

## **Proposed recommended changes for Title 87-2, Electricians Rule Post Public Comment Period**

In response to the comments received, the Commission has amended the Rule to accomplish the requests in the following manner:

Under 2.4 Specialty Electrician License add:

**d. A "single family residential dwelling journeyman electrician license (SP-SFDJ) which authorizes the licensee to install, maintain, or repair only electrical wiring and devices that are in or on a single family residential dwelling or an ancillary to a single family residential dwelling. Electrical work that is covered by another special restricted license can be performed by a SP-SFD licensee without obtaining the other special restricted license as long as it is in or on a single family residential dwelling or an ancillary to a single family residential dwelling. This license also allows the bearer to function as "Apprentice Electrician" in commercial and all other settings so that the hours worked maybe applied to "Journeyman Electrician" license as noted in §87-2-2.2.**

Under 4.4 Specialty License add:

**4.4.a" Single Family Residential Dwelling Journeyman Electrician License (SP-SFDJ)  
Must have completed an electrical vocational education program of at least one thousand eighty hours in length approved by the state board of education which should have an On-the-Job training/work hours module included and successfully passed all final written and practical testing as required by the WV Department of Education with an affidavit from each student's instructor showing competency to sit for the journeyman electrician examination. This license also allows the bearer to function as "Apprentice Electrician" in commercial and all other settings so that the hours worked maybe applied to "Journeyman Electrician" license as noted in §87-2-2.2.**

July 07, 2017

Mr. Tyree:

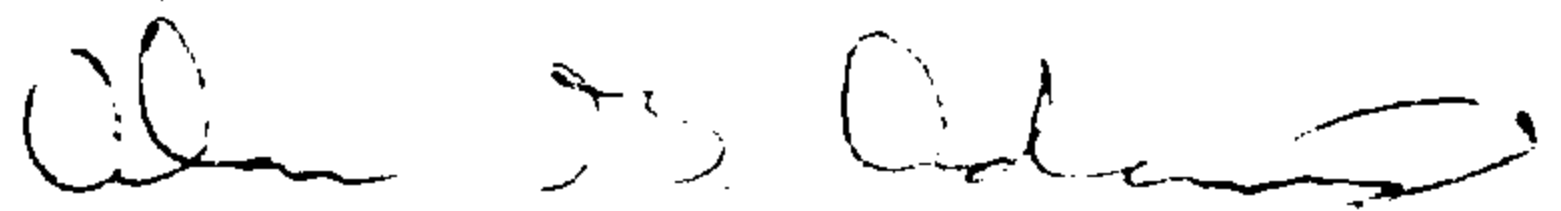

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the -job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

Kenneth E. Tyree Jr.

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

Kenneth E. Tyree Jr.

July 6, 2017

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

Kenneth E. Tyree Jr.

The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Charleston, WV 25301

July 07, 2017

Mr. Tyree:

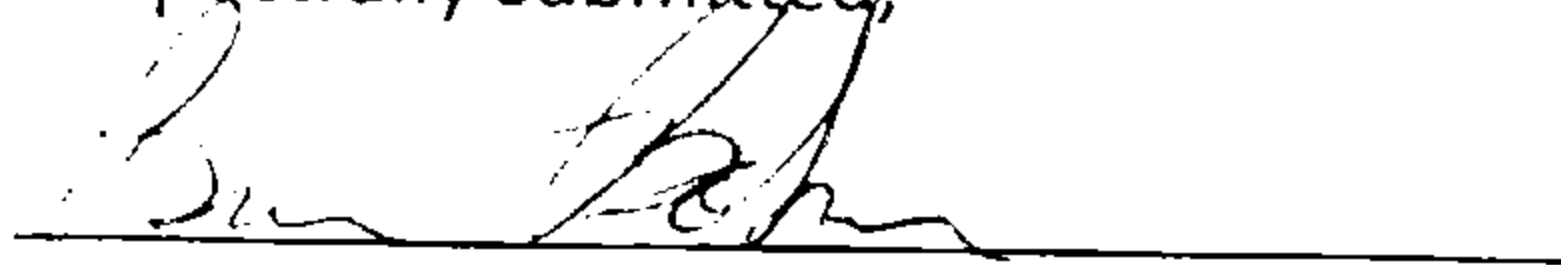

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

July 6, 2017

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

Kenneth E. Tyree Jr.  
State Fire Marshal

Apprenticeship

July 6, 2017

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

David A Nary Sr.

