic HAP in certain waste materials and wastewaters in the dyeing/finishing operation or group of dyeing/finishing operations for which you use the emission rate with add-on controls option.

(3) *Calculate the organic HAP emissions reductions for each controlled dyeing/finishing operation.* Determine the mass of organic HAP emissions reduced for each controlled dyeing/finishing operation during the compliance period. The emissions reductions determination quantifies the total organic HAP emissions that pass through the emission capture system and are destroyed or removed by the add-on control device. Use the procedures in paragraph (f)(4) of this section to calculate the mass of organic HAP emissions reductions for each controlled dyeing/finishing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances. For each controlled dyeing/finishing operation using a solvent recovery system for which you conduct a liquid-liquid material balance, use the procedures in paragraph (f)(5) of this section to calculate the organic HAP emissions reductions.

(4) *Calculate the organic HAP emission reduction for each controlled dyeing/finishing operation not using liquid-liquid material balance.* For each controlled dyeing/finishing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emissions reductions using Equation 5 of this section. The equation applies the emission capture system efficiency and add-on control device efficiency to the mass of organic HAP contained in the dyeing and finishing materials applied in the dyeing/finishing operation served by the emission capture system and add-on control device during the compliance period. For any period of time a deviation specified in § 63.4342(c) or (d) occurs in the controlled dyeing/finishing operation, including a deviation during startup, shutdown, or malfunction, then you must assume zero efficiency for the emission capture system and add-on control device. Equation 5 of this section treats the dyeing and finishing materials applied during such a deviation as if they were applied on an uncontrolled dyeing/finishing operation for the time period of the deviation.

$$H_C = (A_I - H_{UNC})\left(\frac{CE}{100} \times \frac{DRE}{100}\right) \quad \text{(Eq. 5)}$$

Where:

H_C = Mass of organic HAP emission reduction for the controlled dyeing/finishing operation during the compliance period, kg.

A_I = Total mass of organic HAP in the dyeing and finishing materials applied in the controlled dyeing/finishing operation during the compliance period, kg, as calculated in Equation 5A of this section.

H_{UNC} = Total mass of organic HAP in the dyeing and finishing materials applied during all deviations specified in § 63.4342(c) and (d) that occurred during the compliance period in the controlled dyeing/finishing operation, kg, as calculated in Equation 5B of this section.

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent. Use the test methods and procedures specified in §§ 63.4360 and 63.4361 to measure and record capture efficiency.

DRE = Organic HAP destruction or removal efficiency of the add-on control device, percent. Use the test methods and procedures in §§ 63.4360 and 63.4362 to measure and record the organic HAP destruction or removal efficiency.

(i) Calculate the total mass of organic HAP in the dyeing and finishing materials applied in the controlled dyeing/finishing operation(s) during the compliance period, kg, using Equation 5A of this section:

$$A_I = \sum_{i=1}^{m}\left(M_{c,i}\right)\left(W_{c,i}\right) \quad \text{(Eq. 5A)}$$

Where:

A_I = Total mass of organic HAP in the dyeing and finishing materials applied in the controlled dyeing/finishing operations(s) during the compliance period, kg.

$M_{c,i}$ = Mass of dyeing or finishing material, i, applied during the compliance period, kg.

$W_{c,i}$ = Mass fraction of organic HAP in dyeing or finishing material, i, kg per kg.

m = Number of different dyeing and finishing materials applied during compliance period.

(ii) Calculate the mass of organic HAP in the dyeing and finishing materials applied in the controlled dyeing/finishing operation during deviations specified in § 63.4342(c) and (d), using Equation 5B of this section.

$$H_{UNC} = \sum_{h=1}^{q}\left(M_h\right)\left(W_h\right) \quad \text{(Eq. 5B)}$$

Where:

H_{UNC} = Total mass of organic HAP in the dyeing and finishing materials applied during all deviations specified in § 63.4342(c) and (d) that occurred during the compliance period in the controlled dyeing/finishing operation, kg.

M_h = Total mass of dyeing and finishing material, h, applied in the controlled dyeing/finishing operation during deviations, kg.

W_h = Mass fraction of organic HAP in dyeing or finishing material, h, kg organic HAP per kg material.

q = Number of different dyeing and finishing materials applied.

(5) *Calculate the organic HAP emissions reductions for controlled dyeing/finishing operation using liquid-liquid material balances.* For each controlled dyeing/finishing operation using a solvent recovery system for which you conduct liquid-liquid

material balances, calculate the organic HAP emissions reductions by applying the volatile organic matter collection and recovery efficiency to the mass of organic HAP contained in the dyeing and finishing materials applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period. Perform a liquid-liquid material balance for the compliance period as specified in paragraphs (f)(5)(i) through (v) of this section. Calculate the mass of organic HAP emissions reductions by the solvent recovery system as specified in paragraph (f)(5)(vi) of this section.

(i) For each solvent recovery system, install, calibrate, maintain, and operate according to the manufacturer's specifications, a device that indicates the cumulative amount of volatile organic matter recovered by the solvent recovery system for the compliance period. The device must be initially certified by the manufacturer to be accurate to within ±2.0 percent of the mass of volatile organic matter recovered.

(ii) For each solvent recovery system, determine the mass of volatile organic matter recovered for the compliance period, kg, based on measurement with the device required in paragraph (f)(5)(i) of this section.

(iii) Determine the mass fraction of volatile organic matter for each dyeing and finishing material applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period, kg volatile organic matter per kg dyeing and finishing material. You may determine the volatile organic matter mass fraction using information provided by the manufacturer or supplier of the dyeing or finishing material.

(iv) Measure the mass of each dyeing and finishing material applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period, kg.

(v) For the compliance period, calculate the solvent recovery system's volatile organic matter collection and recovery efficiency using Equation 6 of this section:

$$R_V = 100\frac{M_{VR}}{\sum_{i=1}^{m} M_i WV_{c,i}} \qquad \text{(Eq. 6)}$$

Where:

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system during the compliance period, percent.

M_{VR} = Mass of volatile organic matter recovered by the solvent recovery system during the compliance period, kg.

M_i = Mass of dyeing or finishing material, i, applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period, kg.

$WV_{c,i}$ = Mass fraction of volatile organic matter for dyeing or finishing material, i, kg volatile organic matter per kg dyeing or finishing material.

m = Number of different dyeing and finishing materials applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period.

(vi) Calculate the mass of organic HAP emission reductions for the dyeing/finishing operation controlled by the solvent recovery system during the compliance period using Equation 7 of this section and according to paragraph (f)(5)(vi)(A) of this section:

$$H_{CSR} = (A_{CSR})\left(\frac{R_V}{100}\right) \qquad \text{(Eq. 7)}$$

Where:

H_{CSR} = Mass of organic HAP emission reduction for the dyeing/finishing operation controlled by the solvent recovery system during the compliance period, kg.

A_{CSR} = Total mass of organic HAP in the dyeing and finishing material applied in the dyeing/finishing operation controlled by the solvent recovery system during the compliance period, kg, calculated using Equation 7A of this section.

R_V = Volatile organic matter collection and recovery efficiency of the solvent recovery system, percent, from Equation 6 of this section.

(A) Calculate the total mass of organic HAP in the dyeing and finishing materials applied in the dyeing/finishing operation(s) controlled by the solvent recovery system during the compliance period, kg, using Equation 7A of this section:

$$A_{CSR} = \sum_{i=1}^{m}(M_{c,i})(W_{c,i}) \qquad \text{(Eq. 7A)}$$

Where:

A_{CSR} = Total mass of organic HAP in the dyeing and finishing materials applied in the dyeing/finishing operations(s) controlled by the solvent recovery system during the compliance period, kg.

$M_{c,i}$ = Mass of dyeing or finishing material, i, applied during the compliance period in the dyeing/finishing operation(s) controlled by the solvent recovery system, kg.

$W_{c,i}$ = Mass fraction of organic HAP in dyeing or finishing material, i, kg per kg.

m = Number of different dyeing and finishing materials applied during compliance period.

(6) *Calculate the total mass of dyeing and finishing materials.* Determine the total mass of dyeing and finishing materials applied, kg, which is the combined mass of all the dyeing and finishing materials applied during the compliance period in the dyeing/finishing operation(s) for which you use the emission rate with add-on controls option, using Equation 5 of § 63.4331.

(7) *Calculate the organic HAP emission rate with add-on controls for the compliance period.* Determine the organic HAP emission rate with add-on controls for the compliance period, kg organic HAP emitted per kg dyeing and finishing materials applied during the compliance period, using Equation 8 of this section.

$$H_{HAP} = \frac{H_e - \sum_{i=1}^{q}(H_{C,i}) - \sum_{j=1}^{r}(H_{CSR,j})}{M_t} \qquad \text{(Eq. 8)}$$

Where:

H_{HAP} = Organic HAP emission rate with add-on controls for the compliance period, kg organic HAP emitted per kg dyeing and finishing materials applied.

H_e = Total mass of organic HAP emissions before add-on controls from all the dyeing and finishing materials applied during the compliance period, kg, determined according to paragraph (f)(2) of this section.

$H_{C,i}$ = Total mass of organic HAP emissions reductions for controlled dyeing/finishing operation, i, not using a liquid-liquid material balance, during the compliance period, kg, from Equation 5 of this section.

$H_{CSR,j}$ = Total mass of organic HAP emissions reductions for dyeing/finishing operation, j, controlled by a solvent recovery system using a liquid-liquid material balance, during the compliance period, kg, from Equation 7 of this section.

M_t = Total mass of dyeing and finishing materials applied during the compliance period, kg, from Equation 5 of § 63.4331.

q = Number of controlled dyeing/finishing operations not using a liquid-liquid material balance.

r = Number of dyeing/finishing operations controlled by a solvent recovery system using a liquid-liquid material balance.

(8) *Compliance demonstration.* To demonstrate initial compliance with the emission limit, the organic HAP emission rate with add-on controls for the compliance period, calculated using Equation 8 of this section, must be less than or equal to the applicable emission limit in Table 1 to this subpart. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the dyeing/finishing operation(s) for which you used the emission rate with add-on controls option and submit a statement that the dyeing/finishing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP emission rate was less than or equal to the applicable emission limit in Table 1 to this subpart, and that you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293.

§ 63.4342 How do I demonstrate continuous compliance with the emission limitations?

(a) To demonstrate continuous compliance with the applicable emission limit in Table 1 to this subpart, the organic HAP emission rate for each compliance period, determined according to § 63.4341(e) for web coating/printing operations and according to § 63.4341(f) for dyeing/finishing operations, must be equal to or less than the applicable emission limit in Table 1 to this subpart. Each month following the initial compliance period described in § 63.4340 is a compliance period consisting of that month and the preceding 11 months. You must perform the calculations in § 63.4341 on a monthly basis.

(b) If the organic HAP emission rate with add-on controls for any compliance period exceeded the applicable emission limit in Table 1 to this subpart, this is a deviation from the emission limitation for that compliance period and must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(c) You must demonstrate continuous compliance with each operating limit required by § 63.4292 that applies to you, as specified in Table 2 to this subpart.

(1) If an operating parameter is out of the allowed range specified in Table 2 to this subpart, this is a deviation from the operating limit that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(2) If an operating parameter deviates from the operating limit specified in Table 2 to this subpart, then you must assume that the emission capture system and add-on control device were achieving zero efficiency during the time period of the deviation. For the purposes of completing the compliance calculations specified in § 63.4341 (e)(4) and (f)(4), you must treat the regulated materials applied during a deviation on a controlled coating/printing or dyeing/finishing operation as if they were applied on an uncontrolled coating/printing or dyeing/finishing operation for the time period of the deviation, as indicated in Equation 1 of § 63.4341 for a web coating/printing operation, and in Equation 5 of § 63.4341 for a dyeing/finishing operation.

(d) You must meet the requirements for bypass lines in § 63.4364(b) for controlled coating/printing or dyeing/finishing operations for which you do not conduct liquid-liquid material balances. If any bypass line is opened and emissions are diverted to the atmosphere when the web coating/printing or dyeing/finishing operation is running, this is a deviation that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7). For the purposes of completing the compliance calculations specified in § 63.4341(e)(4), you must treat the coating, printing, thinning, and cleaning materials applied during a deviation on a controlled web coating/printing operation as if they were used on an uncontrolled web coating/printing operation for the time period of the deviation, as indicated in Equation 1 of § 63.4341. For the purposes of completing the compliance calculations specified in § 63.4341(f)(4), you must treat the dyeing and finishing materials applied during a deviation on a controlled dyeing/finishing operation as if they were used on an uncontrolled dyeing/finishing operation for the time period of the deviation, as indicated in Equation 5 of § 63.4341.

(e) You must demonstrate continuous compliance with the work practice standards in § 63.4293. If you did not develop a work practice plan, or you did not implement the plan, or you did not keep the records required by § 63.4312(j)(8), this is a deviation from the work practice standards that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(f) As part of each semiannual compliance report required in § 63.4311, you must identify the coating/printing and dyeing/finishing operation(s) for which you use the emission rate with add-on controls option. If there were no deviations from the applicable emission limit in Table 1 to this subpart, you must submit a statement that, as appropriate, the web coating/printing operations or the dyeing/finishing operations were in compliance with the emission limitations during the reporting period because the organic HAP emission rate for each compliance period was less than or equal to the applicable emission limit in Table 1 to this subpart, and you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293 during each compliance period.

(g) During periods of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing or dyeing/finishing operation that may affect emission capture or control device efficiency, you must operate in accordance with the startup, shutdown, and malfunction plan required by § 63.4300(c).

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing or dyeing/finishing operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the startup, shutdown, and malfunction plan. The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations according to the provisions in § 63.6(e).

(i) [Reserved]

(j) You must maintain records as specified in §§ 63.4312 and 63.4313.

Compliance Requirements for the Organic HAP Overall Control Efficiency and Oxidizer Outlet Organic HAP Concentration Options

§ 63.4350 By what date must I conduct performance tests and other initial compliance demonstrations?

(a) *New and reconstructed affected sources.* For a new or reconstructed affected source, you must meet the requirements of paragraphs (a)(1) through (4) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4283. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4360, 63.4361, and 63.4362, and establish the operating limits required by § 63.4292, within 180 days of the applicable compliance date specified in § 63.4283. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), you must initiate the first material balance no later than the applicable compliance date specified in § 63.4283.

(2) You must develop and begin implementing the work practice plan required by § 63.4293 no later than the compliance date specified in § 63.4283.

(3) You must complete the compliance demonstration for the initial compliance period according to the requirements of § 63.4351. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the first full month after the compliance date, or the date you conduct the performance tests of the emission capture systems and add-on control devices, or initiate the first liquid-liquid material balance for a solvent recovery system, whichever is later. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4360, 63.4361, and 63.4362; results of liquid-liquid material balances conducted according to § 63.4351(d)(5); calculations according to § 63.4351 and supporting documentation showing that during the initial compliance period either the organic HAP overall control efficiency was equal to or greater than the applicable overall control efficiency limit in Table 1 to this subpart or the oxidizer outlet organic HAP concentration was no greater than 20 parts per million by weight (ppmw) on a dry basis; the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4364; and documentation of whether you developed and implemented the work practice plan required by § 63.4293.

(4) You do not need to comply with the operating limits for the emission capture system and add-on control device required by § 63.4292 until after you have completed the performance tests specified in paragraph (a)(1) of this section. Instead, you must maintain a log detailing the operation and maintenance of the emission capture system, add-on control device, and continuous parameter monitors during the period between the compliance date and the performance test. You must begin complying with the operating limits for your affected source on the date you complete the performance tests specified in paragraph (a)(1) of this section. This requirement does not apply to solvent recovery systems for which you conduct liquid-liquid material balances according to the requirements of § 63.4351(d)(5).

(b) *Existing sources.* For an existing affected source, you must meet the requirements of paragraphs (b)(1) through (3) of this section.

(1) All emission capture systems, add-on control devices, and CPMS must be installed and operating no later than the applicable compliance date specified in § 63.4283. Except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), you must conduct a performance test of each capture system and add-on control device according to the procedures in §§ 63.4360, 63.4361, and 63.4362, and establish the operating limits required by § 63.4292, within 180 days of the compliance date specified in § 63.4283. For a solvent recovery system for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), you must initiate the first material balance no later than the compliance date specified in § 63.4283.

(2) You must develop and begin implementing the work practice plan required by § 63.4293 no later than the compliance date specified in § 63.4283.

(3) You must complete the compliance demonstration for the initial compliance period according to the requirements of § 63.4351. The initial compliance period begins on the applicable compliance date specified in § 63.4283 and ends on the last day of the first full month after the compliance date. The initial compliance demonstration includes the results of emission capture system and add-on control device performance tests conducted according to §§ 63.4360, 63.4361, and 63.4362; results of liquid-liquid material balances conducted according to § 63.4351(d)(5); calculations according to § 63.4351 and supporting documentation showing that during the initial compliance period the organic HAP overall control efficiency was equal to or greater than the applicable organic HAP overall control efficiency limit in Table 1 to this subpart or the oxidizer outlet organic HAP concentration was no greater than 20 ppmw on a dry basis and the efficiency of the capture system was 100 percent; the operating limits established during the performance tests and the results of the continuous parameter monitoring required by § 63.4364; and documentation of whether you developed and implemented the work practice plan required by § 63.4293.

§ 63.4351 How do I demonstrate initial compliance?

(a) You may use the organic HAP overall control efficiency option or the oxidizer outlet organic HAP concentration option for any individual web coating/printing operation, for any group of web coating/printing operations in the affected source, or for all of the web coating/printing operations in the affected source. You may include both controlled and uncontrolled web coating/printing operations in a group for which you use the organic HAP overall control efficiency option. You must use either the compliant material option, the emission rate without add-on controls option, or the emission rate with add-on controls option for any web coating/printing operation(s) in the affected source for which you do not use either the organic HAP overall control efficiency option or the oxidizer outlet organic HAP concentration option. To demonstrate initial compliance, any web coating/printing operation for which you use the organic HAP overall control efficiency option must meet the applicable organic HAP overall control efficiency limitations in Table 1 to this subpart according to the procedures in paragraph (d) of this section. Any web coating/printing operation for which you use the oxidizer outlet organic HAP concentration option must meet the 20 ppmw on a dry basis limit and achieve 100 percent capture efficiencies according to the procedures in paragraph (e) of this section. To demonstrate initial compliance with either option, you also must meet the applicable operating limits in § 63.4292 according to the procedures in paragraph (b) of this section and the

work practice standards in § 63.4293 according to the procedures in paragraph (c) of this section. When calculating the organic HAP overall control efficiency according to this section, do not include any coating, printing, thinning, or cleaning materials applied on web coating/printing operations for which you use the compliant material option, the emission rate without add-on controls option, the emission rate with add-on controls option, or the oxidizer outlet organic HAP concentration option. You do not need to redetermine the mass of organic HAP in coating, printing, thinning, or cleaning materials that have been reclaimed onsite and reused in web coating/printing operation(s) for which you use the organic HAP overall control efficiency option.

(b) *Compliance with operating limits.* Except as provided in § 63.4350(a)(4), and except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.4351(d)(5), you must establish and demonstrate continuous compliance during the initial compliance period with the operating limits required by § 63.4292, using the procedures specified in §§ 63.4363 and 63.4364.

(c) *Compliance with work practice requirements.* You must develop, implement, and document your implementation of the work practice plan required by § 63.4293 during the initial compliance period as specified in § 63.4312.

(d) *Compliance with organic HAP overall control efficiency limits.* You must follow the procedures in paragraphs (d)(1) through (7) of this section to demonstrate compliance with the applicable organic HAP overall control efficiency limit in Table 1 to this subpart.

(1) *Determine the mass fraction of organic HAP and mass of coating or printing materials.* Follow the procedures specified in § 63.4331(a)(1) and (3) to determine the mass fraction of organic HAP and mass of each coating, printing, thinning, and cleaning material applied during the compliance period.

(2) *Calculate the total mass of organic HAP emissions before add-on controls.* Using Equation 1 of § 63.4331, calculate the total mass of organic HAP emissions before add-on controls from all coating, printing, thinning, and cleaning materials applied during the compliance period minus the organic HAP in certain waste materials in the web coating/printing operation or group of web coating/printing operations for which you use the organic HAP overall control efficiency option.

(3) *Calculate the organic HAP emissions reductions for each controlled web coating/printing operation.* Determine the mass of organic HAP emissions reduced for each controlled web coating/printing operation during the compliance period. The emissions reductions determination quantifies the total organic HAP emissions that pass through the emission capture system and are destroyed or removed by the add-on control device. Use the procedures in paragraph (d)(4) of this section to calculate the mass of organic HAP emissions reductions for each controlled web coating/printing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances. For each controlled web coating/printing operation using a solvent recovery system for which you conduct a liquid-liquid material balance, use the procedures in paragraph (d)(5) of this section to calculate the organic HAP emissions reductions.

(4) *Calculate the organic HAP emissions reductions for controlled web coating/printing operations not using liquid-liquid material balance.* For each controlled web coating/printing operation using an emission capture system and add-on control device other than a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emissions reductions using Equation 1 of § 63.4341. The equation applies the emission capture system efficiency and add-on control device efficiency to the mass of organic HAP contained in the coating, printing, thinning, and cleaning materials applied in the web coating/printing operation served by the emission capture system and add-on control device during the compliance period. For any period of time a deviation specified in § 63.4352(c) or (d) occurs in the controlled web coating/printing operation, including a deviation during startup, shutdown, or malfunction, then you must assume zero efficiency for the emission capture system and add-on control device. Equation 1 of § 63.4341 treats the coating, printing, thinning, and cleaning materials applied during such a deviation as if they were applied on an uncontrolled web coating/printing operation for the time period of the deviation.

(i) Calculate the total mass of organic HAP in the coating and printing material(s) applied in the controlled web coating/printing operation during the compliance period, kg, using Equation 1A of § 63.4341.

(ii) Calculate the total mass of organic HAP in the thinning and cleaning materials applied in the controlled web coating/printing operation(s) during the compliance period, kg, using Equation 1B of § 63.4341.

(iii) Calculate the mass of organic HAP in the coating, printing, thinning, and cleaning materials applied in the controlled web coating/printing operation during deviations specified in § 63.4352(c) and (d), using Equation 1C of § 63.4341.

(5) *Calculate the organic HAP emissions reductions for controlled web coating/printing operations using liquid-liquid material balance.* For each controlled web coating/printing operation using a solvent recovery system for which you conduct liquid-liquid material balances, calculate the organic HAP emissions reductions by applying the volatile organic matter collection and recovery efficiency to the mass of organic HAP contained in the coating, printing, thinning, and cleaning materials applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period. Perform a liquid-liquid material balance for the compliance period as specified in paragraphs (d)(5)(i) through (vi) of this section.

(i) For each solvent recovery system, install, calibrate, maintain, and operate according to the manufacturer's specifications, a device that indicates the cumulative amount of volatile organic matter recovered by the solvent recovery system for the compliance period. The device must be initially certified by the manufacturer to be accurate to within ±2.0 percent of the mass of volatile organic matter recovered.

(ii) For each solvent recovery system, determine the mass of volatile organic matter recovered for the compliance period, kg, based on measurement with the device required in paragraph (d)(5)(i) of this section.

(iii) Determine the mass fraction of volatile organic matter for each coating and printing material applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg volatile organic matter per kg coating and printing material. You may determine the volatile organic matter mass fraction using Method 24 of 40 CFR part 60, appendix A, or an EPA approved alternative method, or you may use information provided by the manufacturer or supplier of the coating or printing material. In the event of any inconsistency between information provided by the manufacturer or

supplier and the results of Method 24 of 40 CFR part 60, appendix A, or an approved alternative method, the test method results will govern.

(iv) Measure the mass of each coating, printing, thinning, and cleaning material applied in the web coating/printing operation controlled by the solvent recovery system during the compliance period, kg.

(v) For the compliance period, calculate the solvent recovery system's volatile organic matter collection and recovery efficiency using Equation 2 of § 63.4341.

(vi) Calculate the mass of organic HAP emissions reductions for the web coating/printing operation controlled by the solvent recovery system during the compliance period, using Equation 3 of § 63.4341.

(6) *Calculate the organic HAP overall control efficiency.* Determine the organic HAP overall control efficiency, kg organic HAP emissions reductions per kg organic HAP emissions before add-on controls during the compliance period, using Equation 1 of this section.

$$E_{HAP} = \frac{\sum_{i=1}^{q}\left(H_{C,i}\right) + \sum_{j=1}^{r}\left(H_{CSR,j}\right)}{H_e} \times 100 \qquad \text{(Eq. 1)}$$

Where:

E_{HAP} = Organic HAP overall control efficiency for the compliance period, kg organic HAP emissions reductions per kg organic HAP emissions before add-on controls during the compliance period.

$H_{C,i}$ = Total mass of organic HAP emissions reductions for controlled web coating/printing operation, i, during the compliance period, kg, from Equation 1 of § 63.4341.

$H_{CSR,j}$ = Total mass of organic HAP emissions reductions for controlled web coating/printing operation, j, during the compliance period, kg, from Equation 3 of § 63.4341.

H_e = Total mass of organic HAP emissions before add-on controls from all the coating, printing, thinning, and cleaning materials applied during the compliance period, kg, determined according to paragraph (d)(2) of this section.

q = Number of controlled web coating/printing operations except those controlled with a solvent recovery system.

r = Number of web coating/printing operations controlled with a solvent recovery system.

(7) *Compliance demonstration.* To demonstrate initial compliance with the organic HAP overall control efficiency in Table 1 to this subpart, the organic HAP overall control efficiency calculated using Equation 1 of this section must be at least 98 percent for new or reconstructed affected sources and at least 97 percent for existing affected sources. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the web coating/printing operation(s) for which you used the organic HAP overall control efficiency option and submit a statement that the web coating/printing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the organic HAP overall control efficiency was greater than or equal to the applicable organic HAP overall control efficiency in Table 1 to this subpart, and you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293.

(e) *Compliance with oxidizer outlet organic HAP concentration limit.* You must follow the procedures in paragraphs (e)(1) through (3) of this section to demonstrate compliance with the oxidizer outlet organic HAP concentration limit of no greater than 20 ppmw on a dry basis.

(1) *Install and operate a PTE.* Install and operate a PTE around each work station and associated drying or curing oven in the web coating/printing operation. An enclosure that meets the requirements in § 63.4361(a) is considered a PTE. Route all organic HAP emissions from each PTE to an oxidizer.

(2) *Determine oxidizer outlet organic HAP concentration.* Determine oxidizer outlet organic HAP concentration through performance tests using the procedures in § 63.4362(a) and (b).

(3) *Compliance demonstration.* To demonstrate initial compliance with the oxidizer outlet organic HAP concentration limit in Table 1 to this subpart, the oxidizer outlet organic HAP concentration must be no greater than 20 ppmv on a dry basis and the efficiency of the capture system must be 100 percent. You must keep all records as required by §§ 63.4312 and 63.4313. As part of the Notification of Compliance Status required by § 63.4310, you must identify the web coating/printing operation(s) for which you used the oxidizer outlet organic HAP concentration option and submit a statement that the web coating/printing operation(s) was (were) in compliance with the emission limitations during the initial compliance period because the oxidizer outlet organic HAP concentration was no greater than 20 ppmv on a dry basis, the efficiency of the capture system was 100 percent, and you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293.

§ 63.4352 How do I demonstrate continuous compliance with the emission limitations?

(a) You must meet all the requirements of this section to demonstrate continuous compliance with the organic HAP overall control efficiency. The organic HAP overall control efficiency for each compliance period, determined according to the procedures in § 63.4351(d), must be equal to or greater than the applicable organic HAP overall control efficiency limit in Table 1 to this subpart. Each month following the initial compliance period described in § 63.4350 is a compliance period. You must perform the calculations in § 63.4351(d) on a monthly basis. You must meet the applicable requirements of paragraphs (c) through (j) of this section to demonstrate continuous compliance with the oxidizer outlet organic HAP concentration limit.

(b) If the organic HAP overall control efficiency for any compliance period failed to meet the applicable organic HAP overall control efficiency in Table 1 to this subpart, this is a deviation from the emission limitation for that compliance period and must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(c) You must demonstrate continuous compliance with each operating limit required by § 63.4292 that applies to you, as specified in Table 2 to this subpart.

(1) If an operating parameter is out of the allowed range specified in Table 2

to this subpart, this is a deviation from the operating limit that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(2) If an operating parameter deviates from the operating limit specified in Table 2 to this subpart, then you must assume that the emission capture system and add-on control device were achieving zero efficiency during the time period of the deviation. For the purposes of completing the compliance calculations specified in § 63.4351(d)(4), you must treat the coating, printing, thinning, and cleaning materials applied during a deviation on a controlled web coating/printing operation as if they were applied on an uncontrolled web coating/printing operation for the time period of the deviation as indicated in Equation 1 of § 63.4341.

(d) You must meet the requirements for bypass lines in § 63.4364(b) for controlled web coating/printing operations for which you do not conduct liquid-liquid material balances. If any bypass line is opened and emissions are diverted to the atmosphere when the web coating/printing operation is running, this is a deviation that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7). For the purposes of completing the compliance calculations specified in § 63.4351(d)(4), you must treat the coating, printing, thinning, and cleaning materials applied during a deviation on a controlled web coating/printing operation as if they were applied on an uncontrolled web coating/printing operation for the time period of the deviation as indicated in Equation 1 of § 63.4341.

(e) You must demonstrate continuous compliance with the work practice standards in § 63.4293. If you did not develop a work practice plan, or you did not implement the plan, or you did not keep the records required by § 63.4312(j)(8), this is a deviation from the work practice standards that must be reported as specified in §§ 63.4310(c)(6) and 63.4311(a)(7).

(f) As part of each semiannual compliance report required in § 63.4311, you must identify the web coating/printing operation(s) for which you use the organic HAP overall control efficiency option or the oxidizer outlet organic HAP concentration option. If there were no deviations from the organic HAP overall control efficiency limitations, submit a statement that you were in compliance with the emission limitations during the reporting period because the organic HAP overall control efficiency for each compliance period was greater than or equal to the applicable organic HAP overall control efficiency in Table 1 to this subpart, and you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293 during each compliance period. If there were no deviations from the oxidizer outlet organic HAP concentration limit, submit a statement that you were in compliance with the oxidizer outlet organic HAP concentration limit, the efficiency of the capture system is 100 percent, and you achieved the operating limits required by § 63.4292 and the work practice standards required by § 63.4293 during each compliance period.

(g) During periods of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing operation that may affect emission capture or control device efficiency, you must operate in accordance with the startup, shutdown, and malfunction plan required by § 63.4300(c).

(h) Consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction of the emission capture system, add-on control device, or web coating/printing operation that may affect emission capture or control device efficiency are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with the startup, shutdown, and malfunction plan. The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations according to the provisions in § 63.6(e).

(i) [Reserved]

(j) You must maintain records as specified in §§ 63.4312 and 63.4313.

Performance Testing and Monitoring Requirements

§ 63.4360 What are the general requirements for performance tests?

(a) You must conduct each performance test required by §§ 63.4340 or 63.4350 according to the requirements in § 63.7(e)(1) and under the conditions in this section, unless you obtain a waiver of the performance test according to the provisions in § 63.7(h).

(1) *Representative web coating/printing or dyeing/finishing operation operating conditions.* You must conduct the performance test under representative operating conditions for the web coating/printing or dyeing/finishing operation. Operations during periods of startup, shutdown, or malfunction and during periods of nonoperation do not constitute representative conditions. You must record the process information that is necessary to document operating conditions during the test and explain why the conditions represent normal operation.

(2) *Representative emission capture system and add-on control device operating conditions.* You must conduct the performance test when the emission capture system and add-on control device are operating at a representative flow rate, and the add-on control device is operating at a representative inlet concentration. You must record information that is necessary to document emission capture system and add-on control device operating conditions during the test and explain why the conditions represent normal operation.

(b) You must conduct each performance test of an emission capture system according to the requirements in § 63.4361. You must conduct each performance test of an add-on control device according to the requirements in § 63.4362.

§ 63.4361 How do I determine the emission capture system efficiency?

You must use the procedures and test methods in this section to determine capture efficiency as part of the performance test required by §§ 63.4340 or 63.4350.

(a) *Assuming 100 percent capture efficiency.* You may assume the capture system efficiency is 100 percent if both of the conditions in paragraphs (a)(1) and (2) of this section are met.

(1) The capture system meets the criteria in Method 204 of appendix M to 40 CFR part 51 for a PTE and directs all the exhaust gases from the enclosure to an add-on control device.

(2) All regulated materials applied in the web coating/printing or dyeing/finishing operation are applied within the capture system; regulated material solvent flash-off, curing, and drying occurs within the capture system; and the removal or evaporation of cleaning materials from the web coating/printing operation surfaces they are applied to occurs within the capture system. For example, this criterion is not met if the web enters the open shop environment when moving between the application station and a curing oven.

(b) *Measuring capture efficiency.* If the capture system does not meet both of the criteria in paragraphs (a)(1) and (2) of this section, then you must use one of the three protocols described in paragraphs (c), (d), and (e) of this section to measure capture efficiency. The capture efficiency measurements use TVH capture efficiency as a

surrogate for organic HAP capture efficiency. For the protocols in paragraphs (c) and (d) of this section, the capture efficiency measurement must consist of three test runs. Each test run must be at least 3 hours duration or the length of a production run, up to 8 hours.

(c) *Liquid-to-uncaptured-gas protocol using a temporary total enclosure or building enclosure.* The liquid-to-uncaptured-gas protocol compares the mass of liquid TVH in regulated materials applied in the web coating/printing or dyeing/finishing operation to the mass of TVH emissions not captured by the emission capture system. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (c)(1) through (6) of this section to measure emission capture system efficiency using the liquid-to-uncaptured-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the web coating/printing or dyeing/finishing operation where regulated materials are applied, and all areas where emissions from these applied regulated materials subsequently occur, such as flash-off, curing, and drying areas. The areas of the web coating/printing or dyeing/finishing operation where capture devices collect emissions for routing to an add-on control device, such as the entrance and exit areas of an oven or tenter frame, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204A or 204F of appendix M to 40 CFR part 51 to determine the mass fraction of TVH liquid input from each regulated material used in the web coating/printing or dyeing/finishing operation during each capture efficiency test run. To make the determination, substitute TVH for each occurrence of the term volatile organic compounds (VOC) in the methods.

(3) Use Equation 1 of this section to calculate the total mass of TVH liquid input from all the regulated materials applied in the web coating/printing or dyeing/finishing operation during each capture efficiency test run.

$$TVH_{applied} = \sum_{i=1}^{n} (TVH_i)(M_i) \qquad \text{(Eq. 1)}$$

Where:

$TVH_{applied}$ = Mass of liquid TVH in regulated materials applied in the web coating/printing or dyeing/finishing operation during the capture efficiency test run, kg.

TVH_i = Mass fraction of TVH in regulated material, i, that is applied in the web coating/printing or dyeing/finishing operation during the capture efficiency test run, kg TVH per kg material.

M_i = Total mass of regulated material, i, applied in the web coating/printing or dyeing/finishing operation during the capture efficiency test run, kg.

n = Number of different regulated materials applied in the web coating/printing or dyeing/finishing operation during the capture efficiency test run.

(4) Use Method 204D or E of appendix M to 40 CFR part 51 to measure the total mass, kg, of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D if the enclosure is a temporary total enclosure.

(ii) Use Method 204E if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound-emitting operations inside the building enclosure, other than the web coating/printing or dyeing/finishing operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(5) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system using Equation 2 of this section:

$$CE = \frac{(TVH_{applied} - TVH_{uncaptured})}{TVH_{applied}} \times 100 \qquad \text{(Eq. 2)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

$TVH_{applied}$ = Total mass of TVH liquid input applied in the web coating/printing or dyeing/finishing operation during the capture efficiency test run, kg.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, kg.

(6) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(d) *Gas-to-gas protocol using a temporary total enclosure or a building enclosure.* The gas-to-gas protocol compares the mass of TVH emissions captured by the emission capture system to the mass of TVH emissions not captured. Use a temporary total enclosure or a building enclosure and the procedures in paragraphs (d)(1) through (5) of this section to measure emission capture system efficiency using the gas-to-gas protocol.

(1) Either use a building enclosure or construct an enclosure around the web coating/printing or dyeing/finishing operation where regulated materials are applied, and all areas where emissions from these applied regulated materials subsequently occur, such as flash-off, curing, and drying areas. The areas of the web coating/printing or dyeing/finishing operation where capture devices collect emissions generated by the web coating/printing or dyeing/finishing operation for routing to an add-on control device, such as the entrance and exit areas of an oven or a tenter frame, must also be inside the enclosure. The enclosure must meet the applicable definition of a temporary total enclosure or building enclosure in Method 204 of appendix M to 40 CFR part 51.

(2) Use Method 204B or 204C of appendix M to 40 CFR part 51 to measure the total mass, kg, of TVH emissions captured by the emission capture system during each capture efficiency test run as measured at the inlet to the add-on control device. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) The sampling points for the Method 204B or 204C measurement must be upstream from the add-on control device and must represent total emissions routed from the capture system and entering the add-on control device.

(ii) If multiple emission streams from the capture system enter the add-on control device without a single common duct, then the emissions entering the add-on control device must be simultaneously measured in each duct and the total emissions entering the add-on control device must be determined.

(3) Use Method 204D or 204E of appendix M to 40 CFR part 51 to measure the total mass, kg, of TVH emissions that are not captured by the emission capture system; they are measured as they exit the temporary total enclosure or building enclosure during each capture efficiency test run. To make the measurement, substitute TVH for each occurrence of the term VOC in the methods.

(i) Use Method 204D if the enclosure is a temporary total enclosure.

(ii) Use Method 204E if the enclosure is a building enclosure. During the capture efficiency measurement, all organic compound-emitting operations inside the building enclosure, other than the web coating/printing or dyeing/finishing operation for which capture efficiency is being determined, must be shut down, but all fans and blowers must be operating normally.

(4) For each capture efficiency test run, determine the percent capture efficiency of the emission capture system using Equation 3 of this section:

$$CE = \frac{TVH_{captured}}{\left(TVH_{captured} + TVH_{uncaptured}\right)} \times 100 \qquad \text{(Eq. 3)}$$

Where:

CE = Capture efficiency of the emission capture system vented to the add-on control device, percent.

$TVH_{captured}$ = Total mass of TVH captured by the emission capture system as measured at the inlet to the add-on control device during the emission capture efficiency test run, kg.

$TVH_{uncaptured}$ = Total mass of TVH that is not captured by the emission capture system and that exits from the temporary total enclosure or building enclosure during the capture efficiency test run, kg.

(5) Determine the capture efficiency of the emission capture system as the average of the capture efficiencies measured in the three test runs.

(e) *Alternative capture efficiency protocol.* As an alternative to the procedures specified in paragraphs (c) and (d) of this section, you may determine capture efficiency using any other capture efficiency protocol and test methods that satisfy the criteria of either the DQO or LCL approach as described in appendix A to subpart KK of this part.

§ 63.4362 How do I determine the add-on control device emission destruction or removal efficiency?

You must use the procedures and test methods in this section to determine the add-on control device emission destruction or removal efficiency as part of the performance test required by §§ 63.4340 and 63.4350. You must conduct three test runs as specified in § 63.7(e)(3) and each test run must last at least 1 hour.

(a) For all types of add-on control devices, use the test methods as specified in paragraphs (a)(1) through (5) of this section.

(1) Use Method 1 or 1A of appendix A to 40 CFR part 60, as appropriate, to select sampling sites and velocity traverse points.

(2) Use Method 2, 2A, 2C, 2D, 2F, or 2G of appendix A to 40 CFR part 60, as appropriate, to measure gas volumetric flow rate.

(3) Use Method 3, 3A, or 3B of appendix A to 40 CFR part 60, as appropriate, for gas analysis to determine dry molecular weight. You may also use as an alternative to Method 3B, the manual method for measuring the oxygen, carbon dioxide, and carbon monoxide content of exhaust gas in ANSI/ASME, PTC 19.10–1981, "Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus]" (incorporated by reference, see § 63.14).

(4) Use Method 4 of appendix A to 40 CFR part 60 to determine stack gas moisture.

(5) Methods for determining gas volumetric flow rate, dry molecular weight, and stack gas moisture must be performed, as applicable, during each test run.

(b) Measure the volatile organic matter concentration as carbon at the inlet and outlet of the add-on control device simultaneously, using Method 25 or 25A of appendix A to 40 CFR part 60. If you are demonstrating compliance with the oxidizer outlet organic HAP concentration limit, only the outlet volatile organic matter concentration must be determined. The outlet volatile organic matter concentration is determined as the average of the three test runs.

(1) Use Method 25 if the add-on control device is an oxidizer and you expect the total gaseous organic concentration as carbon to be more than 50 parts per million (ppm) at the control device outlet.

(2) Use Method 25A if the add-on control device is an oxidizer and you expect the total gaseous organic concentration as carbon to be 50 ppm or less at the control device outlet. Method 25A must be used to demonstrate compliance with the oxidizer outlet organic HAP concentration limit.

(3) Use Method 25A if the add-on control device is not an oxidizer.

(c) If two or more add-on control devices are used for the same emission stream, then you must measure emissions at the outlet to the atmosphere of each device. For example, if one add-on control device is a concentrator with an outlet to the atmosphere for the high-volume, dilute stream that has been treated by the concentrator, and a second add-on control device is an oxidizer with an outlet to the atmosphere for the low-volume, concentrated stream that is treated with the oxidizer, you must measure emissions at the outlet of the oxidizer and the high volume dilute stream outlet of the concentrator.

(d) For each test run, determine the total gaseous organic emissions mass flow rates for the inlet and the outlet of the add-on control device, using Equation 1 of this section. If there is more than one inlet or outlet to the add-on control device, you must calculate the total gaseous organic mass flow rate using Equation 1 of this section for each

inlet and each outlet and then total all of the inlet emissions and total all of the outlet emissions:

$$M_f = Q_{sd} C_c [12] [0.0416] [10^{-6}] \qquad \text{(Eq. 1)}$$

Where:

M_f = Total gaseous organic emissions mass flow rate, kg/hour (h).

C_c = Concentration of organic compounds as carbon in the vent gas, as determined by Method 25 or Method 25A, ppmv, dry basis.

Q_{sd} = Volumetric flow rate of gases entering or exiting the add-on control device, as determined by Method 2, 2A, 2C, 2D, 2F, or 2G, dry standard cubic meters/hour (dscm/h).

0.0416 = Conversion factor for molar volume, kg-moles per cubic meter (mole/m^3) (@ 293 Kelvin (K) and 760 millimeters of mercury (mmHg)).

(e) For each test run, determine the add-on control device organic emissions destruction or removal efficiency using Equation 2 of this section.

$$DRE = \frac{M_{fi} - M_{fo}}{M_{fi}} \qquad \text{(Eq. 2)}$$

Where:

DRE = Organic emissions destruction or removal efficiency of the add-on control device, percent.

M_{fi} = Total gaseous organic emissions mass flow rate at the inlet(s) to the add-on control device, using Equation 1 of this section, kg/h.

M_{fo} = Total gaseous organic emissions mass flow rate at the outlet(s) of the add-on control device, using Equation 1 of this section, kg/h.