I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Mr. Tyree:

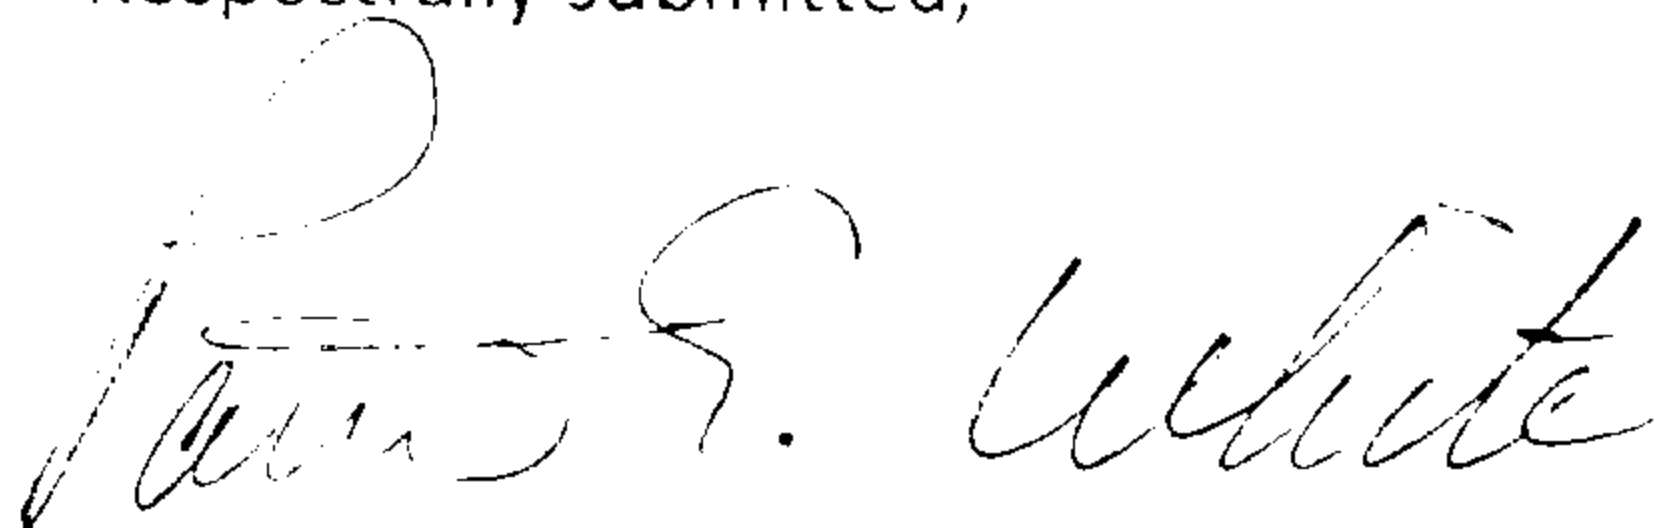

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

---

Mr. Tyree:

I am writing you to express my concerns on the proposed changes to the State Fire Commission Series 2 Electrician Licensing Rules. I am an electrician by trade with a license issued from your office.

I am a product of a United States Department of Labor/Bureau of Apprenticeship and Training Registered Electrical Apprenticeship Program. In my opinion, the training received through this program, has provided me the best experience an electrician can receive. The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on the job training/work hours module as outlined in 87-2-4 (4.2). The instruction received in the classrooms coupled with the 8,000 hours of on-the-job training supervised by a Journeyman Wireman Electrician is what has provided me the extensive training needed as an electrician in the industrial, commercial, and residential markets where I am currently employed. I believe that the electrical program through the various vocational schools provide a sound and solid base on which to build a career on. However, these young men and women, upon completing these programs, are not qualified to work as a journeyman electrician in many of the environments that they may be placed.

That is where the changes outlined to the current electrical licensing rules concerns me. In my opinion, the on-the-job training requirement of four years should not be reduced for a journeyman electrician's license. Most vocational school training programs are focused on providing training to install, maintain, or repair electrical devices that are in or on single family residential dwellings. I would support a Residential Single Family Dwelling license to be issued by the State after completion of the vocational school program if it incorporates an on-the-job training/work hours module as outlined in 87-2-4 (4.2). The license holder could then apply to take the Journeyman License test after submitting four years of documented on-the-job training while working as an electrician in the residential market.

A license is a certification issued by the State that assures the residents, employers, and consumers that a qualified electrician is performing their electrical work as a craftsman that is knowledgeable of the National Electric Code and has obtained the experience to safely install, repair, and maintain their electrical needs. Safety should be our number one priority.

Respectfully submitted,

---