(f) Determine the emission destruction or removal efficiency of the add-on control device as the average of the efficiencies determined in the three test runs and calculated in Equation 2 of this section.

§ 63.4363 How do I establish the add-on control device operating limits during the performance test?

During the performance test required by §§ 63.4340 or 63.4350 and described in §§ 63.4360, 63.4361, and 63.4362, you must establish the operating limits required by § 63.4292 according to this section, unless you have received approval for alternative monitoring and operating limits under § 63.8(f) as specified in § 63.4292.

(a) *Thermal oxidizers.* If your add-on control device is a thermal oxidizer, establish the operating limits according to paragraphs (a)(1) and (2) of this section.

(1) During the performance test, you must monitor and record the temperature at least once every 15 minutes during each of the three test runs. You must monitor the temperature in the firebox of the thermal oxidizer or immediately downstream of the firebox before any substantial heat exchange occurs.

(2) Use the data collected during the performance test to calculate and record the average temperature maintained during the performance test. This average temperature is the minimum operating limit for your thermal oxidizer.

(b) *Catalytic oxidizers.* If your add-on control device is a catalytic oxidizer, establish the operating limits according to either paragraphs (b)(1) and (2) or paragraphs (b)(3) and (4) of this section.

(1) During the performance test, you must monitor and record the temperature at the inlet to the catalyst bed and the temperature difference across the catalyst bed at least once every 15 minutes during each of the three test runs.

(2) Use the data collected during the performance test to calculate and record the average temperature at the inlet to the catalyst bed and the average temperature difference across the catalyst bed maintained during the performance test. These are the minimum operating limits for your catalytic oxidizer.

(3) As an alternative to monitoring the temperature difference across the catalyst bed, you may monitor the temperature at the inlet to the catalyst bed and implement a site-specific inspection and maintenance plan for your catalytic oxidizer as specified in paragraph (b)(4) of this section. During the performance test, you must monitor and record the temperature just before the catalyst bed at least once every 15 minutes during each of the three test runs. Use the data collected during the performance test to calculate and record the average temperature just before the catalyst bed during the performance test. This is the minimum operating limit for your catalytic oxidizer.

(4) You must develop and implement an inspection and maintenance plan for your catalytic oxidizer(s) for which you elect to monitor according to paragraph (b)(3) of this section. The plan must address, at a minimum, the elements specified in paragraphs (b)(4)(i) through (iii) of this section.

(i) Annual sampling and analysis of the catalyst activity (*i.e.*, conversion efficiency) following the manufacturer's or catalyst supplier's recommended procedures.

(ii) Monthly inspection of the oxidizer system, including the burner assembly and fuel supply lines for problems and, as necessary, adjust the equipment to assure proper air-to-fuel mixtures.

(iii) Annual internal and monthly external visual inspection of the catalyst bed to check for channeling, abrasion, and settling. If problems are found, you must take corrective action consistent with the manufacturer's recommendations and conduct a new performance test to determine destruction efficiency according to § 63.4362.

§ 63.4364 What are the requirements for CPMS installation, operation, and maintenance?

(a) *General.* If you are using a control device to comply with the emission standards in § 63.4290, you must install, operate, and maintain each CPMS specified in paragraphs (c) and (d) and (e) of this section according to the requirements in paragraphs (a)(1) through (8) of this section. You must install, operate, and maintain each CPMS specified in paragraph (b) of this section according to paragraphs (a)(5) through (7) of this section.

(1) Each CPMS must complete a minimum of one cycle of operation for each successive 15-minute period. You must have a minimum of four equally spaced successive cycles of CPMS operation to have a valid hour of data.

(2) You must have valid data from at least 90 percent of the hours during which the process operated.

(3) You must determine the hourly average of all recorded readings according to paragraphs (a)(3)(i) and (ii) of this section.

(i) To calculate a valid hourly value, you must have at least three of four equally spaced data values from that hour from a continuous monitoring system (CMS) that is not out-of-control.

(ii) Provided all of the readings recorded in accordance with paragraph (a)(3) of this section clearly demonstrate continuous compliance with the standard that applies to you, then you

are not required to determine the hourly average of all recorded readings.

(4) You must determine the rolling 3-hour average of all recorded readings for each operating period. To calculate the average for each 3-hour averaging period, you must have at least two of three of the hourly averages for that period using only average values that are based on valid data (*i.e.*, not from out-of-control periods).

(5) You must record the results of each inspection, calibration, and validation check of the CPMS.

(6) At all times, you must maintain the monitoring system in proper working order including, but not limited to, maintaining necessary parts for routine repairs of the monitoring equipment.

(7) Except for monitoring malfunctions, associated repairs, or required quality assurance or control activities (including calibration checks or required zero and span adjustments), you must conduct all monitoring at all times that the unit is operating. Data recorded during monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities shall not be used for purposes of calculating the emissions concentrations and percent reductions specified in Table 1 to this subpart. You must use all the valid data collected during all other periods in assessing compliance of the control device and associated control system. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

(8) Any averaging period for which you do not have valid monitoring data and such data are required constitutes a deviation, and you must notify the Administrator in accordance with § 63.4311(a).

(b) *Capture system bypass line.* You must meet the requirements of paragraphs (a)(5) through (6) and (b)(1) and (2) of this section for each emission capture system that contains bypass lines that could divert emissions away from the add-on control device to the atmosphere.

(1) You must monitor or secure the valve or closure mechanism controlling the bypass line in a nondiverting position in such a way that the valve or closure mechanism cannot be opened without creating a record that the valve was opened. The method used to monitor or secure the valve or closure mechanism must meet one of the requirements specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) *Flow control position indicator.* Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow control position indicator that takes a reading at least once every 15 minutes and provides a record indicating whether the emissions are directed to the add-on control device or diverted from the add-on control device. The time of occurrence and flow control position must be recorded, as well as every time the flow direction is changed. The flow control position indicator must be installed at the entrance to any bypass line that could divert the emissions away from the add-on control device to the atmosphere.

(ii) *Car-seal or lock-and-key valve closures.* Secure any bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. You must visually inspect the seal or closure mechanism at least once every month to ensure that the valve is maintained in the closed position, and the emissions are not diverted away from the add-on control device to the atmosphere.

(iii) *Valve closure continuous monitoring.* Ensure that any bypass line valve is in the closed (non-diverting) position through monitoring of valve position at least once every 15 minutes. You must inspect the monitoring system at least once every month to verify that the monitor will indicate valve position.

(iv) *Automatic shutdown system.* Use an automatic shutdown system in which the web coating/printing or dyeing/finishing operation is stopped when flow is diverted by the bypass line away from the add-on control device to the atmosphere when the web coating/printing or dyeing/finishing operation is running. You must inspect the automatic shutdown system at least once every month to verify that it will detect diversions of flow and shutdown the web coating/printing or dyeing/finishing operation.

(2) If any bypass line is opened, you must include a description of why the bypass line was opened and the length of time it remained open in the semiannual compliance reports required in § 63.4311.

(c) *Oxidizers.* If you are using an oxidizer to comply with the emission standards, you must comply with paragraphs (c)(i) through (iii) of this section.

(i) Install, calibrate, maintain, and operate temperature monitoring equipment according to the manufacturer's specifications. The calibration of the chart recorder, data logger, or temperature indicator must be verified every 3 months or the chart recorder, data logger, or temperature indicator must be replaced.

(ii) For an oxidizer other than a catalytic oxidizer, install, calibrate, operate, and maintain a temperature monitoring device equipped with a continuous recorder. The device must have an accuracy of ±1 percent of the temperature being monitored in degrees Celsius, or ±1°Celsius, whichever is greater. The thermocouple or temperature sensor must be installed in the combustion chamber at a location in the combustion zone.

(iii) For a catalytic oxidizer, install, calibrate, operate, and maintain a temperature monitoring device equipped with a continuous recorder. The device must be capable of monitoring temperature with an accuracy of ±1 percent of the temperature being monitored in degrees Celsius or ± 1 degree Celsius, whichever is greater. The thermocouple or temperature sensor must be installed in the vent stream at the nearest feasible point to the inlet and outlet of the catalyst bed. Calculate the temperature rise across the catalyst.

(d) *Other types of control devices.* If you use a control device other than an oxidizer or wish to monitor an alternative parameter and comply with a different operating limit, you must apply to the Administrator for approval of an alternative monitoring method under § 63.8(f).

(e) *Capture system monitoring.* If you are complying with the emission standards in § 63.4290 through the use of a capture system and control device, you must develop a site-specific monitoring plan containing the information specified in paragraphs (e)(1) and (2) of this section for these capture systems. You must monitor the capture system in accordance with paragraph (e)(3) of this section. You must make the monitoring plan available for inspection by the permitting authority upon request.

(1) The monitoring plan must:

(i) Identify the operating parameter to be monitored to ensure that the capture efficiency determined during the initial compliance test is maintained; and

(ii) Explain why this parameter is appropriate for demonstrating ongoing compliance; and

(iii) Identify the specific monitoring procedures.

(2) The monitoring plan must specify the operating parameter value or range of values that demonstrate compliance with the emission standards in § 63.4290. The specified operating parameter value or range of values must represent the conditions present when

the capture system is being properly operated and maintained.

(3) You must conduct all capture system monitoring in accordance with the plan.

(4) Any deviation from the operating parameter value or range of values which are monitored according to the plan will be considered a deviation from the operating limit.

(5) You must review and update the capture system monitoring plan at least annually.

Other Requirements and Information

§ 63.4370 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the Administrator has delegated authority to your State, local, or tribal agency, then that agency (as well as the U.S. EPA), has the authority to implement and enforce this subpart. You should contact your EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under subpart E of this part, the authorities contained in paragraph (c) of this section are retained by the Administrator and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section:

(1) Approval of alternatives to the work practice standards in § 63.4293 under § 63.6(g).

(2) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of major alternatives to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

§ 63.4371 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in 40 CFR 63.2, and in this section as follows:

Add-on control means an air pollution control device, such as a thermal oxidizer or carbon adsorber, that reduces pollution in an air stream by destruction or removal before discharge to the atmosphere.

As-applied means the condition of a coating at the time of application to a substrate, including any added solvent.

As purchased means the condition of a coating, printing, slashing, dyeing, or finishing material as delivered to the affected source, before alteration.

Capture device means a hood, enclosure, room, floor sweep, or other means of containing or collecting emissions and directing those emissions into an add-on air pollution control device.

Capture efficiency means the portion (expressed as a percentage) of the pollutants from an emission source that is delivered to an add-on control device.

Capture system means one or more capture devices intended to collect emissions generated by a web coating/printing or dyeing/finishing operation in the use of regulated materials, both at the point of application and at subsequent points where emissions from the regulated materials occur, such as flashoff, drying, or curing. As used in this subpart, multiple capture devices that collect emissions generated by a web coating/printing or dyeing/finishing operation are considered a single capture system.

Cleaning material means a solvent used to remove contaminants and other materials, such as dirt, grease, or oil, from a textile before a web coating/printing operation (surface preparation) or from equipment associated with the web coating/ printing operation, such as tanks, rollers, rotary screens, and knife or wiper blades. Thus, it includes any cleaning material used in the web coating and printing subcategory for surface preparation of substrates or process operation equipment cleaning or both with the exception of cleaning material applied to the substrate using handheld, non-refillable aerosol containers.

Coating means the application of a semi-liquid coating material to one or both sides of a textile web substrate. Once the coating material is dried (and cured, if necessary), it bonds with the textile to form a continuous solid film for decorative, protective, or functional purposes. Coating does not include finishing where the fiber is impregnated with a chemical or resin to impart certain properties, but a solid film is not formed.

Coating material means an elastomer, polymer, or prepolymer material applied as a thin layer to a textile web. Such materials include, but are not limited to, coatings, sealants, inks, and adhesives. Decorative, protective, or functional materials that consist only of acids, bases, or any combination of these substances are not considered coating material for the purposes of this subpart. Thinning materials also are not included in this definition of coating materials, but are accounted for separately.

Coating operation means equipment used to apply cleaning materials to a web substrate to prepare it for coating material application (surface preparation), to apply coating material to a web substrate (coating application) and to dry or cure the coating material after application by exposure to heat or radiation (coating drying or curing), or to clean coating operation equipment (equipment cleaning). A single coating operation may include any combination of these types of equipment, but always includes at least the point at which a coating or cleaning material is applied and all subsequent points in the affected source where organic HAP emissions from that coating or cleaning material occur. There may be multiple coating operations in an affected source. Coating material application with handheld, non-refillable aerosol containers, touch-up markers, or marking pens is not a coating operation for the purposes of this subpart. Polyurethane foam carpet backing operations are not coating operations for the purposes of this subpart.

Container means any portable device in which a material is stored, conveyed, treated, disposed of, or otherwise handled.

Continuous parameter monitoring system means the total equipment that may be required to meet the data acquisition and availability requirements of this subpart, used to sample, condition (if applicable), analyze, and provide a record of coating or printing operation, or capture system, or add-on control device parameters.

Controlled web coating/printing or dyeing/finishing operation means a web coating/printing or dyeing/finishing operation from which some or all of the organic HAP emissions are routed through an emission capture system and add-on control device.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limit, or operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, or operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of

whether or not such failure is permitted by this subpart.

Dyeing means the process of applying color to the whole body of a textile substrate with either natural or synthetic dyes. Dyes are applied to yarn, fiber, cord, or fabric in aqueous solutions and dried before or after finishing, depending on the process. Continuous dyeing processes include, but are not limited to thermosol, pad/steam, pad/dry, and rope range dyeing. Batch dyeing processes include, but are not limited to, jet, beck, stock, yarn, kier, beam, pad, package and skein dyeing.

Dyeing materials means the purchased dyes and dyeing auxiliaries that are used in the dyeing process. The dyes are the substances that add color to textiles through incorporation into the fiber by chemical reaction, absorption or dispersion. Dyeing auxiliaries are various substances that can be added to the dyebath to aid dyeing. Dyeing auxiliaries may be necessary to transfer the dye from the dyebath to the fiber or they may provide improvements in the dyeing process or characteristics of the dyed fiber.

Dyeing operation means the collection of equipment used to dye a textile substrate and includes equipment used for dye application, dye fixation, and textile substrate rinsing and drying. A single dyeing operation may include any combination of these types of equipment, but always includes at least the point at which a dyeing material is applied and all subsequent points in the affected source where organic HAP emissions from that dyeing material occur. There may be multiple dyeing operations in an affected source. Dyeing material application with handheld, non-refillable aerosol containers, touch-up markers, brushes, or marking pens is not a dyeing operation for the purposes of this subpart.

Emission limitation means an emission limit, operating limit, or work practice standard.

Enclosure means a structure that surrounds a source of emissions and captures and directs the emissions to an add-on control device.

Fabric means any woven, knitted, plaited, braided, felted, or non-woven material made of filaments, fibers, or yarns including thread. This term includes material made of fiberglass, natural fibers, synthetic fibers, or composite.

Finishing means the chemical treatment of a textile (*e.g.*, with resins, softeners, stain resist or soil release agents, water repellants, flame retardants, antistatic agents, or hand builders) that improves the appearance and/or usefulness of the textile substrate.

Finishing materials means the purchased substances (including auxiliaries added to the finish to improve the finishing process or the characteristics of the finished textile) that are applied individually or as mixtures to textile substrates to impart desired properties.

Finishing operations means the collection of equipment used to finish a textile substrate including chemical finish applicator(s), flashoff area(s) and drying or curing oven(s).

Laminated fabric means fabric composed of a high-strength reinforcing base fabric between two plies of flexible thermoplastic film. Two or more fabrics or textiles or a fabric and a paper substrate may be bonded with an adhesive to form a laminate. The bonding of a fabric substrate to paper is not subject to the requirements of this subpart.

Manufacturer's formulation data means data on a material (such as a coating, printing, slashing, dyeing and finishing) that are supplied by the material manufacturer based on knowledge of the ingredients used to manufacture that material, rather than based on testing of the material. Manufacturer's formulation data may include, but are not limited to, information on density, organic HAP content, and coating, printing, dyeing, slashing, finishing, thinning, or cleaning material content.

Mass fraction of organic HAP means the ratio of the mass of organic HAP to the mass of a material in which it is contained; kg of organic HAP per kg of material.

Month means a calendar month or a pre-specified period of 28 days to 35 days to allow for flexibility in recordkeeping when data are based on a business accounting period.

No organic HAP means no organic HAP is present at 0.1 percent by mass or more for OSHA-defined carcinogens as specified in 29 CFR 1910.1200(d)(4) and at 1.0 percent by mass or more for other compounds. The organic HAP content of a regulated material is determined according to § 63.4321(e)(1).

Operating scenario means for a dyeing/finishing process operation or group of process operations, the combination of operating conditions (including but not limited to, type of substrate, type and mass fraction of organic HAP in dyeing/finishing materials applied, and the process operation temperature and pressure) affecting the fraction of organic HAP applied in dyeing and finishing operations discharged to wastewater. For example, a dyeing process operation run at atmospheric pressure would be a different operating scenario from the same dyeing process operation run under pressure.

Organic HAP content means the mass of organic HAP per mass of solids for a coating or printing material calculated using Equation 1 of § 63.4321. The organic HAP content is determined for the coating or printing material as purchased.

Organic HAP overall control efficiency means the total efficiency of a control system, determined either by:

(1) The product of the capture efficiency as determined in accordance with the requirements of § 63.4361 and the control device organic emissions destruction or removal efficiency determined in accordance with the requirements of § 63.4362; or

(2) A liquid-liquid material balance in accordance with the requirements of § 63.4341(e)(5) or (f)(5) or § 63.4351(d)(5).

Permanent total enclosure (PTE) means a permanently installed enclosure that meets the criteria of Method 204 of appendix M, 40 CFR part 51, for a PTE and that directs all the exhaust gases from the enclosure to an add-on control device.

Point of determination means each point where process wastewater exits the dyeing/finishing process unit.

Printing means the application of color and patterns to textiles, usually in the form of a paste, using a variety of techniques including, but not limited to roller, rotary screen, and ink jet printing. After application of the printing material, the textile usually is treated with steam, heat, or chemicals to fix the color.

Printing material means the purchased substances, usually including gums or thickeners, dyes and appropriate chemicals such as defoamers and resins that are mixed to produce the print pastes applied to textile substrates as patterns and colors.

Printing operation means equipment used to apply cleaning materials to a web substrate to prepare it for printing material application (surface preparation), to apply printing material to one or both sides of a web substrate (printing application) and to dry or cure the printing material after application by exposure to heat or radiation (printing material drying or curing), or to clean printing operation equipment (equipment cleaning). A single printing operation may include any combination of these types of equipment, but always includes at least the point at which a printing or cleaning material is applied and all subsequent points in the affected

source where organic HAP emissions from that printing or cleaning material occur. There may be multiple printing operations in an affected source.

Publically owned treatment works or *POTW* means any device or system used in the treatment (including recycling and reclamation) of municipal sewage or industrial wastes of a liquid nature which is owned by a "State" or "municipality" (as defined by section 502(4) of the CWA). This definition includes sewers, pipes or other conveyances only if they convey wastewater to a POTW providing treatment.

Regulated materials means the organic-containing materials that are used in the three printing, coating, and dyeing subcategories defined in § 63.4281(a). Organic-HAP containing regulated materials are the source of the organic HAP emissions limited by the requirements of this subpart. The specific regulated materials for each subcategory are defined in § 63.4282.

Research or laboratory operation means an operation whose primary purpose is for research and development of new processes and products that is conducted under the close supervision of technically trained personnel and is not engaged in the manufacture of final or intermediate products for commercial purposes, except in a *de minimis* manner.

Responsible official means responsible official as defined in 40 CFR 70.2.

Slashing means the application of a chemical sizing solution to warp yarns prior to weaving to protect against snagging or abrasion that could occur during weaving.

Slashing materials, also known as sizing, means the purchased compounds that are applied to warp yarns prior to weaving. Starch, gelatin, oil, wax, and manufactured polymers such as polyvinyl alcohol, polystyrene, polyacrylic acid and polyacetates are used as sizing compounds.

Slashing operation means the equipment used to mix and prepare size for application and the slasher, which is the equipment used to apply and dry size on warp yarn.

Solids means the nonvolatile portion of the coating and printing materials that makes up the dry film on a coated substrate and the pattern or color on a printed substrate.

Startup, initial means the first time equipment is brought online in a facility.

Surface preparation means chemical treatment of part or all of a substrate to prepare it for coating or printing material application.

Temporary total enclosure means an enclosure constructed for the purpose of measuring the capture efficiency of pollutants emitted from a given source as defined in Method 204 of appendix M, 40 CFR part 51.

Textile means any one of the following:

(1) Staple fibers and filaments suitable for conversion to or use as yarns, or for the preparation of woven, knit, or nonwoven fabrics;

(2) Yarns made from natural or manufactured fibers;

(3) Fabrics and other manufactured products made from staple fibers and filaments and from yarn; and

(4) Garments and other articles fabricated from fibers, yarns, or fabrics.

Thinning material means an organic solvent that is added to a coating or printing material after the coating or printing material is received from the supplier.

Total volatile hydrocarbon (TVH) means the total amount of nonaqueous volatile organic material determined according to Methods 204A through 204C of appendix M to 40 CFR part 51 and substituting the term TVH each place in the methods where the term VOC is used. The TVH includes both VOC and non-VOC.

Uncontrolled web coating/printing or dyeing/finishing operation means acoating/printing or dyeing/finishing operation from which none of the organic HAP emissions are routed through an emission capture system and add-on control device.

Volatile organic compounds (VOC) means any compounds defined as VOC in 40 CFR 51.100(s).

Wastewater means water that is generated in a web coating, web printing, slashing, dyeing or finishing operation and is collected, stored, or treated prior to being discarded or discharged.

Web means a continuous textile substrate which is flexible enough to be wound or unwound as rolls.

Tables to Subpart OOOO of Part 63

If you are required to comply with emission limitations in accordance with §§ 63.4290 and 63.4291, you must comply with the applicable emission limits in the following table:

TABLE 1 TO SUBPART OOOO OF PART 63.—EMISSION LIMITS FOR NEW OR RECONSTRUCTED AND EXISTING AFFECTED SOURCES IN THE PRINTING, COATING AND DYEING OF FABRICS AND OTHER TEXTILES SOURCE CATEGORY

If your affected source is a . . .	And it conducts . . .	Then this is the organic HAP emission limit for each compliance period . . .
1. New or reconstructed coating and printing affected source.	Coating operations only, *or* Printing operations only, *or* Both coating and printing operations.	You may choose any one of the following limits: Reduce organic HAP emissions to the atmosphere by achieving at least a 98 percent organic HAP overall control efficiency; Limit organic HAP emissions to the atmosphere to no more than 0.08 kg of organic HAP per kg of solids applied; or If you use an oxidizer to control organic HAP emissions, operate the oxidizer such that an outlet organic HAP concentration of no greater than 20 ppmv on a dry basis is achieved and the efficiency of the capture system is 100 percent.

TABLE 1 TO SUBPART OOOO OF PART 63.—EMISSION LIMITS FOR NEW OR RECONSTRUCTED AND EXISTING AFFECTED SOURCES IN THE PRINTING, COATING AND DYEING OF FABRICS AND OTHER TEXTILES SOURCE CATEGORY—Continued

If your affected source is a . . .	And it conducts . . .	Then this is the organic HAP emission limit for each compliance period . . .
2. Existing coating and printing affected source	Coating operations only, *or* Printing operations only, *or* Both coating and printing operations.	You may choose any one of the following limits: Reduce organic HAP emissions to the atmosphere by achieving at least a 97 percent organic HAP overall control efficiency; Limit organic HAP emissions to the atmosphere to no more than 0.12 kg of organic HAP per kg of solids applied; or If you use an oxidizer to control organic HAP emissions, operate the oxidizer such that an outlet organic HAP concentration of no greater than 20 ppmv on a dry basis is achieved and the efficiency of the capture system is 100 percent.
3. New, reconstructed or existing dyeing finishing affected source.	a. Dyeing operations only	You must limit organic HAP emissions to the atmosphere to no more than 0.016 kg of organic HAP per kg of dyeing materials applied.
	b. Finishing operations only	You must limit organic HAP emissions to the atmosphere to no more than 0.0003 kg of organic HAP per kg of finishing materials applied.
	c. Both dyeing and finishing operations	You must limit organic HAP emissions to the atmosphere to no more than 0.016 kg of organic HAP per kg of dyeing and finishing materials applied.
4. New, reconstructed or existing slashing affected source.	Slashing operations only	You must limit organic HAP emissions to the atmosphere to no more than zero kg organic HAP per kg of slashing materials as determined according to §63.4321(e)(1)(iv) of this subpart.

If you are required to comply with the operating limits by §63.4292, you must comply with the applicable operating limits in the following table:

TABLE 2 TO SUBPART OOOO OF PART 63.—OPERATING LIMITS IF USING ADD-ON CONTROL DEVICES AND CAPTURE SYSTEM

For the following device . . .	You must meet the following operating limit . . .	And you must demonstrate continuous compliance with the operating limit by . . .
1. Thermal oxidizer	a. The average temperature in any 3-hour block period must not fall below the temperature limit established according to §63.4363(a)	i. Collecting the temperature data according to §63.4364(c); ii. Reducing the data to 3-hour block averages; and iii. Maintaining the 3-hour block average temperature at or above the temperature limit.
2. Catalytic oxidizer	a. The average temperature measured at the inlet to the catalyst bed in any 3-hour block period must not fall below the limit established according to §63.4363(b); and either	i. Collecting the temperature data according to §63.4364(c); ii. reducing the data to 3-hour block averages; and iii. maintaining the 3-hour block average catalyst bed inlet temparature at or above temperature limit.
	b. Ensure that the average temperature difference across the catalyst bed in any 3-hour block period does not fall below the temperature difference limit established according to §63.4363(b)(2); or	Collecting the temperature data according to §63.4364(c), reducing the data to 3-hour block averages, and maintaining the 3-hour block average temperature difference at or above the temperature difference limit.

TABLE 2 TO SUBPART OOOO OF PART 63.—OPERATING LIMITS IF USING ADD-ON CONTROL DEVICES AND CAPTURE SYSTEM—Continued

For the following device . . .	You must meet the following operating limit . . .	And you must demonstrate continuous compliance with the operating limit by . . .
	c. Develop and implement an inspection and maintenance plan according to § 63.4363(b)(4).	Maintaining an up-to-date inspection and maintenance plan, records of annual catalyst activity checks, records of monthly inspections of the oxidizer system, and records of the annual internal inspections of the catalyst bed. If a problem is discovered during a monthly or annual inspection required by § 63.4363(b)(4), you must take corrective action as soon as practicable consistent with the manufacturer's recommendations.
3. Emission capture system	Submit monitoring plan to the Administrator that identifies operating parameters to be monitored according to § 63.4364(e).	Conduct monitoring according to the plan (§ 63.4364(e)(3)).

You must comply with the applicable General Provisions requirements according to the following table:

TABLE 3 TO SUBPART OOOO OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART OOOO

Citation	Subject	Applicable to subpart OOOO	Explanation
§ 63.1(a)(1)–(12)	General Applicability	Yes.	
§ 63.1(b)(1)–(3)	Initial Applicability Determination	Yes	Applicability to subpart OOOO is also specified in § 63.4281.
§ 63.1(c)(1)	Applicability After Standard Established	Yes.	
§ 63.1(c)(2)–(3)	Applicability of Permit Program for Area Sources.	No	Area sources are not subject to subpart OOOO.
§ 63.1(c)(4)–(5)	Extensions and Notifications	Yes.	
§ 63.1(e)	Applicability of Permit Program Before Relevant Standard is Set.	Yes.	
§ 63.2	Definitions	Yes	Additional definitions are specified in § 63.4371.
§ 63.3(a)–(c)	Units and Abbreviations	Yes.	
§ 63.4(a)(1)–(5)	Prohibited Activities	Yes.	
§ 63.4(b)–(c)	Circumvention/Severability	Yes.	
§ 63.5(a)	Construction/Reconstruction	Yes.	
§ 63.5(b)(1)–(6)	Requirements for Existing, Newly Constructed, and Reconstructed Sources.	Yes.	
§ 63.5(d)	Application for Approval of Construction/Reconstruction.	Yes.	
§ 63.5(e)	Approval of Construction/Reconstruction	Yes.	
§ 63.5(f)	Approval of Construction/Reconstruction Based on Prior State Review.	Yes.	
§ 63.6(a)	Compliance With Standards and Maintenance Requirements—Applicability.	Yes.	
§ 63.6(b)(1)–(7)	Compliance Dates for New and Reconstructed Sources.	Yes	Section 63.4283 specifies the compliance dates.

TABLE 3 TO SUBPART OOOO OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART OOOO—Continued

Citation	Subject	Applicable to subpart OOOO	Explanation
§63.6(c)(1)–(5)	Compliance Dates for Existing Sources	Yes	Section 63.4283 specifies the compliance dates.
§63.6(e)(1)–(2)	Operation and Maintenance	Yes.	
§63.6(e)(3)	Startup, Shutdown, and Malfunction Plan	Yes	Only sources using an add-on control device to comply with the standards must complete startup, shutdown, and malfunction plans.
§63.6(f)(1)	Compliance Except During Startup, Shutdown, and Malfunction.	Yes	Applies only to sources using an add-on control device to comply with the standards.
§63.6(f)(2)–(3)	Methods for Determining Compliance	Yes.	
§63.6(g)(1)–(3)	Use of an Alternative Standard	Yes.	
§63.6(h)	Compliance With Opacity/Visible Emission Standards.	No	Subpart OOOO does not establish opacity standards and does not require continuous opacity monitoring systems (COMS).
§63.6(i)(1)–(16)	Extension of Compliance	Yes.	
§63.6(j)	Presidential Compliance Exemption	Yes.	
§63.7(a)(1)	Performance Test Requirements—Applicability	Yes	Applies to all affected sources. Additional requirements for performance testing are specified in §§63.4360, 63.4361, and 63.4362.
§63.7(a)(2)	Performance Test Requirements—Dates	Yes	Applies only to performance tests for capture system and control device efficiency at sources using these to comply with the standard.
§63.7(a)(3)	Performance Tests Required by the Administrator.	Yes.	
§63.7(b)–(e)	Performance Test Requirements—Notification, Quality Assurance, Facilities Necessary for Safe Testing, Conditions During Test.	Yes	Applies only to performance tests for capture system and control device efficiency at sources using these to comply with the standard.
§63.7(f)	Performance Test Requirements—Use of Alternative Test Method.	Yes	Applies to all test methods except those used to determine capture system efficiency.
§63.7(g)–(h)	Performance Test Requirements—Data Analysis, Recordkeeping, Waiver of Test.	Yes	Applies only to performance tests for capture system and add-on control device efficiency at sources using these to comply with the standards.
§63.8(a)(1)–(3)	Monitoring Requirements—Applicability	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standards. Additional requirements for monitoring are specified in §63.4364.
§63.8(a)(4)	Additional Monitoring Requirements	No	Subpart OOOO does not have monitoring requirements for flares.
§63.8(b)	Conduct of Monitoring	Yes.	
§63.8(c)(1)–(3)	Continuous Monitoring Systems (CMS) Operation and Maintenance.	Yes	Applies only to monitoring of capture system and add-on control device efficiency at sources using these to comply with the standards. Additional requirements for CMS operations and maintenance are specified in §63.4364.
§63.8(c)(4)	CMS	No	Section 63.4364 specifies the requirements for the operation of CMS for capture systems and add-on control devices at sources using these to comply.

TABLE 3 TO SUBPART OOOO OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART OOOO—Continued

Citation	Subject	Applicable to subpart OOOO	Explanation
§63.8(c)(5)	COMS	No	Subpart OOOO does not have opacity or visible emission standards.
§63.8(c)(6)	CMS Requirements	No	Section 63.4364 specifies the requirements for monitoring systems for capture systems and add-on control devices at sources using these to comply.
§63.8(c)(7)–(8)	CMS Out of Control Periods and Reporting	Yes.	
§63.8(d)—(e)	Quality Control Program and CMS Performance Evaluation.	No	Subpart OOOO does not require the use of continuous emissions monitoring systems.
§63.8(f)(1)–(5)	Use of an Alternative Monitoring Method	Yes.	
§63.8(f)(6)	Alternative to Relative Accuracy Test	No	Subpart OOOO does not require the use of continuous emissions monitoring systems.
§63.8(g)(1)–(5)	Data Reduction	No	Sections 63.4342 and 63.4352 specify monitoring data reduction.
§63.9(a)	Applicability and General Information	Yes.	
§63.9(b)	Initial Notifications	No	Subpart OOOO provides 1 year for an existing source to submit an initial notification.
§63.9(c)	Request for Extension of Compliance	Yes.	
§63.9(d)	Notification that Source is Subject to Special Compliance Requirements.	Yes.	
§63.9(e)	Notification of Performance Test	Yes	Applies only to capture system and add-on control device performance tests at sources using these to comply with the standards.
§63.9(f)	Notification of Visible Emissions/Opacity Test	No	Subpart OOOO does not have opacity or visible emission standards.
§63.9(g)(1)–(3)	Additional Notifications When Using CMS	No	Subpart OOOO does not require the use of continuous emissions monitoring systems.
§63.9(h)	Notification of Compliance Status	Yes	Section 63.4310 specifies the dates for submitting the notification of compliance status.
§63.9(i)	Adjustment of Submittal Deadlines	Yes.	
§63.9(j)	Change in Previous Information	Yes.	
§63.10(a)	Recordkeeping/Reporting—Applicability and General Information	Yes.	
§63.10(b)(1)	General Recordkeeping Requirements	Yes	Additional Requirements are specified in §§63.4312 and 63.4313.
§63.10(b)(2)(i)–(v)	Recordkeeping Relevant to Startup, Shutdown, and Malfunction Periods and CMS.	Yes	Requirements for Startup, Shutdown, and Malfunction records only apply to add-on control devices used to comply with the standards.
§63.10(b)(2)(vi)–(xi)		Yes.	
§63.10(b)(2)(xii)	Records	Yes.	
§63.10(b)(2)(xiii)		No	Subpart OOOO does not require the use of continuous emissions monitoring systems.
§63.10(b)(2)(xiv)		Yes.	
§63.10(b)(3)	Recordkeeping Requirements for Applicability Determinations.	Yes.	

TABLE 3 TO SUBPART OOOO OF PART 63.—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART OOOO—Continued

Citation	Subject	Applicable to subpart OOOO	Explanation
§63.10(c)(1)–(6)	Additional Recordkeeping Requirements for Sources with CMS.	Yes.	
§63.10(c)(7)–(8)		No	The same records are required in §63.4311(a)(7).
§63.10(c)(9)–(15)		Yes.	
§63.10(d)(1)	General Reporting Requirements	Yes	Addtional requirements are specified in §63.4311.
§63.10(d)(2)	Report of Performance Test Results	Yes	Additional requirements are specified in §63.4311(b).
§63.10(d)(3)	Reporting Opacity or Visible Emissions Observations.	No	Subpart OOOO does not require opacity or visible emissions observations.
§63.10(d)(4)	Progress Reports for Sources With Compliance Extensions.	Yes.	
§63.10(d)(5)	Startup, Shutdown, and Malfunction Reports	Yes	Applies only to add-on control devices at sources using these to comply with the standards.
§63.10(e)(1)–(2)	Additional CMS Reports	No	Subpart OOOO does not require the use of continuous emissions monitoring systems.
§63.10(e)(3)	Excess Emissions/CMS Performance Reports	No	Section 63.4311(a) specifies the contents of periodic compliance reports.
§63.10(e)(4)	COMS Data Reports	No	Subpart OOOO does not specify requirements for opacity or COMS.
§63.10(f)	Recordkeeping/Reporting Waiver	Yes.	
§63.11	Control Device Requirements/Flares	No	Subpart OOOO does not specify use of flares for compliance.
§63.12	State Authority and Delegations	Yes.	
§63.13	Addresses	Yes.	
§63.14	Incorporation by Reference	Yes	ASNI/ASME PTC 19.10–1981, Part 10
§63.15	Availability of Information/Confidentiality	Yes.	

You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data.

TABLE 4 TO SUBPART OOOO OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS

Solvent/solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
1. Toluene	108–88–3	1.0	Toluene.
2. Xylene(s)	1330–20–7	1.0	Xylenes, ethylbenzene.
3. Hexane	110–54–3	0.5	n-hexane.
4. n-Hexane	110–54–3	1.0	n-hexane.
5. Ethylbenzene	100–41–4	1.0	Ethylbenzene.
6. Aliphatic 140		0	None.
7. Aromatic 100		0.02	1% xylene, 1% cumene.
8. Aromatic 150		0.09	Naphthalene.
9. Aromatic naphta	64742–95–6	0.02	1% xylene, 1% cumene.
10. Aromatic solvent	64742–94–5	0.1	Naphthalene.
11. Exempt mineral spirits	8032–32–4	0	None.
12. Ligroines (VM & P)	8032–32–4	0	None.
13. Lactol spirits	64742–89–6	0.15	Toluene.

TABLE 4 TO SUBPART OOOO OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR SOLVENTS AND SOLVENT BLENDS—Continued

Solvent/solvent blend	CAS. No.	Average organic HAP mass fraction	Typical organic HAP, percent by mass
14. Low aromatic white spirit	64742–82–1	0	None.
15. Mineral spirits	64742–88–7	0.01	Xylenes.
16. Hydrotreated naphtha	64742–48–9	0	None.
17. Hydrotreated light distillate	64742–47–8	0.001	Toluene.
18. Stoddard solvent	8052–41–3	0.01	Xylenes.
19. Super high-flash naphtha	64742–95–6	0.05	Xylenes.
20. Varsol® solvent	8052–49–3	0.01	0.5% xylenes, 0.5% ethylbenzene.
21. VM & P naphtha	64742–89–8	0.06	3% toluene, 3% xylene.
22. Petroleum distillate mixture	68477–31–6	0.08	4% naphthalene, 4% biphenyl.

You may use the mass fraction values in the following table for solvent blends for which you do not have test data or manufacturer's formulation data:

TABLE 5 TO SUBPART OOOO OF PART 63.—DEFAULT ORGANIC HAP MASS FRACTION FOR PETROLEUM SOLVENT GROUPS [a]

Solvent type	Average organic HAP mass fraction	Typical organic HAP, percent by mass
Aliphatic [b]	0.03	1% Xylene, 1% Toluene, and 1% Ethylbenzene.
Aromatic [c]	0.06	4% Xylene, 1% Toluene, and 1% Ethylbenzene.

[a] Use this table only if the solvent blend does not match any of the solvent blends in Table 4 to this subpart and you only know whether the blend is aliphatic or aromatic.

[b] Mineral Spirits 135, Mineral Spirits 150 EC, Naphtha, Mixed Hydrocarbon, Aliphatic Hydrocarbon, Aliphatic Naphtha, Naphthol Spirits, Petroleum Spirits, Petroleum Oil, Petroleum Naphtha, Solvent Naphtha, Solvent Blend.

[c] Medium-flash Naphtha, High-flash Naphtha, Aromatic Naphtha, Light Aromatic Naphtha, Light Aromatic Hydrocarbons, Aromatic Hydrocarbons, Light Aromatic Solvent.

Environmental Protection Agency

40 CFR Part 63

National Emission Standards for Hazardous Air Pollutants for Source Categories: General Provisions; and Requirements for Control Technology Determinations for Major Sources in Accordance With Clean Air Act Sections, Sections 112(g) and 112(j); Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[FRL –7498–8]

RIN 2060–AK52

National Emission Standards for Hazardous Air Pollutants for Source Categories: General Provisions; and Requirements for Control Technology Determinations for Major Sources in Accordance With Clean Air Act Sections, Sections 112(g) and 112(j)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; amendments.

SUMMARY: In this action, we are adopting final amendments to the General Provisions for national emission standards for hazardous air pollutants (NESHAP) and to the rule which establishes criteria and procedures for equivalent emission limitations adopted pursuant to Clean Air Act (CAA) section 112(j). These final rule amendments establish a new timetable for the submission of section 112(j) Part 2 applications, which is based on the timetable we have agreed to follow for promulgation of the remaining NESHAP, and modify the content requirements for Part 2 applications. These final rule amendments also establish revised procedures for requests for applicability determination previously submitted under the section 112(j) rule, and for section 112(j) applications submitted by sources that previously obtained a case-by-case determination under CAA section 112(g). These final rule amendments also adopt various amendments to the NESHAP General Provisions governing startup, shutdown, and malfunction (SSM) plans, some of which were proposed by EPA pursuant to a settlement agreement in a judicial action concerning the prior amendments published on April 5, 2002.

EFFECTIVE DATE: May 30, 2003.

ADDRESSES: Docket No. OAR–2002–0038 (formerly A–2002–21) is located at the EPA Docket Center, EPA West, U.S. EPA (6102T), 1301 Constitution Avenue, NW., Room B–102, Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: For information concerning applicability and rule determinations, contact your State or local permitting agency representative or the appropriate EPA Regional Office representative. For further information concerning the development of these rule amendments, contact Mr. Rick Colyer, U.S. EPA, Office of Air Quality Planning and Standards, Minerals and Inorganic Chemicals Group, C504–05, Research Triangle Park, North Carolina 27711, telephone number (919) 541–5262, e-mail *colyer.rick@epa.gov.*

SUPPLEMENTARY INFORMATION: *Docket.* We have established an official public docket for this action under Docket ID No. OAR–2002–0038. The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the Office of Air and Radiation Docket and Information Center (Air Docket) in the EPA Docket Center, (EPA/DC) EPA West, Room B102, 1301 Constitution Avenue, NW., Washington, DC 20460. The EPA Docket Center Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

Electronic Docket Access. You may access the final rule electronically through the EPA Internet under the **Federal Register** listings at *http://www.epa.gov/fedrgstr/.*

An electronic version of the public docket is available through EPA's electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at *http://www.epa.gov/edocket/* to view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility in the above paragraph entitled "Docket." Once in the system, select "search," then key in the appropriate docket identification number.

Worldwide Web (WWW). In addition to being available in the docket, an electronic copy of today's promulgated rule amendments will also be available on the WWW through the Technology Transfer Network (TTN). Following the Administrator's signature, a copy of the rule amendments will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg.* The TTN provides information and technology exchange in various areas of air pollution control. If more information regarding the TTN is needed, call the TTN HELP line at (919) 541–5384.

Regulated Entities. Categories and entities potentially regulated by this action include all section 112 source categories listed under section 112(c) of the CAA.

Industry Group: Source Category

Fuel Combustion

Combustion Turbines
Engine Test Facilities
Industrial Boilers
Institutional/Commercial Boilers
Process Heaters
Reciprocating Internal Combustion Engines
Rocket Testing Facilities

Non-Ferrous Metals Processing

Primary Aluminum Production
Primary Copper Smelting
Primary Lead Smelting
Primary Magnesium Refining
Secondary Aluminum Production
Secondary Lead Smelting

Ferrous Metals Processing

Coke By-Product Plants
Coke Ovens: Charging, Top Side, and Door Leaks
Coke Ovens: Pushing, Quenching, Battery Stacks
Ferroalloys Production: Silicomanganese and Ferromanganese
Integrated Iron and Steel Manufacturing
Iron Foundries Electric Arc Furnace (EAF) Operation
Steel Foundries
Steel Pickling—HCl Process Facilities and Hydrochloric Acid Regeneration

Mineral Products Processing

Alumina Processing
Asphalt Concrete Manufacturing
Asphalt Processing
Asphalt Roofing Manufacturing
Asphalt/Coal Tar Application—Metal Pipes
Clay Products Manufacturing
Lime Manufacturing
Mineral Wool Production
Portland Cement Manufacturing
Refractories Manufacturing
Taconite Iron Ore Processing
Wool Fiberglass Manufacturing

Petroleum and Natural Gas Production and Refining

Oil and Natural Gas Production
Natural Gas Transmission and Storage
Petroleum Refineries—Catalytic Cracking (Fluid and other) Units, Catalytic Reforming Units, and Sulfur Plant Units
Petroleum Refineries—Other Sources Not Distinctly Listed

Liquids Distribution

Gasoline Distribution (Stage 1)
Marine Vessel Loading Operations
Organic Liquids Distribution (Non-Gasoline)

Surface Coating Processes

Aerospace Industries
Auto and Light Duty Truck
Large Appliance
Magnetic Tapes
Manufacture of Paints, Coatings, and Adhesives
Metal Can
Metal Coil
Metal Furniture
Miscellaneous Metal Parts and Products
Paper and Other Webs
Plastic Parts and Products
Printing, Coating, and Dyeing of Fabrics
Printing/Publishing
Shipbuilding and Ship Repair
Wood Building Products
Wood Furniture

Waste Treatment and Disposal

Hazardous Waste Incineration
Municipal Landfills
Off-Site Waste and Recovery Operations
Publicly Owned Treatment Works (POTW) Emissions
Sewage Sludge Incineration
Site Remediation
Solid Waste Treatment, Storage and Disposal Facilities (TSDF)

Agricultural Chemicals Production

Pesticide Active Ingredient Production

Fibers Production Processes

Acrylic Fibers/Modacrylic Fibers Production
Rayon Production
Spandex Production

Food and Agriculture Processes

Manufacturing of Nutritional Yeast
Cellulose Food Casing Manufacturing
Vegetable Oil Production

Pharmaceutical Production Processes

Pharmaceuticals Production

Polymers and Resins Production

Acetal Resins Production
Acrylonitrile-Butadiene-Styrene Production
Alkyd Resins Production
Amino Resins Production
Boat Manufacturing
Butyl Rubber Production
Carboxymethylcellulose Production
Cellophane Production
Cellulose Ethers Production
Epichlorohydrin Elastomers Production
Epoxy Resins Production
Ethylene-Propylene Rubber Production
Flexible Polyurethane Foam Production
Hypalon (tm) Production
Maleic Anhydride Copolymers Production
Methylcellulose Production
Methyl Methacrylate-Acrylonitrile-Butadiene-Styrene Production
Methyl Methacrylate-Butadiene-Styrene Terpolymers Production
Neoprene Production
Nitrile Butadiene Rubber Production
Nitrile Resins Production
Non-Nylon Polyamides Production
Phenolic Resins Production
Polybutadiene Rubber Production
Polycarbonates Production
Polyester Resins Production
Polyether Polyols Production
Polyethylene Terephthalate Production
Polymerized Vinylidene Chloride Production
Polymethyl Methacrylate Resins Production
Polystyrene Production
Polysulfide Rubber Production
Polyvinyl Acetate Emulsions Production
Polyvinyl Alcohol Production
Polyvinyl Butyral Production
Polyvinyl Chloride and Copolymers Production
Reinforced Plastic Composites Production
Styrene-Acrylonitrile Production
Styrene-Butadiene Rubber and Latex Production

Production of Inorganic Chemicals

Ammonium Sulfate Production—Caprolactam By-Product Plants
Carbon Black Production
Chlorine Production
Cyanide Chemicals Manufacturing
Fumed Silica Production
Hydrochloric Acid Production
Hydrogen Fluoride Production
Phosphate Fertilizers Production
Phosphoric Acid Manufacturing
Uranium Hexafluoride Production

Production of Organic Chemicals

Ethylene Processes
Quaternary Ammonium Compounds Production
Synthetic Organic Chemical

Miscellaneous Processes

Benzyltrimethylammonium Chloride Production
Butadiene Dimers Production
Carbonyl Sulfide Production
Cellulosic Sponge Manufacturing
Chelating Agents Production
Chlorinated Paraffins
Chromic Acid Anodizing
Commercial Dry Cleaning (Perchloroethylene)—Transfer Machines
Commercial Sterilization Facilities
Decorative Chromium Electroplating
Dry Cleaning (Petroleum Solvent)
Ethylidene Norbornene Production
Explosives Production
Flexible Polyurethane Foam Fabrication Operations
Friction Products Manufacturing
Halogenated Solvent Cleaners
Hard Chromium Electroplating
Hydrazine Production
Industrial Cleaning (Perchloroethylene)—Dry-to-Dry Machines
Industrial Dry Cleaning (Perchloroethylene)—Transfer Machines
Industrial Process Cooling Towers
Leather Tanning and Finishing Operations
OBPA/1,3-Diisocyanate Production
Paint Stripping Operations
Photographic Chemicals Production
Phthalate Plasticizers Production
Plywood and Composite Wood Products
Polyether Polyols Production
Pulp and Paper Production
Rubber Chemicals Manufacturing
Rubber Tire Manufacturing
Semiconductor Manufacturing
Symmetrical Tetrachloropyridine Production

Categories of Area Sources

Chromic Acid Anodizing
Commercial Dry Cleaning (Perchloroethylene)—Dry-to-Dry Machines
Commercial Dry Cleaning (Perchloroethylene)—Transfer Machines
Commercial Sterilization Facilities
Decorative Chromium Electroplating
Halogenated Solvent Cleaners
Hard Chromium Electroplating
Secondary Lead Smelting

This list is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. To determine whether you are regulated by this action, you should examine the section 112(d) regulation for your source category. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section. Only source categories listed in Table 1 for which standards have not been promulgated are affected by the section 112(j) regulation.

TABLE 1.—SECTION 112(j) PART 2 APPLICATION DUE DATES

Due date	MACT standard
10/30/03	Combustion Turbines. Lime Manufacturing. Site Remediation. Iron and Steel Foundries. Taconite Iron Ore Processing. Miscellaneous Organic Chemical Manufacturing (MON) [1]. Organic Liquids Distribution. Primary Magnesium Refining. Metal Can (Surface Coating). Plastic Parts and Products (Surface Coating). Chlorine Production. Miscellaneous Metal Parts and Products (Surface Coating) (and Asphalt/Coal Tar Application—Metal Pipes) [2].
4/28/04	Industrial Boilers, Institutional/Commercial Boilers and Process Heaters [3] Plywood and Composite Wood Product Reciprocating Internal Combustion Engines [4] Auto and Light-Duty Truck (Surface Coating).
8/13/05	Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters [5] Hydrochloric Acid Production [6].

[1] Covers 23 source categories, *see* Table 2 of this preamble.
[2] Two source categories.
[3] Includes all sources in the three categories, Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters that burn no hazardous waste.
[4] Includes engines greater than 500 brake horsepower.
[5] Includes all sources in the three categories, Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters that burn hazardous waste.
[6] Includes furnaces that produce acid from hazardous waste at sources in the category Hydrochloric Acid Production.

TABLE 2.—MON SOURCE CATEGORIES

Manufacture of Paints, Coatings, and Adhesives.
Alkyd Resins Production.
Maleic Anhydride Copolymers Production.
Polyester Resins Production.
Polymerized Vinylidene Chloride Production.
Polymethyl Methacrylate Resins Production.
Polyvinyl Acetate Emulsions Production.
Polyvinyl Alcohol Production.
Polyvinyl Butyral Production.
Ammonium Sulfate Production-Caprolactam By-Product Plants.
Quaternary Ammonium Compounds Production.
Benzyltrimethylammonium Chloride Production.
Carbonyl Sulfide Production.
Chelating Agents Production.
Chlorinated Paraffins Production.
Ethylidene Norbornene Production.
Explosives Production.
Hydrazine Production.
OBPA/1,3-Diisocyanate Production.
Photographic Chemicals Production.
Phthalate Plasticizers Production.
Rubber Chemicals Manufacturing.
Symmetrical Tetrachloropyridine Production.

Judicial Review. The amendments to the General Provisions and the section 112(j) provisions were proposed on December 9, 2002 (67 FR 72875). Today's action announces EPA's final decision concerning the amendments. Under section 307(b)(1) of the CAA, judicial review of these amendments is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by July 29, 2003. Under section 307(d)(7)(B) of the CAA, only those objections to this rule that were raised with reasonable specificity during the period for public comment may be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements that are the subject of today's final rule may not be challenged separately in civil or criminal proceedings brought by the EPA to enforce these requirements.

Outline. The information presented in this preamble is organized as follows:

I. Background
A. General Provisions
B. CAA Section 112(j) Provisions
C. The Sierra Club Litigation
D. Review of Proposed Settlement Under CAA Section 113(g)
E. Proposed Rule
II. Final Amendments to the General Provisions
A. Startup, Shutdown, and Malfunction Plans
B. Other Sections of the General Provisions
III. Final Amendments to the Section 112(j) Provisions
A. General Applicability
B. New Schedule for Part 2 Applications
C. Requests for Applicability Determination
D. Prior Section 112(g) Determinations
E. Later Part 1 Applications
F. Content of Part 2 Applications
IV. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review
B. Paperwork Reduction Act
C. Regulatory Flexibility Act (RFA)
D. Unfunded Mandates Reform Act
E. Executive Order 13132: Federalism

I. Background

A. General Provisions

Section 112 of the CAA requires us to list categories and subcategories of major sources and area sources of hazardous air pollutants (HAP) and to establish NESHAP for the listed source categories and subcategories. Major sources of HAP are those that have the potential to emit 10 tons/yr or more of any one HAP or 25 tons/yr or more of any combination of HAP. Area sources of HAP are those sources that do not have potential to emit 10 tons/yr or more of any one HAP and 25 tons/yr or more of any combination of HAP.

The General Provisions in 40 CFR part 63 establish the framework for emission standards and other requirements developed pursuant to section 112 of the CAA. The General Provisions eliminate the repetition of general information and requirements in individual NESHAP by consolidating all generally applicable information in one location. They include sections on applicability, definitions, compliance dates and requirements, monitoring, recordkeeping and reporting, among others. In addition, they include administrative sections concerning actions that the EPA (or delegated authorities) must take, such as making determinations of applicability, reviewing applications for approval of new construction, responding to requests for extensions or waivers of applicable requirements, and generally enforcing national air toxics standards. The General Provisions become

applicable to a CAA section 112(d) source category rule when the source category rule is promulgated and becomes effective.

The NESHAP General Provisions were first promulgated on March 16, 1994 (59 FR 12408). We subsequently proposed a variety of amendments to that initial rule, based in part on settlement negotiations with industrial trade organizations which had sought judicial review of the rule and in part on our practical experience in developing and implementing NESHAP, also know as maximum achievable control technology (MACT) standards, under the General Provisions (66 FR 16318, March 23, 2001). We then promulgated final amendments to the General Provisions pursuant to that proposal (67 FR 16582, April 5, 2002).

B. CAA Section 112(j) Provisions

The 1990 Amendments to section 112 of the CAA included a new section 112(j), which is entitled "Equivalent Emission Limitation by Permit." Section 112(j)(2) provides that the provisions of section 112(j) apply if EPA misses a deadline for promulgation of a standard under section 112(d) established in the source category schedule for standards. After the effective date of a title V permit program in a State, section 112(j)(3) requires the owner or operator of a major source in a source category, for which the EPA failed to promulgate a section 112(d) standard, to submit a permit application 18 months after the missed promulgation deadline.

We first promulgated a rule to implement section 112(j) on May 20, 1994 (59 FR 26429). We subsequently proposed a variety of amendments to that initial rule, based in part on settlement negotiations with industrial trade organizations which had sought judicial review of the rule and in part on our own further evaluation of the existing procedures (66 FR 16318, March 23, 2001). We then promulgated final amendments to the section 112(j) rule, along with our final amendments to the General Provisions (67 FR 16582, April 5, 2002).

C. The Sierra Club Litigation

We promulgated the final rule amending the NESHAP General Provisions and the requirements for case-by-case determinations under CAA section 112(j) on April 5, 2002 (67 FR 16582). The Sierra Club filed a petition seeking judicial review of that final rule on April 25, 2002, *Sierra Club* v. *U.S. Environmental Protection Agency,* No. 02–1135 (DC Circuit). The Sierra Club also filed a petition seeking administrative reconsideration of certain provisions in the final rule, pursuant to CAA section 307(d)(7)(B).

Shortly after the filing of the petition, EPA commenced discussions with the Sierra Club concerning a settlement agreement. We reached initial agreement with the Sierra Club on the terms of a settlement and lodged the tentative agreement with the court on August 15, 2002. Under the proposed settlement, we agreed to propose a rule to make specified amendments to the General Provisions and section 112(j) rules no later than 2 months after signature and to take final action on the proposed amendments within 7 months after signature.

D. Review of Proposed Settlement Under CAA Section 113(g)

As required by section 113(g) of the CAA, EPA published a notice in the **Federal Register** affording interested persons an opportunity to comment on the terms of the proposed settlement in *Sierra Club* v. *U.S. Environmental Protection Agency,* No. 02–1135 (DC Circuit) (67 FR 54804, August 26, 2002). In response to that notice, we received 110 timely comments, the vast majority of which opposed one or more provisions of the proposed settlement.

Virtually all of the commenters expressed concern about the practical consequences of a provision in the proposed settlement which required us to propose reducing the time between section 112(j) Part 1 and Part 2 applications from 24 months to 12 months. We agreed with the commenters that this approach would have resulted in wasteful expenditures by the applicants and the permitting agencies to prepare and to process applications which in all likelihood would never have been acted upon. Given the strong opposition to this approach reflected in the comments both by industry sources and organizations and by State and local permitting authorities, we were pleased when the Sierra Club agreed to discuss modifying the proposed settlement to establish an alternative timetable for submission of section 112(j) Part 2 applications.

The EPA and the Sierra Club then negotiated a revised settlement based on a new approach suggested by organizations representing State and local governments. In the revised settlement, we agreed to propose a schedule requiring that section 112(j) Part 2 applications for affected sources in those categories for which MACT standards were scheduled to be promulgated prior to May 15, 2002, be submitted by May 15, 2003, and section 112(j) Part 2 applications for all remaining source categories be submitted by 60 days after the scheduled promulgation date for the source category in question. We also agreed to propose the same amendments to the General Provisions concerning SSM plans which were set forth in the original settlement. The EPA and the Sierra Club executed a final settlement agreement in *Sierra Club* v. *U.S. Environmental Protection Agency,* No. 02–1135 (DC Circuit), and filed it with the court on November 26, 2002.

E. Proposed Rule

Following execution of the final settlement agreement, we published a proposed rule effectuating its terms (67 FR 72875, December 9, 2002). In addition to the proposed amendments required by the settlement, we also proposed to revise a new recordkeeping provision concerning SSM plans we adopted in the April 5, 2002 final rule, and we requested comment on issues presented by the section governing the content of section 112(j) Part 2 applications and on certain other sections in the NESHAP General Provisions we amended in the April 5, 2002 final rule.

We received 73 public comment letters in response to our proposal. We have carefully evaluated all of these comments and have modified the amendments we proposed in certain respects. Our responses to some of the major comments we received, and the decisions we have made concerning appropriate final amendments to the NESHAP General Provisions and the section 112(j) rule, are discussed in the sections which follow.

II. Final Amendments to the General Provisions

A. Startup, Shutdown, and Malfunction Plans

1. The General Duty To Minimize Emissions

We proposed revisions in the language in 40 CFR 63.6(e)(1)(i) to correct a potential problem in interpreting the relationship between the general duty to minimize emissions established by that section and the compliance of a source with its SSM plan. The section in question was modified in the April 5, 2002 final rule because the prior language appeared to impose on a source a general duty to further reduce emissions even when the source is already in full compliance with the applicable MACT standard. We deemed this result to be unreasonable and made corresponding changes in the language of the rule.

However, when we made that change, we inadvertently adopted some language which could be construed as contrary to the policies regarding the relationship between the general duty to minimize emissions and SSM plans which we stated in the proposal preamble for the preceding amendments. The SSM plans must be drafted in a manner which satisfies the general duty to minimize emissions (40 CFR 63.6(e)(3)(i)(A)). Thus, compliance with a properly drafted SSM plan during a period of startup, shutdown, or malfunction will necessarily also constitute compliance with the duty to minimize emissions, even though compliance with the MACT standard itself during a period of SSM may not be practicable. When we proposed the preceding amendments, we stated explicitly that "* * * compliance with an inadequate or improperly developed SSM plan is no defense for failing to minimize emissions." (66 FR 16327, March 23, 2001).

The Sierra Club subsequently pointed out to us that the actual language of the section as promulgated could be construed to indicate that a facility that complies with its SSM plan—regardless of whether the plan is inadequate or improperly developed—thereby satisfies its general duty to minimize emissions. We did not intend this result. Such a construction could encourage abuse because SSM plans do not have to be reviewed or approved by the permitting authority before they take effect, and because such plans may also be revised by the owner or operator of the source without prior notice to the permitting authority. The revisions to 40 CFR 63.6(e)(1)(i) which we proposed in this rulemaking were intended to assure that this section would not be construed in this manner.

We received numerous comments from industry opposing the proposed revised language. In general, the commenters did not disagree with the general principles concerning the relationship between the general duty to minimize emissions and the compliance of a source with its SSM plan which we articulated in the proposal preamble. Rather, the commenters expressed concerns about the interpretation of the proposed language.

We believe that much of the concern expressed by the commenters is based on one alternative construction of the phrase "to the levels required by the relevant standards," which replaced the phrase "at least to the levels required by the relevant standards" in several sections of the April 5, 2002 final rule. While we intended this phrase to mean that emissions must be minimized to the greatest extent which is practicable, unless and until the levels required by the applicable MACT standard are achieved, some commenters were concerned that this phrase would be construed to require that the standard be met at all times. While we believe that such a construction would be unreasonable in the context of the remainder of the rule, we do understand how the literal language could be construed in this manner. The parenthetical phrase which followed this language in one section of the April 5, 2002 final rule helped to mitigate the potential that readers might adopt this alternative construction. However, as we have explained, it also created the significant problem identified by the Sierra Club.

Many commenters suggested that we modify the language of the rule itself to more clearly establish those general principles which we stated in the proposal preamble. We agree with these commenters. Accordingly, we have adopted new language for § 63.6(e)(1)(i), which establishes the general duty to minimize emissions. This new language makes it clear that during a period of SSM, the general duty to minimize emissions requires the owner or operator to reduce emissions to the greatest extent consistent with safety and good air pollution control practices. However, during an SSM event, the general duty to minimize emissions does not require an owner or operator to achieve the levels required by the applicable MACT standard at other times, or to make further efforts to reduce emissions if such levels have been successfully achieved.

Rather than restating these principles in other sections of the rule, we have instead cross-referenced the revised language of § 63.6(e)(1)(i) in § 63.6(e)(3)(i)(A) and § 63.6(e)(3)(vii)(B). This assures that the same principles concerning the duty to minimize emissions will also be applied in the drafting of an SSM plan and in determining whether a particular SSM plan requires revision. We believe that this combination of amendments is responsive to the concerns expressed by the industry commenters. However, it also achieves our original purpose by assuring that a source will not be considered to have satisfied the duty to minimize emissions merely because it has complied with the provisions of an inadequate SSM plan.

We note that the Sierra Club argued in its comments that the whole concept that a MACT standard does not apply during periods of SSM has a questionable legal basis, and that any exemption for such activities should be strictly limited to those instances where violation of emission limitations is "unavoidable." We believe that we have discretion to make reasonable distinctions concerning those particular activities to which the emission limitations in a MACT standard apply, and we, therefore, disagree with the legal position taken by the Sierra Club. However, we note that the general duty to minimize emissions is intended to be a legally enforceable duty which applies when the emission limitations in a MACT standard do not apply, thereby limiting exceedances of generally applicable emission limitations to those instances where they cannot be reasonably avoided.

The general duty to minimize emissions requires that owners or operators review their SSM plans on an ongoing basis and make appropriate improvements to assure that excess emissions are avoided. Our experience in another regulatory context illustrates how sources and regulatory authorities can work together to improve procedures for SSM events. We have been working with the petroleum refining industry to reduce the number and significance of refinery acid gas flaring episodes, and a refinery flaring reduction protocol has now been implemented at about 35 refinery facilities nationwide. The protocol helps sources to determine the root cause of certain flaring events, determine the corrective action(s) for such problems, and then to implement the corrections.

Use of this protocol has resulted in a dramatic drop in the number of SSM events. For example, one company reduced the percentage of time in flare at its refineries (including all startup, shutdown, maintenance, upset activities) from 29.0% in 1998 to 1.6% in 2002. The EPA intends to develop guidance this year that will highlight the best practices that have been implemented by various refiners around the country to improve their response to SSM events. We believe that the experience we have gained in this process may also be beneficial to other facilities as they work to improve the quality and comprehensiveness of their SSM plans.

2. Public Access to SSM Plans

We also proposed some changes to 40 CFR 63.6(e)(3)(v), the section that governs submission of SSM plans to the EPA Administrator, and to the State or local permitting authorities which operate as the Administrator's designated representatives. That section provides that the current SSM plan must be made available upon request to the Administrator for "inspection and

copying." The "Administrator" is defined to include a State which has received delegation and is therefore the Administrator's "authorized representative" (40 CFR 63.2).

We stated in the proposal preamble for the previous rulemaking (66 FR 16326, March 23, 2001) that the permit writer or the Administrator may also require submission of the SSM plan. However, Sierra Club observed during settlement discussions that the rule as amended in April 5, 2002 did not expressly require that SSM plans be submitted to the Administrator or to the permitting authority upon request.

Because SSM plans are required for facilities subject to CAA section 112, they clearly are covered by CAA section 114(a). Therefore, to address the concern expressed by Sierra Club, we have revised the rule to make it clear that the owner or operator of an affected facility is required to submit its SSM plan to the Administrator or the permitting authority upon request. We also note that SSM plans are considered to be submitted to the Administrator under CAA section 114 even if they are submitted to a State or local agency acting on the Administrator's behalf (40 CFR 2.301(b)(2)). Under CAA section 114(c), any plan that is submitted to EPA or the permitting authority must also be made available to the public, unless the submitter makes a satisfactory showing that disclosure would divulge methods or processes that are entitled to protection under the Trade Secrets Act, 18 U.S.C. 1905.

During settlement discussions, the Sierra Club also expressed concern that some permitting authorities might not construe the rule to require that an SSM plan be obtained from the affected source when it is requested by a member of the public. We agreed to propose some revisions to the rule to facilitate better public access. We proposed to require sources to submit a copy of the SSM plan to the permitting authority at the time it is first adopted and each time it is subsequently revised.

Many commenters vigorously opposed these proposed amendments. A number of industry commenters argued that there is no general obligation to provide public access to SSM plans, and that only those plans that the States or EPA actually elect to obtain from the sources must be made available to the public. These commenters argued that EPA has incorrectly construed the SSM plan as an integral part of the permit documentation that must be made available to the public under CAA sections 114(c) and 503(e).

Industry commenters also argued that requiring routine submission of SSM plans would be very burdensome for sources, because SSM plans are often fully integrated into other operating procedures at a source, and production of a complete SSM plan might, therefore, require copying and compilation of other documents. Commenters also expressed concern about the burden on sources associated with identification and segregation of claimed Confidential Business Information (CBI), and the danger that permitting authorities might inadvertently disclose such information. Commenters also argued that routine submission of SSM plans would be burdensome for the permitting authorities.

A number of commenters suggested that appropriate public access to SSM plans could be assured by a less burdensome approach, focusing on the specific problems with the current rule that we identified in the proposal. Some commenters suggested that EPA could adopt new regulatory language specifically requiring sources to submit SSM plans when requested by the permitting authority. Others suggested that EPA provide clearer guidance to permitting authorities indicating that they are responsible and have the authority to obtain SSM plans when requested by the public. We think that these ideas are constructive.

We acknowledge that adopting a requirement that copies of SSM plans be routinely submitted to the permitting authorities would be burdensome. In particular, we think that significant resources would be expended on the process of identifying and segregating claimed CBI in each plan. We also acknowledge that the proper maintenance of these extra records would necessarily involve additional resource expenditures by the permitting authorities.

We have concluded that these additional burdens are not necessary to assure appropriate public access to SSM plans. As suggested by some commenters, we have decided instead to adopt a less burdensome approach tailored to the specific problems we identified in the proposal.

We believe that SSM plans will be most effective in minimizing emissions during periods of startup, shutdown, or malfunction if they are fully integrated with the detailed process and operating procedures of a facility. We also recognize that these types of procedures may contain trade secrets and other sensitive information, and that the integration of SSM plans with these other procedures may make it more difficult and costly for a facility to redact them in a way that would be suitable for public disclosure. We do not wish to discourage facilities from integrating SSM plans with other procedures.

On the other hand, we recognize that there will sometimes be substantial public interest in the details of SSM plans. There is increasing concern about emissions that may occur during a period of startup, shutdown, or malfunction. In addition, SSM plans may include basic information about when the emission limitations in a MACT standard apply to a particular facility and when they do not. To strike the right balance between public disclosure and the need to make SSM plans comprehensive and effective, we have adopted the following approach in this final rule.

First, we believe that the permitting authorities, acting on behalf of the public, can and should play the primary role in reviewing SSM plans and ensuring that affected sources take the necessary steps to minimize emissions during periods of startup, shutdown, or malfunction. We know that some permitting authorities review these plans during the process for initial permit issuance. In other instances, we expect that permitting authorities will review SSM plans in conjunction with inspections and other site visits, when they can more readily observe how the SSM plan relates to other operational procedures at the facility. In addition, under the language we are adopting, owners or operators must promptly submit a copy of any SSM plan (or any portion thereof) maintained at the affected source if requested by the permitting authority.

If a member of the public wishes to review the SSM plan for a particular facility, or a specific portion of that plan, he or she can ask that the permitting authority request the plan from the facility. We are also adding language requiring that the permitting authority request that the owner or operator submit to the permitting authority a particular SSM plan (or the relevant portion thereof) whenever a member of the public makes a specific and reasonable request to examine or receive a copy. Upon receipt of such a request, the permitting authority should take prompt action to make the plan available to the requestor. We also expect that, upon receiving a request that is insufficiently specific or may be overly broad, the permitting authority will work with the requestor to clarify the request and to assure that it is focused on the requestor's specific needs or interests.

As in our proposal, the owner or operator may elect to submit the

requested SSM plan in an electronic format, and any portion of the plan that is claimed to be CBI entitled to protection under CAA section 114(c) or the Trade Secrets Act must be clearly designated in the submission. Moreover, we want to encourage all parties to adopt procedures for providing public access to SSM plans which avoid unnecessary burdens or delays. Therefore, if an owner or operator and a requestor both agree that it would be more expedient or convenient for the requestor to examine the SSM plan (or a portion thereof) at the facility where it is maintained, this approach could be utilized instead of requiring submission of the SSM plan to the permitting authority. This on-site inspection procedure would be most practicable in those instances where the owner or operator has concluded that it is not necessary to redact claimed CBI when the plan is being examined at the facility that maintains it.

We think this approach assures appropriate public access to SSM plans, but dramatically reduces the aggregate expenditure of resources by sources and permitting authorities. We recognize that this approach could result in some additional delay before a member of the public could obtain a copy of the non-confidential portions of an SSM plan. However, we think that requiring routine submission of every SSM plan, without regard for whether any member of the public will ultimately seek access to it, involves a resource burden which is disproportionate to the time which may be saved when a specific plan is actually requested by a member of the public.

As for the concern of some commenters that claimed CBI information might be inadvertently disclosed, we think this is less probable when SSM plans must be submitted only on demand rather than routinely. If a submitter knows that the non-confidential portions of a plan will definitely be disclosed, we believe the submitter will be more likely to do a good job of segregating claimed CBI and preparing to properly substantiate its claim.

Some commenters expressed concern about the Homeland Security implications of public access to SSM plans. It may be that some information in a particular SSM plan could be sensitive from a Homeland Security perspective. In most instances, we think that such sensitive information would also be entitled to confidential treatment under CAA section 114(c). However, we note that the entire Federal government is presently reviewing public access requirements to assure that they are compatible with Homeland Security, and it is possible that we may in the future propose other changes in public access to SSM plans as part of this important effort.

3. Reporting Requirements

During the April 5, 2002, rulemaking concerning revisions to the General Provisions and section 112(j) rules, we received a comment from representatives of the State and local permitting authorities indicating that it would assist them in performing their oversight function if facilities were required to include the number and a description of all malfunctions that occurred during the prior reporting period in the required semiannual report. In response to that comment, we added a new reporting obligation to the language governing periodic SSM reporting in 40 CFR 63.10(d)(5)(i). However, the language we added was not limited to malfunctions and required that the facility report "the number, duration, and a brief description of each startup, shutdown, and malfunction." We later concluded that the inclusion of startups and shutdowns in this reporting requirement was unnecessary and burdensome, and we proposed to delete these events from this provision.

Many commenters supported that proposal. The Sierra Club opposed the deletion of startups and shutdowns from this reporting requirement, arguing that sources might improperly define events as startups and shutdowns. We consider this type of abuse unlikely, and we do not believe in any case that the routine reporting of all startups and shutdowns would be particularly helpful in preventing it.

In some industries, startup and shutdown events are numerous and routine. So long as the provisions of the SSM plan are followed, there does not appear to be any real utility in requiring that each individual startup and shutdown be reported or described. As many commenters noted, in those instances where a startup or shutdown includes actions which do not conform to the SSM plan and the standard is exceeded, the facility is otherwise required to promptly report these deviations from the plan.

Some commenters objected to our retention of the new malfunction reporting requirement. These commenters argue that a requirement to report all malfunctions is duplicative of other requirements, except in those instances where an SSM plan was followed during an event and no excess emissions occurred. We do not agree with these commenters that the malfunction reporting requirement should be entirely eliminated, but we have concluded that its scope can be narrowed.

With respect to malfunctions, the rule expressly requires that the SSM plan must be revised by the facility if there is an event meeting the characteristics of a malfunction which is not addressed by the plan (40 CFR 63.6(e)(3)(vii)). At the time of proposal, we believed that reporting of all malfunctions is necessary to assure that this requirement is satisfied. However, after reviewing the comments and evaluating this issue in the context of the rule as a whole, we believe that the problem of identifying new kinds of malfunctions which would require revision of the SSM plan is adequately addressed by other provisions in the rule. If a type of malfunction is not addressed by the current SSM plan, we believe that any actions taken during such a malfunction cannot be reasonably construed as actions consistent with the plan and that such actions would otherwise be reportable under § 63.10(d)(5)(i) or § 63.10(d)(5)(ii). We discuss these reporting provisions further below.

However, we also agree with a comment by the Sierra Club that reporting of malfunctions would help permitting authorities determine whether sources are attempting to circumvent the standard by improperly defining events as malfunctions. To prevent this type of potential abuse, we do not think that all malfunctions need to be reported. Rather, we think this problem can be addressed by requiring that the affected source report only those malfunctions which occurred during the reporting period and which caused or may have caused an emission limitation in the relevant standard to be exceeded. Thus, we have decided to retain the requirement that the owner or operator report malfunctions in the periodic report, but to limit its scope to those malfunctions which caused or may have caused an emission limitation in the relevant standard to be exceeded.

Moreover, we stated in the proposal that minor or routine events that do not have a significant impact on the ability of a source to meet the standard need not be classified as a malfunction, addressed by the SSM plan, or included in periodic reports. We think there is no reason to classify an event as a malfunction if it does not cause, or have the potential to cause, the emission limitations in an applicable standard to be exceeded.

A number of commenters requested that we make this policy clear in the regulatory language, rather than only in the preamble. These commenters

suggested that the definition of malfunction could be revised to accomplish this. We think this is a good idea, and we have revised the definition accordingly. We think that this change will make it clear that events that do not cause, or have the potential to cause, emission limitations in an applicable standard to be exceeded need not be included either in the SSM plan or in periodic malfunction reports.

We note that 40 CFR 63.10(d) describes two distinct types of SSM reports. Periodic SSM reports are submitted on a semiannual basis and are described in § 63.10(d)(5)(i). Immediate SSM reports which are triggered by a particular event, and which require an oral or facsimile report within 2 working days and a written report within 7 working days, are described in § 63.10(d)(5)(ii). During our review of the comments concerning the various SSM reporting provisions, we realized that there is an unresolved conflict between an amendment we made in the April 5, 2002 final rule and the language of 40 CFR 63.10(d) as it is currently codified. Although we amended 40 CFR 63.6(e)(3)(iv) to limit the immediate reporting obligation for actions which are not consistent with the SSM plan to those instances where the source exceeds the relevant emission standard, we did not make a similar conforming change in 40 CFR 63.10(d)(5)(ii). This discrepancy was also specifically identified by one commenter. We are amending § 63.10(d)(5)(ii) to correct this problem.

We are also making another conforming amendment in § 63.10(d)(5)(i). Since immediate reports of actions not consistent with the SSM plan are not required if the emission limitations in the standard are not exceeded, we believe that the periodic SSM report should identify any instances in which actions taken were not consistent with the plan but no emission limitations were exceeded.

4. Correction of Plan Deficiencies

We proposed another small change to 40 CFR 63.6(e)(7). The rule as amended in April 5, 2002 provides that EPA or the permitting authority "may" require that an SSM plan be revised if certain specified deficiencies are found. In the proposal, we stated that we could not foresee any circumstance where revision of an SSM plan should not be mandatory if it has been specifically found to be deficient under one of the criteria set forth in this section. Therefore, we proposed to change the language to make such revisions mandatory rather than discretionary.

Some commenters objected to this proposal, but their principal concern was that the criterion requiring the SSM plan to satisfy the duty to minimize emissions might be interpreted in a manner contrary to the other general principles we have articulated. We believe this concern is fully resolved by the amendments to the provisions concerning the general duty to minimize emissions which we are adopting and described above.

Some commenters also argued that the current practice of giving permitting authorities discretion concerning whether to require changes in an SSM plan works well, and there is no reason to change it unless a problem can be demonstrated. We find this argument unpersuasive. If a permitting authority has specifically found that a plan is deficient according to one of the criteria, we see no reason why it should not be mandatory for corrective action to be taken.

B. Other Sections of the General Provisions

1. Monitoring Definition

During the April 5, 2002, rulemaking, one commenter suggested that we revise the definition of "monitoring" in 40 CFR 63.2 to include the phrase "or to verify a work practice standard." There are times when we must adopt a work practice standard under CAA section 112(h) rather than an emission standard under CAA section 112(d), and compliance with such a work practice standard is sometimes verified by activities which are similar in character to those required to monitor compliance with an emission standard. Therefore, we thought that the suggested revision was a sensible one. However, because the additional language was not originally proposed by EPA, we decided to take additional comment concerning this language.

One industry commenter supported the revised monitoring definition. Other commenters expressed concern that the revised definition could make changes in work practice verification a significant permit modification, or that the revised definition might require verification of work practices beyond the procedures specified in a particular MACT standard. We do not intend either of these results, and we are not persuaded that the revised definition will cause either of these problems. Therefore, we have retained the revised definition without change.

2. Combined Compliance Reports

In the April 5, 2002, rulemaking, we also made a small change in the language of 40 CFR 63.9(h)(2)(ii), by adding the phrase "(or activities that have the same compliance date)" in response to a industry commenter. The commenter was concerned that separate compliance reports might be required for compliance obligations that have the same date and requested the option of filing a single compliance status report covering multiple compliance obligations. Because the new language we adopted was not originally proposed by EPA, and some questioned whether it clearly achieved the intended purpose, we decided to request additional comment concerning this revision and potential alternatives.

All commenters on this change agreed with our original intent in making the change, but some commenters suggested that the language is confusing and proposed alternative language. We have adopted new language for § 63.9(h)(2)(ii) which is similar to the alternative language suggested by one of these commenters.

III. Final Amendments to the Section 112(j) Provisions

A. General Applicability

In the proposed rule, we stated our intent to include new language concerning general applicability in the final amendments to the section 112(j) rule. We proposed to state explicitly that no further process to develop a case-by-case MACT determination under section 112(j) is required for any source once a generally applicable Federal MACT standard governing that source has been promulgated. In our view, it is obvious that no further process to implement section 112(j) with respect to a particular source is required or appropriate once a Federal standard governing that source has been promulgated under CAA section 112(d) or 112(h). All commenters who addressed this issue supported our proposal. A new paragraph effectuating it has been added to the general applicability provisions as 40 CFR 63.50(c).

Just as it is obvious that all activities to develop an equivalent emission limitation under CAA section 112(j) should end following promulgation of a generally applicable Federal standard, it is also clear from the statutory language that any final equivalent emission limitation which may be issued prior to adoption of such a standard is itself an enforceable Federal requirement, which remains in force until revised or supplanted pursuant to section 112(j)(6) and 40 CFR 63.56. Although it is clear from the statute that permitting authorities are expected to utilize the

title V permitting procedures to adopt and issue an equivalent emission limitation under section 112(j), it is also clear that the authority to establish and require compliance with such a limitation is provided by section 112(j) itself rather than title V. Section 112(j)(4) requires that each equivalent emission limitation be submitted for review and approval by EPA under the procedures established by CAA section 505, and upon final adoption at the time of permit issuance such an equivalent emission limitation is a binding order which may be enforced directly under Federal law. An equivalent emission limitation takes effect upon issuance of the permit containing it under section 112(j)(5), and it remains applicable to the source until it is revised or superceded, regardless of the subsequent status of the permit in which it was initially contained. For the sake of clarity, we have included additional general applicability language in 40 CFR 63.50(d) which embodies these principles.

B. New Schedule for Part 2 Applications

Under our final settlement agreement with the Sierra Club, we proposed to replace the existing schedule for submission of section 112(j) Part 2 applications (also referred to as Part 2 MACT applications or simply Part 2 applications), under which most Part 2 applications would have been due on May 15, 2004, with a new schedule establishing a specific deadline for submission of all Part 2 applications for all affected sources in a given category or subcategory. With respect to those categories or subcategories for which MACT standards are scheduled to be promulgated after this rulemaking is complete, we proposed specific Part 2 application deadlines which are 60 days after each respective scheduled promulgation date. For those categories or subcategories for which MACT standards were scheduled to be promulgated while this rulemaking was pending, we proposed a Part 2 application deadline of May 15, 2003. However, because all of the standards scheduled to be promulgated during this rulemaking process have in fact been promulgated, there is no need to take any further action concerning the proposed Part 2 application deadline for those categories.

We note that commenters were generally supportive of the new approach to scheduling of section 112(j) Part 2 applications which we proposed. We agree with commenters that the proposed schedule will permit us to avoid a wasteful expenditure of public and private resources, so long as there are no further delays in promulgation of the remaining MACT standards. We note also that the prompt and significant consequences if a promulgation deadline is missed will create new incentives for EPA and the other stakeholders to assure that the agreed promulgation deadlines are met.

The Part 2 application deadlines which we proposed for each category or subcategory were based on a separate agreement in principle we had reached with the Sierra Club on a schedule for promulgation of all remaining MACT standards which were included in the original schedule established pursuant to CAA section 112(e)(1) and 112(e)(3). While this rulemaking was pending, this agreed schedule was incorporated in a proposed consent decree and filed in *Sierra Club* v. *Whitman*, 01–1337 (D.D.C.). On March 27, 2003 (68 FR 14976), we published a notice pursuant to CAA section 113(g) affording interested persons 30 days to submit comments concerning the proposed consent decree. We have now reviewed all timely comments received concerning the proposed consent decree and have determined that there is no basis at this time for modification of the schedule incorporated in that decree.

We note that many commenters on this rulemaking opposed the promulgation schedule for particular MACT standards. We received comments arguing that the promulgation schedule should be extended for the MACT standards for Brick and Structural Clay Products, Combustion Turbines, Iron and Steel Foundries, Taconite Iron Ore Processing, Miscellaneous Organic Chemical Manufacturing (MON), and Metal Can Surface Coating. We understand why these comments were submitted on this rulemaking since the notice providing an opportunity to comment on the proposed consent decree had not been published at the time they were submitted. However, we also believe that the most appropriate context for consideration of these comments is the review of the proposed consent decree under CAA section 113(g). Accordingly, we have deemed all comments submitted on this rulemaking concerning the schedule for promulgation of particular MACT standards to also be comments concerning the proposed consent decree in *Sierra Club* v. *Whitman*. Although some commenters complained that they were denied due process or otherwise prejudiced by the failure of EPA to provide a comment opportunity concerning that consent decree, these objections are now moot in view of the fact that their comments have been considered both in this rulemaking and as part of the section 113(g) process.

In general, we believe that it is incumbent on EPA to issue all MACT standards for which the mandatory statutory promulgation date has already passed as rapidly as is practicable. We also believe that EPA is in the best position to evaluate those tasks that remain and the resources that are available to accomplish those tasks and then to establish an appropriate schedule for promulgation of overdue standards. We respectfully disagree with those commenters who argue that EPA will be unable to adhere to the agreed schedule for promulgation of particular standards.

After considering all of the comments, we have decided to adopt the schedule for section 112(j) Part 2 applications with respect to MACT standards that have not yet been promulgated, exactly as it was proposed. We have added appropriate implementing language and related tables to 40 CFR 63.52(e)(1).

Many commenters expressed concern about the possibility of additional delays in the promulgation of MACT standards and requested that EPA provide advance notice if it expects to miss one of the promulgation deadlines in the consent decree. As we stated in the proposal, we recognize that the schedule for submission of section 112(j) Part 2 applications leaves relatively little time for sources to prepare and submit such applications if a particular promulgation deadline is missed. In recognition of the tight time frames, we will try to provide prompt advance notice to affected sources and to permitting authorities if we have reason to believe that an impending promulgation deadline for a particular MACT standard will not be met.

Many commenters also requested that EPA extend the corresponding Part 2 application deadline in the event that the date for promulgation of a MACT standard in the consent decree is itself extended. We note that the dates we are adopting in this rulemaking for submission of Part 2 applications for particular categories and subcategories cannot be made automatically contingent on the content of a consent decree which has not itself been codified. We do not expect to consider any future revisions to the schedule for submission of Part 2 applications unless the schedule set forth in the consent decree is itself modified. If the deadline for promulgation of any MACT standard which appears in the consent decree is extended by the District Court in accordance with the provisions of that decree, we will consider at that time whether any corresponding adjustment

in the schedule for Part 2 applications set forth in this rule is necessary and appropriate. If we conclude that a change in the schedule for Part 2 applications is warranted, we will consider the use of expedited procedures including direct final rulemaking.

C. Requests for Applicability Determination

In the proposed rule, we noted that some additional structural changes in the section 112(j) rule are required to assure that the new schedule for Part 2 applications is as uniform as practicable for the sources in a given category or subcategory. To achieve this uniformity, we proposed certain changes in the procedures for those sources which have previously submitted a request for applicability determination under 40 CFR 63.52(e)(2)(i).

In the section 112(j) rule as amended on April 5, 2002, § 63.52(e)(2)(i) established a process by which major sources could request that the permitting authority determine whether or not specific sources at their facility belong in any category or subcategory requiring a case-by-case determination under section 112(j). All requests for applicability determination were due at the same time as the section 112(j) Part 1 applications (also referred to as Part 1 MACT applications or simply Part 1 applications) on May 15, 2002. Under the old procedures, a negative determination by the permitting authority concerning such a request meant that no further action was required, while a positive determination meant that the applicant was required to submit a Part 2 application within 24 months.

We lack precise information concerning how many requests for applicability determination were submitted to permitting authorities on or before May 15, 2002, but we believe that hundreds of such requests are pending. We know that some of these requests reflected genuine uncertainty concerning the scope of the activities or equipment governed by a particular category or subcategory. For some of these requests, the subsequent issuance of a proposed MACT standard or other subsequent events may have resolved such uncertainty. However, we also believe that many of these requests were filed merely because the filing of such a request operated to defer the deadline for submission of a Part 2 application.

To reconcile the processing of pending requests for applicability determination with the new uniform schedule for Part 2 applications, we proposed that each affected source which still wishes to pursue a previously filed request for applicability determination under 40 CFR 63.52(e)(2)(i) be required to resubmit and supplement that request within 60 days after EPA publishes final action in this rulemaking, or within 60 days after EPA publishes a proposed MACT standard for the category or subcategory in question, whichever is later. We proposed to delay the requirement to resubmit and supplement a request for applicability determination until after a proposed MACT standard is available because our experience tells us that most uncertainties regarding applicability can be resolved by examining the specific applicability language in the proposed MACT standard. We also proposed to require that each resubmitted request for an applicability determination be supplemented to specifically discuss the relation between the source(s) in question and the applicability provision in the proposed MACT standard for the category or subcategory in question, and to explain why there may still be uncertainties that require a determination of applicability. Finally, we proposed to require that the permitting authority act upon each resubmitted and supplemented request for applicability determination within an additional 60 days after the applicable deadline for the resubmitted request.

Comment on our proposals concerning processing of requests for applicability determination was more limited than on many other elements of our proposal. Some commenters requested that we provide for extensions of the deadline for action by the permitting authority. We understand that the time frame for action on a resubmitted request for applicability determination by the permitting authority is an expedited one, but we believe that extending this time frame would undermine our efforts to establish a single uniform schedule for Part 2 applications. We are hopeful that sources will act in a responsible manner and will resubmit only those requests for which genuine unresolved applicability issues remain after publication of a proposed MACT standard. This is a reasonable expectation because the procedural incentives for submission of such requests which existed previously will be eliminated. We also think that the availability of a proposed MACT standard, and the mandatory supplementation of the resubmitted request to address the effect of that proposed standard, should assure an adequate record for expedited decisions by the permitting authorities on those requests that are resubmitted.

Some commenters requested that we establish a presumption of negative applicability if the permitting authority does not make a timely decision concerning a resubmitted request. We disagree with this concept because it would establish a substantial new incentive for a source to resubmit a pending request, regardless of whether there are any genuine and significant remaining questions regarding applicability. However, we also believe it would not be appropriate to establish a presumption of positive applicability if the permitting authority does not act in a timely manner on a resubmitted request. This would penalize those sources who sincerely believe that they are not covered by the proposed rule, but are merely seeking confirmation of that conclusion by the permitting authority. We intend the absence of either a negative or a positive presumption to create a strong incentive for a source to work closely with the permitting authority to resolve any genuine applicability issues in a timely manner.

Several commenters requested that EPA make provision for the submission of new requests for applicability determination. We do not believe that the creation of a new adjudicatory process of this type in this rulemaking is either appropriate or practical. However, we encourage those sources that have new questions concerning the applicability of a proposed MACT standard to their operations or equipment to seek guidance from responsible personnel at the permitting authority and the appropriate EPA Regional Office.

One commenter requested that we make it clear that any decision by a permitting authority concerning a request for applicability determination is null and void once a final MACT standard has been promulgated. The commenter noted that a determination of applicability based on the language of the proposed standard may not always correctly anticipate the ultimate applicability of the final promulgated standard. We agree with this comment. Requests for applicability determination submitted under 40 CFR 63.52(e)(2)(i) are intended solely to determine whether a source must submit a section 112(j) application, not to resolve applicability issues which may arise in other contexts. As we discussed in the section concerning general applicability above, no further process to develop an equivalent emission limitation under section 112(j) is necessary or

appropriate once a generally applicable Federal standard has been promulgated.

After reviewing all of the comments, we have decided to adopt amendments to the procedures for requests for applicability determination as we proposed them. We have added new language to 40 CFR 63.52(e)(2)(i) which effectuates this decision.

As we noted in the proposal, those major sources which elect to resubmit requests for applicability determination with respect to sources that may be governed by one of the MACT standards which are scheduled to be promulgated by August 31, 2003, may not be entitled to receive a determination by the permitting authority on the resubmitted request until shortly after the scheduled promulgation date. If such a standard is delayed, and there is no negative determination by the permitting authority on the resubmitted request, the Part 2 application for sources within the category in question will be due on October 30, 2003. This tight time frame underscores the importance of careful coordination between such sources and the permitting authority if it appears that a MACT standard will be delayed. As discussed above, EPA will endeavor to provide timely information to affected sources and permitting authorities if it becomes apparent that the promulgation schedule for any of the remaining MACT standards will not be met.

D. Prior Section 112(g) Determinations

As part of our proposal to establish a single uniform Part 2 application deadline for all sources in a given category or subcategory, we also proposed some changes to the procedures governing CAA section 112(j) applications for those sources which have previously received a case-by-case determination pursuant to CAA section 112(g). To understand the effect of this proposal, it is helpful to review the substantive relationship between these separate statutory requirements.

In general, we anticipate that emission control requirements established as part of a previous case-by-case determination under section 112(g) will subsequently be adopted by the permitting authority to satisfy any applicable 112(j) requirements as well. This is because the determination required for any sources subject to CAA section 112(g) is supposed to be based on new source MACT, and the subsequent application of section 112(j) requirements to those same sources will be based on existing source MACT. Moreover, to assure that inconsequential differences in emission control do not result in unduly burdensome sequential case-by-case determinations, the section 112(j) rule requires the permitting authority to adopt any prior case-by-case determination under section 112(g) as its determination for the same sources under section 112(j) if it "determines that the emission limitations in the prior case-by-case determination are substantially as effective as the emission limitations which the permitting authority would otherwise adopt under section 112(j)." *See* 40 CFR 63.52(a)(3), (b)(2), and (e)(2)(ii).

Under the rule as it was amended on April 5, 2002, sources which had previously obtained a case-by-case determination under CAA section 112(g) were generally required to submit a request for an "equivalency determination" to decide if the applicable section 112(g) requirements are "substantially as effective" as the requirements which would otherwise apply under section 112(j). As explained above, we believe that this determination will generally be positive. However, the rule as amended on April 5, 2002 provided that, if such a determination were negative, the source would then be required to submit a Part 2 application within 24 months. As in the case of requests for applicability determination, changes to the old language are required to place all sources in a given category or subcategory on the same schedule for submission of Part 2 applications.

Thus, we proposed to adopt the Part 2 application deadline for a given category or subcategory as the final deadline for submission of a request for an "equivalency determination" by any affected source that previously obtained a case-by-case determination under CAA section 112(g). Those sources who submitted such requests earlier under the provisions of the existing rule need not resubmit them. However, we also proposed to construe all requests for an equivalency determination, regardless of when they were submitted, as a section 112(j) Part 2 application as well.

Under the amendments we proposed, the permitting authority must first make an equivalency determination. In the event of a negative determination, the permitting authority will then proceed to adopt a separate set of case-by-case requirements pursuant to section 112(j). This process will be completed in the same 18-month period that applies to the processing of all other Part 2 applications.

In the proposal, we explained that this revised process would not impose any new burden on sources or permitting authorities, because the permitting authority should already have all of the information required for a Part 2 application in any instance where it is already administering section 112(g) requirements applicable to the same source.

As in the case of requests for applicability determination, relatively few comments were received concerning this element of our proposal. Commenters generally accepted our view that a source which has already received a case-by-case determination under section 112(g) should not need to submit additional information in a section 112(j) application. A couple of commenters requested that the deadline for submission of a request for an equivalency determination be delayed if the promulgation of a MACT standard is delayed. Since we are proposing that the deadline for submission of requests for an equivalency determination be the same as the deadline for Part 2 applications, our discussion above of the effect of potential delays applies equally to this issue.

After reviewing all of the comments, we have decided to adopt amendments to the procedures for requests for equivalency determination exactly as we proposed them. We have added new language to 40 CFR 63.52(e)(2)(ii) which effectuates this decision.

E. Later Part 1 Applications

In drafting new language to effectuate our amendments to the section 112(j) rule, we identified one additional conforming change in the prior rule language which is necessary. There are a few instances where a source may be required to submit a Part 1 application meeting the requirements of 40 CFR 63.53(a) for the first time on a date which is after the otherwise uniform date for submission of Part 2 applications which we are establishing. This may occur under 40 CFR 63.52(b) when new emission units are installed at a major source, when there is an increase in the potential to emit that causes an area source to become a major source, or when EPA establishes a lesser quantity emission rate that causes an area source to become a major source. This may also occur under 40 CFR 63.52(c) if a source that has previously obtained a section 112(j) determination changes the equipment or activities which were previously covered by that determination.

We consider it relatively unlikely that any of these provisions will be triggered, even if there is a delay in the promulgation of one or more MACT standards which results in submission of some Part 2 applications. However, in the event that any Part 1 applications must be submitted for the first time after

the deadline for submission of Part 2 applications, we think it is appropriate to provide an additional 60 days for submission of a Part 2 application after the applicable deadline for the Part 1 application. We have added another sentence to 40 CFR 63.52(e)(1) which addresses this matter.

F. Content of Part 2 Applications

We intend to meet the obligations we will be assuming under the consent decree in *Sierra Club* v. *Whitman* to promulgate the remaining MACT standards in a timely manner. If we succeed in promulgating all remaining MACT standards by the applicable deadlines, there will be no need for submission of any Part 2 applications. However, we also made it clear in the proposed rule that we want to minimize any unnecessary burdens associated with the submission of Part 2 applications if such applications do become necessary. We do not want to require the submission of any information which is not truly necessary to prepare for potential issuance of case-by-case MACT determinations. To that end, our proposal included some general guidance concerning the relationship between Part 2 applications and an applicable proposed MACT standard, and we also asked some additional questions intended to assist us in further limiting any unnecessary burden associated with Part 2 applications.

In our proposal, we stated that we think it is reasonable for an affected source submitting a Part 2 application to rely directly on the content of the applicable proposed MACT standard in identifying affected emission points. We also stated that applicants could reasonably limit the information they submit concerning HAP emissions to those specific HAP or groups of HAP which would be subject to actual control in the applicable proposed MACT standard. Commenters were generally supportive of these principles. Rather than merely providing guidance, we have decided to revise the language of 40 CFR 63.53(b) to expressly incorporate these principles.

Many commenters argued that the burden of compiling a Part 2 application could be diminished by permitting cross-referencing of various other documents. We agree generally with this concept, although we think that the specific information which is being cross-referenced needs to be clearly identified and the information being cross-referenced should also be information that is readily available to the permitting authority. Rather than attempting to specify those particular documents that may be appropriately cross-referenced, we have decided to adopt language setting forth general principles regarding the cross-referencing of other documents in Part 2 applications. These general principles are included in a new paragraph codified as 40 CFR 63.53(b)(1).

We have concluded that an applicant should be permitted to cross-reference specific information in any prior submission to the permitting authority, so long as the applicant does not presume favorable action on any prior application or request which is still pending. Further, we have concluded that an applicant should be permitted to cross-reference any part of a standard proposed by EPA pursuant to CAA section 112(d) or 112(h) for a category or subcategory which includes sources to which the Part 2 application applies. We also want to assure applicants that they can cross-reference a proposed standard as part of their Part 2 application without necessarily supporting the proposal itself. Thus, an applicant who cross-references a proposed standard is free to argue that another approach (other than the approach proposed by EPA) should be used in making the case-by-case MACT determination.

We received numerous comments in response to our question asking whether the applicant needs to provide "estimated total uncontrolled and controlled emission rates" for HAP, and in response to our question asking whether new emission testing should be required if an applicant lacks sufficient information to make meaningful estimates. Many commenters argued that estimated emission rates are not necessary, and that no new emission testing should be required. Commenters also argued that such information can be requested by the permitting authority in those instances where it may be needed.

In evaluating these comments, we have considered whether estimates of controlled and uncontrolled emission rates are consistently needed to process a Part 2 application. In some instances, such emission data may be necessary to identify those emission points which would be subject to control under a proposed MACT standard, but we believe that the provision requiring the applicant to otherwise identify such emission points is sufficient in those instances where this is true. Such emission information may also be necessary in some cases to develop permit terms which apply the general requirements of a particular MACT standard or determination to the particular characteristics of an affected source. However, we believe that it is sufficient to assure that the permitting authority can request that an applicant provide specific emission information it needs for this purpose. We note that if such information is not provided in the Part 2 application, the permitting authority will still be able to obtain it in the context of the permitting process which follows. Based on this analysis, we have decided to delete the provision requiring estimates of total uncontrolled and controlled HAP emission rates in Part 2 applications, and to add a provision requiring the applicant to submit any additional emission data or other information specifically requested by the permitting authority.

Commenters generally argued that the applicant should not be required to submit "information relevant to establishing the MACT floor." We agree with this conclusion. We do not think applicants should be required to submit such information, but we do think they should be free to do so if they wish to propose an alternative to the floor determination set forth in the proposed MACT standard. Accordingly, we have deleted this information as a mandatory requirement, but have retained the provision permitting the applicant to suggest an alternative set of emission limitations or work practice provisions on a discretionary basis.

IV. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), we must determine whether a regulatory action is "significant" and, therefore, subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that these final amendments are not a "significant regulatory action" under the terms of Executive Order 12866 and are, therefore, not subject to OMB review.

B. Paperwork Reduction Act

As required by the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, the OMB must approve any reporting and recordkeeping requirements that qualify as an information collection request (ICR) under the PRA.

Approval of an ICR is not required for the General Provisions amendments because, for sources affected by CAA section 112 only, the General Provisions do not require any activities until source category-specific standards have been promulgated or until title V permit programs become effective. The actual recordkeeping and reporting burden that would be imposed by the General Provisions for each source category covered by 40 CFR part 63 will be estimated when standards applicable to such category are promulgated.

Approval of an ICR is not required for the section 112(j) rule amendments, either. The EPA fully expects to promulgate all remaining MACT standards before the Part 2 permit applications are due, thus eliminating the burden associated with preparing the application and developing case-by-case MACT determinations for individual sources.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

C. Regulatory Flexibility Act (RFA)

The EPA has determined that it is not necessary to prepare a regulatory flexibility analysis in connection with these final amendments. The EPA has also determined that these amendments will not have a significant economic impact on a substantial number of small entities. For purposes of assessing the impact of today's rule amendments on small entities, small entities are defined as: (1) A small business whose parent company has fewer than 1,000 employees; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; or (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final amendments on small entities, EPA has concluded that this action will not have a significant economic impact on a substantial number of small entities.

A regulatory flexibility analysis is not necessary for the General Provisions amendments because it is unknown at this time which requirements from the General Provisions will be applicable to any particular source category, whether such category includes small businesses, and how significant the impacts of those requirements would be on small businesses. Impacts on small entities associated with the General Provisions will be assessed when specific emission standards affecting those sources are developed. "Small entities" will be defined in the context of the applicability of those standards.

Similarly, no analysis has been prepared for the amendments to the section 112(j) rule. The rule provides general guidance and procedures concerning the implementation of an underlying statutory requirement, but it does not by itself impose any regulatory requirements or prescribe the specific content of any case-by-case determination which might be made under section 112(j). Although the final amendments will not have a significant economic impact on a substantial number of small entities, EPA nonetheless has tried to reduce the impact of the rule amendments on small entities. We do not require the Part 2 permit applications until 60 days after the scheduled MACT standard promulgation date. We fully anticipate that all MACT standards will be promulgated before any Part 2 applications are due, thus eliminating the burden of submitting a Part 2 application.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with "Federal mandates" that may result in expenditures to State, local, and tribal governments, in aggregate, or by the private sector, of $100 million or more in any 1 year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objective of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows the EPA to adopt an alternative other than the least-costly, most cost-effective, or least-burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted.

Before the EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

The EPA has determined that these final amendments do not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any 1 year. The EPA has determined that this action is not a "significant" regulatory action within the meaning of Executive Order 12866, and it does not impose any additional Federal mandate on State, local and tribal governments or the private sector within the meaning of the UMRA. Thus, today's final rule amendments are not subject to the requirements of sections 202, 203, and 205 of the UMRA.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999), requires the EPA to develop an accountable process to ensure "meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications." "Policies that have federalism implications" are defined in the Executive Order to include regulations that have "substantial direct effects on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government."

These final amendments do not have federalism implications and will not have substantial direct effects on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of Government, as specified in Executive Order 13132. Nevertheless, in the spirit of Executive Order 13132 and consistent with EPA policy to promote communications between EPA, State and local governments, EPA specifically solicited comment on the rule amendments from State and local officials.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175 (65 FR 67249, November 6, 2000) requires EPA to develop an accountable process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have tribal implications." "Policies that have tribal implications" are defined in the Executive Order to include regulations that have "substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes."

These final rule amendments do not have tribal implications. They will not have substantial direct effects on tribal governments, or on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes, as specified in Executive Order 13175. There are currently no tribal governments that have approved title V permit programs to which sources would submit permit applications on May 15, 2002. Accordingly, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 (62 FR 19885, April 23, 1997) applies to any rule that (1) is determined to be "economically significant" as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the Agency must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonable alternatives considered by the Agency.

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that are based on health or safety risks, such that the analysis required under section 5–501 of the Executive Order has the potential to influence the regulation. The final amendments to the General Provisions are not subject to Executive Order 13045 because the provisions provide general technology performance and compliance guidelines for section 112(d) standards, which are not based on health or safety risks. Likewise, the final amendments to the section 112(j) rule are not subject to Executive Order 13045 because they establish the process for developing case-by-case MACT, and thus are based on technology performance and not on safety or health risks.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, Or Use

These final amendments are not subject to Executive Order 13211 (66 FR 26355, May 22, 2001), because they are not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act of 1995

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995, (Pub. L. No. 104–113) (15 U.S.C. 272 note), directs the EPA to use voluntary consensus standards in their regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs the EPA to provide Congress, through annual reports to OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

The final amendments to the General Provisions do not include any technical standards; they consist primarily of revisions to the generally applicable procedural and administrative requirements that the General Provisions overlay on NESHAP. The final amendments to the section 112(j) rule, which establishes requirements and procedures for owners or operators of major sources of HAP and permitting authorities to follow if the EPA misses the deadline for promulgation of section 112(d) standards, clarify and amend current procedural and administrative provisions to establish equivalent emissions limitations by permit. Therefore, section 112(j) is also not a vehicle for the application of voluntary consensus standards.

J. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the SBREFA, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. Therefore, we will submit a report containing the final amendments and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. These final amendments are not a "major rule" as defined by 5 U.S.C. 804(2), and therefore will be effective May 30, 2003.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: May 8, 2003.

Christine Todd Whitman,

Administrator.

■ For the reasons cited in the preamble, part 63, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—[Amended]

■ 2. Section 63.2 is amended by revising the first sentence in the definition of *Malfunction* to read as follows:

§ 63.2 Definitions.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control and monitoring equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. * * *

* * * * *

■ 3. Section 63.6 is amended by:
■ a. Revising paragraph (e)(1)(i);
■ b. Revising the first sentence in paragraph (e)(3)(i) introductory text;
■ c. Revising paragraph (e)(3)(i)(A);
■ d. Revising paragraph (e)(3)(iv);
■ e. Adding five sentences to the end of paragraph (e)(3)(v);
■ f. Revising paragraph (e)(3)(vi);
■ g. Revising the introductory text to paragraph (e)(3)(vii) and revising paragraph (e)(3)(vii)(B); and
■ h. Revising the last sentence in paragraph (e)(3)(viii).
■ The revisions and addition read as follows:

§ 63.6 Compliance with standards and maintenance requirements.

* * * * *

(e) * * *

(1)(i) At all times, including periods of startup, shutdown, and malfunction, the owner or operator must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. During a period of startup, shutdown, or malfunction, this general duty to minimize emissions requires that the owner or operator reduce emissions from the affected source to the greatest extent which is consistent with safety and good air pollution control practices. The general duty to minimize emissions during a period of startup, shutdown, or malfunction does not require the owner or operator to achieve emission levels that would be required by the applicable standard at other times if this is not consistent with safety and good air pollution control practices, nor does it require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures (including the startup, shutdown, and malfunction plan required in paragraph (e)(3) of this section), review of operation and maintenance records, and inspection of the source.

* * * * *

(3) *Startup, shutdown, and malfunction plan.* (i) The owner or operator of an affected source must develop and implement a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, and malfunction, and a program of corrective action for malfunctioning process and air pollution control and monitoring equipment used to comply with the relevant standard. * * *

(A) Ensure that, at all times, the owner or operator operates and maintains each affected source, including associated air pollution control and monitoring equipment, in a manner which satisfies the general duty to minimize emissions established by paragraph (e)(1)(i) of this section;

* * * * *

(iv) If an action taken by the owner or operator during a startup, shutdown, or malfunction (including an action taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, and the source exceeds any applicable emission limitation in the relevant emission standard, then the owner or operator must record the actions taken for that event and must report such actions within 2 working days after commencing actions inconsistent with the plan, followed by a letter within 7 working days after the end of the event, in accordance with § 63.10(d)(5) (unless the owner or operator makes alternative reporting arrangements, in advance, with the Administrator).

(v) * * * The Administrator may at any time request in writing that the owner or operator submit a copy of any startup, shutdown, and malfunction plan (or a portion thereof) which is maintained at the affected source or in the possession of the owner or operator. Upon receipt of such a request, the owner or operator must promptly submit a copy of the requested plan (or a portion thereof) to the Administrator. The Administrator must request that the owner or operator submit a particular startup, shutdown, or malfunction plan (or a portion thereof) whenever a member of the public submits a specific and reasonable request to examine or to receive a copy of that plan or portion of a plan. The owner or operator may elect to submit the required copy of any startup, shutdown, and malfunction plan to the Administrator in an electronic format. If the owner or operator claims that any portion of such a startup, shutdown, and malfunction plan is confidential business information entitled to protection from disclosure under section 114(c) of the Act or 40 CFR 2.301, the material which is claimed as confidential must be clearly designated in the submission.

(vi) To satisfy the requirements of this section to develop a startup, shutdown, and malfunction plan, the owner or operator may use the affected source's standard operating procedures (SOP) manual, or an Occupational Safety and Health Administration (OSHA) or other plan, provided the alternative plans meet all the requirements of this section and are made available for inspection or submitted when requested by the Administrator.

(vii) Based on the results of a determination made under paragraph (e)(1)(i) of this section, the Administrator may require that an owner or operator of an affected source make changes to the startup, shutdown, and malfunction plan for that source. The Administrator must require appropriate revisions to a startup, shutdown, and malfunction plan, if the Administrator finds that the plan:

* * * * *

(B) Fails to provide for the operation of the source (including associated air pollution control and monitoring equipment) during a startup, shutdown, or malfunction event in a manner consistent with the general duty to minimize emissions established by paragraph (e)(1)(i) of this section;

* * * * *

(viii) * * * In the event that the owner or operator makes any revision to the startup, shutdown, and malfunction plan which alters the scope of the activities at the source which are deemed to be a startup, shutdown, or malfunction, or otherwise modifies the applicability of any emission limit, work practice requirement, or other requirement in a standard established

under this part, the revised plan shall not take effect until after the owner or operator has provided a written notice describing the revision to the permitting authority.

* * * * *

■ 4. Section 63.9 is amended by revising the first sentence in paragraph (h)(2)(ii) and adding a sentence to the end of paragraph (h)(2)(ii) to read as follows:

§ 63.9 Notification requirements.

* * * * *

(h) * * *

(2) * * *

(ii) The notification must be sent before the close of business on the 60th day following the completion of the relevant compliance demonstration activity specified in the relevant standard (unless a different reporting period is specified in the standard, in which case the letter must be sent before the close of business on the day the report of the relevant testing or monitoring results is required to be delivered or postmarked). * * * Notifications may be combined as long as the due date requirement for each notification is met.

* * * * *

■ 5. Section 63.10 is amended by revising paragraphs (d)(5)(i) and (ii) to read as follows:

§ 63.10 Recordkeeping and reporting requirements.

* * * * *

(d) * * *

(5)(i) *Periodic startup, shutdown, and malfunction reports.* If actions taken by an owner or operator during a startup, shutdown, or malfunction of an affected source (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan (see § 63.6(e)(3)), the owner or operator shall state such information in a startup, shutdown, and malfunction report. Such a report shall identify any instance where any action taken by an owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) is not consistent with the affected source's startup, shutdown, and malfunction plan, but the source does not exceed any applicable emission limitation in the relevant emission standard. Such a report shall also include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. Reports shall only be required if a startup, shutdown, or malfunction occurred during the reporting period. The startup, shutdown, and malfunction report shall consist of a letter, containing the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, that shall be submitted to the Administrator semiannually (or on a more frequent basis if specified otherwise in a relevant standard or as established otherwise by the permitting authority in the source's title V permit). The startup, shutdown, and malfunction report shall be delivered or postmarked by the 30th day following the end of each calendar half (or other calendar reporting period, as appropriate). If the owner or operator is required to submit excess emissions and continuous monitoring system performance (or other periodic) reports under this part, the startup, shutdown, and malfunction reports required under this paragraph may be submitted simultaneously with the excess emissions and continuous monitoring system performance (or other) reports. If startup, shutdown, and malfunction reports are submitted with excess emissions and continuous monitoring system performance (or other periodic) reports, and the owner or operator receives approval to reduce the frequency of reporting for the latter under paragraph (e) of this section, the frequency of reporting for the startup, shutdown, and malfunction reports also may be reduced if the Administrator does not object to the intended change. The procedures to implement the allowance in the preceding sentence shall be the same as the procedures specified in paragraph (e)(3) of this section.

(ii) *Immediate startup, shutdown, and malfunction reports.* Notwithstanding the allowance to reduce the frequency of reporting for periodic startup, shutdown, and malfunction reports under paragraph (d)(5)(i) of this section, any time an action taken by an owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, and the source exceeds any applicable emission limitation in the relevant emission standard, the owner or operator shall report the actions taken for that event within 2 working days after commencing actions inconsistent with the plan followed by a letter within 7 working days after the end of the event. The immediate report required under this paragraph (d)(5)(ii) shall consist of a telephone call (or facsimile (FAX) transmission) to the Administrator within 2 working days after commencing actions inconsistent with the plan, and it shall be followed by a letter, delivered or postmarked within 7 working days after the end of the event, that contains the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, explaining the circumstances of the event, the reasons for not following the startup, shutdown, and malfunction plan, and describing all excess emissions and/or parameter monitoring exceedances which are believed to have occurred. Notwithstanding the requirements of the previous sentence, after the effective date of an approved permit program in the State in which an affected source is located, the owner or operator may make alternative reporting arrangements, in advance, with the permitting authority in that State. Procedures governing the arrangement of alternative reporting requirements under this paragraph (d)(5)(ii) are specified in § 63.9(i).

* * * * *

■ 6. Section 63.13 is amended by revising the address for EPA Region IV in paragraph (a) to read as follows:

§ 63.13 Addresses of State air pollution control agencies and EPA Regional Offices.

(a) * * *

EPA Region IV (Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee). Director, Air, Pesticides and Toxics Management Division, Atlanta Federal Center, 61 Forsyth Street, Atlanta, GA 30303–3104.

* * * * *

Subpart B—[Amended]

■ 7. Section 63.50 is amended by adding paragraph (c) and paragraph (d) to read as follows:

§ 63.50 Applicability.

* * * * *

(c) The procedures in §§ 63.50 through 63.56 apply for each affected source only after the section 112(j) deadline for the source category or subcategory in question has passed, and only until such time as a generally applicable Federal standard governing that source has been promulgated under section 112(d) or 112(h) of the Act. Once a generally applicable Federal standard governing that source has been promulgated, the owner or operator of the affected source and the permitting authority are not required to take any further actions to develop an equivalent

emission limitation under section 112(j) of the Act.

(d) Any final equivalent emission limitation for an affected source which is issued by the permitting authority pursuant to §§ 63.50 through 63.56 prior to promulgation of a generally applicable Federal standard governing that source under section 112(d) or 112(h) of the Act shall be deemed an applicable Federal requirement adopted pursuant to section 112(j) of the Act. Each such equivalent emission limitation shall take effect upon issuance of the permit containing that limitation under section 112(j)(5) of the Act, and shall remain applicable to the source until such time as it may be revised or supplanted pursuant to the procedures established by §§ 63.50 through 63.56. Such a final equivalent emission limitation, and all associated requirements adopted pursuant to § 63.52(f)(2), are directly enforceable under Federal law regardless of whether or not any permit in which they may be contained remains in effect.

■ 8. Section 63.52 is amended by revising paragraphs (e)(1) and (e)(2)(i) through (ii) to read as follows:

§ 63.52 Approval process for new and existing affected sources.

* * * * *

(e) *Permit application review.*

(1) Each owner or operator who is required to submit to the permitting authority a Part 1 MACT application which meets the requirements of § 63.53(a) for one or more sources in a category or subcategory subject to section 112(j) must also submit to the permitting authority a timely Part 2 MACT application for the same sources which meets the requirements of § 63.53(b). Each owner or operator shall submit the Part 2 MACT application for the sources in a particular category or subcategory no later than the applicable date specified in Table 1 to this subpart. The submission date specified in Table 1 to this subpart for Miscellaneous Organic Chemical Manufacturing shall apply to sources in each of the source categories listed in Table 2 to this subpart. When the owner or operator is required by §§ 63.50 through 63.56 to submit an application meeting the requirements of § 63.53(a) by a date which is after the date for a Part 2 MACT application for sources in the category or subcategory in question established by Table 1 to this subpart, the owner or operator shall submit a Part 2 MACT application meeting the requirements of § 63.53(b) within 60 additional days after the applicable deadline for submission of the Part 1 MACT application. Part 2 MACT applications must be reviewed by the permitting authority according to procedures established in § 63.55. The resulting MACT determination must be incorporated into the source's title V permit according to procedures established under title V, and any other regulations approved under title V in the jurisdiction in which the affected source is located.

(2) Notwithstanding paragraph (e)(1) of this section, the owner or operator may request either an applicability determination or an equivalency determination by the permitting authority as provided in paragraphs (e)(2)(i) and (ii) of this section.

(i) Each owner or operator who submitted a request for an applicability determination pursuant to paragraph (d)(1) of this section on or before May 15, 2002, which remains pending before the permitting authority on May 30, 2003, and who still wishes to obtain such a determination, must resubmit that request by July 29, 2003, or by the date which is 60 days after the Administrator publishes in the **Federal Register** a proposed standard under section 112(d) or 112(h) of the Act for the category or subcategory in question, whichever is later. Each request for an applicability determination which is resubmitted under this paragraph (e)(2)(i) must be supplemented to discuss the relation between the source(s) in question and the applicability provision in the proposed standard for the category or subcategory in question, and to explain why there may still be uncertainties that require a determination of applicability. The permitting authority must take action upon each properly resubmitted and supplemented request for an applicability determination within an additional 60 days after the applicable deadline for the resubmitted request. If the applicability determination is positive, the owner or operator must submit a Part 2 MACT application meeting the requirements of § 63.53(b) by the date specified for the category or subcategory in question in Table 1 to this subpart. If the applicability determination is negative, then no further action by the owner or operator is necessary.

(ii) As specified in paragraphs (a) and (b) of this section, an owner or operator who has submitted an application meeting the requirements of § 63.53(a) may request a determination by the permitting authority of whether emission limitations adopted pursuant to a prior case-by-case MACT determination under section 112(g) that apply to one or more sources at a major source in a relevant category or subcategory are substantially as effective as the emission limitations which the permitting authority would otherwise adopt pursuant to section 112(j) for the source in question. Such a request must be submitted by the date for the category or subcategory in question specified in Table 1 to this subpart. Any owner or operator who previously submitted such a request under a prior version of this paragraph (e)(2)(ii) need not resubmit the request. Each request for an equivalency determination under this paragraph (e)(2)(ii), regardless of when it was submitted, will be construed in the alternative as a complete application for an equivalent emission limitation under section 112(j). The process for determination by the permitting authority of whether the emission limitations in the prior case-by-case MACT determination are substantially as effective as the emission limitations which the permitting authority would otherwise adopt under section 112(j) must include the opportunity for full public, EPA, and affected State review prior to a final determination. If the permitting authority determines that the emission limitations in the prior case-by-case MACT determination are substantially as effective as the emission limitations which the permitting authority would otherwise adopt under section 112(j), then the permitting authority must adopt the existing emission limitations in the permit as the emission limitations to effectuate section 112(j) for the source in question. If more than 3 years remain on the current title V permit, the owner or operator must submit an application for a title V permit revision to make any conforming changes in the permit required to adopt the existing emission limitations as the section 112(j) MACT emission limitations. If less than 3 years remain on the current title V permit, any required conforming changes must be made when the permit is renewed. If the permitting authority determines that the emission limitations in the prior case-by-case MACT determination under section 112(g) are not substantially as effective as the emission limitations which the permitting authority would otherwise adopt for the source in question under section 112(j), the permitting authority must make a new MACT determination and adopt a title V permit incorporating an appropriate equivalent emission limitation under section 112(j). Such a determination constitutes final action for purposes of judicial review under 40 CFR 70.4(b)(3)(x) and corresponding State title V program provisions.

* * * * *

■ 9. Section 63.53 is amended by:
■ a. Redesignating paragraphs (b)(1) and (2) as paragraphs (b)(2) and (3);
■ b. Adding a new paragraph (b)(1); and
■ c. Revising newly designated paragraph (b)(2).
■ The addition and revision read as follows:

§ 63.53 Application content for case-by-case MACT determinations.

* * * * *

(b) * * *

(1) In compiling a Part 2 MACT application, the owner or operator may cross-reference specific information in any prior submission by the owner or operator to the permitting authority, but in cross-referencing such information the owner or operator may not presume favorable action on any prior application or request which is still pending. In compiling a Part 2 MACT application, the owner or operator may also cross-reference any part of a standard proposed by the Administrator pursuant to section 112(d) or 112(h) of the Act for any category or subcategory which includes sources to which the Part 2 application applies.

(2) The Part 2 application for a MACT determination must contain the information in paragraphs (b)(2)(i) through (b)(2)(v) of this section.

(i) For a new affected source, the anticipated date of startup of operation.

(ii) Each emission point or group of emission points at the affected source which is part of a category or subcategory for which a Part 2 MACT application is required, and each of the hazardous air pollutants emitted at those emission points. When the Administrator has proposed a standard pursuant to section 112(d) or 112(h) of the Act for a category or subcategory, such information may be limited to those emission points and hazardous air pollutants which would be subject to control under the proposed standard.

(iii) Any existing Federal, State, or local limitations or requirements governing emissions of hazardous air pollutants from those emission points which are part of a category or subcategory for which a Part 2 application is required.

(iv) For each identified emission point or group of affected emission points, an identification of control technology in place.

(v) Any additional emission data or other information specifically requested by the permitting authority.

* * * * *

■ 10. Subpart B is amended by adding Tables 1 and 2 to the end of the subpart to read as follows:

Tables to Subpart B of Part 63

TABLE 1 TO SUBPART B OF PART 63.—SECTION 112(j) PART 2 APPLICATION DUE DATES

Due date	MACT standard
10/30/03	Combustion Turbines.
	Lime Manufacturing.
	Site Remediation.
	Iron and Steel Foundries.
	Taconite Iron Ore Processing.
	Miscellaneous Organic Chemical Manufacturing (MON).[1]
	Organic Liquids Distribution.
	Primary Magnesium Refining.
	Metal Can (Surface Coating).
	Plastic Parts and Products (Surface Coating).
	Chlorine Production.
	Miscellaneous Metal Parts and Products (Surface Coating) (and Asphalt/Coal Tar Application—Metal Pipes).[2]
4/28/04	Industrial Boilers, Institutional/Commercial Boilers and Process Heaters.[3]
	Plywood and Composite Wood Products.
	Reciprocating Internal Combustion Engines.[4]
	Auto and Light-Duty Truck (Surface Coating).
8/13/05	Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters.[5]
	Hydrochloric Acid Production.[6]

[1] Covers 23 source categories, see Table 2 to this subpart.

[2] Two source categories.

[3] Includes all sources in the three categories, Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters that burn no hazardous waste.

[4] Includes engines greater than 500 brake horsepower.

[5] Includes all sources in the three categories, Industrial Boilers, Institutional/Commercial Boilers, and Process Heaters that burn hazardous waste.

[6] Includes furnaces that produce acid from hazardous waste at sources in the category Hydrochloric Acid Production.

TABLE 2 TO SUBPART B OF PART 63.—MON SOURCE CATEGORIES

Manufacture of Paints, Coatings, and Adhesives.
Alkyd Resins Production.
Maleic Anhydride Copolymers Production.
Polyester Resins Production.
Polymerized Vinylidene Chloride Production.
Polymethyl Methacrylate Resins Production.
Polyvinyl Acetate Emulsions Production.
Polyvinyl Alcohol Production.
Polyvinyl Butyral Production.
Ammonium Sulfate Production-Caprolactam By-Product Plants.
Quaternary Ammonium Compounds Production.
Benzyltrimethylammonium Chloride Production.
Carbonyl Sulfide Production.
Chelating Agents Production.
Chlorinated Paraffins Production.
Ethylidene Norbornene Production.
Explosives Production.
Hydrazine Production.
OBPA/1,3-Diisocyanate Production.
Photographic Chemicals Production.
Phthalate Plasticizers Production.
Rubber Chemicals Manufacturing.
Symmetrical Tetrachloropyridine Production.

In the matter of:

PUBLIC HEARING ON PROPOSED REVISIONS TO LEGISLATIVE RULE

45 CSR 34 "EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES PUSUANT TO 40 CFR PART 63"

Transcript of proceedings had at a public hearing in the above-styled matter taken by Missy L. Young, Certified Court Reporter and Commissioner in and for the State of West Virginia, at the West Virginia Division of Environmental Protection, Office of Air Quality, Conference Room, 7012 MacCorkle Avenue, S.E., Charleston, West Virginia, commencing at 6:02 p.m., on the 15th day of July, 2003, pursuant to notice.

MISSY L. YOUNG, C.C.R.
POST OFFICE BOX 13221
SISSONVILLE, WEST VIRGINIA 25360

FORM CSR - LASER REPORTERS PAPER & MFG. CO. 800-626-6313

P R O C E E D I N G S

MS. CHANDLER: The purpose of this hearing is to accept comments on proposed revisions to rule 45CSR34 - Emissions Standards for Hazardous Air Pollutants for Source Categories Pursuant to 40 CFR Part 63. This rule establishes and adopts national emissions standards for hazardous air pollutants (NESHAP) and other regulatory requirements promulgated by the U.S. Environmental Protection Agency pursuant to section 112 of the federal Clean Air Act, as amended.

This rule codifies general procedures and criteria to implement emission standards for stationary sources that emit, or have the potential to emit, one or more of the hazard air pollutants (HAP) in or pursuant to section 112(b) of the Clean Air Act.

The rule adopts by reference the NESHAP standards of 40 CFR Parts 63 and 65 (Consolidated Federal Air Rule) to the extent referenced in 40 CFR Part 63, promulgated as of June 1, 2003.

The rule also adopts associated reference methods, performance specifications and other tests methods which are appended to these standards and contained in 40 CFR Parts 63 and 65. Any person who constructs, reconstructs, modifies or operates any source

FORM CSR - LASER REPORTERS PAPER & MFG. CO. 800-626-6313

subject to the provisions of 40 CFR Part 63 must comply with the applicable NESHAPs and this rule.

45CSR34, in conjunction with 45CSR15, establishes general provisions for emissions standards for hazardous air pollutants (NESHAP) and other regulatory requirements promulgated by the U.S. Environmental Protection Agency pursuant to section 112 of the federal Clean Air Act, as amended. 45CSR34 incorporates hazardous air pollutant standards codified by U.S. Environmental Protection Agency under 40 CFR Part 63 whereas 45CSR15, incorporates hazardous air pollutant standards promulgated by USEPA under 40 CFR Part 61.

This revised rule incorporates by reference the following new or revised NESHAP standards promulgated as of June 1, 2003: National Emission Standard for Hazardous Air Pollutants for Pesticide Active Ingredient Production, Generic Maximum Achievable Control Technology Standards, Surface Coating of Metal Coil, Cellulose Products Manufacturing, Phosphoric Acid Manufacturing Plants and Phosphate Fertilizers Production Plants, Primary Copper Smelting, Secondary Aluminum Production, Portland Cement Manufacturing Industry, Rubber Tire Manufacturing.

Polyvinyl Chloride and Copolymers

FORM CSR - LASER REPORTERS PAPER & MFG. CO. 800-626-6313

Production, Surface Coating of Large Appliances, Friction Materials Manufacturing Facilities, Publically Owned Treatment Works, Paper and Other Web Coating, Hazardous Waste Combustors, Municipal Solid Waste Landfills, Chemical Recovery Combustion Sources at Kraft, Soda Sulfite, and Stand-alone Semichemical Pulp Mills, Rubber Tire Manufacturing, Surface Coating of Metal Coil, Coke Ovens, Pushing, Quenching and Battery Stacks, Flexible Polyurethane Foam Fabrication Operations, Refractory Products Manufacturing, Hydrochloric Acid Production, Reinforced Plastic Composites Production, Asphalt Processing and Asphalt Roofing Manufacturing, Brick and Structural Clay Products Manufacturing, Clay Ceramics Manufacturing, Integrated Iron and Steel Manufacturing, Semiconductor Manufacturing, Surface Coating of Metal Furniture, Engine Test Cells/Stands, Surface Coating of Wood Building Products and Printing, Coating, Dyeing of Fabrics and Other Textiles, and General Provisions and Requirements for Control Technology Determinations for Major Sources in Accordance With Sections 112(g) and 112(j).

Upon authorization and promulgation of revisions to the 45CSR34, the Division of Air Quality will provide the U.S. Environmental Protection Agency the

FORM CSR - LASER REPORTERS PAPER & MFG. CO. 800-626-6313

updated final rules as part of West Virginia's program delegation of the NSPS and NESHAP standards, which became effective on January 8, 2002.

The floor is now open for public comment on 45CSR34. There being nothing further, this public hearing for the proposed 45CSR34 is concluded.

(WHEREUPON, the public hearing was concluded.)

FORM CSR - LASER REPORTERS PAPER & MFG. CO. 800-626-6313

BEFORE THE WEST VIRGINIA DEPARTMENT OF

EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES PURSUANT TO 40 CFR PART 63

RESPONSE TO COMMENTS

On June 13, 2003, the Division of Air Quality (DAQ) commenced the public comment period and subsequently held a public hearing on July 15, 2003 to accept oral comments on the proposed rule, 45CSR34. Written comments were also accepted through 6:00 PM on Monday, July 15, 2003. No person verbally commented at the public hearing concerning proposed rule 45CSR34. No commenter submitted substantive written comments regarding proposed rule 45CSR34. Therefore, no response is required by the Division.
